October 2022

FOREWORD

6th International Anatolian Agriculture, Food, Environment and Biology Congress
(Targid 2022)

The 6th International Anatolian Agriculture, Food, Environment and Biology Congress has been organized in Kütahya on 7-9 October 2022 to bring the developments in agriculture, food, environment and biology to the agenda and to enable new collaborations. It hosted by Kütahya Municipality under the leadership of Niğde Ömer Halisdemir University, Sivas Cumhuriyet University, Kütahya Dumlupınar University and The Turkish Journal of Agriculture - Food Science and Technology (TURJAF), organized by Turkish Science and Technology Publishing (TURSTEP). Presentations will be hybrid (face-to-face and online) at our congress.

In the congress, the participant scientists working in agriculture and related disciplines shared scientific developments, offered scientific solutions to international problems, increased their cooperation, and created scientific outcomes that will benefit humanity. Online oral and poster presentations in our congress were simultaneously broadcasted live on the TURJAF TV channel on YouTube and these videos will be available in the future in our channel. In this way, researchers who are interested in the subject can watch these presentations again on YouTube and TARGID's (www.targid.org) website later.

359 papers from 24 countries were presented to our congress. 147 of these papers came from foreign countries and 212 came from Türkiye. The countries of the participants who sent papers to the congress and the number of incoming articles are as follows; Algeria (7), Australia (1), Azerbaijan (18), Bangladesh (5), Ethiopia (6), Germany (1), Ghana (3), India (1), Iran (4), Iraq (3), Italy (1), Lebanon (1), Malaysia (2), Nepal (1), Nigeria (30), Pakistan (42), Poland (2), Rawalpindi (1), Romania (2), Rwanda (10), Spain (1), Sri Lanka (3), USA (2), and Türkiye (212).

As the host of the congress, the Mayor of Kütahya Prof. Dr. Alim Işık, and the chairmen of the Congress Prof. Dr. Hasan Eleroğlu, Prof. Dr. Muhammet Dönmez, Prof. Dr. Sedat Karaman, Prof. Dr. Zeliha Selamoğlu, TURJAF editors Prof. Dr. Hasan Eleroğlu and Prof. Dr. Ahmet Şekeroğlu have undertaken important duties in the organization and successful progression of the congress. Additionally, Asst. Profs. Mustafa Duman, Burak Şen and Emre Aksoy have taken responsibilities as the secretary of the congress. Finally, Res. Asst. Mustafa Güzel, Yunus Emre Şentürk, Brian Tainika and Mustafa Özcan from the "CNS Congress Organizations" company helped with the congress organization. We would like to thank the Mayor of Kütahya Prof. Dr. Alim Işık, and all our stakeholders and all scientists who participated and supported the congress.

Sincerely yours,

Coordinator of the Congress

14.45-15.00	<u>Dilvin İpek</u> , Nukhet N. Demirel Zorba	Türkiye	Sanitizing Stainless Steel Process Surfaces By New Natural Disinfectant Formula
15.00-15.15	<u>Asuman Büyükkılıç Yanardağ</u> , İbrahim Halil Yanardağ	Türkiye	A Review: Covid-19 Impacts On Soil
15.15-15.30	<u>Mustafa Ulas</u> , Nilufer Gulnar Celik	Türkiye	Valproic Acid Prevents Oxidative Spleen Damage Due To Spinal Cord Injury By Regulating Antioxidant Enzymes In Rats
15.30-15.45	Ali Rıza Köşker, Yılmaz Uçar, Mustafa Durmuş, <u>Koray Korkmaz</u> , Hatice Asuman Yılmaz	Türkiye	Metal levels of commercially important Saurida lessepsianus from North-Eastern Mediterranean: Health risk estimation
15.45-16.00	Ara		Break

8 Ekim 2022 Cumartesi, 08 October 2022 Saturday, Time by Türkiye
PROF.DR. ERCAN TEZER SALONU/ PROF.DR. ERCAN TEZER HALL

6.Oturum / 6st Session
Oral Presentation Online

Başkan/ Moderator: Dr. Fatma Ergün /Ahmet Akyol			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
16.00-16.15	<u>Aysel Kekillioğlu</u> , Kutbettin Arslan, Fatma Soysaldı, Gülten Ökmen	Türkiye	Determination of Antibacterial and Antioxidant Activities of Eisenia fetida (Savigny, 1826) Against Mastitis Pathogens
16.15-16.30	<u>Aysel Kekillioğlu</u> , <u>Manal Mutahar Ali Al-Hajj</u>	Türkiye	Challenges Of Scientific Research in Molecular Biotechnology in Yemen
16.30-16.45	<u>Gülşah Keklik</u>	Türkiye	Data Mining Methods Used In Livestock And An Application
16.45-17.00	Fatma Ergün	Türkiye	Determination Of Phytochemicals And Antioxidant Capacities Of Fresh Scots Pine (Pinus Sylvestris L.) Sprouts Consumed As Herbal Tea
17.00-17.15	Ara		Break

8 Ekim 2022 Cumartesi, 08 October 2022 Saturday, Time by Türkiye
PROF.DR. ERCAN TEZER SALONU/ PROF.DR. ERCAN TEZER HALL

7.OTURUM / 7st session
Oral Presentation Online

Başkan/ Moderator: Doç.Dr. Cem Baltacıoğlu/Ahmet Akyol			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
17.15-17.30	Mehmet Yetisen, <u>Cem Baltacıoğlu</u> , Hasan Uslu	Türkiye	Reactive Extration Of Lactic Acid Using Trioctylamine With Environmentally Friendly Solvents
17.30-17.45	Asiye Özcan Tarım, <u>Cem Baltacıoğlu</u>	Türkiye	New Trends In Functional Beverages Nowadays
17.45-18.00	<u>Orkun Emiralioğlu</u> , Mehmet Zahit Yeken, Ali Çelik, Vahdettin Çiftçi	Türkiye	The Monitoring Of The Resistance Genes Associated With BCMV And BCMNV In Promising Common Bean Lines
18.00-18.15	<u>Burcu Aksüt</u> , Hakan Polatci, Muhammed Taşova	Türkiye	The Effect Of Drying Methods On Drying And Thermo-Physical Properties Of Apricot Kernels
18.15-18.30	<u>Hatice Yıldırım</u> , Latif Gürkan Kaya, Hüseyin Samet Aşıkutlu	Türkiye	Is The World Ready For A New Pandemic After The Covid-19 Pandemic?
18.30-18.45	Ara		Break

8 Ekim 2022 Cumartesi, 08 October 2022 Saturday Time by Türkiye
PROF.DR. ERCAN TEZER SALONU/ PROF.DR. ERCAN TEZER HALL

8.OTURUM / 8st session
Oral Presentation Online

Başkan/ Moderator: Dr.Saba Zafar /Ahmet Akyol			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
18.45-19.00	<u>Amar Rouabhi</u> , Abdelali Djelloul, Abdelhamid Mekhlouf	Algeria	Assessment of Durum wheat behavior according to phenology and climatic patterns in the semi-arid region of Setif-Algeria
19.00-19.15	<u>Wajid khan</u> , Nisar Ali, Muhammad Nazir Uddin, Dawood Ghafoor, Muhammad Ishaq, Haji khan, Muhammad Rizwan, Shahab Ahmad khan	Pakistan	Differential antimicrobial potential of Ajuga bracteosa Wall ex. Benth based on extraction solvents
19.15-19.30	<u>Saba Zafar</u> , Haris Khurram, Muhammad Kamran, Madeeha Fatima, Aqsa Parvaiz, Rehan Sadiq Shaikh	Pakistan	Association Study for GJA8 Variants with Age-Related Cataract in Population of Pakistan
19.30-19.45	Md. Shafiul Islam, Shitosri Mondal, Prodipto Bishnu Angon, Md. Abdul Jalil	Bangladesh	A Critical Review on The Accumulation of Microplastics In Agroecosystem and Its Effects on Terrestrial Plants

8 Ekim 2022 Cumartesi, 08 October 2022 Saturday, Time by Türkiye
PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

1. OTURUM / 1st session
Oral Presentation Online

Başkan/ Moderator: Dr. Ebrahim Alinia-Ahandani /Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
09.00-9.15	<u>Aliyeva Tarana</u> , Hajiyeva Hadiyya, Samedova Ayten, Malikova Afag	Azerbaijan	Soil Contamination With Protein And Vitamin Preservatives
9.15-9.30	Adigozalov Parviz	Azerbaijan	Evaluation Of Environmentally Harmful Mineral Fertilizer Standards In Irrigated Gray Brown Soils In Samukh District
9.30-9.45	<u>Muhammad Umair Asghar</u> , Mariusz Korczyński, Sibel Canogullari Doğan, Sema Yaman	Poland Türkiye	Alternatives To Antibiotics In The Poultry Diet Regarding One Health Concept
9.45-10.00	<u>Ebrahim Alinia-Ahandani</u> , Zahra Alizadeh-Terepoei, Zeliha Selamoglu	İran Türkiye	Overview On Raspberry Leaves And Blue Cohosh (Caulophyllum Thalictroides) As Partus Preparatory Prevalence And Frequency Of Diabetic Autonomic Neuropathy (DAN) And Their Related Risk Factors In Type 1 Diabetic Patients Of Hyderabad And Jamshoro
10.00-10.15	<u>Tahira Jabeen Ursani</u> , Fahmida Channa	Pakistan	Break
10.15-10.30	Ara		

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

2. OTURUM / 2st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Tahira Jabeen Ursani/Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
10.30-10.45	<u>Muhammad Umair Asghar</u> , Mariusz Korczyński, Martyna Wilk, Barbara Król, Maja Shupczyńska, Sibel Canogullari Doğan, Sema Yaman	Poland Türkiye	Nutritional Strategies Particularly Lactic Acid Bacteria To Reduce Methane Production In Ruminants
10.45-11.00	<u>Muhammad Junaid Khilji</u> , <u>Tahira Jabeen Ursani</u> and Jawaid Ahmed Khokhar	Pakistan	The Testosterone Role In Adolescent Males From Hospital Of Hyderabad And Jamshoro
11.00-11.15	Aijazan Parveen Lakhari, <u>Tahira Jabeen Ursani</u> and Jawaid Ahmed Khokhar	Pakistan	Evaluation Of Diabetic Foot Complications In Outdoor Patients At Different Hospitals From District Naushahro Feroze Sindh
11.15-11.30	<u>Usman M. Khan</u> , Mesut Selamoglu	Pakistan Türkiye	The Role Of E-Commerce In The Daily Food Sector
11.30-11.45	<u>Aliyeva Tarana</u> , Abdullayev Rizvan, Melikova Afak	Azerbaijan	Interrelation Of Humic Substances With Chemical Substances And Pollutants
12.00-13.30	Ara		Break

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

3. OTURUM / 3st session

Oral Presentation Online

Başkan/ Moderator: Dr. Oyeyemi Sunday Dele /Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
13.30-13.45	<u>Oyeyemi Sunday Dele</u> , Oyedele Alfred Adedayo and Ismaila Grace Kehinde	Nigeria	Studies on Nutritional Profile and Mineral Bioavailability of Some Solanum species Consumed as Fruits in Ekiti State, Nigeria
13.45-14.00	<u>Jerry Ampofo-Asiama</u> , Nazir Kizzie-Hayford, Salifu Seidu-Larry	Ghana	Effect Of Sweetening Type On The Quality And Acceptability Of Roselle Tea.
14.00-14.15	<u>Sadia Zafar</u> and Asghari Bano	Pakistan	Comparative Effect Of Wild Type Of Pseudomonas Moraviensis And Its Mutants On Chickpea Under Salinity
14.15-14.30	Obembe Olusola Michael	Nigeria	Insecticidal Activity Of The Seed Powders Of Bush Banana, Uvaria Afzelli Scott Elliot Against Maize Weevil, Sitophilus Zeamais Motschulsky (Coleoptera: Curculionidae).
14.30-14.45	Ara		Break

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

4. OTURUM / 4st session

Oral Presentation Online

Başkan/ Moderator: /Dr.Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
14.45-15.00	<u>Arif Şanlı</u> , Fatma Zehra Ok	Türkiye	Effects Of Foliar Plant Growth Regulator Applications On Fruit And Essential Oil Yield Of Fennel (Foeniculum Vulgare Mill)
15.00-15.15	<u>Burhan Özsoy</u> , Özge Doğanay Erbaş Köse	Türkiye	Overall Assessment Of The Efficiency Of Nitrification And Urease Inhibitors
15.15-15.30	<u>Metin Caglar</u> , <u>Rzgar Farooq Rashid</u> , Zeliha Selamoglu	Irak Türkiye	Atatürk Dam Lake's (Adıyaman, Türkiye) Planktonic Diatoms
15.30-15.45	<u>Sahebeh Hajipour</u> , <u>Ebrahim Alinia-Ahandani</u> , Zeliha Selamoglu	İran Türkiye	A Fundamental Approach To The Medicinal Effects Of Walnut Green Husk (Juglans Regia L)
15.45-16.00	Ara		Break

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

5. OTURUM / 5st session

Oral Presentation Online

Başkan/ Moderator: Dr. Carmen –Olguța Brezuleanu /Dr. Emre Aksoy			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
16.00-16.15	Ebrahim Alinia-Ahandani	İran	A Glimpse Of The Amazing Effects Of Some Effective Medicinal Plants On The Skin
16.15-16.30	Carmen –Olguța Brezuleanu , Diana Elena Creangă, Mădălina-Maria Brezuleanu , Alexandru Sorin Tudoran	Romania	Aspects Related To The Implementation Of European Instruments, Programs And Policies For The Protection Of The Environment In The Romanian Space
16.30-16.45	Usman M. Khan, Mesut Selamoglu, <u>Ali Murad Khan</u>	USA Türkiye Pakistan	The Globalization Of The Food Sector And The Importance Of The Logistic
16.45-17.00	Usman M. Khan, Mesut Selamoglu, <u>Ali Murad Khan</u>	USA Türkiye Pakistan	The Role Of E-Commerce In The Daily Food Sector
17.00-17.15	Vahid Saatchian, Seyed karim Saadat Mirghadim, Zeliha Selamoglu, <u>Ebrahim Alinia-Ahandani</u> Ara	İran Türkiye	Identifying And Modeling Factors Affecting The Special Value Of The Green Brand In Women's Recreational-Sports Activities Break

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

6. OTURUM / 6st session

Oral Presentation Online

Başkan/ Moderator: /Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
17.15-17.30	Niyonsenga Evergiste, Musana Rwalinda Fabrice, Saidi Rumanzi Mbaraka, Ismael Niyokwizigirwa, Erastus Dushimyesu, Theophile Kanyarwanda, Egide Niyibizi, Eric Muhayimana, Emmanuel Niyigaba	Rwanda	Effects Of Inorganic And Organic Fertilizers On Irish Potato (Solanum Tuberosum L.): Growth, Yield And Processing Quality In Volcanic Soil-Musanze District
17.30-17.45	Laiba Arshad, Ibrahim Jantan, Syed Nasir Abbas Bukhari	Pakistan Malaysia Saudi Arabia	Enhanced Immunosuppressive Effects Of 3,5-Bis[4 (Diethoxymethyl) Benzylidene]-1-Methyl-Piperidin- 4-One, An A, B-Unsaturated Carbonyl-Based Compound As Plga-B-Peg Nanoparticles
17.45-18.00	Theophile Kanyarwanda, Habimana Sylvestre, Umuhoza Karemera Noella Josiane, Musana Rwalinda Fabrice, Uwizize Grace, Niyokwizigirwa Ismael, Dushimyesu Erastus, Niyonsenga Evergiste, Niyomugabo Jean De Dieu, Tuyishime Emmanuel	Rwanda Burundi	Effect of organic and industrial fertilizers on reducing sugar, specific gravity, dry matter and starch composition of fresh harvested irish potato varieties in Musanze District Rwanda
18.00-18.15	Sambo S. Mailumo, <u>Godfrey C. Onuwa</u>	Nigeria	Adoption Index of Recommended Onion Production Practices and Correlation of Multivariate Factors among Smallholder Farmers
18.15-18.30	<u>Hadjer Chenini-Bendiab</u> and Nouredine Djebli	Algeria	Nephroprotective effect of Algerian date seed extract (Phoenix dactylifera L.) against mercuric chloride-Induced alterations of kidney tissue
18.30-18.45	<u>Erastus Dushimyesu</u> , Sylvestre Habimana, Fabrice Musana Rwalinda, James Mushayija	Rwanda Japan	Evaluation Of The Effect Of Fertilization And Drying Methods On Pre And Post Aflatoxin Infection In Maize Under Busogo Climatic Conditions Break

8 Ekim 2022 Cumartesi, 8 October 2022 Sunday Time by Türkiye

PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL

7. OTURUM / 7st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Hasan Eleroğlu /Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
18.45-19.00	Mehmet Zahit Demir, <u>Hasan Eleroğlu</u>	Türkiye	Effects of Addition of Phytase Enzyme, Red Pepper, Dried Caper Powder, Propolis Extract and Alfalfa Juice to Free-Raised Egg Chicken Feeds on Egg Quality Parameters
19.00-19.15	Derya Güloğlu		
19.15-19.30	<u>Arif Şanlı</u> , Hülya Özgönen Özkaya	Türkiye	Antifungal Activities Of Sulphur Applications Against Rhizoctonia Solani And Fusarium Solani On Potato
19.30-19.45	<u>Büşra Sena Savaş</u> , Şebnem Şimşek Ara	Türkiye	Some Bioactive Properties of Tea Waste Break

9 Ekim 2022 Pazartesi, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. OSMAN TEKİNEL SALONU/ PROF.DR. OSMAN TEKİNEL HALL

1. OTURUM / 1st session

Oral Presentation Online

Başkan/ Moderator: Dr. Muhammad Shahid/Dr.Burak Şen			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
09.00-9.30	Dr. Muhammad Shahid	Pakistan	Seed Priming: A Shotgun Approach For Crop Improvement With Special Reference To Maize Under Salt Stress
9.30-9.45	Sordji Larweh, <u>Ammal Abukari</u>	Ghana	Small-Scale Farmers' Perception Of The Adoption Of Agroforestry Practices In Tolon District, Ghana
9.45-10.00	<u>Festus Maniriho</u> , and Mehmet. A. Aşkin	Rwanda Northern Cyprus	Occurrence Of Parthenocarpic Embryos Development During Fruit Formation Among Olive (Olea Europea) Cultivars
10.00-10.15	<u>Oluwadurotimi O. Akintade</u> , Gbemisola E. Ogunleye, Abiodun Ogbesajana	Nigeria.	Analysis of organic compounds in industrial effluents and surface water.
10.15-10.30	Ara		Break

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. OSMAN TEKİNEL SALONU/ PROF.DR. OSMAN TEKİNEL HALL

2.OTURUM / 2st session

Oral Presentation Online

Başkan/ Moderator: Doç.Dr. Halil Toktay/Dr. Burak Şen

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
10.30-10.45	<u>Aqsa Parvaiz</u> , Ghulam Mustafa, Faiz Ahmad Joyia	Pakistan	Red Rot Resistant Transgenic Sugarcane Developed By Over-Expression Of SUGARWIN Gene(S)
10.45-11.00	<u>Muhammad Amjad Ali</u> , Usman Arshad, Halil Toktay	Pakistan Türkiye	Combination Of Biochar With Antagonistic Microbes To Control Plant Parasitic Nematodes In Different Crops: A Way Forward To Green Plant Protection Strategies
11.00-11.15	<u>Begna Tesema</u> Bekana, Tolera Megersa, Fedhasa Benti	Ethiopia	Effects Of Land, Use Land Cover And Slope Gradients On Soil Fertility At Kori Sub-Watershed, East Wollega, Ethiopia
11.15-11.30	Andrew Bamidele Falowo	Nigeria	Evaluation Of Nutritional And Antioxidant Properties Of Chenopodium Ambrosioides L. And Crassocephalum Crepidioides Leaf Meal As Potential Feed Additives
11.30-11.45	A.P.L.N.S. Jayakody, K.W.A. Madhushan, A.T. Pelawatta and P. N. Yapa	Sri Lanka	Effect Of Biofertilizers And Organic Amendments On Germination And Seedling Growth Of Common Dry Zone Forest Species In Sri Lanka: Sustainable Reforestation Practices In Sri Lanka
12.00-13.30	Ara		Break

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

15.00-15.15	<u>Neslihan Öner</u> , Yağmur Yaşar Fırat	Türkiye	Environmental Effects Of Food Production Systems And Dietary Models
15.15-15.30	Yüksel Aksoy, Ahmet Şekeroğlu, <u>Mustafa Duman</u>	Türkiye	A Study On Determination Of Survival Rate, Some Reproductive And Growth Traits Of Akkaraman Sheep Reared Rural Farm Conditions In Niğde Province
15.30-15.45	Tarık Balkan	Türkiye	Abamectin, hexythiazox and spiromesifen resistance in populations of Tetranychus urticae Koch (Acari:Tetranychidae) collected from cucumber greenhouses in central district of Tokat province
15.45-16.00	Ara	Break	

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. ERDOĞAN PEKEL SALONU/ PROF.DR. ERDOĞAN PEKEL HALL

6.OTURUM / 6st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Kenan Yıldız /Dr. Mustafa Duman

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
16.00-16.15	Fatmanur Çezik, Çetin Çekiç, Kenan Yıldız, Hakan Karadağ, Osman Nuri Öcalan	Türkiye	Effects Of Light And Dark Conditions On Root Development Of Black Mulberry (Morus Nigra L.) Hardwood Cuttings
16.15-16.30	<u>Ala Asi Mohammed Al-Salihi</u> , Mehmetcan Olgaç, Emircan Dinçer, Hakan Polatçı, Onur Saraçoğlu	Irak Türkiye	Comparison Of Some Quality Parameters In Fresh And Dry Samples Of Morus Rubra Fruits
16.30-16.45	<u>Mehmet Emin İşbilir</u> , Onur Saraçoğlu, Emircan Dinçer, Alperen Donat, Ala Asi Mohammed Al-Salihi	Türkiye Irak	Effects Of Paclobutrazol Applications On Rooting Performance Of Black Mulberry (Morus Nigra L.) Hardwood Cuttings
16.45-17.00	Sevinç Yeşilyurt, Muazzez Gürkan	Türkiye	Bioremediation In Forest Ecosystem
17.00-17.15	Ara	Break	

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. ERDOĞAN PEKEL SALONU/ PROF.DR. ERDOĞAN PEKEL HALL

7.OTURUM / 7st session

Oral Presentation Online

Başkan/ Moderator: Dr. Tarık Balkan /Dr. Mustafa Duman

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
17.15-17.30	Tarık Balkan, Sabriye Belgüzar, Mehmet Kızıllarslan, Özlem Yılmaz	Türkiye	Biodegradation of Some Pesticides by Enterobacter cloacae; in vitro
17.30-17.45	Esra Ünbaşı, Coşkun Konyalı, Türker Savaş	Türkiye	Effects of Cold Stress During Incubation on Hatchability and Sex Ratio in Layers
17.45-18.00	Turgut Atay, Mustafa Alkan, Betül Tarhanacı	Türkiye	Contact effects of Mentha piperita L. (Lamiaceae) essential oil on two important stored product pests [Tribolium castaneum (Herbst, 1797) (Coleoptera: Tenebrionidae) and Sitophilus granarius (Linnaeus, 1758) (Coleoptera: Dryophthoridae)]
18.00-18.15	Özlem Derebaşı, Ahmet Şükrü Demirci, Göksel Tırpancı Sivri	Türkiye	Utilization of Postbiotics in Foods
18.15-18.30	Ara	Break	

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. ERDOĞAN PEKEL SALONU/ PROF.DR. ERDOĞAN PEKEL HALL

8.OTURUM / 8st session

Oral Presentation Online

Başkan/ Moderator: Doç.Dr. Deniz Dinçel /Dr. Mustafa Duman

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
18.30-18.45	Mustafa Varo, Sibel Alapala Demirhan, Ali Gündüz	Türkiye	Investigation of Some Morphological Traits of Hair Goats in Under Breeder Conditions in Isparta Province
18.45-19	Zeynep Eroglu, Mutlu Cevik	Türkiye	Investigation Of The Changes In Rheological Properties Of Purpel Basil Sherbet Samples Concentrated By Ohmic Heating At Different Voltage Gradient
19.00-19.15	Deniz Dinçel	Türkiye	Determination of the frequency of g.1267 G >A polymorphism in the MC4R gene in Berrichon du Cher Sheep

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

1.OTURUM / 1st session

Oral Presentation Online

Başkan/ Moderator: Dr. Emre Aksoy/Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
09.00-9.15	Aliu Olamide Oyedun and Lukman Omoniyi Lawal	Nigeria	Microplastics As A Threat To Meat Consumption, Review
9.15-9.30	Jannatun Nayeema, Jannatul Ferdous	Bangladesh	Transplanted Aman Growth, Yield And Nutrient Uptake As Affected By Phosphorous
9.30-9.45	Ridwan Mukaila	Nigeria	Investigating Rural Households' Willingness To Pay For Improved Solid Waste Management And Its Driving Factors. Evidence From Nigeria
9.45-10.00	Anees Ur Rehman, Muhammad Mudassir Iqbal, Attif Ramzan	Pakistan	A Review On Soil Water Conservation By Mulching Practices
10.15-10.30	Ara	Break	

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

2.OTURUM / 2st session

Oral Presentation Online

Başkan/ Moderator: Ashiq Hussain/Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
10.30-10.45	Nadjet Mostefa and Nouredine Djebli	Algeria	Evaluation Of The Neuroprotective Activity Of Passiflora Edulis Seeds On Alzheimer's Disease "In Vivo Study"
10.45-11.00	Ashiq Hussain	Pakistan	Evaluation Of Total Antioxidant And Oxidant Status, Oxidative Stress Index And DPPH Free Radical Scavenging Activities Of Pumpkin (Cucurbita Maxima) Seeds Ethanolic Extracts
11.00-11.15	Sanubar Aslanova	Azerbaijan	Productivity, Forage Quality And Capacity Of Thymuseta-Vicaetum-Festucosum Formation In The Mountain Part Of Talish
11.15-11.30	Muhammad Mudassir Iqbal, Attif Ramzan, Anees Ur Rehman	Pakistan	Sterilization Effect Of 0.1 Hgcl2 On The Invitro Germination Of Papaya (Carica Papaya Linn) Seeds To Produce Disease-Free Plants
11.30-11.45	Ara	Break	

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

3.OTURUM / 3st session

Poster Presentation Online

Başkan/ Moderator: Dr. Olugbenga David Oloruntola/Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
11.45-11.50	Norazura Aila Mohd Hassim and Sivaruby Kanagaratnam	Malaysia	Wide Temperature Range Palm-Based Chocolate Spread
11.50-11.55	Clement Olufemi Osowe, Olugbenga David Oloruntola, Olufemi Adesanya Adu, Simeon Olugbenga Ayodele and Samuel Adebawale Adeyeye	Nigeria	Under Tropical Conditions, Dietary Supplementation With Vitamin C And Ficus Exasperata Leaf Powder Enhanced Broiler Chicken Growth And Meat Quality
11.55-12.00	Akpeji Stephanie, Odunayo Olawuyi and Bukola Adebayo-Tayo	Nigeria	Application Of Rhizobium And Its Exopolysaccharides In Drought And Disease Control
12.00-12.05	Alao Omoniyi Solomon, Jadesola Fawzhia Sanusi, Gbemisola Elizabeth Akinola and Bukola Christianah Adebayo-Tayo	Nigeria	Nutritional Composition And Shelf-Life Extension Of Formulated Nano-Food Blends Fortified With Selenium Enriched Lactobacillus Pentosus (LP-Senps) Nanoparticles
12.05-12.10	Huseynli Atlas	Azerbaijan	Determination Of Ecotoxicant Substances In Solid Waste Caused By Hydrogen Purification Process Of petroleum Oils
12.10-12.15	Sevinj Hajiyeve, Shamilov Nazim, Tarana Aliyeva, Madina Nabiyeve	Azerbaijan	Ecological Assessment Of Transboundary Rivers Of Azerbaijan
12.15-12.20	Sevinj Hajiyeve, Nazim Shamilov, Tarana Aliyeva, Madina Nabiyeve	Azerbaijan	Modern Ecological Situation And Pollution Of The Araz River
12.20-12.25	Oyinlola, K. A., Ogunleye, E. O., Adeyemo, M. O., Adebayo-Tayo, B.C. and Garuba E. O.	Nigeria	Bioactive Compound Profiling And In-Vitro Antimicrobial Study Of Ginger (Zingiber Officinale) Against Pneumococcal Bacteria
12.25-12.30	Gbemisola Elizabeth Ogunleye, Bukola Christianah Adebayo-Tayo, Kubrat Abiola Oyinlola, Oluwadurotimi Akintade, Racheal Oluwayemisi Fashogbon, Temiloluwa Adesina	Nigeria	Green Synthesis, Characterization And Antimicrobial Potential Of Selenium Nanoparticles From Ocimum Gratissimum
12.30-12.35	Olumuyiwa Joseph Olorotimi	Nigeria	Dietary Influence Of Monosodium Glutamate On Serum Electrolytes And Antioxidant Status Of Laying Hens
12.35-12.40	Olugbenga David Oloruntola, Andrew Bamidele Falowo, Simeon Olugbenga Ayodele, Samuel Adebawale Adeyeye, Clement Olufemi Osowe, and Deborah Adebukola Oloruntola	Nigeria	Justicia Carnea Leaf Meal Has The Potential To Improve The Performance And Immunoglobulins Of Broiler Chickens Fed Aflatoxin-Contaminated Diets
12.40-12.45	Norazura Aila Mohd Hassim and Sivaruby Kanagaratnam	Malaysia	Wide Temperature Range Palm-Based Chocolate Spread
12.45-13.30	Ara		Break

9 Ekim 2022 Pazar, October 2022 Sunday, Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

4.OTURUM / 4st session

Oral Presentation Online

Başkan/ Moderator: Dr. İlkey Kutlar /Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
13.30-13.45	Oktay Yazıcı, İlkey Kutlar	Türkiye	
13.45-14.00	Cansel Özge, İlkey Kutlar	Türkiye	
14.00-14.15	Derviş Özdemir	Türkiye	Macro-anatomical Studies on the Skeletal System of Mammals. II. Ossa Membri Pelvini
14.15-14.30	Aykut Şener, Sedat Kıcı, Muharrem Kaya	Türkiye	A Study on The Response of Triticale to Different Doses of Foliar Epibrassinolide Application
14.30 -14.45	Ara		Break

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

5.OTURUM / 5st session

Oral Presentation Online

Başkan/ Moderator: Dr. Şerife Topkaya/Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
14.45-15.00	Yunus Emre Şentürk, Ahmet Akyol, Ahmet Şekeroğlu, Brian Tainika, Mustafa Duman	Türkiye	The Effect of Different Breeding Systems on Egg Quality
15.00-15.15	Muhammed Rafiq Hafiz, Şerife Topkaya	Türkiye	Molecular analysis of the presence of Potato leafroll virus and Potato virus X
15.15-15.30	Özlem Altuntaş, Leyla Doğan	Türkiye	The Effect Of The Covid-19 Process On Vegetable Agriculture In Türkiye
15.30-15.45	Özlem Altuntaş İbrahim Kutalmış Kutsal	Türkiye	Then Effects Of Some Rhizobacteria Species On Plant Development And Fruit Quality In Melons Grown Under Irrigated And Non-Irrigated Conditions
15.45-16.00	Adnan Ayan, Burçak Aslan Çelik, Özlem Oruç Kilinç, Özgür Yaşar Çelik, Özge Oktay Ayan	Türkiye	
	Ara		Break

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

6. OTURUM / 6st session

Oral Presentation Online

Başkan/ Moderator: Yunus Emre Şentürk			
Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
16.00-16.15	Zeynep Kilci, Ramazan Ulku Cetin	Türkiye	Determination Of Chemical And Microbiological Quality In Commercial Tahini Samples
16.15--16.30	Zeynep Kilci, Ramazan Ulku Cetin	Türkiye	Determination Of Chemical And Microbiological Quality In Commercial Tahini Halva Samples
16.45-17.00	Ara		

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

7.OTURUM / 7st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Yusuf Ziya OĞRAK / Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
17.00-17.15	Duygu Sevinç, Muazzez Gürkan Eser	Türkiye	Investigation of Antibacterial Activity of Aromatized Kombucha
17.15-17.30	Yusuf Ziya Oğrak, Şahin Alici	Türkiye	Investigation of Stray Dogs Problem in Sivas Province Animal Shelter Example
17.30-17.45	Yusuf Ziya Oğrak, Sevgi Durna Daştan, Taner Daştan	Türkiye	Investigation of Mitochondrial COI gene polymorphisms of dogs in Sivas Municipality Dog shelter
17.45-18.00	Hasan Asil	Türkiye	Agriculture 4.0 and Its Applications in Türkiye
18.00-18.15	Ara		

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. NURETTİN KAŞKA SALONU/ PROF.DR. NURETTİN KAŞKA HALL

8.OTURUM / 8st session

Oral Presentation Online

Başkan/ Moderator: Dr. Suzan Biran Ay / Yunus Emre Şentürk

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
18.15-18.30	Merve Kalaycı, Suzan Biran Ay	Türkiye	Production And Characterization of Carboxymethyl Cellulose (CMC)/ Gelatine (GLT)/ Tara Gum (TG) Biomedical Films Enriched with Smoke Tree Leaf Extract
18.30-18.45	Elif Duyuşen Güven, Serpil Özmihçı, Görkem Akıncı, Berkay Tümer, Melda Uyar	Türkiye	Investigation of the development of purslane plant (Portulaca Oleracea L.) under soil stress conditions
18.45-19.00	Elif Duyuşen Güven, Görkem Akıncı, Ayşenur Özuysal	Türkiye	Evaluation Of Energy Potential In Dumping Sites: A Case Study For Akhisar- Manisa
19.00-19.15	İlker Atik, Ayşe Janseli Denizkara, Gökhan Akarca, Azize Atik	Türkiye	Biological Activities Of Extracts Of Red And Yellow Hawthorn Fruits In Different Solvents

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

1.OTURUM / 1st session

Oral Presentation Online

Başkan/ Moderator: Dr. Bukola C Adebayo-Tayo/Ahmet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
09.00-9.15	Muhammad Muddassir Ali	Pakistan	Cytotoxic and Genotoxic effects of Bisphenol S on different Model Organisms
9.15-9.30	Bukola C Adebayo-Tayo, Solomon Omoniyi Alao, Jadesola Fawzhia Sanusi	Nijerya	Phytofabrication and biological evaluation of silver nanoparticles of Bridelia ferruginea extracts
9.30-9.45	Hira Ishaq, Wajahat Mehmood	Pakistan	Impact of Cumin on physiological function of Body,Review
9.45-10.00	Oyetoro John Oyewole And Adewole Williams A.	Nijerya	Effect Of Amrec Technologies Of Federal University Of Agriculture Abeokuta On Income Level Of Cassava And Soya-Bean Farmers In Ogun-State, Nigeria
10.00-10.15	Gabriela Savastre, Alin Ciobica, Gabriel-Ionut Plavan	Romania	A Modern Perspective On The Influence Of Pesticides In Some Neuropsychiatric Manifestations
10.15-10.30	Ara		Break

9 October 2022 Sunday Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

2.OTURUM / 2st session

Oral Presentation Online

Başkan/ Moderator: Fatma Coşkun Topuz /Ahmet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
10.30-10.45	Onur Sefa Alkaç, <u>Muhammed Esat Tunce</u> , Esra Öndeş, Rümeysa Temir, Mehmet Güneş	Türkiye	Effects of Different Levels of Compost and Fertilization Applications on the Growing Media on Gerbera (Gerbera jamesonii sp.) Plant Growth and Flowering
10.45-11.00	Onur Sefa Alkaç, <u>Fulya Okatar</u>	Türkiye	The Effects of Different Rhizobacteria and Mycorrhiza Applications on Root Growth of Rose Cuttings
11.00-11.15	Fatma Coşkun Topuz	Türkiye	Mathematical Modeling of Fresh Green Pepper (Capsicum L.) Dried at Different Powers in Microwave Oven
11.15-11.30	<u>Cem Okan Özer</u> , Ganimet Beyzanurvar, Ezgi Demir Özer	Türkiye	The Effect Of Pomegranate (Punica Granatum L.) Flower Extracts On The Physicochemical Properties Of Heat-Treated Chicken Sausages
11.30-11.45	Ahmet Tamkoc, Ozkan Taspınar, Ahmet Konuk, Tuba Uzun, Saliha Mutlu, Bilal <u>Mohammed Abbas Al-Rubaye</u> , İlker Topal	Türkiye	Selection Of Winter-Resistant Genotypes And Determination Of Some Agricultural Characteristics In Hybrid Feed Pea Lines (F2)
11.45-11.50	Ara		Break

9 October 2022 Sunday Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

3.OTURUM / 3st session

Poster Presentation Online

Başkan/ Moderator: Prof.Dr. Kutbettin Arslan /Ahmet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
11.50-11.55	<u>Gülten Ökmen</u> , Kutbettin Arslan, Başak Görmen, Zeynep Biter	Türkiye	Determination of antibacterial activity of Helichrysum arenarium L. extracts against crop spoiling pathogens
11.55-12.00	<u>Emre Aydemir</u> , İnci Bilge	Türkiye	Artificial Intelligence Applications In Livestock
12.00-12.05	<u>Emre Aydemir</u> , İnci Bilge	Türkiye	Disease Diagnosis In Animals With Artificial Intelligence Based Odor Detection Sensors
12.05-12.10	Emre Aydemir	Türkiye	Some Digestive Respiratory And Nervous Diseases Observed In Poultry
12.10-12.15	Semra Küçük <u>Sergen Ünal</u> , Esma Özsoy, Özlem Sefer,	Türkiye	The Ferritins in the Aquatic Products
12.15-12.20	Ayşe Feyza Tufan Dülger, Neslihan Zahide Öztürk Gökçe, Emre Yörtük	Türkiye	Determination Of Resistance Levels Of Hordeum Vulgare L. Lines Grown In Türkiye Against F.
12.30-13.30	Ara		Culmorum Break

9 October 2022 Sunday Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

4.OTURUM / 4st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Kutbettin ARSLAN/Amet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
13.30-13.45	<u>Muhammad Tjammal Rehman</u> , Iqra Saleem1, Arslan Rasool, Muhammad Shahid	Pakistan	Structural Characterization Antioxidant, Hemolytic And Antimicrobial Activities Of Gymnema Sylvestre
13.45-14.00	<u>Arslan Rasool</u> , Hamna Mazhar, Muhammad Tjammal Rehman, Muhammad Shahid	Pakistan	Characterization And Evaluation Of Pharmacological Potential Of Crocus Sativus Stigma Extract
14.00-14.15	<u>Aliyeva Tarana</u> , Abdullayev Rizvan, Melikova Afak	Azerbaijan	Interrelation Of Humic Substances With Chemical Substances And Pollutants
14.15-14.30	<u>Aliyeva Tarana</u> , Samedova Ayten, Hajiyeva Hadiyya1, Melikova Afak	Azerbaijan	Cadmium And Zinc In The Environment
14.30-14.45	Ara		Break

9 October 2022 Sunday Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

5.OTURUM / 5st session

Oral Presentation Online

Başkan/ Moderator: Dr. Vildan Akdeniz/Ahmet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
14.45-15.00	Vildan Akdeniz	Türkiye	Effects of Ultrasonication on Probiotics and Prebiotics in Dairy Technology
15.00-15.15	Ayşe Nur Tarhan, Muhammet Donmez, <u>Zeynep Simsek</u>	Türkiye	Properties of Buffalo Milk Raised in Kutahya Region
15.15-15.30	<u>Elif Yaganoglu</u> , Caner Yerli, Nergiz Dila Senol	Türkiye	Effect of hazelnut husk compost on physiological properties of pepper under drought stress
15.30-15.45	Onur Sefa Alkaç, <u>Esra Öndeş</u> , Rümeysa Temir, Esat Tuncel, Mehmet Emin İşbilir	Türkiye	Acceleration the Growth of Dahlia (Dahlia sp.) Plants Grown with a Growth Retardant with Gibberellic Acid
15.45-16.00	Ara		Break

9 October 2022 Sunday Time by Türkiye

PROF.DR. ERCAN TEZER SALONU / PROF: DR: ERCAN TEZEL HALL

6.OTURUM / 6st session

Oral Presentation Online

Başkan/ Moderator: Prof.Dr. Cengiz Yücedağ /Ahmet Akyol

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
16.00-16.15	Leyla İdikut, Duygu Uskutoğlu	Türkiye	Investigation of the Effect of Fertilizer Doses on Bean Pod Properties
16.15-16.30	Leyla İdikut, Duygu Uskutoğlu, Kazım Emre Göktas, Samet Karadeniz	Türkiye	Investigation of Winter Cultivation of Different Chickpea Varieties
16.30-16.45	Sevgi Belikırık, Cengiz Yücedağ	Türkiye	Determination of the Recreational Status of the Marmaris National Park
16.45-17.00	Ali Üney, Cengiz Yücedağ	Türkiye	A Study on Morphological Characteristics of Some Angiosperm Ornamental Plant Seedlings
17.00-17.15	Canberk Akkoç, Cengiz Yücedağ	Türkiye	The Effects of Demographic Characteristics on Plant Preference of People Living in Detached Houses: The Case of Fethiye, Türkiye
	Ara		Break

9 October 2022 Sunday Time by Türkiye
PROF.DR. ERCAN TEZER SALONU / PROF. DR: ERCAN TEZEL HALL
7.OTURUM / 7st session
Oral Presentation Online

Başkan/ Moderator: Doç.Dr. Serdar DURU /Ahmet Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
17.15-17.30	Serdar Duru, Süleyman Can Baycan	Türkiye	Comparison of Performance of Holstein Cattle Raised in Two Farms with Similar Environmental Conditions in Bursa and Aydın
17.30-17.45	Burak Uzun, F. İlknur Unuvar, İlkay Dellal	Türkiye	Türkiye's Foreign Trade Competitiveness in Quince
17.45-18.00	Ece Gökçe Çakır – Dindar	Türkiye	A Study on the Taxonomy of Gentiana lutea (Gentianaceae)
18.00-18.15	Semra Küçük	Türkiye	The Using of Probiotics for Aquatic Organisms
18.15-18.30	Semra Küçük	Türkiye	The Coenzyme Q10 (CoQ10) in Fish

9 Ekim 2022 Pazar, 9 October 2022 Sunday, Time by Türkiye
PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL
1. OTURUM / 1st session
Oral Presentation Online

Başkan/ Moderator: Dr.Hülya Saygı/Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
09.00-9.15	Ismael Niyokwizigirwa	Rwanda	Testing the Biological Control Potentials of Fungi Associated Within Potato Crop in Higher Lands of Rwanda
9.15-9.30	Songül Çakmakçı, Mehmet Ali Salik	Türkiye	Lipophilic Antioxidants Of Milk And Their Benefits To Human Health
9.30-9.45	Aykut Şener	Türkiye	Determination of Quality Characteristics of Local Bean Lines Selected by Selection Breeding Method
9.45-10.00	Hülya Saygı	Türkiye	Applications of Organomineral and Chemical Fertilizers in Strawberry Production
10.00-10.15	Hayriye Gökür Ağca Küçükaydin, Göksel Tirpanci Sivri, Ömer Öksüz	Türkiye	Effects on Plant Growth
10.15-10.30	Ara		Production of Vitamin B12 by Propionic Acid Bacteria
			Break

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye
PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL
2.OTURUM / 2st session
Oral Presentation Online

Başkan/ Moderator: Dr. Hande Baltacıoğlu/Dr. Emre Aksoy

Saat/Hour	Yazar/Autor/s	Ülke/ Country	Başlık/Title
10.30-10.45	İkbal Abdullah Şahin, Hande Baltacıoğlu	Türkiye	Non-Thermal Technologies In Fruit Juice Processing
10.45-11.00	Elif İldiz, Şükrü Canpolat, Cemil İşlek, Elif Yürümez Canpolat, Yasemin İşlek, Ilgaz Akata	Türkiye	Bjerkandera adusta collected from Niğde: Analysis of Total Phenolic Compound, Antioxidant, and Antimicrobial Properties
11.00-11.15			
11.15-11.30	İsmail İbrahim İsmail Al-Barwari, Murat Turan, Ferda Karakuş	Irak Türkiye	Determination of Factors Affecting Red Meat Consumption Habits in Duhok Province (Northern Iraq)
11.30-11.45	Gizem AKSU	Türkiye	The Effect of Indole Acetic Acid on Forage Soybean under Drought Stress
12.00-13.30	Ara		

9 Ekim 2022 Pazar, 9 October 2022 Sunday Time by Türkiye
PROF.DR. AHMET CAN ÜLGER SALONU/ PROF.DR. AHMET CAN ÜLGER HALL
3. OTURUM / 3st session

Effects of Addition of Some Plant Extracts to Free-Raised Egg Chicken Feeds on Egg Quality Parameters

Mehmet Zahit Demir^{1,*}, Hasan Eleroğlu²

¹Hayvan Besleme ve Beslenme Hastalıkları, Veteriner Fakültesi, Sivas Cumhuriyet Üniversitesi Sivas,Türkiye

²Sivas Teknik Bilimler Meslek Yüksekokulu, Sivas Cumhuriyet Üniversitesi Sivas,Türkiye

Abstract

It was determined that adding Phytase enzyme with 16 hours of illumination daily increased egg yield, feed consumption and egg weight significantly ($P<0.01$). Egg weight, egg white and yolk weights, egg shell weight and breaking resistance increased. and its effect on egg quality criteria was positive. Addition of 0.75% red pepper to the ration showed higher redness values of egg yolks ($P<0.001$). The difference was found to be statistically significant. In this study, it was revealed that the addition of red pepper had a positive effect on the yolk color of free-raised laying hens. An in vivo experiment was conducted to determine the effect of adding Dried Capers (*Capparis spinosa*) leaf to the diet. Powder (DCL) four groups of commercial chickens (ATAK-S) 0, 5, 10 and 15 g on egg production and egg quality of laying hens at the beginning of the laying period. They were fed diets containing DCL/kg. The results showed that dietary DCL had no effect on feed intake, egg mass (EM) and egg production parameters ($P>0.05$). As a result of the study, the addition of feed propolis extract did not have a significant effect on performance values among the experimental groups. The yolk of the eggs in the groups coated with propolis extract was found to be lighter. On the other hand, the effect of propolis coating on the specific gravity values of the eggs was found to be significant. In addition, a decrease was observed in TMA values. In the electron microscope picture examination, it was observed that the propolis coating created a closing/occlusive effect on the eggs. As a result, when propolis application was added to the feed of chickens in the chicken pasture, there was no difference in terms of the performance parameters examined. However, it has been observed that coating the eggs with the extract has an effect on increasing the shelf life. No statistically significant difference was observed in the performance results during the experiment with the addition of alfalfa juice. However, it was observed that egg mass values tended to increase as age and yield increased. No statistical difference was observed in the first 4 weeks in the examined external quality parameters. 25-28. At the age of week, the effect of interaction was found to be significant in egg weight, shell break resistance and shell ratio. It was determined that the difference observed in egg weight and shell ratio was due to the pasture effect. It was observed that the statistical difference observed in the shell cracking resistance was caused by the addition of alfalfa juice and was positively affected. In the last 4 weeks, the effect of the interaction was found to be statistically significant only on the shell weight and shell thickness parameters

Key Words: *Phytase Enzyme, Red Pepper, Propolis Extract, Egg Quality, Free Range*

Serbest Yetiştirilen Yumurta Tavuk Yemlerine Bazı Bitki Ekstraktlarının İlavesinin Yumurta Kalite Parametreleri Üzerine Etkileri

Özet

Günlük 16 saat aydınlatma yapılarak, fitaz enzimi ilave edilmesi yumurta verimi, yem tüketimi ve yumurta ağırlığını önemli düzeyde ($P<0,01$) artırdığı belirlenmiştir. Yumurta ağırlığı yumurta ak ve sarı ağırlıkları ile yumurta kabuk ağırlığı ve kırılma direnci artmıştır. Fitaz enzimi ilavesinin performans ve yumurta kalite kriterleri üzerine etkisi olumlu olmuştur. Rasyona %0,75 kırmızı biber ilavesi yumurta sarılarının kırmızılık değerleri daha yüksek saptanmıştır ($P<0,001$). farklılık istatistiki olarak önemli bulunmuştur. Yürütülen bu çalışma ile kırmızı biber ilavesinin, serbest yetiştirilen yumurta tavuklarının yumurta sarısı rengi üzerine olumlu etkisi olduğu ortaya konmuştur. Kuru Kapari (*Capparis spinosa*) yaprağının diyetle eklenmesinin etkisini belirlemek için bir in vivo deney yapılmıştır. Yumurtlama döneminin başında yumurta tavuklarının yumurta üretimi ve yumurta kalitesi üzerine toz (DCL) dört grup ticari tavuklar (ATAK-S) 0, 5, 10 ve 15 g DCL/kg içeren rasyonlarla beslendi. Sonuçlar göstermiştir ki, diyet DCL'nin yem alımı, yumurta kütlesi (EM) ve yumurta üretim parametreleri ($P>0.05$) üzerinde hiçbir etkisi olmamıştır. Çalışma sonucunda deneme grupları arasında performans değerleri açısından yem propolis ekstraktının ilavesinin önemli bir etkisi bulunmamıştır. Propolis ekstraktının kaplandığı gruplardaki yumurtaların sarısı daha açık renk bulunmuştur. Diğer yandan propolis kaplanmasının yumurtanın özgül ağırlık değerlerine etki önemli bulunmuştur. Ayrıca TMA değerlerinde düşme görülmüştür. Yapılan elektron mikroskobu resim incelemesinde propolis kaplanmasının yumurta üzerindeki gözenekleri kapatıcı/tıkayıcı bir etki yarattığı görülmüştür. Sonuç olarak propolis uygulaması tavuk merasındaki tavukların yemlerine ilave edildiğinde incelenen performans parametreleri açısından herhangi bir farklılık ortaya çıkarmamıştır. Ancak yumurtaların ekstraktla kaplanmasının raf ömrünü artırıcı etkisi olduğu görülmüştür. Yonca suyu ilavesinde deneme boyunca performans sonuçlarında, istatistiki olarak önemli bir farklılık gözlenmemiştir. Bununla birlikte yumurta kütlesi değerlerinin, yaş ve verim arttıkça yükselme eğiliminde olduğu görülmüştür. İncelenen dış kalite parametrelerinde ilk 4 hafta istatistiki bir farklılık gözlenmemiştir. 25-28. Haftalık yaşta ise yumurta ağırlığı, kabuk kırılma direnci ve kabuk oranında ise interaksyonun etkisi önemli bulunmuştur. Yumurta ağırlığı ve kabuk oranında gözlenen farklılığın mera etkisinden kaynaklandığı saptanmıştır. Kabuk kırılma direncinde gözlenen istatistiki farklılığın ise, yonca suyu ilavesinden kaynaklandığı ve olumlu etkilendiği görülmüştür. Son 4 haftalık dönemde ise, sadece kabuk ağırlığı ve kabuk kalınlığı parametrelerinde interaksyonun etkisi istatistiki olarak önemli bulunmuştur.

Abstract

Freshwater lobster, which is obtained from inland waters and is among the export products with high commercial value; Crayfish, known in Türkiye, have an important place in aquaculture. The most important crayfish species cultivated are in three different families as Astacidae, Parastacidae and Cambaridae. In Türkiye, the narrow-clawed crayfish (*Astacus leptodactylus* Eschscholtz, 1823), which is called Turkish crayfish in the Astaciade family, is distributed as a single species. Crayfish are ecologically important benthic organisms of the aquatic ecosystem in fresh waters and are catalysts of organic matter conversion. In this study, it was aimed to determine the biological and ecological characteristics of crayfish.

Key Words: Crayfish, *A.leptodactylus*, biological, ecological features

Tatlısu İstakozu (*Astacus Leptodactylus* Eschscholtz, 1823)'Nun Biyolojik Ve Ekolojik Özellikleri

Özet

İç sulardan elde edilen ve ticari değeri yüksek ihraç ürünleri arasında yer alan tatlısu istakozu; Türkiye’de bilinen adıyla kerevitler, su ürünlerinde önemli bir yere sahiptirler. Yetiştiriciliği yapılan en önemli kerevit türleri Astacidae, Parastacidae ve Cambaridae olmak üzere üç ayrı familya içerisinde yer almaktadır. Türkiye’de ise Astaciade familyasında bulunan Türk kereviti olarak adlandırılan dar kısıkaçlı kerevit (*Astacus leptodactylus* Eschscholtz, 1823) tek tür olarak dağılım göstermektedir. Kerevitler ekolojik olarak tatlı sularda akuatik ekosistemin önemli bentik organizmalarından olup, organik madde dönüşümünün katalizörlerindendir Bu çalışmada, kerevitlerin biyolojik ve ekolojik özelliklerinin belirlenmesi amaçlanmıştır.

Anahtar Kelimeler: Tatlısu istakozu, *A.leptodactylus*, biyolojik, ekolojik özellikler

Giriş

Türkiye’de kerevit ismiyle de bilinen tatlısu istakozu Dünya’da 1830’lu yıllardan sonra önemli bir ticari ürün olarak değerlendirilirken, Türkiye’de ise II. Dünya savaşıdan sonra su ürünleri içerisinde önemli ihraç ürünleri arasında yer almıştır (Harlıoğlu, 2008).

Türkiye’de yaygın olarak bulunan tek kerevit türü *Astacus leptodactylus* (Eschscholtz, 1823)’tur. Astacidae ailesi içerisinde yer alan tatlısu istakozlarının, doğal yaşam alanı kuzey yarım kürenin iç sularıdır. Türkiye iç sularında Türk kereviti olarak adlandırılan dar kısıkaçlı kerevit (*Astacus leptodactylus* Eschscholtz, 1823) tek tür olarak dağılım göstermekte ve iki alttürü bulunmaktadır (*Astacus leptodactylus leptodactylus* Eschscholtz, 1823 ve *Astacus leptodactylus salinus* Nordmann, 1842) (Geldiay ve Kocataş, 1970). *Astacus leptodactylus* Türkiye, Ukrayna, Güneybatı Rusya, İran, Kazakistan, Belarus, Slovakya, Bulgaristan, Romanya ve Macaristan’ını da kapsayan geniş bir yayılım alanı bulan bu tür, dünya genelinde doğal olarak 27 ülkede yaşamaktadır. Bununla beraber 14 ülkeye de nakil edilmiştir. Çek Cumhuriyeti, Polonya, Almanya, Finlandiya, Danimarka, Hollanda, İngiltere, Litvanya ülkelerinde bulunmaktadır (Diler, 2013).

Avrupa ve Amerika’da lüks bir besin maddesi olarak tüketilen tatlısu istakozunun ülkemizde tüketimi oldukça azdır. Bu nedenle üretimin tümü Avrupa ve İskandinavya ülkelerine ihraç edilmekte ve ülkemiz için önemli bir gelir sağlamaktadır (Halver, 2002).

Ülkemizde kerevit üretiminde ve ekonomik değerinde yıllara göre dalgalanmalar görülmektedir. Kerevit üretimi 1979 yılında 500 ton iken, 1982 yılında bu değer 6.500 tona yükselmiştir (Köksal, 1988). 1985’ten sonra kerevit üretimi aşırı avcılık, kirlilik ve kerevit vebası (*Aphanomyces astaci*) nedeniyle 5.000 tonlardan 200 tona kadar gerilemişken şu an ülkemizde 1 233 tona yükselmiştir (TÜİK, 2022). Ayrıca bazı Avrupa ülkeleri, kerevit vebası nedeni ile azalan stoklarını desteklemek için Amerika’dan kerevit vebasına dirençli olan *Pacifastacus leniusculus* ve *Procambarus clarkii* türü kerevitleri kendi iç sularına aşılamışlardır (Sağlamtimur, 2007).

Tatlısu istakozu yetiştiriciliği günümüzde iki yöntem ile gerçekleştirilmektedir. Birinci yöntem, yumurtalı dişilerden yavru üretimi, diğer yöntem ise bu yavruların doğal sulara atılacak boyaya kadar büyütülmesidir (Berber ve Palaz, 2000; Kumlu, 1998). Kültür şartlarında üretilen ve beslenen yavru istakozların stoklamada kullanılması tercih edilmektedir. Doğal ortamın stoklanmasında ergin tatlısu istakozlarının kullanılması ucuz ve teknik açıdan kolay olması avantaj olurken, yem seçme alışkanlıkları, çevreye uyum sağlamalarının zor olması, hastalık taşıyabilecek riskleri olmasından da dezavantaj sağlamaktadır. Bu nedenle doğal sulara ergin dişi ve erkek, yumurtalı dişi ve yavruların yerine ilk yazını bitirmekte olan veya bitirmiş bireylerin atılmasının daha uygun olacağı belirtilmiştir (Berber ve Palaz, 2000).

Tatlısu İstakozlarının Sistematikteki Yeri

Türkiye’de kerevit adıyla bilinen tatlısu istakozu türünün sistematik açıdan sınıflandırılması aşağıdaki gibidir (NCBI, 2019).

Şube	: <i>Arthropoda</i>	: Eklem bacaklılar
Sınıf	: <i>Crustacea</i>	: Kabuklular
Alt Sınıf	: <i>Malacostraca</i>	: Gelişmiş kabuklular
Takım	: <i>Decapoda</i>	: On ayaklılar
Familya	: <i>Astacidae</i>	: İstakozlar (Kerevitler)
Cins	: <i>Astacus</i>	: İstakoz (Kerevit)
Tür	: <i>Astacus leptodactylus</i>	: Göl İstakozu

Tatlısu İstakozlarının Biyolojisi

Tatlısu İstakozlarının Morfolojik Özellikleri

Dar kısıkaçlı kerevit (narrow-clawed) crayfish olarak adlandırılan *Astacus leptodactylus*’un toplam uzunluğu genellikle 15 cm olmakla birlikte bazen 30 cm’ye kadar ulaşabilmektedir (Köksal, 1988). Tatlısu istakozlarının şekil ve renkleri oldukça değişken olduğu için tatlısu istakozlarının alt türleri bu özelliklere bakılarak tanımlanmaktadır. Genel renkleri zeytin yeşili, ancak birçoğu hafif kırmızı bir belirti ile kahverengimsi, sarımsı yeşil rengindedir. Karapaks ve kısıkaçları genellikle beneklidir (Pöckl ve Eder, 1998). Karapaksın şekli geniş ya da dar olabilmekte ve rostrum genellikle uzundur.

Tatlısu istakozlarında vücut, sefalotoraks ve abdomen olmak üzere iki kısımdan meydana gelmiştir. Sefalotoraks kısmı karapaks olarak adlandırılan sert bir kabukla örtülmüştür. Tatlısu istakozları 19 çift segmentten oluşmuş olup bunlar, gözler, 2 çift anten, 2 çift maksil, 3 çift maksilliped, 1 çift mandibular uzantı, 5 çift pereopod (yürüme ayakları), 5 çift pleopod (yüzme ayakları) ve telsondan oluşmuştur (Şekil 1). Kuyruk kısmı telson ve üropod bölümlerinden oluşmuştur (Hobbs, 1989).

Şekil 1. Tatlısu istakozunun dorsal görünüşü (A) ve ventral görünüşü (B) (Holdich ve Reeve, 1988)

Tatlısu İstakozlarının Anatomik Özellikleri

Sindirim Sistemi

Tatlısu istakozlarında sindirim sistemi ağız, yemek borusu, mide ve bağırsaktan oluşur. Tüketilmek üzere alınan besinler ağız parçaları ve çenelerle parçalanmaktadır ve sonrasında yemek borusu vasıtasıyla mideye ulaşır. İki bölümden oluşan midede sindirilen besinler orta bağırsağa ve ardından son bağırsağa geçerek anüsten dışarıya atılır. Tatlısu istakozlarında bağırsaklar mavi renkli olup su regülasyonunu düzenlerler (Diler, 2013).

Solunum Sistemi

İstakozların solungaçları 18 çifttir ve sillerle kaplıdır. İki ile üçüncü çene ayağı (maksilliped) ve ilk dört yürüme ayağının bazal segmentinden çıkarlar (Diler, 2013).

Dolaşım Sistemi

Tatlısu istakozlarının dolaşım sistemi “açık dolaşım sistemi” dir. Kalpten arterlere pompalanan kan, iç organlar vasıtasıyla kaslara oksijen ve sindirilen besin maddelerini taşır. Kirlenen kan tekrar damarlar yoluyla solungaçlara ulaşır ve buralarda temizlenir. Solungaçlar ile temizlenen kan gövde boşluğuna (sülom) geçer. Tatlısu istakozlarının kanı renksizdir. Açık hava ile temas ettiğinde oksitlenir. Böylelikle kan rengi maviye doğru dönen bir renk alır. Kan renginin mavi olması oksijende demir yerine bakır içeren pigmentin yani hemosiyaninin varlığını gösterir (Diler, 2013).

Boşaltım Sistemi

İstakozlarda ana boşaltım organı anten bezleridir. Mercimek boyutlarındaki bir çift böbrek antenlerin tabanından dışarı açılır. Böbrekler üre ve ürik asiti, solungaçlar ise amonyağı boşaltır (Diler, 2013).

Sinir Sistemi

İstakozlardaki sinir sistemi ip merdiven şeklinde olup ganglionlar ve sinir tellerinden oluşur (Şekil 2). Sinir kordonu üzerinde 6 çift ganglion vardır ve her ganglionda ise 3 çift sinir bulunur (Diler, 2013).

Kas Sistemi

Tatlısu istakozlarında kas sistemi bükücü ve açıcı kaslar olarak iki tiptir. Bükücü kaslar, bağlı oldukları bölgeyi bedene doğru veya yakınındaki bir ekleme doğru çeken kaslardır. Açıcı kaslar bağlı bulundukları bölgeyi uzatan kaslardır (Diler, 2013).

Şekil 2. Tatlısu istakozunun iç organlarının görünümü (Anonim, 2020a)

Tatlısu İstakozlarında Üreme ve Yaşam Döngüsü

İstakozlar ayrı eşeylidir. Dişilerin yumurta kanalları üçüncü çift yürüme ayaklarında bulunurken, erkeklerin vas deferensleri ise beşinci çift yürüme ayaklarının koksasına açılır. Erkeklerde, birinci ve ikinci pleopodlar spermatoforların dişi istakozların seminal reseptaculum kısmına transferinde rol oynar bunlara gonopod denir. Dişi istakozlarda ise böyle bir yapı yoktur. İstakozlarda üreme sonbaharda su sıcaklığının düşmesi ile başlar. İstakozlarda çiftleşme su sıcaklığının 7-12 °C olduğu ekim, kasım ve aralık aylarında meydana gelir. Erkek tatlısu istakozları spermalarını dişinin üçüncü çift yürüme ayakları arasındaki cinsiyet deliğine bırakır. Çiftleşmeden sonra boşalan spermalar dişinin son üç yürüme ayaklarına ve kuyruğu üzerine yapışır. Su ile temas eden spermalar sertleşerek bu bölgede şekilsiz ve beyaz leke halinde bir görüntü oluşturur. Dişiler genel olarak çiftleşmeden 4-6 hafta sonra yumurtalarını gece bırakır ve döllenme işlemi gerçekleşir. Su sıcaklığı 6-11 °C'ye düştüğünde tatlısu istakozlarında yumurtalar gözüktür. Yumurtalar genital delikten çıkarlar. Yumurtlama sırasında yumurtalarla beraber abdomenin altında bulunan bezlerden yapışkan ve sarı renkte salgılanan salgı, sertleşmiş sperma paketlerini yumuşatarak spermaların serbest kalmasında görev yaparlar. Yumurtaları spermalar döller. Yumurtlama ile döllenme arasında 14-15 gün geçer. Döllenmiş yumurtalar herhangi bir tabiat olayı veya suni ayırma olmadığı sürece üzüm salkımı gibi, kış boyunca annenin kuyruk kısmının altındaki yüzme ayakçıklarında asılı olarak gelişme sürecine devam ederler. Yüzme ayakçıklarının diğer bir görevi de yumurtaların taze sularla devamlı temasını sağlamak ve oksijene olan ihtiyaçlarını gidermektir. Yumurtaların kuluçka süresi kış ve ilkbahar boyunca sürer. Güney bölgelerde dişiler yumurtalarını 5-6 ay taşıırken, kuzey bölgelerde 6-8 ay taşırlar.

Yumurtaların açılması Mayıs ya da Haziran ayının sonuna kadar sürebilmektedir (Köksal, 1988; Alekhovich ve Kulesh, 1996; Stucki, 1999).

Tatlısu ıstakozlarının yaşam süreleri çevresel şartlara ve türlerine göre değişim göstermekle birlikte, Astacidae familyasına ait türler 8 yıla kadar yaşayabilmektedir. Tatlısu ıstakozlarında büyüme süreci, vücutlarından eski kabuğun atılıp, yeni kabuğun oluşup sertleşmesiyle gerçekleşmektedir. Bu işleme kabuk değiştirme (molt) denir. Kabuk değiştirme işlemi zor ve zahmetli bir süreç olup, tatlısu ıstakozları bu süreçte savunmasızdır (Hobbs, 2001; Reynolds ve Souty-Grosset, 2012; Cumberlidge ve ark., 2015). Tatlısu ıstakozlarında dış iskeleti oluşturan kutikula tabakası, epikutikula, ekzokutikula ve endokutikula olmak üzere 3 katmandan oluşmaktadır. Kabuk değiştirme süreci premolt, molt, postmolt ve intermolt dönem olmak üzere 4 safhadan oluşmaktadır. Premolt dönemde proteolitik enzimler vasıtasıyla kutikula parçalanır, eski dış iskelet ayrılır, yeni dış iskeletin oluşması için eski kabuğun tamamen vücuttan atılmasıyla molt dönemine geçilir. Endokutikula katmanı ise postmolt dönemde oluşur. İntermolt dönemde ise tatlısu ıstakozları sert yeni dış iskelete sahip olur (Lachaise ve ark., 1993; Denny ve Gaines, 2007).

İstakozların yaşam döngülerinde, yetişkin ıstakozlar havalar soğumaya başladığında sonbaharda çiftleşirler ve dişi ıstakozlarda spermatofor görülür. Çiftleşmeden 4-6 hafta sonra yumurtlama gerçekleşir ve inkübasyon başlar. İlkbahar sonunda yumurtalar açılır, juveniller (karapaksı yuvarlak, gelişmemiş, üropodları yok) görülür. Telson ile anneye yapışık kalırlar sonra serbest hale geçip, kısıkaçlarıyla anneye tutunurlar ve bu süreç birinci dönemdir. İkinci dönemde ise, 6-8 gün sonra kabuk değiştirilir, karapaks tam gelişir ve üropodlar hala gelişmemiştir. Üçüncü dönemde, ıstakozlar beş gün sonra kabuk değiştirirler ve üropodlar oluşur. İlk yılda juveniller 6-7 kez kabuk değiştirirler. Yetişkin olana kadar yılda 2-3 kez kabuk değiştirirler (Kumlu, 2001) Şekil (3).

Şekil 3. Tatlısu ıstakozlarının yaşam döngüsü (Anonim, 2020b)

Yaşam Alanları ve Beslenme Özellikleri

İstakozlar geniş bir habitat alanına sahiptir. Yaşam alanlarını sığ ve derin göllerde, nehirlerde, akarsularda, çeşitli dip yüzeylerde sürdürürler. Derin göllerde 50 m'den daha sığ derinliklerde yaşarlar. İstakozlar kıyıları oyuk, bol bitkili, taşlıklı, balıksız suları severler. Yuvalarını toprağı oyarak yaparlar, bu çukurlar genellikle 15-20 cm derinlikte olabilir. İstakozlar yuvalarda kısıkaçları dışarıda olmak üzere saklanır ve düşmanlarını kolaylıkla ve

küçük canlıları kendilerini göstermeden tüketebilirler (Şekil 4) (Köksal, 1988; Cherkashina ve ark., 1999). İstakozların yaşadıkları sular bol kalkerli ve akıntılı sulardır. Kabuklarının gelişimi için kalker gereklidir. Yaşadıkları suların temiz ve oksijen bakımından zengin olması gereklidir (Çizelge 1) (Cukerzıs, 1973; Köksal, 1988).

Şekil 4. Tatlısu istakozlarının saklanmaları (Anonim, 2020c)

Çizelge 1. Tatlısu istakozları için uygun çevresel koşullar (Cukerzıs, 1973; Köksal, 1988)

Çevresel Koşullar	
Sıcaklık	
Üreme için	4-13 °C
Büyüme için	14-22 °C
pH	6.5-8.5
Kalsiyum	50-100 mg/L
Oksijen	>3.97 mg/L
Tuzluluk	‰0-5

Astacus cinsine ait tatlısu istakozları gece ve akşamüstü avlanırlar. Genellikle besinlerini güneş battıktan sonra aramaya çıkarlar. Omnivor beslenme özelliği göstermekle birlikte besin kaynaklarının temelini suda yaşayan ve yarı suda yaşayan bitkiler, bentik omurgasızlar ve detrituslar oluşturmaktadır. Bunlar hayvansal kaynaklı da (kurtlar, böcekler, mollusklar ve zooplankton) olabilir (Hessen ve Skurdal, 1986; Köksal, 1988; Skurdal ve ark., 1992; Nyström ve ark., 1999). Omnivor beslenmelerine rağmen seçici tüketicilerdir. Makrofitlerin seçimi genellikle bitkinin yapısı tarafından belirlenir ve bu nedenle suya batmış yerleşik makrofitleri tercih ederler. Omurgasızlar arasından özellikle salyangozları severler ve ince kabuklu türleri kalın kabuklu türlere göre daha çok tercih ederler. Fakat mollusk olmayan omurgasızları daha az tüketirler (Nyström ve Strand, 1996; Nyström, 1999). İstakozların en iyi beslendiği dönem ilkbahar başlangıcından sonbahara kadar olan dönemdir. Nehir ve göl istakozlarının en iyi 20-25°C sıcaklıktaki sularda iyi beslenmektedirler. Kabuk değişirme safhasında istakozların besin alımı bir müddet durmaktadır. Juvenil aşamada fito ve zooplanktonlarla beslenebilen yavru tatlısu istakozları, yetiştiricilik esnasında ciğer ve dalak verilir.

Sonuç

Tatlısu istakozları, iç sularda ekolojik dengenin sağlanmasında önemli etkileri bulunan kabuklu canlılardır. Çürümüş organik maddeler üzerinden beslenen, detritusun işlenmesi ve mineralizasyonunda, bentik çeşitlilik ve partikül organik madde birikiminde önemli rol oynayan bu canlılar için “ekosistem mühendisi” benzetmesi yapılmaktadır (Zhang ve ark., 2004).

Ülkemizde, ihracat değeri yüksek olan tatlısu ıstakozları popülasyonunun kerevit ve basından korumak için kontamine olmuş her türlü tekne, çizme ve avcılık malzemesinin başka bir su kaynağına götürülmeden önce birkaç gün boyunca tamamen kurutulması ya da mantara karşı etkili dezenfektanlarla dezenfekte edilmesi, ayrıca hastalığın bulunduğu kaynaktaki ıstakozların henüz bulaşımının olmadığı başka bir su kaynağına taşınmaması hususunda gereken hassasiyetin gösterilmesi gerekmektedir.

Ülkemizde iklim koşulları dikkate alınarak tatlısu ıstakozlarının zirai bitkilerle ve diğer sucul canlılarla polikültür şeklinde üretilmeleri daha ekonomik bir kazanç sağlayabilir. Bu durum dikkate alınarak, azalan tatlısu ıstakozu stoklarımızın güçlendirilmesi ve diğer sucul türlerle entegrasyonunun sağlanmasının ülkemiz ekonomisine katkıda bulunacağı muhakkaktır.

Abstract

Freshwater lobster (*Astacus leptodactylus* Eschscholtz, 1823) (crayfish), which is an ecologically and economically important species worldwide, is a species obtained from inland waters, which is among the export products of our country. Crayfish production in Türkiye is based on hunting from natural water resources, dam lakes and ponds. Insufficient food, stock density and low use of barns in crayfish farming adversely affect farming. The aim of this review is to contribute to the development of freshwater lobster breeding by examining the importance of feeding, stock density and shelter use in the juvenile period in freshwater lobster breeding.

Key Words: Crayfish, *A.leptodactylus*, juvenile, stocking density, feed

Tatlısu İstakozu *Astacus leptodactylus* (Eschscholtz, 1823) Yetiştiriciliğinde Yavru Dönemde Beslenme, Stok Yoğunluğu ve Barınak Kullanımının Önemi

Özet

Dünya çapında ekolojik ve ekonomik olarak önemli bir tür olan tatlısu istakozları (*Astacus leptodactylus* Eschscholtz, 1823) (kerevit) ülkemiz içinde ihraç ürünleri arasında yer alan iç sulardan elde edilen bir türdür. Türkiye’de kerevit üretimi doğal su kaynakları, baraj gölleri ve göletlerden yapılan avcılığa dayanmaktadır. Kerevit yetiştiriciliğinde besin yetersizliği, stok yoğunluğu ve barınak kullanımının az olması yetiştiriciliği olumsuz yönde etkilemektedir. Bu derlemenin amacı, tatlısu istakozu yetiştiriciliğinde yavru dönemde beslenme, stok yoğunluğu ve barınak kullanımının önemi incelenerek, tatlısu istakozu yetiştiriciliğinin gelişmesine katkı sağlamaktır.

Anahtar Kelimeler: Tatlısu istakozu, *A.leptodactylus*, juvenil, stok yoğunluğu, beslenme

Giriş

Dünya çapında ekolojik ve ekonomik olarak önemli bir tür olan tatlısu istakozları (*Astacus leptodactylus* Eschscholtz, 1823) (kerevit) ülkemiz içinde ihraç ürünleri arasında yer alan iç sulardan elde edilen bir türdür (Kozák ve ark., 2015; Yazıcıoğlu ve ark., 2018). Tatlısu istakozları dünyada 737 tür ve alt tür ile temsil edilmektedir (Crandall ve Buhay, 2008; Crandal ve De Grave, 2017) ve bu türlerin yaklaşık olarak 15’i ekonomik öneme sahiptir (Holdich, 1993; Ackerfors, 2000). Oldukça fazla türün varolmasına rağmen genellikle avcılık ve yetiştiricilik alanlarında ekonomik olarak önem arz eden familyalar (Parastacidae, Cambaridae, Astacidae) olarak bilinmektedir. Amerika’da çoğunlukla kırmızı bataklık istakozu (*Procambarus clarkii*), beyaz nehir istakozu (*Procambarus zonangulus*) ve *Orconectes* spp., türlerinin yetiştiriciliği yapılmaktadır.

Avrupa’da sanayileşmeyle beraber ortaya çıkan su kirliliği ve bilinçsiz avcılık yüzünden kerevit vebası olarak adlandırılan bir mantar türü (*Aphanomyces astaci*) doğal sularda büyük hasarlara sebep olmuştur. Bununla beraber hastalık yapan bu mantar türü, 1860’lı yıllarda Amerika’dan ilk önce İtalya’ya, oradan da diğer Avrupa ülkelerine ve Rusya’ya yayılmıştır (Ackefors, 2000). Dolayısıyla, Avrupa ülkeleri giderek artan ihtiyaçlarını karşılayamaz duruma gelmiş ve tatlısu istakozlarının fazla tüketildiği Avrupa ülkelerindeki istakozlar hastalık yüzünden büyük zarar görmüştür. Bu aşamada artık tatlısu istakozu yetiştiriciliği önem kazanmış ve ilk çalışmalar, 1860’lı yıllarda Fransa’da başlamıştır. Yapay yollarla yavru üretimi ise ilk olarak 1912 yılında Rus araştırmacı Cukerzis tarafından yapılmıştır (Köksal, 1986).

Tatlısu istakozları protein kaynağı olarak düşük kaloriye sahiptir, bununla beraber B grubu vitaminleri, sodyum, potasyum, kalsiyum ve magnezyum yönünden zengin bir besindir (Goddard, 1988). C vitamini ve karoten içeriği birçok ticari balık türünden daha fazladır. Besin değerinin yanı sıra, çoğu ülkede tatlısu istakozunun beğenilerek tüketilmesi ve geçen süre içerisinde ekonomik değerinin artması bu ürünün kültür şartlarındaki üretimine hız kazandırmıştır (Harlıoğlu ve Köprücü, 2000).

Astacidae ailesi içerisinde yer alan tatlısu istakozlarının, doğal yaşam alanı kuzey yarım kürenin iç sularıdır. Ülkemiz iç sularında Türk kereviti olarak adlandırılan dar kısıkaçlı kerevit (*Astacus leptodactylus* Eschscholtz, 1823) tek tür olarak dağılım göstermektedir. Türkiye tatlısularındaki doğal tatlısu istakozu türü olan bu türün, iki alttürü bulunmaktadır (*Astacus leptodactylus leptodactylus* Eschscholtz, 1823 ve *Astacus leptodactylus salinus* Nordmann, 1842) (Geldiay ve Kocataş, 1970). *Astacus leptodactylus* Türkiye, Ukrayna, Güneybatı Rusya, İran, Kazakistan, Belarus, Slovakya, Bulgaristan, Romanya ve Macaristan’ını da kapsayan geniş bir yayılım alanı bulan bu tür, dünya genelinde doğal olarak 27 ülkede yaşamaktadır. Bununla beraber 14 ülkeye de nakil edilmiştir. Çek

Cumhuriyeti, Polonya, Almanya, Finlandiya, Danimarka, Hollanda, İngiltere, Litvanya ülkelerinde bulunmaktadır (Diler, 2013).

Ülkemizde kerevit yetiştiriciliğine ilişkin çalışmalar çok az olup, bu konuda önemli bir uygulama bulunmamaktadır (Alpbaz, 2005). Bu çalışmalarda doğal ortamlardan avcılık yolu ile elde edilen yumurtalı anaçlardan yavru elde edilmesi ve bu yavruların doğal suların restorasyonu ve stokların takviyesi gibi amaçlar için belli bir boya kadar büyütülmesi ve sonra doğal sulara bırakılması yada su kaynaklarında pazarlanabilir boya gelinceye kadar büyütülmesi gibi konularda üretim ve beslemeye yönelik çalışmalar yapılmış ve halende yapılmaktadır. Ülkemizin doğal türü olan *Astacus leptodactylus* stokları özellikle aşırı avcılık, su kirliliği ve kerevit vebası nedeniyle pek çok su kaynağında azalmıştır ve doğal stokların takviyesi için yetiştiricilik çalışmalarının yapılmasına ihtiyaç duyulmaktadır. Bu derlemede, juvenil dönemde kerevit yetiştiriciliğinde beslenme, stok yoğunluğu ve barınak tipinin önemi vurgulanarak kerevit yavru yetiştiriciliği konusunda katkı sağlamak amaçlanmıştır.

Kerevit yavrularında beslenme, stok yoğunluğu ve barınak tipi

Beslenme

Kerevit yetiştiriciliğinde yavruların hayatta kalmalarını ve büyümelerini etkileyen en önemli faktörlerden biri beslenmedir. Omnivor beslenme özelliğine sahip olan kerevitlerin besin kaynaklarının temelini mikrobiyal açıdan zengin olan detrituslar oluşturur. Bunlar hayvansal kaynaklı (kurtlar, böcekler, mollusklar ve zooplankton) olabileceği gibi, bitkisel kaynaklı da olabilir. Yeşil bitkilerle beslenen kerevitlerin asıl besin olarak yararlandıkları kaynaklar, dekompoze olmuş bitki saplarının üzerinde bulunan bakteri, mantar ve diğer mikro organizmalardır (James ve Huner, 1985). Başarılı bir yavru üretimi için kerevitlere canlı yem, alabalık pelet yemi, haşlanmış patates gibi besinler verilebilir. Kerevitlerin beslenmesinde kullanılacak yapay yemlerin besin madde içerikleri; protein %18-44, lipit %1-5 ve mineral madde miktarının %7-10 civarında olması önerilmektedir (Lee ve Wickins, 1992). Yavruların ideal bir şekilde büyümesi için başlangıçta vücut ağırlıklarının %1-4 oranında, daha sonraki aşamalarda ise %0.3-1 oranında yem verilmesi önerilir. Juvenil aşamada zoo ve fitoplanktonlarla beslenebilen yavru kerevitlere, yetiştiricilik esnasında ciğer ve dalak verilir. Genç yavrular için en elverişli olan fitoplanktonun diatomlar olduğu ifade edilmiştir (Atay, 1997). Alderman ve Wickins (1990), kerevit yavrularının, özellikle su bitkileri arasında yaşayan krustaselerle beslendiği, yetişkinlerin ise besin kaynaklarının %70'inin bitkisel orjinli olduğunu bildirmişlerdir. Kerevitlerde planktonik ve epifitik organizmalarla başlayan beslenme, juvenil ve yetişkinlerde yeşil otlar, detrital besin zinciri, dekompoze olmuş bitki saplarıyla devam edip şeker kamışı ve çiftlik gübreleride besin kaynağı olarak kullanılmaktadır.

Köksal (1985), değişik rasyonların *A.leptodactylus* yavrularının büyümesi ve yaşama oranına etkileri araştırmış ve en yüksek büyümenin, *Artemia salina* nauplii ile hazırlanan rasyon ile beslenen yavrularda elde edildiğini ve erkek bireylerin dişilere göre daha iyi geliştiğini belirtmiştir. En düşük büyümenin ise, haşlanmış patates ve kızılgaç yaprağı ile hazırlanan rasyon ile beslenen yavrularda olduğu saptanmıştır.

Alderman ve Wickins (1990), yaptıkları deneme sonunda, kerevitlerin laboratuvar koşullarında, patates ve havuç ile iyi beslendiklerini ancak üretimde sürekliliğini sağlamak için kerevitlerin bulundukları ortamlarda doğal besin kaynaklarının olması gerektiğini belirtmişlerdir.

Köksal ve ark. (1992), Eskişehir (Çifteler)'de *A. leptodactylus* yavruları ile 4 farklı yem kullanarak beton ve toprak havuz da 4 ay süresince besleme yaptıkları çalışmada, en yüksek büyümeyi, günlük olarak 1220 mg (taze balık+su teresi) ile beslenen yavru tathısu kerevitlerinde tespit etmişlerdir.

Aydın (1998), beton havuzlarda çiftleştirilmiş bireylerden elde edilen başlangıç total uzunluğu 11.12 mm, karapaks uzunluğu 6.6 mm ve ağırlıkları 67 mg olan kerevit juvenillerini 436 juvenil/m² oranında stoklayarak, başlangıçta *Artemia* sp. ve *Daphnia* sp., üç hafta sonra alternatif olarak doğranmış taze alabalık eti ve alabalık peleti ile beslemiştir. Denemenin başlamasını takiben, 2, 3, 4 ve 5. aylarda juvenillerde ortalama ağırlıklar sırasıyla, 0.482 g, 0.684 g, 0.973 g ve 1.038 g olmuştur. Juvenillerdeki hayatta kalma oranı ise 5. ayda % 55.99 olarak tespit etmiştir.

Berber (1999), 200'er adet *A. leptodactylus* yavrusunun bulunduğu iki toprak havuzda, havuzların birine çiftlik gübresi diğerine ise alabalık pelet yemi kullanarak 7 ay boyunca denemeye tabi tutmuştur. Deneme sonunda, alabalık pelet yemi kullanılan havuzdaki bireylerin hem boy hem de ağırlıkça daha iyi geliştiğini belirtmiştir.

Zaikov ve ark. (2000), II. dönem kerevit yavrularının beslenmesinde 30 gün süreyle soya unu, et unu, pelet yem (protein %30.7) ve zooplankton (*Daphnia magna*) kullandıkları denemelerinde en iyi gelişim oranı ve en yüksek yaşama oranının (%68,13) *Daphnia magna* ile besleme yapılan yavrularda olduğunu bildirmişlerdir.

Ulikowski ve Krzywosz (2004), yemleme sıklığının kerevitlerin gelişim ve hayatta kalma oranlarına etkilerini araştırdıkları çalışmalarında, başlangıç vücut ağırlıkları 30,2 mg total vücut uzunlukları 9,8 mm olan II. dönem *A. leptodactylus* yavrularını 300 birey/m² stok yoğunluğunda, barınak kullanmadan tanklara stoklamışlardır. Denemede 12, 24, 48 ve 96 saatte bir olmak üzere 4 farklı şekilde 28 gün süreyle beslenen *A.leptodactylus* juvenillerinin gelişimlerini yemleme sıklığının etkilediği saptanmıştır. Yine aynı çalışmada, ilk stok yoğunluğu 300, 600 ve 1200 birey/m² olan *A. leptodactylus*'larda, hayatta kalma oranları sırasıyla %70, %58 ve %47,8 olarak

bulunmuştur. Araştırmacılar, bu denemelerden elde ettikleri bulgulardan, yetiştiriciliğin ilk ayları esnasında kerevitlerde hayatta kalma oranlarının başlangıç stok yoğunluğundan etkilendiğini tespit etmişlerdir.

Zahmetkesh ve ark. (2007), yapmış oldukları denemede, *Astacus leptodactylus* yavrularının farklı oranlarda kalsiyum ilave yemlerle (0, 1, 2, 3 ve 4) besleyerek büyüme ve yaşama oranlarını araştırmasında en iyi ağırlık ve boy artışı %3-4 kalsiyum oranlı yemle beslenen grupta, en yüksek büyüme (11,65 g) %4 kalsiyumlu yemle beslenen grupta, en düşük yaşama oranı ise %2 kalsiyumlu yemle beslenen grupta (%30) olduğunu belirtmişlerdir. Güner (2009) kerevit yavrularını % 55 protein içeren ticari alabalık yemi, % 35 protein içeren sazan yemi, % 18 protein içeren kıyılmış balık eti ve % 3.6 protein içeren saman yemleriyle besledikleri çalışmada, hem ağırlıkça hem de boyca en iyi büyüme alabalık yemi ile beslenen grupta, en yüksek yaşama oranı ise balık eti ile beslenen grupta (% 81.85) tespit etmiştir.

Cilbiz (2010), yapmış oldukları çalışmada yeme kalsiyum %1,5; % 2,0; %2,5 ve %3,0 oranlarında ilave edilmiş ve yüksek oranda kalsiyum içeren yemler (%2,5-%3,0) daha iyi ağırlık ve boy artışı ile yüksek yaşama oranı sağlarken, en düşük veriler kontrol grubunda gözlemlenmiştir. Tatlısu istakozların yemlerinde olması gereken en uygun kalsiyum oranı, regresyon analizine göre %2,5-3,0 olduğunu bildirmiştir.

Şirin (2010), kerevit yavru yemine farklı oranlarda kalsiyum (%3, %6 ve %12) kaynağı koyarak oluşturulan bir denemede %6 kalsiyum klorid veya karbonat ilaveli yemlerin kerevitler için en ideal olduğunu önermiştir.

Koca ve ark. (2011) farklı oranlarda (%0, 10, 20, 30 ve 40) kerevit yavru yemlerine karides artık unu ilave etmiştir. Kerevitlere verilen yemlerin büyüme, yem değerlendirme oranı ve yaşama oranı üzerine etkilerinin incelendiği çalışmada en yüksek ağırlık kazanımı %10 karides artık unu içerikli grupta olduğunu bildirmişlerdir.

Stok Yoğunluğu ve Barınak Tipi

Aksu ve Harlioğlu (2003), *A. leptodactylus*'un barınak tercihlerini ve bu seçimde değişik faktörlerin etkisini incelemişlerdir. Araştırmada barınaktaki ışık geçirgenliğinin, barınak kullanımına etkisi ile bireylerin en fazla siyah barınaklara (%79.3) ve sırasıyla saydam renkli (%13.6), yeşil (%6.4) ve beyaz renkli barınaklara (%0.8) kullandıklarını tespit etmişlerdir. Barınak içinin yapay olarak aydınlatılması durumunda tatlısu istakozlarının barınak kullanma oranlarının %56.67 olduğunu; 60 mm, 70 mm ve 80 mm çapındaki barınakların birbirlerine yakın oranlarda kullandıklarını belirlemişlerdir. Ayrıca havalandırma yapılmayan akvaryumlardaki tatlısu istakozlarının yüksek oranda barınak kullandıkları, farklı barınak tipi seçiminde ise, en çok boru barınak tipini tercih ettikleri (%64.4) ve çakıl taban üzerindeki barınaklara diğerlerine oranla daha fazla kullandıklarını belirtmişlerdir.

Mazlum (2007), farklı stok yoğunluğunun ortalama II. dönem *Astacus leptodactylus* yavrularının gelişmeleri, yem değerlendirme ve hayatta kalma oranları üzerine etkilerini inceledikleri çalışmada üç farklı stok yoğunluğundan (50, 100 ve 200 birey/m²) grupları ortalama 22,4 mg ağırlığındaki kerevitler stoklanmış ve deneme 120 gün sürmüştür. Deneme boyunca yavrular ticari alabalık yemi (%50 protein, %6,5 lipid, %12 mineral, %13 yem, %1,2 selüloz) ile beslenmiştir. Deneme sonunda, metrekareye 50, 100 ve 200 adet kerevit olan gruplardaki kerevitlerin ulaştıkları son ağırlıklar sırası ile 1,26±0,06 g, 1,16±0,25 g, 0,91±0,12 g olarak bulunmuştur. Total uzunlukları 16-41 mm arasında değişmiştir. Deneme sonunda, hem ağırlık hem uzunlukla ilgili gelişim artan stok yoğunluğundan negatif olarak etkilenebilir. Deneme sonunda elde edilen hayatta kalma oranlarının da 50, 100 ve 200 birey/m² olarak stoklanan bireylerde sırasıyla %85,4, %73,8 ve %61 olduğu ifade edilmiştir. Sonuç olarak kerevitlerde gelişme ve hayatta kalma üzerinde stok yoğunluğunun önemli bir etkisi bulunmuş, fakat stok yoğunluğunun yem dönüşüm oranını etkilemediği ifade etmiştir.

Uzun (2007), farklı stok yoğunluğunun juvenil tatlısu kerevitlerinin büyümeleri, yem değerlendirme ve hayatta kalma oranları üzerine etkilerini araştırdıkları çalışmada üç farklı stok yoğunluğu (10 kerevit/m², 50 kerevit/m² ve 100 kerevit/m²) grupları 1,7 m²'lik tanklara sırası ile 17, 85 ve 170 adet kerevit olacak şekilde 9 adet tanka stoklanmıştır. Deneme sonunda metrekareye 10, 50 ve 100 adet kerevit olan gruplardaki kerevitlerin ulaştıkları son ağırlıklar ve uzunluklar sırası 15 ile 2,27±1,41 g, 1,400±0,84 g, 1,079±0,6 g ve uzunluklar ise 4,83±0,8 cm, 3,73±0,75 cm, 3,51±0,75 cm olarak bulunmuştur. Deneme sonunda boy ve uzunluk parametrelerinin artışı stok yoğunluğunun artması ile olumsuz etkilendiğini gözlemlenmiştir. Deneme sonunda en iyi büyüme (hem ağırlıkça hem de boyca) stok yoğunluğu en az olan grupta (10 kerevit/m²) gerçekleştiğini tespit etmiştir.

Harlioğlu (2008), *P. leniusculus* ve *A. leptodactylus* 2. dönem juvenillerine 12 saat ışık, 12 saat karanlık şeklinde ışık rejimi uygulanan akvaryumlarda ve farklı stok yoğunluklarının (234, 468, 937 juvenil/m²) hayatta kalma ve gelişime etkisini araştırdığı çalışmasını 2 ay sürdürmüş ve sonuçta artan stok yoğunluğunun daha düşük hayatta kalma oranına neden olduğunu bildirmiştir.

Mazlum ve Uzun (2008), kerevitlerde yapılan farklı bir çalışmada korunak tiplerinin yaşama oranı üzerinde önemli olduğu tespit edilmiştir. Yapılan denemede PVC boru ve ağ materyalinin kontrole göre önemli oranda yaşama oranını arttırdığı belirtilmiştir.

Sonuç

Kerevit yetiştiriciliği ile ilgili yapılan araştırmalar değerlendirildiğinde;

- Yavrularda canlı yem ile beslemenin büyüme ve yaşama oranını arttırdığı,
- Stok yoğunluğunun artışıyla kerevit yavrularında yaşama oranının azaldığı,
- Barınak kullanımı kerevitlerin birbirleriyle olan temasının azalmasına ve yem alımının artmasına neden olup kerevitlerin büyüme ve yaşama oranını arttırdığı tespit edilmiştir.

Wide Temperature Range Palm-Based Chocolate Spread

Norazura Aila Mohd Hassim¹ and Sivaruby Kanagaratnam¹

¹Food and Feed Technology Unit, Malaysian Palm Oil Board, Kajang, Malaysia

Abstract

The study screened blended base oils (various ratio of palm superolein (POOo) and sunflower oil (SFO)) and waxes (0% - 3.5% sunflower wax (SFW), carnauba wax (CW) and bees wax (BW)) for the production of chocolate spread at wide range of temperature (5°C-45°C). Main parameters for the blended base oil screening were solid fat content (SFC) as well as hardness and spreadability of the chocolate spread from the blended base oils. Main parameters for the waxes screening were SFC of the selected blended base oil and waxes as well as hardness, spreadability and stability of chocolate spread containing selected blended base oil with different percentage of wax (OSW). Blended oil of POOo: SFO at 50:50 ratio was chosen as base oil as its SFC does not affected by temperature and its chocolate spread was still spreadable at 5°C and projected hardness of below commercial chocolate spread at 5°C. Chocolate spread produced from OSW of 3.5% SFW and 3.5% CW showed promising and positive results of spreadability at 5°C, hardness at 5°C as well as stability structure (no oiling out) at 5°C-40°C after 24 hr of storage. The SFC of OSW with 3.5% SFW showed constant trend at experimental temperatures of 5°C-45°C while the SFC of 3.5% CW showed constant trend at experimental temperatures of 15°C-40°C.

Key Words: *Sunflower wax, Carnauba wax, Bees wax, spreadability, phase separation*

Abstract

The performance characteristics and breast meat antioxidative status and cholesterol of broiler chickens fed diets supplemented with vitamin c and *Ficus exasperata* leaf powder (FLP) were assessed. Two hundred and forty day-old Cobb 500 broiler chickens were randomly allotted to four treatment diets. Diet 1 is the control. Diets 2, 3 and 4 were supplemented with 200mg/kg vitamin C, 10,000 mg/kg FLP, and 200mg/kg vitamin c + 10,000 mg/kg FLP, respectively. The broiler chickens' body weight gain (BWG) was considerably ($P<0.05$) improved by vitamin c, FLP, and vitamin c + FLP supplementations, with the broiler chickens given the vitamin c + FLP supplemented diet having a significantly ($P<0.05$) highest BWG. The feed conversion ratio and feed intake were not significant ($P>0.05$). The vitamin c, FLP and vitamin c + FLP significantly ($P<0.05$) reduced the lipid oxidation of the broiler meat, compared to the control. The vitamin c, FLP and vitamin c + FLP significantly ($P<0.05$) increased the glutathione peroxidase activities of the broiler meat, compared to the control. The vitamin c + FLP supplementation improved ($P<0.05$) the catalase activities of the broiler's meat, compared to the control.

Introduction

The expansion in the human population has resulted in increased food consumption and, a large increase in worldwide animal protein production, particularly in tropical countries (Renaudeau et al., 2012). Broiler production is projected to ease the problem of animal protein scarcity that most tropical countries are experiencing (Hatab et al., 2019). Under good management and a thermoneutral zone of 180°C -24°C, broiler chickens reach a market weight of about 2 kg at about 49 days of age (Tallentire et al., 2016).

However, sustainable broiler production is being affected by hampered by climate change, which usually subjects the birds to heat stress and consequently, depressed performance and profitability (Rahimi et al., 2020). Therefore, the adoption of dietary antioxidant supplementation and adaptation of the birds' diets to changing climatic trends while taking into account the economic status of the regions where they are produced has been suggested as a potential ameliorative approach to reduce the negative effects of heat stress on tropical birds (Tawfeek et al., 2014). Heat stress causes pyrexia, poor growth performance, anorexia, and lower feed efficiency in broiler chickens (Ozbey and Ozcelik, 2004). Heat stress causes broiler chickens to have an altered fatty acid composition in their fatty tissues, increasing the quantity of saturated fatty acids. As a result, there will be more fat in the subcutaneous layer, which will have a negative impact on the meat and carcass quality of broiler chickens (Kpomasse et al., 2021).

Vitamin C is a trace element having biological roles, such as antioxidant defence in heat-stressed broiler chicks. It has a high antioxidant capacity, polyphenols, and natural availability (Waseem et al., 2016). Medicinal plants are also good sources of biologically active antioxidants, and they've been examined for their ability to neutralise free radicals (Gul et al., 2011). *Ficus exasperata* leaf powder was found to possess a substantial number of minerals and phytochemicals with strong antioxidant activity, hence it was suggested that it be used as a dietary natural antioxidant supplement (Osowe et al., 2021). Anticonvulsant, antibacterial, hypoglycemic, antiulcer, hypotensive, hypolipidemic, anti-inflammatory, oxytocin inhibitory, antipyretic, and anxiolytic properties are all found in the leaves of *F. exasperate* (Ahmed et al., 2012). The purpose of this study was to see how dietary supplementation with vitamin C and *Ficus exasperata* leaf powder affected the performance and meat quality of broiler chickens.

Materials and Methods

The Research and Ethics Committee of the Department of Animal Production and Health, Federal University of Technology, Akure (FUTA), Nigeria, approved the experiment's standards and criteria for animals and animal protocol. The experiment was placed in February and March of 2021, at a temperature of 27.77±0.4 degrees Celsius on average. The process for gathering, preparing, and testing *Ficus exasperata* leaf powder (FLP) was published by Osowe et al., (2021).

Local markets in Akure, Nigeria, were visited to procure vitamin C powder (Avondale Laboratories Limited, Banbury, England) and other feed ingredients. To address the dietetic requirements of the experimental broiler

chickens, a basic experimental diet (Table 1) was compounded for the starting phase (0 to 21 days) and the finishing phase (21-42 days).

The basic experimental diet was divided into four equal portions and called diets 1 to 4 for each phase. Diet 1 is the control. Diets 2, 3 and 4 were supplemented with 200mg/kg vitamin C, 10,000 mg/kg FLP, and 200mg/kg vitamin c + 10,000 mg/kg FLP, respectively.

In Nigeria, the feeding trial was held at the FUTA Teaching and Research Farm. A total of 240 Cobb 500 broiler chicks were randomly assigned to the diets in a completely randomised arrangement for this experiment. Each diet was replicated six times, each time with ten birds (10 birds/replicate). To a depth of 3 cm, wood flakes were spread to blanket the floor of the experimental pen (2m × 1m) that contained each replicate. For the first week, the temperature in the experimental house was maintained at 31±2 degrees Celsius, then lowered by 2 degrees Celsius each week until it reached 26±2 degrees Celsius. The lights were left on for 24 hours on the first day, and then for 23 hours on successive days.

Every seven days, the experimental broiler chicks' body weight (BW) and feed intake (FI) were checked and measured. The difference between the birds' initial and final BW was used to calculate the average body weight gain (BWG). By dividing the amount of feed consumed by the amount of weight gained, the feed conversion ratio was calculated.

On day 42 of the feeding research, 18 birds (3 replications) from each dietary group were chosen at random and sacrificed as reported by Oloruntola et al (2019). About 100g of breast meat was sliced for measuring lipid peroxidation (Tokur et al., 2006), glutathione peroxidase activity (Cichoski et al., 2012), catalase activity (Hadwan and Khabt, 2018), and meat cholesterol (de Almeida et al., 2006).

The model: $F_{gh} = \mu + t_s + \beta_{gh}$, was used in this experiment, where F_{gh} = any of the response variables; μ = the overall mean; t_s = effect of the sth treatment (T = diets 1, 2, 3 and 4); and β_{gh} = random error due to experimentation. SPSS version 20 was used to do a one-way ANOVA on the data. Duncan's multiple range test was used to examine the differences ($P < 0.05$) between the experimental treatment averages.

Results and Discussion

The meat quality and performance characteristics of broiler chicken fed vitamin C and *Ficus exasperata* leaf powder supplemented diets are shown in Table 2. The broiler chickens' BWG was considerably ($P < 0.05$) improved by vitamin c, FLP, and vitamin c + FLP supplementations, with the broiler chickens given the vitamin c + FLP supplemented diet having the significantly ($P < 0.05$) highest BWG. The feed conversion ratio and feed intake were not significant ($P > 0.05$).

Table 1: Experimental diets' composition

Ingredients (%)	Starter (1-21 days)	Grower/finisher (22-42 days)
Maize	50.35	58.35
Rice bran	0	3
Maize bran	3	0
Soy oil	1	1

Glutathione peroxidase (umole/mg)	27.15 ^b	50.06 ^a	56.62 ^a	52.36 ^a	4.15	0.02
Catalase (kU)	35.15 ^b	50.17 ^{ab}	50.76 ^{ab}	52.77 ^a	2.89	0.04
Cholesterol (mg//dl)	110.73	109.93	106.78	107.98	4.20	0.99

Means with a different superscript in the same column are significantly ($P < 0.05$) different; FLP: *Ficus exasperata*, leaf powder; Diet 1: Control; Diet 2: 200mg/kg vitamin C; Diet 3: 10,000 mg/kg FLP; Diet 4: 200 mg/kg + 10,000 mg/kg FLP; SEM: Standard error of the means.

High ambient temperature in the tropics constitutes thermal stress that is a major cause of systemic oxidative stress; and consequently poor growth performance (Ahaotu et al., 2019; Hu et al., 2019). As a result, the increased body weight growth seen in the birds fed vitamin C and FLP in this study could be a result of the bioactive components in FLP and vitamin C's actions in lowering the effects of oxidative stress in broiler chickens. The antioxidant characteristics of phytochemicals or phyto-additives were attributed to their therapeutic effects, which included a reduction in antioxidant stress, an increase in antioxidant activity in diverse tissues, and an overall improvement in health (Settle et al., 2014). The antioxidant activities of FLP were reported (Osowe et al., 2021). Vitamin C is also the most abundant water-soluble antioxidant in the cell and extracellular fluids, protecting against phagocyte-derived oxidants by lowering phagocyte adherence to the endothelium, minimising respiratory burst, and avoiding lipid peroxidation (Close et al., 2006). Vitamin c and phytochemicals act as antioxidants, that neutralize free radicals and remove their power to cause damage.

The vitamin c, FLP and combination of vitamin c and FLP significantly ($P < 0.05$) reduced the lipid oxidation of the broiler meat, compared to the control. The vitamin c, FLP and combination of vitamin c and FLP significantly ($P < 0.05$) increased the glutathione peroxidase activities of the broiler meat, compared to the control. The vitamin c + FLP supplementation improved ($P < 0.05$) the catalase activities of the broiler's meat, compared to the control. Heat stress significantly reduces the quality of chicken meat (Hashizawa et al., 2019). As observed in this study; vitamin C and FLP supplementation reduced lipid oxidation and increased glutathione peroxidase and catalase activities in broiler meat, suggesting that the supplements improved the body's defence against oxidative damage by controlling oxidative materials and free radicals through an enzymatic antioxidant system (Suri et al., 2019). Catalase and glutathione peroxidase are prominent enzymes that fight free radicals and alter the degrees of lipid peroxidation in meat and meat quality (Dominguez et al., 2019; Suri et al., 2019). In conclusion, The fed vitamin C (200 mg/kg) and *Ficus exasperata* leaf powder (10,000 mg/kg) supplementation and their combination improved the body weight gain, meat glutathione peroxidase, and meat catalase of the broiler chickens. The meat lipid peroxidation was also reduced by the dietary supplementations used in this study.

Risks, Regulations and Genetic Engineering: A Way Forward for Commercialization of Gm Crops in Pakistan

Mahmood-ur-Rahman

Department of Bioinformatics & Biotechnology, GC University – Faisalabad, Allama Iqbal Road, Faisalabad-38000, Pakistan

Abstract

The rapid progress in biotechnology has significantly promoted the development and production of Genetically Modified (GM) plants. The extensive global cultivation of GM crops has generated greater benefits that might provide opportunities for solving problems related to food security, however, it has also raised considerable biosecurity concerns worldwide. Major concerns from GM crops are on natural environment, human and animal health and society. The potential environmental consequences due to transgene escape from a GM crop to its non-GM crop counterparts (crop-crop) and weedy or wild relative (crop-weed) via gene flow are the most debated biosafety issues internationally. GM crops are truly biological novelties, their release into the environment poses concerns about the unpredictable ecological and evolutionary responses that GM species themselves and the interacting biota may express in the medium and long term. One of the consequences of GM crop may be a generalized contamination of natural flora by GM traits and a degradation and erosion of the commonly owned genetic resources available today for agricultural development. However, these concerns can be resolved by developing efficient investigative techniques via modern biotechnology and genetic engineering. A systematic risk assessment will facilitate the appropriate prediction of potential environmental consequences caused by GM crops. Moreover, enforcement of National Biosafety Guidelines is highly recommended to avoid potential consequences.

Abstract

Microbial contamination of food is still an important public health problem for human society, and poses economic concerns due to product losses. Plant secondary metabolites are frequently studied against microorganisms that cause health and economic losses due to their antibacterial, insecticidal, antifungal, acaricidal, and cytotoxic activities, and because they are obtained naturally. In this study, the different extracts (ethanol, methanol) obtained from *Punica granatum* fruit peels were used against *Erwinia caratovora* subsp. *caratovora* ECC100, *Rathayibacter tritici* DSMZ7486, *Agrobacterium vitis*, *Rathayibacter iranica* DSMZ7484, *Pseudomonas putida*, *Pseudomonas tomato* Pt52-a. These bacteria are crop spoilage pathogens. The antibacterial activities were carried out using the disc diffusion method. In addition, another activity test was Minimum Inhibitory Concentration (MIC) which was performed with the broth dilution method. At the end of the study, the highest antibacterial activity was determined with a 16.5 mm inhibition zone diameter against *A. vitis* from methanol extract, and the lowest antibacterial activity was determined against *A. vitis* from ethanol extract. The lowest MIC value of *Punica granatum* fruit peel extracts was obtained for *A. vitis* and *Pseudomonas putida* in the 6500 µg/mL concentration, the highest MIC value was determined at 13000 µg/mL for various crop spoiling pathogens. As a result, it is suggested that *Punica granatum* fruit peels have antibacterial activities against crop spoiling pathogens, and can be used in the fight against these pathogens.

Key Words: *Punica*, Crop spoiling pathogens, Antibacterial activity, Minimum inhibitory concentration

***Punica granatum* L. Meyve Kabuklarının Ürün Bozan Patojenlere Karşı Antibakteriyel Aktivitelerinin Belirlenmesi**

Özet

Gıdaların mikrobiyal kontaminasyonu, insan toplumu için hala önemli halk sağlığı sorunudur ve yarattığı ürün kayıplarından dolayı ekonomik kaygılar oluşturmaktadır. Bitki sekonder metabolitleri, antibakteriyel, insektisit, antifungal, akarisit ve sitotoksik aktiviteleri nedeniyle sağlık ve ekonomik kayıplara neden olan mikroorganizmalara karşı ve doğal olarak elde edildikleri için sıklıkla araştırılmaktadır. Bu çalışmada *Punica granatum* meyve kabuklarından elde edilen farklı ekstraktlar (etanol, metanol) *Erwinia caratovora* subsp. *caratovora* ECC100, *Rathayibacter tritici* DSMZ7486, *Agrobacterium vitis*, *Rathayibacter iranica* DSMZ7484, *Pseudomonas putida*, *Pseudomonas tomato* Pt52-a 'ya karşı kullanılmıştır. Antibakteriyel aktiviteler disk difüzyon metodu kullanılarak gerçekleştirilmiştir. Ayrıca sıvı dilüsyon yöntemi ile gerçekleştirilen Minimum İnhibitör Konsantrasyon (MİK) bir diğer aktivite testidir. Çalışma sonunda en yüksek antibakteriyel aktivite metanol ekstresinden *A. vitis* ' e karşı 16,5 mm inhibisyon zon çapı ile, en düşük antibakteriyel aktivite ise etanol ekstresinden *A. vitis* 'e karşı tespit edilmiştir. *Punica granatum* meyve kabuk ekstraktlarının en düşük MİK değeri 6500 µg/mL konsantrasyonunda *A. vitis* ve *Pseudomonas putida* için elde edilirken, en yüksek MİK değeri 13000 µg/mL konsantrasyonunda çeşitli ürün bozan patojenleri için saptanmıştır. Sonuç olarak, *Punica granatum* meyve kabuklarının ürün bozan patojenlere karşı antibakteriyel aktiviteye sahip olduğu ve bu patojenlere karşı mücadelede kullanılabileceği önerilmektedir.

Abstract

It is very important that the foods consumed by people are reliable for their healthy growth and development. New foods are being developed every day depending on consumer demand. Many of these foods are produced from the basic food sources we know, and various additives are used to improve their physical, chemical, and microbiological properties and to extend their storage period. However, some of these additives are unhealthy, carcinogenic, or toxic, leading researchers to discover natural and reliable additives. Many *Helichrysum* species are used in traditional medicine. *Helichrysum* has been used in the treatment of various ailments such as skin infections, gallbladder, respiratory and digestive system disorders, and kidney stones. In addition, antioxidant, hepatoprotective, antibacterial, antiviral, and antifungal studies have also been reported. This study, it was aimed to determine the antibacterial activities of different extracts from *Helichrysum* against *Erwinia caratovora* subsp. *caratovora* ECC100, *Rathayibacter tritici* DSMZ7486, *Agrobacterium vitis*, *Rathayibacter iranicus* DSMZ7484, *Pseudomonas putida*, *Pseudomonas tomato* Pt52-a. The antibacterial activity of *Helichrysum* has been tested against crop spoiling pathogens, and the disk diffusion method has been used for this study. The minimum inhibitory concentration (MIC) was determined by the broth dilution method. According to the results of the study, the highest inhibition zone was determined from the methanol extract of the plant, this bacterium is *Pseudomonas tomato*, and the zone is 19 mm. At the end of the minimum inhibitor studies, all MIC values were determined to be higher than 10000 µg/mL. As a result, it is suggested that *Helichrysum* extracts have antibacterial activities against crop spoiling pathogens, and can be used in the fight against these pathogens.

Key Words: *Helichrysum*, Crop spoiling pathogen, Antibacterial activity, Minimum inhibitory concentration

***Helichrysum arenarium* L. Ekstrelerinin Ürün Bozan Patojenlere Karşı Antibakteriyel Aktivitesinin Belirlenmesi**

Özet

İnsanların tükettiği besinlerin güvenilir olması sağlıklı büyümeleri ve gelişmeleri için çok önemlidir. Tüketici talebine bağlı olarak her gün yeni gıdalar geliştirilmektedir. Bu gıdaların birçoğu bildiğimiz temel gıda kaynaklarından üretilmekte olup, fiziksel, kimyasal ve mikrobiyolojik özelliklerini geliştirmek ve saklama sürelerini uzatmak için çeşitli katkı maddeleri kullanılmaktadır. Bununla birlikte, bu katkı maddelerinin bazıları sağlıksız, kanserojen veya toksiktir, araştırmacıları doğal ve güvenilir katkı maddeleri keşfetmeye yönlendirir. Geleneksel tıpta birçok *Helichrysum* türü kullanılmaktadır. Geleneksel tıpta birçok *Helichrysum* türü kullanılmaktadır. *Helichrysum* cilt enfeksiyonları, safra kesesi, solunum ve sindirim sistemi bozuklukları ve böbrek taşları gibi çeşitli rahatsızlıkların tedavisinde kullanılmıştır. Ayrıca antioksidan, hepatokoruyucu, antibakteriyel, antiviral ve antifungal çalışmalar da bildirilmiştir. Bu çalışma, *Helichrysum*' dan elde edilen farklı ekstraktların *Erwinia caratovora* subsp. *caratovora* ECC100, *Rathayibacter tritici* DSMZ7486, *Agrobacterium vitis*, *Rathayibacter iranicus* DSMZ7484, *Pseudomonas putida*, *Pseudomonas tomato* Pt52-a' ya karşı antibakteriyel aktivitelerinin belirlenmesini amaçlamıştır. *Helichrysum*' un antibakteriyel aktivitesi ürün bozan patojenlere karşı test edilmiş ve bu çalışma için disk difüzyon yöntemi kullanılmıştır. Minimum inhibitör konsantrasyonu (MİK) ise sıvı dilüsyon metodu ile belirlenmiştir. Çalışmanın sonuçlarına göre en yüksek inhibisyon zonu bitkinin metanol ekstraktından belirlenmiştir, bu bakteri *Pseudomonas tomato*' dur ve zon 19 mm'dir. Minimum inhibitör çalışmaları sonunda, tüm MİK değerlerinin 10000 µg/mL'den yüksek olduğu belirlenmiştir. Sonuç olarak, *Helichrysum* ekstraktlarının ürün bozan patojenlere karşı antibakteriyel aktiviteye sahip olduğu ve bu patojenlerle mücadelede kullanılabileceği önerilmektedir.

Çay Yetiştiriciliğinde Küçük Aile İşletmelerinin Pazarlama Sorunlarının Belirlenmesi: Rize İli Örneği

Oktay Yazıcı¹, İlkey Kutlar²

¹Rize İli Derepazarı İlçesi Tarım ve Orman Müdürlüğü, Rize

²Akdeniz Üniversitesi Ziraat Fakültesi Tarım Ekonomisi Bölümü, Antalya

Özet

Dünyada yaklaşık 50 ülkede çay yetiştirilmektedir. Türkiye ise dünya çay üretiminde 5.sırada yer almaktadır. Türkiye çay alanları 2015 yılında 762 bin dekar iken 2019 yılında 849 bin dekara çıkmıştır. Üretim miktarı 1,33 milyon tondan, 1,45 milyon tona; verim ortalaması ise 1.743 kg/da'dan, 1.708 kg/da'a yükselmiştir. Ülkemizde çay tarımı küçük aile işletmeleri tarafından yapılmakta ve çaylık alanların %65'i Rize ilindedir. Bu nedenle çalışma alanı olarak Rize ili seçilmiştir. Çalışmanın amacı Rize ili Derepazarı ilçesinde çay yetiştiriciliği yapan küçük aile işletmelerinin pazarlama sorunlarını ortaya koymaktır. Bu kapsamda 50 çay üreticisi ile yüz yüze anket yapılmıştır. Bu kapsamda çiftçilerin yaşı, eğitim düzeyi, medeni durumu, aile genişliği, tarım dışı bir işte çalışma durumu, kooperatif ortaklığı gibi sosyo-ekonomik özellikleri incelenmiştir. Ayrıca çay tarımı ile ilgili teknik bilgi düzeyleri, çay tarımını tercih nedenleri, arazi ve hayvan varlığı, tarım ve tarım dışı gelir durumları, işletmede işçi çalıştırma durumları ele alınmıştır. Çiftçilerin ürettikleri çayı sattıkları yerler, satış şekilleri, çay fiyatının belirlenmesinde etkili olan kurumlar, çay üretiminde ve pazarlama aşamalarında karşılaşılan sorunlar incelenip ortaya konulmaya çalışılmıştır. Elde edilen veriler istatistik programında ortalama, frekans, yüzde dağılımları tablolar halinde analiz edilerek yorumlanmıştır. Buna göre çiftçilerin %36.2'si çay pazarlamasında yaşadığı en önemli sorunun ÇAYKUR'un uyguladığı kontenjan olduğunu ifade etmiştir. Ayrıca çay fabrikalarında yaşanan yoğunluk nedeniyle bazı günler alım yapılamaması (%33.3), çay alım fiyatlarının düşük olması (%29.7) ve alıcı çeşidinin azlığı (%0.7) diğer yaşanan sorunlar olarak tespit edilmiştir.

Anahtar kelimeler: çay üreticisi, küçük aile işletmesi, pazarlama sorunları

Eğiticilerin Eğitiminin Tarımsal Yayım Açısından Önemi: Adana Tarımsal Yayım ve Hizmetiçi Eğitim Merkezi (TAYEM)

Cansel Özge¹, İlkay Kutlar²

¹Adana Zirai Üretim İşletmesi Tarımsal Yayım ve Hizmetiçi Eğitim Merkezi Müdürlüğü, Adana

²Akdeniz Üniversitesi Ziraat Fakültesi Tarım Ekonomisi Bölümü, Antalya

Özet

Bilgi; öğrenme, araştırma ve gözlem yolu ile elde edilen gerçektir. Türkiye’de çiftçilere tarımsal konularda bilgi ve hizmet götüren en önemli kamu kuruluşu Tarım ve Orman Bakanlığı’dır. Bakanlık, bünyesindeki teknik personelin hizmetiçi eğitimler kapsamında Adana ve Aydın Söke’de bulunan Tarımsal Yayım ve Hizmetiçi Eğitim Merkezleri’nde tarımsal konularda yeni bilgiler edinmeleri, kendilerini geliştirmeleri ve varolan bilgilerini pekiştirmeleri amacıyla açılan kurslara katılımlarını önemsemektedir. Bu çalışma ile Adana Tarımsal Yayım ve Hizmetiçi Eğitim Merkezi’nin (TAYEM) kurslarına katılan 120 teknik personelin (kursiyer) görüş ve düşünceleri ortaya konulmuştur. Ayrıca eğiticilerin eğitiminin tarımsal yayım açısından önemi değerlendirilmiştir. Elde edilen verilere göre kursiyerlerin %75.0’ı kursun içeriği ve hedeflenen amacın uyumlu olduğunu, %70.8’i aldıkları eğitimin mesleki/kişisel gelişimlerine katkı sağladığını, %64.2’si eğitimin konusu ile kendi kurumlarında çalıştıkları konuların uyumlu olduğunu, %68.3’ü eğitimlerde kullanılan materyal ve araçların yeterli olduğunu, %65.0’ı kurs sürelerinin yeterli olduğunu ve %78.3’ü eğiticilerin kurs konularına hâkim olduğunu ifade etmiştir.

Evaluation of yield decrease in common beans due to anthracnose (*Colletotrichum lindemuthianum*) below sub-temperate environment of Northwestern of Rwanda.

Erastus Dushimeyesu^{1*}, Sylvestre Habimana¹, Fabrice Musana Rwalinda¹

¹The University of Rwanda, School of agriculture and food sciences, Department of Crop sciences- Musanze, Rwanda

*Corresponding author

Abstract

In the field, research was conducted with the aim of assessing the yield loss in common beans due to anthracnose using four cultivars with various levels of resistance. Randomized complete block design as experiment design was used methods where each selected cultivar was grown and the yield loss caused by anthracnose was assessed with the goal of measuring the yield drop in common beans due to anthracnose in Rwanda for data analysis, a level of significance of >0.05 was utilized to accept the hypothesis. Field trials on the particularly susceptible cultivar Gikundiro 2 showed the maximum harm in terms of incidence and severity in both infection circumstances. The severity of pod infection on pods ranging from 3-9 (0-) resulted in reduction in quantity of seeds which contain a pod ranging from 10.52 % -57.76 % and the loss in weight of seeds per pods ranging from 21.93 % - 68.77 %, both demonstrated a direct impact on seed yield. However, determinate cultivars showed a greater drop in yield (58.5%) than indeterminate cultivars (10.52%) although both were sensitive, based on this research, anthracnose causes economic yield loss on variety Gikundiro 2 and vuzimpundu.

Key Words: Incidence, Resistance, Severity, yield loss, Anthracnose.

Introduction

Beans are one of the main crops grown in Rwanda where they are grown in the mid hills of 900-1300 meters above sea level and high hills of 1800-3000 meters above sea level where the total area of beans is 2037 ha with the productivity of 3.5 tones /ha in subtropical to temperate agro-climatic conditions (Musana *et al* 2020). Common beans are often grown during the growing seasons (September 2020 for season A, February and 2021 for season B) and the humid atmosphere makes the crop vulnerable to fungal, bacterial and viral infections. *Colletotrichum lindemuthianum* (Sacc. and Magnus) Lams-Scrib causes anthracnose of beans which is the destructive diseases in tropical and subtropical environments especially under cold and humid settings. The crop is vulnerable to pathogen attack from seedling to maturity depending on the presence of favorable climatic conditions for disease initiation and development (Erdinc *et al*, 2017).

In the northwest of Rwanda, bean anthracnose is a common occurrence with a wide pathogenic variety and Kiryumukwe (RWV 1129) cultivars are susceptible to any race of the pathogen. In susceptible kinds, the disease causes yield and quality losses with yield losses as high as 95% in some cases. Even though various elements of bean anthracnose have been thoroughly investigated, there is little information in the literature stated in the estimation of yield loss as the essential element to consider when conducting inventory on crop production, policies of crop insurance, deployment of gene as well as quarantine variety (Urinzwenimana *et al*, 2017). Under epidemic conditions, the fungus' seed-borne nature can have a devastating effect on both quantity and quality of output. This research presents the results of loss estimation in kidney bean cultivars with differential resistance to bean anthracnose as well as the impact of background contamination (an infection that begins outside the field) on the crop quality and quantity (Imran *et al*, 2021).

Materials and Methods

Area for research

The study took place in Rwanda, Gicumbi and Burera Districts of the Northern province and Rubavu District of the western province, The last to districts share a border with Uganda to the north while Rubavu District shares border with the Democratic Republic of Congo on the west. The area has an altitude averaged of 1,400 m a.s.l with 1°22' 51.6" south latitude as well as 30° 17' 07" east longitude. The rain per year is between 800 and 1000 millimeters while the average of temperature per year is between 25.3°C -27°C. The soils in the higher land region are humid ferrasols while that of lower region is vertisols with the pH of 6.3 (Mohammed H.*et al*, 2015).

Experimental Design

Soil analysis revealed that the experimental soil had medium nitrogen and phosphorus concentration as well as high potassium content before field preparation. Before planting, necessary levels of nitrogen and phosphorous of 20 kg and 60 kg per hectare respectively were applied to ensure the proper nutrient status of the soil (Mojid *et al*, 2021). During the growing season 30 plots of 2 x 1.5 m² each were planted with four bean cultivars: Vuzimpundu (RWV 3316) (resistant), Mpanguhe (RWV 3317) (moderately resistant), Gikundiro 2 (MAC 49) (highly susceptible) and Kiryumukwe (RWV 1129) (susceptible) in Randomized complete block design (RBD) with 3

replications. To reduce inter-plots interference, guard plots of 1 x 1 m² were used. Carbendazim was sprayed three times 0.1 percent at different phases of plant growth in the check plots to keep them disease-free it means control plots along with a seed treatment of 2.5 gm per kg of seed. Because it proved resistant to 103 and 935 races in field settings, the Vuzimpundu (RWV 3316) cultivar was preserved as an overall check. The experiment was repeated for two seasons but because the second year was not an epidemic year, only one-year's data was used to determine yield losses.

The progression of the disease through time

The severity of anthracnose was recorded at 15-day intervals from the arrival of 1st signs of disease through the crop maturity in various cultivars and treatments to study disease progression over time. The infection rate 'r' was determined using Vander Plank's standard equation (1963) and I calculated the AUDPC with referring to Shaner and Finney's method (1977) (Alves *et al*, 2016).

Estimation of yield loss

Infected seed and crop have an impact on common bean yield.

Infected seeds of the susceptible cultivars Gikundiro 2 (MAC 49), Kiryumukwe (RWV 1129), and the moderately resistant cultivar Mpanguhe (RWV 3317) were utilized for investigating the seed-borne inoculum effect on disease development and yield of common beans, while healthy seeds of these varieties were sown to investigate the role of background contamination (external source of inoculum). Anthracnose was introduced to the healthy seed plots by planting two border rows of sensitive cultivars. Gikundiro 2 (MAC 49) was infected with a combination of races found in the Gicumbi District area at the primary leaf stage and second trifoliate leaf stage (103 and 935). Plants were sprayed three times with Carbendazim at different stages of plant growth (35 days after planting, pod initiation, and pod development) as well as a seed treatment in control plots of each type. 2.5 grams of seed per kilogram data on disease incidence and severity were collected every 15 days from the onset of symptoms until the crop reached maturity. The plants were monitored for symptom development on a regular basis and 25 of them were labeled to keep track of disease severity and yield. At harvest, the quantity (numbers) of pods in each plant as well as the quantity (numbers) of seed in each plant were counted. After the seeds were sun-dried the yields of various treatments were calculated to calculate yield loss as a percent yield loss in various cultivars, the following formula was used:

$$\text{Percent yield loss} = 100 \times (\text{YCP} - \text{YDP}) / \text{YCP}$$

Where YCP stands for yield in the control plot and YDP stands for yield in the diseased plot.

(Nirmala *et al*, 2015)

On a randomly selected pod, a 0-9 point scale from diseased to healthy was used to investigate the relationship between disease severity and yield, and 25 pods/ response type/ replication were used to quantify disease severity and yield. For the yield comparison, healthy pods from the control plot were chosen the weight of the seeds per pod and the number of seeds per pod were also verified.

Results and Discussion

Anthracnose development on various cultivars

On four bean cultivars with variable resistance, the progression of anthracnose originating from seed-borne infection (infected seed crop) and background contamination (external inoculum) revealed that disease incidence and severity were significantly higher in the highly susceptible cultivar Gikundiro 2 (MAC 49) in the crop raised from infected seed. (Fig1&2) (Binyam Tsedaley, 2015). Due to seed-borne infection, the cultivar Gikundiro 2 (MAC 49) had the highest terminal disease severity (79.48 percent), followed by Kiryumukwe (RWV 1129) (26.23 percent), and Mpanguhe (RWV 3317) (3.74 percent). Similarly, significant changes in disease incidence between types were discovered. No disease was recorded in cultivar Vuzimpundu (RWV 3316) (Highly resistant) which was planted as an overall check. The disease initiated about two weeks late (July 2021) in the crop having background contamination as compared to the crop raised from infected seed (Muhammad *et al* 2018).

Seed-borne infection and background contamination were statistically equal in terms of terminal illness severity and apparent rate of infection. However, in seed-borne infection, AUDPC was much greater which could be attributable to the fact that disease began late (2 weeks) in background contamination. (Chang *et al*, 2020). Table 1 shows the AUDPC, terminal severity of disease and apparent infection rate 'r' for several cultivars. For AUDPC, there were very significant variations between the extremely susceptible, susceptible and moderately resistant genotypes between different treatments. In both the crops receiving inoculum from seed-borne infection and background contamination, the AUDPC was highest in Gikundiro 2 (MAC 49) (2672.69) and lowest in Mpanguhe (RWV 3317) (327.64). Observations on the severity of terminal disease and the apparent rate of infection showed essentially identical trends in different kinds. The results demonstrated that the terminal disease severity of the extremely sensitive, susceptible and moderately resistant cultivars differed significantly (Buerstmay, 2019). There were no significant differences in terminal disease severity or infection rate between crops with a seed-borne infection and those with background contamination while the latter had lower values. The findings demonstrated that the apparent rate of infection differed significantly amongst the cultivars (Krishna *et al*, 2021).

Estimation of productivity loss

Disease's impact on yield parameters

Table 2 shows the impact of seed-borne infection and background contamination on yield parameters of various varieties. Amount of pod in each plant and grains per pod per plant decreased by 40% for extremely sensitive (Gikundiro 2 (MAC 49)) cultivars, but was non-significant in susceptible (Kiryumukwe (RWV 1129)) and moderately resistant (Mpanguhe (RWV 3317)) cultivars. Cultivar Gikundiro 2 (MAC 49) showed maximum reduction in the amount of pods per plant and the amount of grains per pod in each plant in both the crops raised from infected seed and under background contamination. However, the amount of pod per plant and amount of seed per pod per plant were lower (2.4%) in the plants having the seed-borne infection. In Bavistin sprayed plants of all cultivars, the total number of pods per plant and the amount seed per pod per plant were at their highest (Asif *et al*, 2021). The quantity of pod per plant and quantity of seed per pod per plant decreased most as a result of seed-borne infection in cultivar Gikundiro 2 (MAC 49). (41.90 % and 52.24 %, respectively). Background

contamination caused a similar drop in Gikundiro 2 (MAC 49). (37.44 % and 49.13 %). The production potential of the cultivars differed significantly, with the susceptible cultivar (Kiryumukwe (RWV 1129)) producing the highest yield when anthracnose was managed. The experimental results shows that the seeds yield for all varieties were highest in check plots of 111.6%.

CVx Treat.Interactions:149.81; Note: **R** stands for Resistant, **MR** stands for moderate resistant, **S** stands for susceptible and **HR** stands for highly susceptible

Between the very sensitive, susceptible and moderately resistant genotypes, there were highly significant differences in yield and yield loss. The yield losses were severe for the extremely vulnerable and susceptible bean varieties, but not for the moderately resistant ones. The yield loss was greatest in extremely sensitive and susceptible bean cultivars, with the largest yield drop of 70.59 percent in Gikundiro 2 (MAC 49) and the lowest yield reduction of 2.81 percent in moderately resistant (Mpanguhe (RWV 3317)).

A similar trend of yield reduction was seen in the crop grown in the presence of background pollution with the greatest reduction in cv. Gikundiro 2 (MAC 49). (67.61 %). Although statistically equal yield reduction owing to seed-borne infection was larger in different cultivars than background contamination (Chang *et al*, 2020).

Relationship of disease severity levels with yield

The data on the impact of pod infection in the productivity of the highly susceptible bean cultivar (Gikundiro 2 (MAC 49)) in terms of the quantity of seeds per pod as well the weight of seed per pod revealed significant differences in the quantity of grains per pod and the weight of grains per pod in pods of various severity grades, with the highest amount of grains per pod and weight of grains per pod in pods of zero severity, which served as the control. The number of seeds per pod was reduced by the most, 57.76 percent, in pods graded 9, followed by 52.59 percent in pods graded 7. Similarly, pods with a severity grade of 9 exhibited the greatest reductions in seed weight/pod (68.77%) while pods with a severity grade of 1 showed the least. There were no significant differences between pods graded 1 and healthy pods (control) (Conner *et al*, 2021).

Significance differences at $P=0.01$ were identified in both disease severity as well as percent reduction in the amount of grains per pod ($r=0.97$), the climate in which the current experiments were conducted was sub-temperate with moderate to high and frequent rainfall throughout the season. Anthracnose epidemics have been found to thrive in this type of climate (Salihu *et al*, 2019).

Bean anthracnose development and losses can be far more severe in temperate than in tropical zones. The disease has resurfaced in all of the district's prospective bean-growing areas resulting in significant yield decreases in vulnerable cultivars. Disease levels differed significantly between resistant and susceptible cultivars as well as between sprayed and unsprayed plots. Although the Kiryumukwe (RWV 1129) cultivar was susceptible the disease severity was significantly lower than that of the highly susceptible Gikundiro 2 (MAC 49) (bush type). This could be attributed to the Local variety's trailing type growth habit which may have resulted in infection avoidance and slow vertical spread of the pathogen. In the moderately resistant cultivar (Mpanguhe (RWV 3)) there were no significance difference in disease severity between sprayed and unsprayed plots (Gaudencia J. Kiptoo *et al*, 2020). Bean anthracnose has a significant impact on bean production due to poor seed germination, seedling vigor, increased plant death, and low yields. Seed spots and blemishes are blamed for marketing losses since they affect the quality rating and salability of the product. Because the terminal disease severity was similar in both treatments (seed-borne infection and background contamination), the non-significant differences in yield reductions per plant in different cultivars could be attributed to maximum disease severity on pods at the growth stage of the pod, which is the greatest susceptible stage in the crop for rapid and fast diseases progression (Abraham Negera and Mashilla Dejene, 2018).

Early pod infection which causes pod death and drops appears to be causing a reduction in the amount of pods per plant and weight of grains /plant insensitive bean varieties resulting in a loss in seed yield. Depending on the situation, anthracnose-related yield losses in susceptible cultivars range from 38 to 100 percent. Because the regression equations revealed substantial correlations between severity grades, the number of seeds per pod and seed weight per pod, yield loss estimations based on severity grade on pods can be made with confidence.

The equations' validity however, will apply to regions where crops are cultivated in epidemic conditions. Anthracnose infection caused a 43.9 percent production loss in French beans and researchers discovered that contamination of pods directly affected the grains yield; however, the magnitude of losses varied depending on severity level. Mohammed *et al*, 2013 investigated the anthracnose severity in beans as well as the influence of it on bean productivity and discovered that the extreme severity of 17.2 -76.6 percent bring out in the average yield loss of 67.2 percent.

Conclusion

In conclusion, in susceptible cultivars of common beans, both seed-borne infection and background contamination can cause nearly identical losses during epidemic years; however, losses are higher in crops where disease originates from infected seed because seed bone infection causes diseased seedling death in addition to early disease initiation in the crop. Seed yield is similarly affected by pod infection, also the scale for loss varies depending on severity of contamination. Indeterminate type varieties also have higher losses than indeterminate type types.

Reduction in cold induced sweetening of potato through knock out of vacuolar invertase gene

Aneela Yasmeen, Allah Bakhsh, Abdul Qayyum Rao

Centre of Excellence in Molecular Biology, University of the Punjab, Lahore, Pakistan

Abstract

CRISPR-Cas9 mediated knock out of vacuolar invertase (VInv) gene was carried out using two single gRNAs in potato cultivar AGB purple. The overall transformation efficiency of potatoes was found to be 11.7%. The primary transformants were screened through PCR, Sanger sequencing, Digital PCR, and ELISA. The amplicon sequencing data showed maximum indel frequency for potato plant T12 (14.3 %) While for plant B4 the maximum indel frequency of 2.0 % was found which resulted in 4.4% knock out and 4% frameshift as analyzed by geneious. qRT-PCR data revealed that mRNA expression of VInv gene was reduced 90-99 folds in edited potato plants when compared to the control. The results obtained from titration method determined that the tubers of B4 transgenic line had five folds fewer reducing sugars when compared to the control. The genome edited potatoes behaved like their conventional counterpart when analyzed on physiological basis. The CRISPR based constructs resulted in successful knock out of VInv gene and ultimately resulted in increased tolerance of potatoes against cold induced sweetening with minimum accumulation of reducing sugar.

Key Words: *Genome editing, knock out, vacuolar invertase, cold induced sweetening*

Pollination of *Brassica campestris* (Cruciferae) by Male vs. Female *Andrena savignyi* (Andrenidae: Hymenoptera)

Waseem Akram¹, Asif Sajjad¹, Ammad Ahmad¹, Muhammad Sajjad², Muhammad Nawab¹

¹Department of Entomology, Faculty of Agriculture and Environment, The Islamia University of Bahawalpur, Bahawalpur, Pakistan

²Department of Entomology, Faculty of Agriculture Science and Technology, Bahauddin Zakariya University, Multan, Pakistan

Abstract

Male and female solitary bees generally differ in their morphological and behavioral characteristics and thus in their pollination effectiveness. The present study was carried out at the research farm of The Islamia University of Bahawalpur, Pakistan to compare the foraging behavior and pollination efficiency of male and female *Andrena savignyi* Spinola, 1838 on *Brassica campestris*. The effect of different environmental abiotic factors i.e., relative humidity, ambient temperature, wind velocity and light intensity on foraging behavior was also studied. *Andrena savignyi* was the most abundant floral visitor comprising 52.17 % of the total floral visitors of *B. campestris*. Male individuals solely fed on nectar while females fed on both nectar and pollen. Females had a higher visitation rate, visitation frequency, pollen deposition and pollen harvest than the males because of their larger size and more dry weight. The maximum abundance of females was recorded at 12:00 pm followed by a sharp decline until 4:00 pm whereas males attained their maximum abundance at 2:00 pm. The female pollinated flowers resulted in greater pod length, pod weight, number of seeds per pod, seed weight per pod and germination percentage than the males. Our results suggest that females of *A. savignyi* deliver better pollination of *B. campestris* than males in terms of its reproductive success and germination percentage. Future studies should emphasize exploring the biology and ecology of *A. savignyi* with a special focus on its artificial nesting.

Keywords: Pollination effectiveness, *Andrena savignyi*, male, female, *Brassica campestris*.

The Effects of Betulinic Acid Administration on Protein and Lipid Profile in Liver Damaged Rats*

Gülşah Bektaş¹, Güler Yenice²

¹Erzurum, Türkiye

²Department of Animal Nutrition and Nutritional Diseases, Faculty of Veterinary Medicine, Ataturk University, Erzurum, Türkiye

Abstract

This study was conducted to investigate the effects of betulinic acid (25 mg/kg, day) on protein and lipid profile in rats with acetaminophen-induced liver damage. Forty male Wistar rats were used in experiment. The animals were divided into four groups, one of which was a control, and five animals were kept in each cage. The experiment lasted 15 days. At the end of the experiment, serum, AST, ALT, ALP, triglyceride, cholesterol and total protein levels were analyzed. Protein and lipid profiles were analyzed in serum samples and liver tissue samples. In acetaminophen-induced liver toxicity group, ALT, AST and ALP levels increased significantly ($P<0.001$) compared to control group, while these values were close to control levels in the treatment group treated with betulinic acid. Serum triglyceride and cholesterol levels were determined to be higher ($P<0.001$) and total protein levels were lower in the toxicity group compared to the control group. Serum triglyceride levels were significantly lower and total protein values were higher in the treatment group compared to the toxicity group. Total oxidant status was significantly higher in the toxicity group compared to all other groups ($P<0.001$). Liver tissue total protein level was found to be lower in the toxicity group compared to the other groups, while total protein level in the treatment group was close to the control group. In conclusion; it was observed that serum and liver tissue lipid and protein profile were adversely affected in acetaminophen induced liver damage and betulinic acid application could have an improvement in these negative effects.

Key Words: Acetaminophen, betulinic acid, liver damage, protein profile, lipid profile

Karaciğer Hasarı Oluşturulmuş Sıçanlarda Betulinik Asit Uygulamasının Protein ve Lipid Profili Üzerine Etkileri

Özet

Bu çalışma asetaminofen ile karaciğer hasarı oluşturulmuş ratlarda betülinik asidin (25 mg/kg gün) protein ve lipid profili üzerine etkilerini araştırmak amacıyla yürütülmüştür. Çalışmada, toplam kırk adet, Wistar cinsi erkek sıçan kullanılmıştır. Hayvanlar biri kontrol olmak üzere dört gruba ayrılmış ve her kafeste beş hayvan bulunacak şekilde muhafaza edilmiştir. Deneme 15 gün sürmüştür. Deneme sonunda kurban edilen hayvanlardan alınan serum örneklerinde AST, ALT, ALP, trigliserit, kolesterol ve total protein düzeyleri analiz edilmiştir. Serum örneklerinde ve karaciğer dokusu örneklerinde protein ve lipid profilleri analiz edilmiştir. Asetaminofen ile karaciğer toksisitesi oluşturulan grupta kontrole göre ALT, AST ve ALP düzeylerinde önemli derecede ($P<0.001$) artış gözlenirken, betülinik asit uygulaması yapılan tedavi grubunda söz konusu değerlerin kontrole yakın düzeylerde olduğu gözlenmiştir. Serum trigliserit ve kolesterol değerleri toksisite oluşturulan grupta kontrole göre yüksek ($P<0.001$), total protein düzeyi ise düşük tespit edilmiştir. Tedavi grubunda serum trigliserit düzeyi toksisite oluşturulan gruba göre önemli derecede düşük, total protein değeri ise yüksek bulunmuştur. Total oksidan durum değerinin toksisite oluşturulmuş grupta diğer tüm gruplara göre önemli derecede ($P<0.001$) yüksek olduğu gözlenmiştir. Karaciğer dokusu total protein düzeyi toksisite oluşturulan grupta diğer gruplara göre düşük bulunurken, tedavi grubunda total protein düzeyinin kontrole yakın olduğu gözlenmiştir. Sonuç olarak; Asetaminofen ile oluşturulan karaciğer hasarında serum ve karaciğer dokusu lipid ve protein profilinin olumsuz etkilendiği, betülinik asit uygulamasının bu olumsuz etkileri iyileştirme etkisinin bulunabileceği gözlenmiştir.

Anahtar Kelimeler: Asetaminofen, betulinik asit, karaciğer hasarı, protein profili, lipid profili

Giriş

Protein, yağ ve karbonhidrat metabolizmalarında önemli fonksiyonları olan karaciğer, ayrıca birçok plazma proteinini üretme, vücuda alınmış toksik maddelerin detoksifikasyonu, vücut için gerekli birçok vitamin ve minerallerin depolanması gibi hayati görevleri olan bir organdır^{1,2}. Yağ asitlerinin sentez ve yıkımı bununla birlikte yağ asitlerinden trigliserid oluşumu, fosfolipit, lipoprotein, keton, kolesterol sentezi, safra asitleri ve safranin

üretilmesi karaciğerde meydana gelen en önemli olaylardır^{1, 3, 4}. Karaciğer aynı zamanda protein sentezi ve yıkılmasında önemli rolü olan bir organdır, serum proteinlerinin çoğunun ana kaynağıdır⁵. Karaciğer fonksiyon bozukluğunun en önemli nedenlerinden biri, asemptomatik transaminit, akut hepatit, kronik hepatit, kolestaz ve karaciğer yetmezliği gibi geniş bir semptom yelpazesine yol açabilen ilaca bağlı karaciğer hasarındır⁶. Steroid olmayan anti-enflamatuar ilaçlar, anti-enfektif ilaçlar (anti-tüberküloz ilaçlar), anti-kanser ilaçları, hormonal ilaçlar, immünoşüpresif ilaçlar, sedatif ve nöropsikiyatrik ilaçlar dahil olmak üzere ilaca bağlı karaciğer hasarına neden olan birçok ilaç sınıfı vardır⁸. İlaça bağlı karaciğer hasarında en sık adı geçen ilaç asetaminofen'dir⁹. Asetaminofen (Parasetamol, N-asetil-P-aminofenol, APAP), analjezik ve antipiretik özelliklere sahip, orta derecede lipit ve suda çözünebilir bir asetanilid türevidir^{10, 11}. Diğer ilaçların çoğu doza bağımlı hepatotoksikite paternine neden olurken asetaminofen genellikle doza bağlı bir şekilde karaciğer hasarına neden olmaktadır¹². Betulinik asit (BA) yaygın olarak huş ağaçlarından (Betula Pendula) izole edilebilen fakat birçok bitki türünde de bulunabilen, 3 β -hidroksi-lup-20(29)-en-28-oik asit yapısında bir pentasiklik lupan tipi triterpendir¹³⁻¹⁵. Betulinik asit çok çeşitli farmakolojik özellik sergilemekte olup, antioksidan, anti-enflamatuar, anti-tümör, anti-anjiyojen, anti-viral, anti-HIV, anti-neoplastik ve anti-plazmodial özelliklerinin olduğu bildirilmektedir¹⁶⁻²¹. Betulinik asidin hepatoprotektif etkinliği ile ilgili sınırlı sayıda çalışma mevcuttur. Yi et al.²² betulinik asidin farelerde hepatoprotektif aktivitesini ve in vivo alkolün neden olduğu karaciğer hasarını önleme potansiyelini ve mekanizmasını araştırdıkları çalışmalarında, betulinik asidin doza bağlı bir şekilde alanin transaminaz, aspartat transaminaz, toplam kolesterol ve triasilgliseritlerin serum seviyelerini önemli ölçüde azalttığını, hepatoprotektif etkisinin altında yatan mekanizmanın, esas olarak doku redoks sisteminin iyileştirilmesi, antioksidan sistemin bakımı ve karaciğerde lipid peroksidasyonunun azalması yoluyla, antioksidan kapasiteyi arttırmasından kaynaklanabileceğini bildirmişlerdir. Quan et al.²³ insüline dirençli HepG2 hücreleri, primer sıçan hepatositleri ve yüksek yağlı diyetle beslenen ICR farelerinden karaciğer dokuları kullanarak yaptıkları çalışmalarında betulinik asidin, karaciğer hücrelerinde hücre içi lipid birikimini etkili bir şekilde iyileştirdiğini ve böylece yağlı karaciğer hastalığının önlenmesi için potansiyel bir terapötik madde olduğunu bildirmişlerdir.

Zheng et al.²⁴ farelerde betulinik asit ile ön muamelenin, serum aspartat aminotransferaz ve alanin aminotransferaz artışlarını önemli ölçüde önlediğini, belirgin antioksidan etkiler gösterdiğini ve D-GalN/LPS kaynaklı akut karaciğer yetmezliğini önlediğini bildirmişlerdir.

Yi et al.²⁵ betulinik asidin deksametazonun neden olduğu timosit apoptozisi üzerine in vivo koruyucu etkisini araştırdıkları çalışmalarında, farelere betulinik asit ile ön muamelenin, doza bağlı olarak Dex kaynaklı oksidatif hasarı hafiflettiğini bildirmişlerdir.

Jain et al.²⁶ betulinik asit içeren Tecomella undulata kök kabuğunun ve betulinik asidin hepatoprotektif etkisini araştırdıkları çalışmalarında, betulinik asit ile ön tedavi uygulanan sıçanlarda hepatosit hasarının önlendiğini bildirmişlerdir. Karaciğer fonksiyonunu uyarabilen ve hepatik koruma sağlayabilen veya hepatik hücrelerin yenilenmesinde yardımcı olabilecek az sayıda geleneksel ilaç vardır, ancak bunların belirli bir dozda hepatotoksik olduğu bilinmektedir²⁷. Doğal bileşiklerin etkili alternatifler olarak değerlendirilmesine ihtiyaç vardır. Çalışma, yaygın olarak huş ağaçlarından izole edilebilen fakat birçok bitki türünde de bulunabilen betulinik asidin (25 mg/kg gün) asetaminofen ile karaciğer hasarı oluşturulmuş ratlarda protein ve lipid profili üzerine etkilerini araştırmak amacıyla yürütülmüştür

Materyal ve Yöntem

Bu çalışmanın gerçekleştirilmesi için gerekli etik kurul onayı Atatürk Üniversitesi Rektörlüğü Hayvan Deneyleri Yerel Etik Kurulu'ndan alınmıştır (30.04.2019 tarih ve 5/93 sayılı karar).

Çalışmada, 40 adet, 250-300 gr ağırlıkta, Wistar cinsi erkek sıçanlar kullanıldı. Deney gruplarının oluşturulması ve çalışma dizaynı Tablo 1'de verilmiştir.

Tablo 1. Deney Gruplarının oluşturulması ve çalışma dizaynı

Gruplar	Grup Adı	Hayvan Sayısı	Uygulama
Grup I	Sağlıklı (Kontrol)	(n=10)	-
Grup II	Asetaminofen	(n=10)	15. günde: 1 g/kg Asetaminofen (tek doz, i.p.)
Grup III	Tedavi	(n=10)	14 gün 25 mg/kg/gün (gavaj) BA, 15. günde: 1 g/kg Asetaminofen (tek doz, i.p.)
Grup IV	BA	(n=10)	14 gün 25 mg/kg/gün (gavaj) BA

Sıçanlar, araştırma süresince 19-21 °C sabit sıcaklıkta ve 12 saat aydınlık/ karanlık sürelerinin olduğu özel hazırlanmış odalarda korundu. Deneysel uygulamalar süresince ratlara standart ticari yemi (pellet yem) ve normal içme suyu verildi. Deneme 15 gün sürmüştür. Çalışma sonunda, asetaminofen uygulamasından 24 saat sonra tüm sıçanlar aynı gün isofluran ile anesteziye alındıktan sonra kalplerinden kan alınarak sakrifiye edildi, kan ve karaciğer doku örnekleri alındı. Alınan serum örneklerinde AST, ALT, ALP, trigliserit, kolesterol ve total protein düzeyleri analiz edilmiştir. Serum örneklerinde ve karaciğer dokusu örneklerinde protein ve lipid profilleri analiz edilmiştir. Lipid profili analizi 20x10 cm Silika Jel 60 F254 Yüksek Performans İnce Tabaka Kromatografisi (YPİTK) plakası kullanılarak gerçekleştirildi. YPİTK plakaları Epson Perfection V700 foto-tarayıcı ile fotoğrafı

alındıktan sonra, her bir örneğe ait lipid bantlarının kapladığı alan Phoretix 1D (TL120) yazılımı kullanılarak tespit edildi ve toplam karışımdaki % olarak ifade edildi²⁸. Protein profili analizi sodyum dodesil sülfat poliakrilamid jel elektroforez (SDS-PAGE) metodu ile gerçekleştirilmiştir²⁸. Analiz sonucunda her bir protein bandının total protein konsantrasyonu içindeki “bireysel yüzde” değerleri kullanılarak, Lowry²⁹ yöntemiyle total protein miktarları hesaplanmış olan örneklerde “g” olarak bireysel protein miktarları belirlenmiştir.

İstatistik analizler için SPSS Statistics 20.0 programı (IBM SPSS statistics for Windows, New York: IBM Corp)66 programı kullanılmış olup, her grubun istatistiksel hesaplamaları ve bu gruplara ait ortalama değerler arasındaki farkın önemliliği için tek yönlü varyans analizi (ANOVA), gruplar arasında bulunan farkın önemini kontrol etmek için Duncan testi uygulanmıştır.

Bulgular ve Tartışma

Karaciğer, organizmanın çeşitli metabolik ve fizyolojik homeostazları ile ilişkili ana organdır. İlaçlar, serbest radikaller, alkol, ksenobiyotikler besin takviyeleri ve kirleticiler, hepatit, siroz ve alkolik karaciğer hastalıklarına neden olan başlıca risk faktörleridir^{30, 31}. Karaciğer fonksiyonunu uyarabilen ve hepatik koruma sağlayabilen veya hepatik hücrelerin yenilenmesinde yardımcı olabilecek az sayıda geleneksel ilaç vardır, ancak bunların belirli bir dozda hepatotoksik olduğu bilinmektedir²⁷. Doğal bileşiklerin etkili alternatifler olarak değerlendirilmesine ihtiyaç vardır.

Asetaminofen toksisitesi sıçanlarda bitki ekstraktlarının ve doğal bileşiklerin hepatoprotektif aktivitesini değerlendirmek için yaygın olarak kullanılan deneysel modellerden biridir³²⁻³⁴. Çalışmada ratlarda karaciğer hasarı oluşturmak için 1 g/kg, tek doz asetaminofen intraperitoneal olarak kullanılmıştır. Hepatik hasarın açık bir işareti, hepatositlerin taşıma fonksiyonlarında meydana gelen rahatsızlıktan dolayı ALT, AST ve ALP gibi hücresel enzimlerin plazmaya sızmasıdır³⁵. Karaciğer hasarında serumda söz konusu enzim düzeyleri yükselmektedir¹. ALT karaciğere daha spesifiktir ve hepatik hasarı analiz etmek için daha iyi bir parametredir³⁵. Çalışmamızda da asetaminofen grubunda ALT düzeylerinin kontrole göre önemli derecede ($P<0.001$) arttığı gözlenmektedir (Tablo 2). Yüksek AST seviyeleri, hücre sızıntısının yanı sıra karaciğerde hücre zarının işlevsel yetenek kaybını göstermekte ve ALP düzeyinin yüksekliği ayrıca karaciğer hücre hasarı ile ilişkilendirilmektedir³⁵. Elde ettiğimiz sonuçlar her iki enzim düzeyinde asetaminofen grubunda kontrole göre önemli derecede ($P<0.001$) arttığını göstermektedir (Tablo 2). Bu sonuçlara göre uygulanan asetaminofen dozu ile karaciğer hasarı oluşturulduğu düşünülmektedir. Asetaminofen ile deneysel karaciğer hasarı oluşturulan çalışmalarda AST, ALT ve ALP düzeylerinin kontrole göre yükseldiği bildirilmektedir³²⁻³⁴.

Tablo 2. Asetaminofen ile indüklenen karaciğer hasarında betülinik asidin karaciğer enzimleri üzerine etkisi.

Gruplar				
Parametreler	Kontrol	Betulinik	Asetaminofen	Tedavi
AST, U/L	45.25±4.17 ^c	48.63±3.10 ^c	178.88±13.65 ^a	75.88±7.79 ^b
ALT, U/L	45.88±2.43 ^b	46.75±2.21 ^b	191.25±16.22 ^a	70.88±5.17 ^b

Betulinik asit ile ön tedavi gören betulinik asit grubunda ALT, AST ve ALP düzeylerinin asetaminofen uygulanan gruba göre önemli düzeyde (P<0.001) düşüş gösterdiği tespit edilmiş olup bu sonuç ratların 25 mg/kg dozda betulinik asit ile ön tedavisinin AST, ALT ve ALP enzimlerindeki artışı engellediğini, betulinik asidin asetaminofenin oluşturduğu karaciğer hasarını önlemede etkin olabileceğini göstermektedir.

Serbest radikaller metabolik ve fizyolojik işlemlerde üretilmekte ve organizmalarda zararlı oksidatif reaksiyonlar oluşturmaktadır. Organizmalar enzimatik ve enzimatik olmayan antioksidan mekanizmalar yoluyla oksidatif strese karşı korunmaktadır. Normal şartlar altında serbest radikal oluşum oranları ile bunların antioksidan enzimler ve moleküller tarafından uzaklaştırılması arasında hassas bir denge vardır. Biyolojik örneklerin oksidatif durumu oksidatif stresin bir göstergesi olarak kabul edilmekte ve toplam oksidan durumu (TOS) ile toplam antioksidan durumunun (TAS) ölçümü oksidatif stresin öngörülmesi için en yaygın prosedürler olarak bilinmektedir³⁶. Çalışmada TAS değerleri bakımından gruplar arasında anlamlı bir fark bulunmazken, TOS değerlerinin asetaminofen uygulanan grupta diğer gruplara göre önemli düzeyde (P<0.001) artış gösterdiği gözlenmiştir (Tablo 3). Aksit ve Bildik³⁷ ve Hismiogullari ve ark.³⁸ çalışmalarında, CCl₄ ile karaciğer hasarı oluşturdukları ratlarda, TOS seviyelerinin kontrole göre arttığını, TAS seviyesinin ise azaldığını bildirmişlerdir. Çalışma sonuçları TAS seviyesi bakımından gruplar arasında istatistiki olarak anlamlı bir fark bulunmamasına rağmen asetaminofen grubunda rakamsal olarak düşüş olduğunu göstermektedir. Betulinik asit ile ön tedavi gören grupta TOS ve TAS seviyelerinin kontrole yakın olduğu görülmekte olup, bu sonuçlar asetaminofen uygulamasının karaciğerde oksidatif strese neden olduğunu, betulinik asidin toksik dozda asetaminofenin karaciğerde oluşturacağı oksidatif strese karşı koruyucu rolü olduğunu düşündürmektedir. Benzer şekilde Yi et al.²⁵ betulinik asit ile ön muamelenin deksametazonun neden olduğu oksidatif stresi hafiflettiğini bildirmişlerdir.

Önceki çalışmalar betulinik asidin karaciğer hasarlarında değişen serum parametreleri üzerinde düzeltici etkilerinin bulunduğunu göstermektedir^{22, 23, 26}. Bu çalışmada serum trigliserit ve kolesterol değerleri toksisite oluşturulan asetaminofen grubunda kontrole göre yüksek, total protein düzeyi ise düşük tespit edilmiştir (P<0.001) (Tablo 4, Şekil 1)). Tedavi grubunda serum trigliserit düzeyi toksisite oluşturulan gruba göre önemli derecede düşük, total protein değeri ise yüksek bulunmuştur (P<0.001). Murali et al.³⁴ ve Jain et al.²⁶ karaciğer hasarında serum TP değerlerinin düştüğünü bildirmişlerdir. Elde edilen veriler karaciğer hasarının neden olduğu, serum TG ve kolesterol düzeylerindeki artışı ve TP düzeylerindeki azalışı, ön tedavi olarak uygulanan betulinik asidin düzelttiğini göstermiştir. Asetaminofen toksisitesine bağlı olarak serum TP düzeyinde olduğu gibi karaciğer dokusunda da TP düzeyinde azalış olduğu görülmektedir (P<0.05) (Tablo 5, Şekil 2). Betulinik asit ön tedavisinin asetaminofen kaynaklı hasara bağlı, karaciğer dokusu TP düzeyindeki bu azalışı önlediği tespit edilmiştir.

Asetaminofenle indüklenmiş karaciğer hasarında betulinik asidin lipid profilleriyle ilgili etkisine bakıldığında; karaciğer dokusunda incelenen parametrelerden kolesterol ve açıl gliserol oranlarının karaciğer hasarında artış gösterdiği, buna karşın serbest yağ asidi, fosfolipid ve triaçilgliserol oranlarının kontrole göre azaldığı tespit edilmiştir (P<0.05) (Tablo 6, Şekil 3). Fosfolipidler fosfor içeren kompleks lipidler olup hücre membranlarının başlıca bileşenleridir. Özellikle serum fosfolipidlerin tanımı karaciğer hastalıklarının tanısında, önemli bir klinik testtir⁴. Betulinik asitle ön tedavinin karaciğer hasarına bağlı açıl gliserol oranında ki yükselişi ve fosfolipid oranında ki düşüşü önlediği gözlenmiştir. Bununla birlikte betulinik asit ön tedavisinin, karaciğer hasarına bağlı triaçil gliserol ve kolesterol oranlarında ki değişimleri önlemede anlamlı bir etkisinin olmadığı ancak rakamsal

olarak iyileşme sağladığı görülmüştür. Ayrıca asetaminofen uygulamasının ve betulinik asit ön tedavisinin karaciğer dokusunda kolesterol esterleri oranı üzerinde bir etki oluşturmadığı da tespit edilmiştir. Sonuç olarak; asetaminofen kaynaklı karaciğer toksisitelerinde, betulinik asidin koruyucu ve karaciğer hasarına bağlı olumsuz etkileri giderici potansiyelinin bulunduğu, karaciğer toksisitelerinde tedaviye ve korunmaya yardımcı olarak kullanımının yararlı olacağı düşünülmektedir.

Physiological Variations of Tomato Varieties (*Solanum lycopersicum* L) Grown in The Environmental Conditions of Busogo, Musanze District, Rwanda

Philippe Sibomana¹, Josiane Noella Karemera Umuhoza¹, Sylvestre Habimana¹ and Job Nyagashi¹

Department of Crop Sciences, School of Agriculture and Food Sciences, University of Rwanda, Musanze- Rwanda

Abstract

The tomato (*Solanum lycopersicum* L) remains an important horticultural crop in Rwanda and its domestic demand is increasing with the population growth. However, the knowledge of Rwandan farmers on the variety that can increase yield in different production circumstances stays also unidentified. For this reason, the performance of five determinate tomato varieties (Assila F1, Sifa F1, Roma VF, Rionex and Cal-J) was evaluated at College's farm. They were cultivated under low temperatures (11-12.5°C minimum and 20-23°C maximum). All varieties showed differences in height, number of leaves and stem diameter. The varieties that supported a high number of leaves limited the light distribution along the whole plant and therefore resulted in low chlorophyll content. The nutritional value characteristics were significantly different for all varieties. A positive relationship between number of clusters per plant and fruits yield was observed. The highest yield was obtained on Assila F1 (35.8tha⁻¹) and Roma VF (27.4tha⁻¹). Therefore, Assila F1 could be chosen as the best hybrid that can be grown by farmers under low temperature areas due to the yield and fruits' quality observed. Roma VF could also be selected as the best performer among the evaluated homozygous genotypes for their acceptable characters.

Key words: *Solanum lycopersicum*, temperature, growth, fruit yield, nutritional quality.

Introduction

The tomato (*Solanum lycopersicum* L) is reported as the most vegetable crop grown in home garden and the second greatly consumed after potato (*Solanum tuberosum* L.) worldwide (Ebert, 2020). According to the Food and Agriculture Organization (2017), tomato crop is grown in open field, greenhouses and screenhouses. The open-field production may be for the fresh market or the processing industry, while the greenhouse production is only for the fresh market. The leading producers worldwide are China, India, Turkey, USA, Egypt, Iran, Italy, Spain, Brazil and Nigeria respectively (FAOSTAT, 2017). Ideally, tomato requires a relatively cool and dry climate for high yield and premium quality but it is also adapted to a varied range of climatic conditions (CABI, 2019).

The optimum temperature range for growth and development is 21-24°C while long exposure of tomato plants to the temperatures below 12°C can produce the chilling injury (CABI, 2019; Eisa *et al.*, 2018). The temperature has a large effect on all aspects of crop development (Hatfield and Prueger, 2015). Leaf and truss initiation rates reduce linearly with reducing temperature (Van Der Ploeg and Heuvelink, 2005). The production of thicker leaves for young plants grown at sub-optimal temperatures result in reduced light interception and therefore cause the plant to have a lower relative growth rate (Ferrante and Mariani, 2018). At that type of temperature, fruit set is reduced as a result of poorer pollen quality (Thakura *et al.*, 2010).

In Rwanda, tomato crop is an important horticultural crop. It is produced on a total area of 6,800ha and comprises 24% of the total area on which the vegetables are grown. This crop is primarily grown in the open field and the production is bound by seasonality (Van Dijk *et al.*, 2017). The yield of tomato crop is 8.6tha⁻¹ while the world yield is 37.6tha⁻¹ (FAOSTAT, 2017). Its cultivation covers 28.4% as compared to other vegetables such as onions (14.2%) and cabbages (12.8%), of the volume of total horticulture production (Clay and Turatsinze, 2014). The domestic demand of tomato in Rwanda is increasing because of tomato processors and consumers; for this reason, Rwanda is a net importer of tomatoes from the neighboring countries (Feed the Future, 2018). The projected area under cultivation from 2016 was 28262ha and will continue to be the same until 2050 and the consumption requirement will continue to increase with the population growth (MINAGRI, 2018). This indicates how efforts should be put to increase the production per unit area.

The government's intention remains to increase the vegetables production by increasing the use of greenhouse technology in combination with other agricultural technologies. However, the knowledge of varieties that can increase yield in different tomato production areas remains unidentified to the farmers since Rwanda Agriculture and Animal Resources Development Board (RAB) has no seed accreditation system for tomatoes, nor seed multiplication programs specifically for tomato crop (Feed the Future, 2018). It is therefore, important to assess the responsiveness of different tomato varieties to the environmental conditions in order to recommend the high yielding variety/varieties to the farmers in the study area. This study has dual objectives: to determine the effect of temperature on vegetative growth and yield parameters of tomato varieties as well as evaluating the effect of temperature on nutritional value of tomato varieties.

Materials and Methods

The field where the experiment was conducted is located at University of Rwanda, College of Agriculture Animal Sciences and Veterinary Medicine, in Busogo sector, Musanze district, Northern Province of Rwanda. The site is characterized by 2300m of altitude, latitude of 1°33'26"S and the longitude of 29°32'39"E and the precipitations ranging between 1400 and 1800mm. The soils are classified into the andisol or andosol type, also known as volcanic soils, with the pH ranging between 5.7 and 5.8 (Uwiringiyimana *et al.*, 2019).

Five determinate tomato varieties: Roma VF, Cal-J, Rionex, Sifa F1 and Assila F1 were used in the experiment. The experimental design was randomized completely block design (RCBD) with five treatments and three replicates. The experiment was composed of 15 plots and each had 9m² while each plot contained 9 plants. The experiment was conducted from September 2019 up to March 2020. Tomato varieties were grown in open field to evaluate their responsiveness to low temperatures of 11-12.5°C minimum and 20-23°C maximum.

Seedlings were prepared by sowing seeds in the appropriate seed trays and covered with plastic cover to increase the temperature in soil and favor germination (Motsa *et al.*, 2015). Re-potting was performed after 30 days from the sowing date in order to improve the seedling's vigor. 80-100 seedlings were re-potted in a pot of 35cm of diameter. Easy gro, a foliar fertilizer composed by 27% N, 10% P₂O₅, 16% K₂O with trace elements 0.03% Boron, 0.05% Copper, 0.1% Iron, 0.05% Manganese, 0.001% Molybdenum, 0.06% Zinc and 0.007% of amino acid was applied onto the seedlings in order to boost their growth. The rate of application was 20g of fertilizer per 20l of water. In order to prevent the attack of early blight (*Alternaria solani*) and late blight (Mildew) in young tomato seedlings, chlorothalonil 500gl⁻¹ was applied at a rate of 30ml per 15l of water. Tomato seedlings to be transplanted in an open field were acclimated for two weeks before planting. The plots were well ploughed and levelled. The seedlings of about 4-5 fully opened leaves were transplanted at 1.0m spacing between plants in the same row and 1.0m between rows. Farmyard manure (8tha⁻¹) was applied and inorganic fertilizer was applied to all varieties in both experiments using NPK 17-17-17 and Urea (46% N) at the rate of 120kgha⁻¹ of Nitrogen, 90Kgha⁻¹ of Phosphate and 90Kgha⁻¹ of potash (Alhrout *et al.*, 2018).

Mulching and staking were also practiced in order to reduce the likelihood of plants with contact of humid soil. Pruning was performed after 60 days from transplantation date. The daily temperatures and precipitations were collected from Rwanda Meteorology Agency. After transplantation, the fungi were controlled by using metalaxyl 8% combined with mancozeb 64% WP alternated with chlorothalonil 500gl⁻¹ SC. The whiteflies and aphids were controlled by interchanging abamectin 18gl⁻¹EC with cypermethrin 4% combined with profenofos 40%.

The plant growth parameters mainly height, number of leaves, number of branches, stem diameter and chlorophyll content in leaves were measured at 60 days after transplantation (DAT) for each variety for three randomly selected crops. The plant height was measured from the ground surface to the tip of plant. The number of leaves and branches per plant were counted on the same day interval. The stem diameter (mm) was measured using the vernier caliper, SPAD 502 instrument was used to measure the chlorophyll value of tomato leaves and the chlorophyll contents (µgcm⁻²) were estimated using Uddling *et al.* (2007) method. The weight of fruits was measured using laboratory scale for grams from Denver instrument Co., USA.

The number of clusters per plant, number of flowers per cluster and number of fruits per plant were also measured on selected three crops while average weight of individual fruit, the total yield per variety and marketable yield percentage was estimated at harvest on all nine crops of each treatment. In order to get the dry matter(DM), fresh tomato fruits were sliced to make the uniform size. 100g of fresh tomatoes were distributed on trays in oven and exposed to 80°C for 8hours (Mawardii *et al.*, 2017). The DM in tomatoes was calculated following the standard steps and the percentages of DM were calculated using Buckmaster's (2020) formula.

The determination of total soluble solids (TSS) in tomato, fruits were harvested and well ripened ones were selected and cleaned using distilled water. The tomato juice was prepared using a blender HGB55E (Model HGBSSSS6) from Waring, USA. Eclipse Professional Optical Refractometer 45-02 (UK) was cleaned using distilled water and dried thoroughly. A couple of juice drops were deposited onto the prism of the refractometer. By aid of outdoor light, the soluble solid was recorded through the eyepiece. The activity was repeated three times to get the accurate results for each treatment (Dobrin *et al.*, 2019).

pH and titratable acidity were measured following the method of Garner *et al.* (2003). To obtain a clear juice, tomato fruits were cleaned, sliced, blended and centrifuged using standard equipment. pH was measured using a pH meter at room temperature and records were taken. 6ml of juice for each sample were put into a 100ml beaker and 50ml of distilled water was added for making a dilution. Titration was performed using 0.1N NaOH to an end point of 8.2. The quantity of NaOH used in milliliters was finally recorded.

For determining the quantity of ascorbic acid in tomato fruits, the method used has been proposed by the International Fruits and Vegetable Juice Association (IFU, Method No.17, 2019) using dichlorophenol-indophenol sodium salt dehydrate (DCPIP) and Mohr's salt.

Lycopene content of tomato samples were obtained following the method of Anthon and Barrett (2007) with slight modifications. Tomato samples for each variety were prepared. Red tomatoes were harvested, cleaned and blended in order to get a juice. From that juice, 100mg were dissolved in 1ml of distilled water and kept out of blight light. Lycopene extraction was performed by adding 8ml of solution prepared by mixing 4ml of hexane, 2ml of ethanol

and 2ml of acetone. Distilled water (1ml) was added to the solution after 10 minutes and vortexed with a magnetic stirrer at 3000rpm for one minute. The samples were allowed to stabilize for 10 minutes in order to allow phases to separate and all air bubbles to disappear. The upper layer (hexane) was collected in cuvette. Distilled water was used as blank sample to zero spectrophotometer at 503nm. The hexane extracts were put in spectrophotometer adjusted at 503nm wavelength. This wavelength was chosen in order to minimize any interference that might be caused by the amount of β -carotene in tomato samples as determined by Davis *et al.* (2002). Finally, the analysis of variance (ANOVA) were obtained using Genstat statistical expert. The treatment effects were compared to F-test of 5% level of significance. Significance differences between tomato varieties were detected using Duncan Multiple Range Test (DMRT).

Results and Discussion

Growth characteristics of tomatoes

The significant difference in plant height, number of leaves and number of branches were observed in all varieties at $p \leq 0.05$ (table 1). Assila F1 was the tallest (64.4cm) followed by Cal-J (56.0cm) while Sifa F1 was the smallest (49.3cm). The highest number of branches was found on both Roma VF and Rionex (7.3) though the lowest number of branches was counted in Sifa F1 (6.0). The latter showed the largest stem diameter (13.7mm) while Assila F1 had the smallest width (11.0mm). When number of leaves were counted, Cal-J had the highest number (62.0) and the lowest number was counted in the plots where grown Sifa F1 (32.3). The chlorophyll content in tomato leaves were also estimated and the results showed that Roma VF accumulated the highest amount of chlorophyll in leaves ($61.3 \mu\text{gcm}^{-2}$) whereas Assila F1 accumulated less ($45.7 \mu\text{gcm}^{-2}$). In addition, the results revealed a strong relationship between chlorophyll content with SPAD value at $R^2=0.84$.

The temperature has a large influence on growth and development in tomato (Deribe *et al.*, 2016). The varieties that bore a high number of leaves limited the light distribution along the whole plant and therefore resulted in low chlorophyll content (Feng *et al.*, 2016). In general, the tomato varieties were not significantly affected by low temperatures. This might be due to acclimation of seedlings before their transplantation to the open field. The current results are in agreement with OECD (2017) which reported that tomato requires minimum temperature above 18°C for vegetative growth and can also survive the lower temperatures (12°C).

Table 1. The growth characteristics of tomato varieties

Varieties	Plant height (cm)	Number of leaves	Number of branches	Stem diameter (mm)	SPAD value	Chlorophyll (μgcm^{-2})

Yield characteristics of tomato varieties

The yield characteristics of tomato varieties used in experiment showed significant difference in number of clusters per plant, number of flowers per cluster, average fruit weight, total yield as well as marketable yield at $p \leq 0.05$ (table 2). The highest total yield was estimated in Assila F1 (35.8tha^{-1}) while Sifa F1 had the lowest (24.3tha^{-1}). Assila F1 produced the highest average weight of individual weight (109.5g) though Cal-J weighed less (45.0g).

The positive relationship between the number of clusters per plant and tomato yield was observed with exception on Cal-J that required a heavy pruning due to its canopy architecture that bear a high number of branches and leaves and therefore limit the light entrance throughout the plant. Chen *et al.*, 2014 reported that tomato cultivated at low temperature produced higher canopy density and more clumped caused by higher leaf area and shorter internodes. The number of flowers per cluster had an effect on total yield of tomato varieties. Nevertheless, there was a slight deviation to Sifa F1 and Cal-J. The highest total yield was estimated in Assila F1 (35.8tha^{-1}) and these findings are close to the statistics of Food and Agriculture Organization which reported in 2017 that tomato yielded 37.6tha^{-1} . Hussain *et al.* (2001) also reported that Tanja cultivar produced highest yield of 41.45tha^{-1} while Nadir produced the heaviest fruits (88.3g/fruit). However, Heuvelink and Dorais (2005) reported that tomato grown outdoors has the potential to produce between 40 and 100tha^{-1} .

The number of flowers per cluster had also an effect on total yield of tomato varieties. Nevertheless, there was a slight deviation to Sifa F1 and Cal-J and might be due to flowers abortion. This may also explain their

responsiveness to lower temperatures that caused those varieties to shed their flowers as they were exposed to the minimum temperatures ranged between 11 to 12.5°C (Ozores-Hampton et al., 2012). The results of the current study showed that higher yield may depend on both number of fruits per plant and the average weight of individual fruit. The lower the weight of a fruit, the lower the total yield will be (Souza et al., 2012).

Table 2. The yield characteristics of tomato varieties

Varieties	Number of clusters per plant	Number of flowers per cluster	Number of fruits per plant	Average fruit weight (g)	Total yield (tha ⁻¹)	Marketable yield	
						(t/ha)	%

^a The means for factors that are followed by the same letters in column are not significantly different, according to DMRT at P≤0.05.

Laboratory analysis of nutritional content

Tomato varieties showed significant difference in titratable acidity (TA), total soluble solids (TSS), ascorbic acid (L-AA), lycopene and dry matter (DM) content at p≤0.05 (table 3). The highest DM (7.1%) was obtained in Assila F1 while Roma VF synthesized less (5.7%). The highest TSS were observed in Rionex followed by Roma Vf while Sifa F1 and Assila F1 had the lowest proportions. The highest TA (0.66%) was recorded in Roma VF with the pH of 4.1 while Assila F1 had the lowest proportions (0.52%) with the pH of 4.3. The L-AA content of tomato fruits were significantly different among different tomato varieties. The highest average quantity of L-AA (14.3mg/100g FW) was obtained in Assila F1 while the lowest quantity (11.4mg/100g FW) was estimated in both Sifa F1 and Rionex. The results of the current study, showed a significant difference for lycopene content in all tomato varieties. Lycopene content varied from 8.1 to 11.0mg/100gFW and the highest amount was obtained in Assila F1 while the lowest were found in Rionex. The difference in pH between all treatments ranged between 0.2-0.3 and the higher the pH was increased; the lower TA was recorded. This could be a result of the loss of citric acid in juice with high pH as explained by Anthon et al. (2011).

The justification of low ascorbic acid obtained in the current study could be associated with low temperature and light intensity to which tomatoes were exposed. Agamy (2016) reported that the L-AA was 12.79 mg/100g of fresh tomatoes while Cantwell (2000) reported 22.5mg/100g FW in red-ripe tomatoes. There was a significant difference in lycopene content for all tomato varieties. Davis et al. (2002) analysed tomatoes and obtained the lycopene content that varied from 3.3 to 12.3mg/100gFW using spectrophotometry at 560nm wavelength while Suwanaruang (2016) obtained 10.4699mg/100g FW at 503nm wavelength.

However, the results of current study showed that low temperatures did not affect the production of DM for all varieties grown. This is correlated to the findings of Van Der Ploeg and Heuvelink (2005) who stated that the low night temperature (NT) set-point from 15°C to 11°C from anthesis until picking of the first fruits, resulted in a 6% increase in yield after 18 weeks of fruit picking and caused in an increase mean fruit weight. Though TSS is regarded as an important quality characteristic in tomato, according to the current findings, the varieties with higher TSS content resulted in lower yield. OECD (2017) also reported that the wild tomato species with high TSS produced low yield.

Table 3. Nutritional value of tomato varieties

Varieties	pH	TA (%)	TSS (%)	L-AA (mg/100g FW)	Lycopene (mg/100gFW)	DM (%)
SIFA F1	4.0±0.0 ^a	0.54±0.01 ^c	3.6±0.01 ^d	11.4±1.8 ^b	8.7±0.0 ^c	6.1±0.1 ^c
ASSILA F1	4.3±0.1 ^a	0.52±0.02 ^d	3.7±0.02 ^d	14.3±0.6 ^a	11.0±0.0 ^a	7.1±0.1 ^a
ROMA VF	4.1±0.1 ^a	0.66±0.01 ^a	3.9±0.02 ^c	12.0±1.7 ^b	9.1±0.2 ^b	5.7±0.0 ^d
RIONEX	4.3±0.0 ^a	0.61±0.02 ^b	4.8±0.02 ^a	11.4±1.2 ^b	8.1±0.1 ^e	6.2±0.1 ^c
CAL-J	4.1±0.1 ^a	0.61±0.01 ^b	4.7±0.02 ^b	14.1±0.3 ^a	8.4±0.0 ^d	6.4±0.1 ^b
GM	4.2	0.59	4.1	12.7	9.0	6.3
L.S.D	N/A	0.01	0.04	2.0	0.18	0.18
C.V (%)	0.0	1.9	0.1	6.4	0.1	0.6

^a The means for factors that are followed by the same letters in column are not significantly different, according to DMRT at P≤0.05.; ^y TA stands for titratable acidity (TA); TSS: Total soluble solids; L-AA: L-ascorbic acid; DM: Dry Matter; FW: Fresh weight.

Conclusions

Despite flower and fruits abortion that may occur when growing tomatoes at relatively low temperatures, number of flowers, number of fruits per plant and average weight of individual fruit showed a positive relationship with plant yield. Therefore, Assila F1 could be chosen as the best hybrid that can be grown by farmers under low temperature areas as it has shown the ability to reward a higher yield, fruit dry matter, L-ascorbic acid, lycopene content and acceptable palatability. Similarly, Roma VF should be selected as the best performer among the evaluated homozygous genotypes for their acceptable characters. In addition, Roma VF could be an important plant material in future when selecting the cold tolerant tomato varieties and mapping their trait loci associated with these genes for further breeding program.

Acknowledgements

Authors are indebted to the University of Rwanda, College of Agriculture, Animal Sciences and veterinary Medicine (UR-CAVM) and the laboratory staff for technical support in chemical analysis of the samples. Authors are also deeply grateful to Rwanda Meteorology Agency for providing all climatological data that were needed for being able to relate the results with the field temperatures.

Abstract

Mentha piperita L. (Peppermint) is a medicinal plant that has gotten a lot of attention from the industrial sector (food and pharmaceutical) because of its wide range of health benefits. Since peppermint is a single ingredient that is commonly used in conventional medicines around the world for a variety of health problems. With the assistance of this review paper, an effort has been made to investigate the nutritive, biochemical, and health potentials of *Mentha piperita*. In this study, we discussed the key basic components found in *Mentha piperita*, as well as their behavior against various diseases such as antimicrobial and nervous system actions. They have cardiovascular and hypotensive benefits, as well as antitumor activity and nutritional benefit. In conclusion, this plant is a simple goal for scientists and researchers to investigate, and the materials that have been tested should be used to deter human diseases.

Key words: *Mentha piperita*, peppermint, medicines, health benefits and disorders.

Introduction

Today population across the globe mainly depend directly or indirectly on traditional remedies for their basic health disorders along with the primary food needs. These traditional medicines mainly involve plant material extracts and mostly aqueous solutions, which can be prepared by heating or soaking plant materials and has prevailed basic healthcare form ancient times. *Mentha piperita* L. (Peppermint) is significant therapeutic herb belongs to family Lamiaceae. It is also known as the oldest herbal plant almost first explained by Carolus Linnaeus in 1753. *M. piperita* is considered among the hoariest curative plants in human history also famous in almost in every culture (Egyptian, Roman and Greek cultures) since ancient times. (Xu et al, 2003) In present era, due to the multidimension uses of *M. piperita*, its consumption is astounding. Due to the presence of various constituents and compounds obtained from this plant and the essential oil extracted from its various portions has enormous use in our daily life areas like pestisides, cosmetics, confectionary pharmaceuticals beverages (Yang et al., 2010). The economic importance of mint is well evident from the fact that its various compounds and constituents obtained from the desiccated and fresh plants and their essential oils forms part of numerous items of daily use like confectionary, cosmetics, oral hygiene products, medications, insecticides, and as a flavor enhancing agent in toothpastes, chewing gums and beverages, to name but a few (Patel et al., 2007).

Besides medicinal potentials it uses as flavoring agent and as a single ingredient in dinners. Action of *M. piperita* as a traditional therapy or substitute remedy that includes: bilious problems, stomach ache, gastritis, intestinal cramp, antiviral, antibacterial, antifungal inflammation, fustian, hard cell of the bile duct, gall-bladder and gastro-intestinal region, antimicrobial activity and respiratory diseases (Capecka et al., 2005).

Distribution

The peppermint plant is native to Europe and extensively spread out in farming all over across the globe. It is wildy originated occasionally with its inheritance. It is an offensive species in Australia, the Galapagos Islands, New Zealand and United States.

Nomenclature

Different names based on local culture and customs across the globe are presented in Table 1. There are more than 100 local names in various countries.

Phytochemical Properties

Various studies show that essential oil extracted from peppermint plant are mainly composed of different secondary metabolites. Peppermint chemical constituents are varying from in leaves and other parts also mainly depend on plant maturity, processing environments, geographical conditions and variety as well (Xu et al, 2003). According to a study conducted by (de Almeida Muradian et al, 1998) fresh leaves of peppermint (Brazil) comprised of 940–1016 retinol equivalents (RE)/100 g β -carotene. The evidence also shows that chlorophylls, carotenoids, ascorbic acids and tocopherols were also reported in various concentration in peppermint oil (Capecka et al., 2005).

Table 1. The most popular local names of mint across the globe

Country	Local name	Country	Local name
Iran	Nanafelfeli	Turkey	Nane
Brazil	Nortela pimento	Russia	Myata perechnaya
USA	Lab Mint, mint	Uruguay	Menta
Norway	Peppermynthe	French	Menthe
Poland	Pepparmunta	Iraq	Nana
Spain	Mentainglesa	Bogota	Yerba Beuna
Portugal	Hortelana pimentosa	Denmark	Pebermynte
Swedish	Pepparmynt	Germany	Peppermint
China	Po Ho	England	Brandy Mint
India	Urdu, mint, Pudina, Pudyana, Puthina	Mexico	Menta piperita

Nutrient Contents

Various studies and researches show that mineral contents from mint foliage are additional wide-range and relating to that of vitamins. Dried peppermint leaves contain major minerals are as g per kg: Potassium 33, Calcium 15.3, Magnesium 5.8 and small quantity of sodium, with smaller amounts as mg per kg of iron 239, Manganese 188, Zinc 51 and Copper 12. Minor amounts as µg per g of Chromium 941, iodine 325 and Selenium 147 are also existing (Zimna and Piekos, 1988, Lozak et al., 2002).

Antioxidant Properties

Recently, interest has been increasing in the consumption of essential oil (Eos) as natural antioxidants. The oxidant species can be produces in the body as a result of different metabolic process and the excess of nitric oxide production may cause failure or damage of different vital organs in our body, thus antioxidant pathways activated in order to neutralize these harmful responses (Nathan et al., 2013). mint is an important medicinal plant and also rich source of many vital antioxidants. Schmidt et al., (2015) mentioned that EOS extracted from mint herb has antiradicals functions with respect to DPPH and hydroxyl (OH⁻) radicals, while it is also stated by some researchers that the extracted essential oils possess radical scavenger activity against the ABTS radical (Yang et al., 2010). The antioxidants action of mint is basically the presence of phenolic compounds in their leaves like rosmarinic acid and flavonoids like hesperidin, naringin, luteolin and eriocitrin (Dorman et al., 2009).

Anti-bacterial Properties

Therapeutic plants have been widely used in common traditional remedies and hence, secondary metabolites from plants are of great interest as anti-microbial mediators today (Mahboubi and Kazempour 2014). Currently, scientists and researchers working on different infectious illnesses, the compounds extracted from peppermint are increasingly interests (Mucciarelli et al., 2007). The essential oils and aqueous solutions from peppermint plant showed excellent anti-microbial action against the following bacteria: *Proteus vulgaris*, *Staphylococcus aureus*, *Streptococcus faecalis*, *Escherichia coli*, *Streptococcus pyogenes*, *Salmonella pullorum*, *Yersinia enterocolitica*, *Comamonas terrigena*, *Acinetobacter sp*, *Shigella dysenteriae*, *Serratia marcescens*, *Mycobacterium avium*, *Salmonella typhi*, *Lactobacillus bulgaricus*, *Streptococcus thermophiles*, *Staphylococcus pyogenes*, *Enterobacter aerogenes*, and *Escherichia coli* (Bohnert et al., 2016). It has been also shown by various studies that mint oil along with menthol having slight anti-bacterial action against Gram-positive and negative bacteria (Shaikh et al., 2014). According to (Inouye et al., 2001) stated the main respiratory pathway pathogens *Staphylococcus aureus*, *Haemophilus influenzae*, *Streptococcus pyogenes* and *Streptococcus pneumoniae* were found susceptible to peppermint oil and to its component's menthol and menthone. From research analysis it appears peppermint can become a major novel target for synthesis of various plant derived drugs against a large spectrum of multi-drugs resistance bacteria.

Anti-headache Activity

From the ancient times, herbal remedy has been used as a major treatment for headache complaints (Levin, 2012). Intake of peppermint and its derivatives in daily diet is the best target for headache cure. Gobel et al., (1994) presented about benefits in combination of peppermint and eucalyptus oil in relieving patients headache problem. While, parallel results were also stated by Levin (Maliakal and Wanwimolruk, 2001).

Nervous system Actions

The and peripheral nervous system along with central nervous system function can be affected by the action of peppermint plant. Atta and Alkofahi during 1998 studied the painkilling mode of actions on an ethanoic quotation of peppermint plant on Swiss rats. Retaining 0.7 percent acetic acid vaccinated to prevail upon the ache observed by squirming. The rats were 1st cured for 30 minutes with 200 or 400 mg/kg (oral dose) of the mint extracts.

Squirming movement in mint cured pests remained meaningfully lowered by 38–44 percent related with saline vaccinated controls. According to (Umezu et al., 2001) that 400 – 800 mg/kg of EOS vaccinated intraperitoneal in rats meaningfully improve ambulatory actions 10–40 minutes afterwards administration. The elements sequestered from peppermint like pulegone, caryophyllene, 1,8-cineole, menthone, isomenthone, menthol and methyl acetate also meaningfully improved ambulatory behavior (Umezu, 2002; 2003).

Cardiovascular and Hypotensive Effects

Today, in developed world, utmost attention is given to the prevention of cardiovascular problems. For such reason massive attention is paying towards a diet plan containing food with antithrombotic effects, as a daily intake of such a diet delivers an easy and controlling way of protection from cardiovascular diseases. An investigation done by Lahlou et al., in (2002) showed that essential oils from peppermint plant has an element called pipertenone oxide, which shows positive effect on cardiovascular system and slow down the heart rat which seems to independently be occurring.

Antitumor Activity

A study carried out by Ohara and Matsuhisa (2002) in which edible plants (120) were screened for anti-tumour encouraging activities against Okadaic acid (OA) and non-12-O-tetradecanoylphorbol13-acetate (TPA)-type promoter that promotes tumor creation by deterring protein phosphatase-2A activity. Among eight plants the peppermint plant was the only one plant that showed up strong activity (85% to 100%) in overwhelming the action of okadaic acid.

Therapeutic Uses

Presently, the oils from peppermint plant have become most measured agent as treatment for a human disorder (Alankar, 2009). Key health benefits of mint oils are shown in (Figure 1). In addition to therapeutic uses, its extract is largely used in food industries as a flavoring agent. As among all chemical compounds that extracted and purified from mint oils, mentholic is the most mutual element and extensively is used for respiratory congestion (Eccles, 2003), headache pain, and skeletal muscles problems (Patel et al., 2007). For adults the best dosage of peppermint oil was reported 0.2 to 0.4 mL three times daily in enteric-coated capsules (Khanna et al., 2014).

Figure 1. The major health benefits of Peppermint Oil.

Conclusion

Peppermint is the most popular single ingredient and traditional herb around the world and contain strong position in market in future. It offers several benefits ranging from the medical ground to other areas like cosmetics, toiletries, and flavoring etc. also to other sides that having a solid links with health: straddling from the food sector to insecticides and repellents. In this current review the nutritive, phytochemical and health potential of peppermint are considered. Moreover, additional researches are required in order to explore the cellular and molecular mechanisms of peppermint and its compounds well known effect on human body.

Abstract

Ginger (*Zingier officinale*) is a tropical herbaceous plant; its rhizome is a common ingredient around the world. They were cultivated in soil and other modern farming methods. The economic impact of ginger, market value addition and socio-economic factors that influence ginger economic benefits in Asia as compare to Pakistan was explored in this research. It exists in a range of pharmaceutical and commercial as green ginger (fresh ginger), dry ginger, ginger powder, and ginger oil and herbal medicine. A worldwide outbreak of ginger remedy to different disease has prompted to focus their efforts on this region. This review also includes its export and import value and SWOT analysis significance in producing ginger that is more beneficial to the Asian community.

Keywords: *Ginger, market value, socio economic, Agricultural Economics, Ecological Economics, Environmental Economics, Natural Resource Economics*

Introduction

Ginger, *Zingier officinale* (Zingiberaceae), rhizome called as "ginger root", tropical herb, which found all around the world, about 5-6% consumed as a traditional spice and known for its diverse nutritional qualities. It has a huge demand in pharmaceutical industries because of its antioxidant properties. (Deme, K., *et, all*, .2021). Ginger usually grows in Southeast Asia including tropical and subtropical climates. Consumers demand it as a desired spice crop with medicinal and nutritional worth, and some local farmers in the United States want to cultivate it as a functional crop in a least tropical, limited-season climate. (Devkota, P. (2022)). In addition, research assays to produce ginger in high tunnels or the field have been undertaken in various eastern and southern states of the United States. As ginger grows better under shade, especially in the seedling stage, significant production in few countries has also been done in direct sunlight. (Adebayo, S. A.,*et,all*,.(2021). This plant is developed in India and many other countries like Bangladesh, Taiwan, Jamaica and Nigeria.

The taste of a fresh, young ginger rhizome is crisp and juicy, without any of the fibers especially in older rhizomes. It has a mild taste and is excellent to eat fresh or making pickled ginger for Japanese cuisine. The harvested rhizomes may also be air dried and will keep for many months before replanting for the next crop or being consumed (Ma, R. H., *et,all*,.2021).The plant contains pharmacologically active compounds in its rhizomes such as anti-inflammatory gingerols that give ginger its pharmaceutical use. More than a hundred chemical components of ginger have been identified or recognized so far though (Amri M., 2016). Each of these compounds, gingerol has gotten the most attention in research for curing persistent inflammation as asthma and rheumatoid arthritis (Akinyemi AJ, *et, all*,.2015).

According to historical data, ginger exports were \$93.29 million in the first two months of 2020, 14.4 percent increase over the same time in 2019. The cost of ginger increased all around the world, especially in the month of March as the Covid-19 overtook globe. Use of ginger increasing an individual's self-defense or immunity which enables human to fight with infection. Until more than 100 compound contents from ginger have been limited or identified at this moment (Akinyemi AJ,*et, all*. 2015).

As furthermore, the cost of ginger has significantly risen overall the globe. Similarly, most footage of inventions that are made with ginger and other spices were posted on internet, in countries like , Ivory Coast ,Ghana, Nigeria,and Cameroon as a therapy to combat Covidien (Observers, 2020). Chinese ginger deterioration create and trading prompted a huge ascent in costs of import of Chinese ginger in nations like Bangladesh, Pakistan and Vietnam . Due to Vietnam, costs of Chinese ginger took off roughly VND 20K-30K (USD 0.86- 1.29) 1kg toward the start of 2020 in the month of February (Plaza, 2020). As per (Lee, S.,2022) among Bangladesh, Chinese ginger which is hydroponically grown, cost 1kg rose by BDT 180- 220 (USD 1.14-1.39). Additionally, inside around scarcely any time periods the Pakistani costs of Chinese ginger i.e PKR 400 (USD 2.53) per kilogram expanded by PKR 80 (USD 0.51) (Lee, S.,2022; Plaza, 2020). There is a demand to modify ginger production to organic culture because consumer demand for organic products continues to raise USDA Economic Research Service (2019).

In this literature, there was an economic and medical value along with the market value including export, import and ginger production of Pakistan along with the comparison to china India and Bangladesh are discusses. Issues constraints and opportunities associated to manufacturing, harvesting, marketing , storing , trading and processing and recognized the strengths , weaknesses, opportunities and threats (SWOT) of ginger production and value added sequence are identify through on FAO time series analysis and trade map research.

Botanical Specification:

Ginger family (Zingiberaceae) has perpetual tuberous or rhizomatous roots. The plants produce upstanding, 60 to 90 cm tall yearly tail (pseudo-stem), consist of light green colored leaves. Stalks accompanied with level sheaths that might be shrugged off tail; 8-12 leaves are available on the stem. Thumb sized glomerular is absent. Blossoms are small and light-yellow in colour. Anthers are doubled folded, long coronate in structure, arenoze directed and horn formed. This perpetual fills in hot environments (Schauenberg and Paris, 1977).

Genotype

The quality boundaries of ginger, like fullness of rhizome, dry recuperation rate, fiber, oleoresin and oil content are profoundly affected by natural components. For dry ginger creation, diversity with high-rise dry recuperation rate (>20 %), low fiber content (<4 %) are essential. Cochin and Calicut dry ginger traded from various district are cultivated nearby cultivars, for example Kuruppampady, Cheranad, Erenad and Wayand in India (Shanmugavelu et al., 2005). Kuruppampady. Ginger is renowned for its high oleoresin content. Further developed varieties are Suruchi, Surabhi, V3 S 1-8, V1E8-2 delivered for new ginger creation (Nybe et al., 2007). Athira and Karthika are two ginger variety delivered by research for huge scope of new and dry ginger creation in subcontinent area (Shylaja et al., 2010).

Active Ingredient

Ginger had active ingredients which manufacture ginger oil i.e terpenes and oleoresin. Ginger also creates approximately 1% - 3% volatile oils and non-volatile pungent components oleoresin. The vital compound i.e terpenes, Sesquiterpenoids hydrocarbons, phenolic compounds that also called gingerol, shogaol and lipophilic rhizome abstracts, produced reasonably active gingerols, which can play significant role in pharmaceutical industries.

Table 1. Composition of ginger rhizome (The following components are involved in the composition of rhizomes. The percentage composition ensures the demand of pharmaceutical industries.)

Particulars	Fresh Ginger Rhizome
Dry matter%	92.71
Crude protein%	5.28
Ether extract%	5.54
Crude fiber%	9.74
Ash%	5.97
Total carbohydrate%	66.26
Oxalate mg/g	4.55
Phytin%	28.83
Tannin%	0.26
Phosphorus%	25.70
Sodium%	40.96
Potassium%	37.34
Calcium%	35.66
Manganese%	19.60
Zinc%	4.06
Iron%	1.44

First Ginger Production in Pakistan

Pakistan's first ginger is harvested in balkasar in the area of chakwal on January 02, 2022. Inaugurated by Special Assistant to the Prime Minister on Poverty Alleviation and Social Safety, Senator Dr Sania Nishtar Ginger is produced only in Sindh province according to Agricultural Statistics of Pakistan (ASP) (2000-2020). The FAOSTAT (FOOD AND AGRICULTURE ORGANIZATION CORPORATE STATISTICAL DATABASE) the country level data of ASP until 2020 (FAOSTAT). These data suggest that during 2020, ginger was grown in Pakistan on 2 ha producing 2 tons of ginger with an average yield of 5000 tons per ha. The data suggest elevated deviation in cultivated area of ginger (ranging 22 ha in 2011 to 291 in 2015) and interrelating variation in its production.

Economic impact of ginger

Ginger is a vital commercialized crop cultivated for its scented rhizomes, that are consumed as medicinal purposes and both for organoleptic and as a spice. The augmentation of cash crops, specifically ginger, provides the opportunity to achieve a complementary commercial resource to the farmers and, allowing them to improve their living quality. The species illustrates an added worth to global trade as it is used all around the world (Meenu G, 2020).

Economic impact of ginger

Ginger is a vital commercialized crop cultivated for its scented rhizomes, that are consumed as medicinal purposes and both for organoleptic and as a spice. The augmentation of cash crops, specifically ginger, provides the opportunity to achieve a complementary commercial resource to the farmers and, allowing them to improve their living quality. The species illustrates an added worth to global trade as it is used all around the world (Meenu G,2020) .

Ginger is widely farmed throughout the world, with production scattered across nations such as India, Pakistan, China, Nigeria, Nepal, Indonesia, Thailand, and others. In 2018, ginger output was 3,038,120 metric tons. (Kumar, P., Dwivedi, P., 2018). While India controls the production and trading of ginger, then appear the United States of America (19.035 tones), the United Kingdom (10.337 tones), Saudi Arabia (8.248 tones), (Pinson C.et.all,2017). Singapore (7.566 tones), Malaysia (7.652 tones), Korea (6.805 tones), the Netherlands (6.981 tones), and Canada (4.680 tones) (Pinson C.et.all,2017).

As long as crop with secondary significance, experimentation in the selection,(graphs one ,two & three) Indicates the yield per area of ginger cultivated in Pakistan, China, India and Bangladesh and show the overall potential of ginger produce in Pakistan through the last two decade. The data collected from FAOSTAT, where the conclusion can identify the potential of Pakistan as compared to its neighboring countries.

Pakistan is the 2nd biggest importer of ginger in the world, which produce ginger 2.00 percent in 2020 but due to less yield it's not enough to meet consumer need. In 2020, the average ginger export price amounted to \$3,125 per ton, picking up by 10% against the previous year. The yield volume of ginger in India from financial year 2015 to 2020, with an approximate for 2021 is 1.89million metric tons increasing from 760 thousand metric tons in financial year 2015. India export almost US\$ 31.5 million value of ginger and import US\$ 19.6 million approximately. Bangladesh produces about 49,405 m tons of ginger annually from about 19055 hectares of land, Bangladesh exported a total of \$41.2B. Regardless, China with the exporting volume up to 578K tons in 2020 which was close by 63% of entire exports. It was indirectly stalked by India that is 102 K tons), China's annual rate of production is at average of 11.87%.

Fig 1. Showing the trend comparsion of Pakistan and India

Fig 2. Showing the trend comparsion of Pakistan and China

Fig 3. Showing the trend comparsion of Pakistan and Bangldash

Presently, the supply chain of ginger is balanced and is starting to drop down. India, China, Nepal, Nigeria, Thailand, and Indonesia are the top producers of ginger worldwide. During the fiscal year 2018, Assam, India's eastern state, was the country's largest ginger producer. This amounted to approximately 168 thousand metric tons or 17.5 percent of the total ginger production in the country. Maharashtra came second, with West Bengal coming third that year. The volume of ginger produced in India for the financial year 2020 was about 1.88 million metric tons. This was higher from 760 thousand metric tons in the previous fiscal year. In that year, spice production in the south Asian country was over 9.7 million metric tons. (Statist Research Department, 2022) .

China

China's ginger industry increased at a mean annual rate of 11.20 percent from 28,742 tons in 1970 to 605,123 tons in 2019. Covid-19's pandemic had economic consequences for countries all around the world. Many countries suffered a decrease in their export commerce. The export of Chinese ginger, on the other hand, has increased massively of its medicinal benefits. During the pandemic, people have started to pay more attention to ginger. In March, China began to reestablish normal commercial activity after the initial lockdown in January and February. While other countries were affected by Covid-19, the market for ginger grew, and China was one of the few countries that could supply it. That is why the export of Chinese ginger increased in volume and value in the first six months of 2020.

Table 1. Ginger production of China

Year	Area/ha	Change%
2016	1109000.00	45.92
2017	1070000.00	-3.52
2018	1762000.00	64.67
2019	1788000.00	1.48

Table 2. Ginger production of Nepal

Date	production /tons	Change%
2016	573,417.00	10.19 %
2017	568,404.00	-0.87 %
2018	592,892.00	4.31 %
2019	605,123.00	2.06 %

Table 3. Ginger production of Nigeria.

Date	Production/tons	Change%
2016	271863.00	12.09
2017	279504.00	2.81
2018	284000.00	1.61
2019	297512.00	4.76

Table 4. Ginger production of Thailand.

Date	production/tons	Change%
2016	774887.00	87.45%
2017	834634.00	7.71%
2018	700000.00	-16.13%
2019	691239.00	-1.25%

Due to the existence of soft rot/rhizome rot disease (loss of up to 30% in the field), a shortage of domestic facilities for industrial extraction and distillation, traditional drying and processing techniques (loss of oil content by 20%), the influence of a single trade outlet in Naxalbari, India, farmers, and traders in East Nepal face extremely low margins. Nepali ginger is the world's fourth-largest producer and 15th-largest exporter, with a total production of 279504 metric tons on 22649ha land (MoAD, 2017; FAO, 2017). Nepali ginger has the highest export potential, given the fact that China and India, the two largest ginger importers are Nepal's neighbors (Workman, 2019).

During the months of October and November 2018, an interview was planned to collect data. According to a compound annual growth study, the area, productivity and yield of ginger have increased at rates of 1.73 %, 1.65 %, and 0.95 % over the last seven years respectively. The B/C ratio of ginger farming in the field of research was 2.42, suggesting that it was a profitable business; farmers earned an additional 1.42 rupees for putting Rs1.0 (0.0088US\$) in ginger. (Manuscript received 22 October 2019; accepted for publication, 2020) (Faculty of Agriculture, Agriculture and Forestry University, Rampur, Chitwan, Nepal).

Nigeria produce an average volume of over 400,000 Metric tons of ginger beyond the 36 states yearly. In 2017, we had a production volume of about 349,895 and it was higher in 2016 with 522,096 metric tons. Typically, ginger is exported in three forms fresh, dried, and processed (powdered). The dried rhizome sells for around 900 Naira per kg on the international market, commanding the highest export price. Nigerian farmers can profit from the \$3 billion ginger market as the nation looks for ways to expand its non-oil export potential. According to data from the Ministry of Agriculture, Nigeria's ginger production is estimated to be 31 million metric tonnes while consumption is estimated to be 65 million MT, leaving a 34 million MT supply-demand mismatch. Nigeria increased its annual ginger production from 80 tonnes in 1970 to 691,239 tonnes in 2019, expanding at a rate of 26.69% on average.

The Ginger farm continues to increase. The total harvest area is ~ 28,000-36,000 acres. The export of fresh Ginger and preserved Ginger bring revenue ~ 800 million and 1,200 million Baht to Thailand. Though Thailand ginger - yield differed in recent years, it managed to enhance through 1970 - 2019 period ending at 164,976 hg/ha in 2019. Though Indonesia ginger - production differed substantially in recent years, it managed to enhance through 2000 - 2019 period ending at 174,380 tons in 2019. In 2020, approximately 179 million kilograms of ginger were produced in Indonesia. The provinces that produced the most ginger include East Java, West Java as well as Central Java (Statista Research Department).

Table 5. Ginger production of Indonesia

Date	Production/tons	Change%
2016	166346.00	2.43%
2017	168025.00	1.01%
2018	166196.00	-1.09%
2019	166923.00	0.44%

Table 6. Ginger production of India.

Date	Area/ha	Change%
2016	340341.00	4.71
2017	216587.00	-36.36
2018	207412.00	-4.24
2019	174,380.00	-15.93

As a result of the closing of land, sea, and air borders due to Covid 19 the ginger supplies in India, the world's second-largest exporter, and Iran, the world's third-largest exporter, faced worsened global scarcity. Prices of ginger began to rise approximately 7-9 percent per from late January to February in China, owing to labor scarcity in farms and distribution networks, as workers were encouraged to stay at home (Plaza, 2020). The increase in demand for ginger resulted in a 17 percent increase in the supply chain in the first two months of 2019 compared to the previous month. (Plaza, 2020; Produce Report, 2020; Wintle, 2020).

Ginger Exporting Countries

The pie chart (1), shows the percentage of Pakistan import throughout the decade. The import throughout decade increasing like 2003 is 3%, 2004 is 5%, 2005 is 7%, 2006 is 9%. The increasing rate from 2003 to 2006 is two. The graph shows that the import increasing 2007 to 2021 is one percent. But throughout the decade decrease. The increasing one or two percent is economically not well but the percentage rate of enhancement is low so Pakistan is eligible to control and work on its exporting area. Pakistan should work on export area why is it decrease from 2% to 1%.

Fig 2. Over the years Pakistan Exports

This research collected data of Ginger through the trade Map. Through trade map we exclude the data throughout the decade and show the market trend of Pakistan importing to top five country. The top highest importing country is China. The imports of china from 2003-2010 is zero but from 2011-2021 throughout the decade is increasing. The top five country 2003-2010 is zero and in the next year from 2011-2021 increasing. In the top five country china import highest then Thailand, Montenegro, Nigeria and Indonesia. The overall import of five country is zero from 2003-2010 and then increasing from 2011-2021.

Ginger Importing Countries

The pie chart(2.3), shows the percentage of Pakistan import from 2003-2021. The import from 2003-2011 zero and then increasing in 2012 is 52% and then decrease in 2013 is 1%, 2014 is 2% 2015 is 15% 2016 is zero in 2017 is 1% in 2018 is 12% in 2020 15% in 2021 is 1%. The overall import from 2003-2021 decreasing and it is economically good and Pakistan work to minimize its importing area and increase its exporting area.

Fig. 2.1. Showing the trend of overall market trend (Export) of Ginger

Fig 2.3. Over the years Pakistan Imports

Fig.2.4. Showing the trend of overall market trend (Import) of Ginger

The above research data is collected through the trade Map. Through trade map we exclude the data throughout the decade and show the market trend of Pakistan importing to top five country. The top highest exporting country is china. The export of china is zero 2003-2020 and only export in 2021. The overall export of these five countries is near to zero. Pakistan works its importing area to minimize and work its exporting area.

As a response, ginger is becoming a source of revenue with a high market value, driven by the crops recognized as nutritional and health characteristics. However, despite the fact that its cultivation is growing widespread and huge interest in ginger production, as there isn't much ongoing research on it. Pakistan has to developed cultivars better guide for producers and establishes profitable and sustainable businesses trend line.

SWAT Analysis

Strength	Weakness
- Well created potential network in rustic regions and production network of farming ginger - Favorable environment for farming ginger creation and can be developed consistently. - Ginger can be created in all space's country or metropolitan both. - Traditional information and abilities of ranchers can be expanded and modern methods of creation are learn by the ranchers. - High value plant use as household meal and pharmaceutical industry. - Potentials for development in region and efficiency expanded by utilizing tank-farming technique of cultivating. - High interest of aqua-farming ginger in India and China and rest of the world after Coronavirus.	- High rate of Ginger decay because of lack of provision special environment and temperature. - Poor gathering of additional created grouping and producers or consumers retailer's marketers when it comes to modern ways of farming. - Lack of worth expansion exercises like awareness campaigns of hydroponic farming of ginger. - Timely inaccessibility of sources of info (seed, manure, labor, technology, nutrients solution). - Lack of reception of further developed innovation because of not quitting orthodox ways of farming. - Weak in reverse and forward linkage. Or unskilled labor.
Opportunities	Threats
- Covid itself is major opportunity for hydroponic ginger as during covid the demand for ginger increased suddenly for health benefits like for boosting up immunity. - Degree for setting up ginger preparing enterprises. - Scope for value added in hydroponic ginger marketing. - Continue creation of hydroponic ginger. For its health benefits. - Government strategy support as hydroponic ginger is high worth income producing crops for all countries particularly Asia countries - Potential to build region and usefulness and its convenience.	- Serious dangers of hydroponic ginger shelf life and sickness due to environmental impacts and expensive treatment. - Decreasing work accessibility because of relocation of hydroponic ginger production in Asian countries. - Price variance such as high prices of hydroponic ginger. - C02 impact and green houses are likewise arising dangers.

Conclusion

Asian's major commercial product, ginger holds a unique place in the nation's economy. The crop has enormous potential for creating agricultural income as well as employment, eventually raising farmers' living standards. Although there has been limited research on the production aspect of ginger cultivation in the region and in-depth examination of the economics potential of ginger cultivation is critical for determining the various investment patterns that are profitable for ginger production.. Moreover, ginger plants are not affected by climatic variations, allowing any crop to cultivate.

Ginger farming is also good for the environment. The production of ginger is profitable in the research areas. Whereas the investment return for ginger producers was high, it fell short of ideal levels. The use of the right

amount of input at the right time is essential for increasing output and profitability, but the farmers' use of technology missed the mark of the recommendations proposed. When farmers have access to modern production techniques and variety seed, yield and production can grow, potentially increasing their revenue. Fair prices for seeds, fertilizers, and insecticides are necessary for farmers. To increase their profit on ginger production, farmers require high-quality seed that is resistant to disease and insects.

Impact of combined inorganic fertilizers with vermicompost on yield and quality of bio-fortified beans (*Phaseolus vulgaris*) in Rwanda

Job Nyagashi*, Noëlla Josiane Umuhoza Karemera, Sylvestre Habimana, Philippe Sibomana

Department of Crop Sciences, College of Agriculture, Animal sciences and Veterinary Medicine; University of Rwanda, P. O. Box: 210 Musanze, Rwanda

*Corresponding author

Abstract

Beans are known to be highly nutritious and being consumed by almost all Rwandans and therefore considered as a staple food. Therefore, a study was conducted in college's farm to assess the effect of different levels of vermicompost and NPK (17-17-17) on the growth, yield and nutritional content of bio-fortified beans. A randomized completely block design with eleven treatments and three replications was used for two consecutive seasons (A and B). Plant height, leaf area index, number of leaves, number of pods per plant, number of seeds per pod, weight of 100 seeds, total yield as well as nutritional value of beans were estimated. The results proved that the treatment with 150kgs of NPK 17-17-17 combined with 5t/ha of vermicompost improved the yield during both seasons as the highest yield was 3.7t/ha and 3.8t/ha respectively. The combination of both fertilizers at the rate of 50% should be recommended to the growers to improve growth and yield since the mineral content is not adversely affected.

Keyword: *Fortified beans, vermicompost, NPK 17-17-17, yield, mineral content*

Introduction

Beans are known as “meat for the poor” and regarded as a “near complete food” based on their nutritional values. A part from proteins, they provide resistant starch, soluble and insoluble fiber, vitamin B and minerals such as iron, zinc, magnesium, copper and potassium (Hutchins, 2011). Moreover, in East African countries, beans are ranked the second after maize as staple food, it is considered as an affordable source of high and quality protein (20-28%), Fiber (56%), Zinc (33mg/kg), energy (32%), Fe (70mg/kg) and vitamin A (Amongi et al., 2018). In Rwanda, bean is one of the six major staple crops under crop intensification program (Nicola, 2011). The annual consumption rate per capita is 164g/day (Ferris et al., 2016), which is higher than elsewhere in the world as a source of iron intake to human body, and as a source of 40% protein, playing a significant role in human nutrition, food security and income (Larochelle & Alwang, 2014). However, on farm productivity and yield decrease dramatically due to diseases and pests, lack of improved seeds, low use of chemical fertilizers (NPK, DAP and Urea) and lack of cheaper innovations of staking are the main challenges experienced by farmers (Gadi et al., 2017).

Many interventions have been identified by the government of Rwanda and partners who are putting more efforts towards the development of climbing beans program and it is among the selected crops in Crop Intensification Program (CIP), which is more profitable in terms of accessing inputs and value addition to small land holdings (MINAGRI, 2011). Mineral fertilizers are still not efficiently used in terms of rates, time of application as well as choice of the right fertilizer by small scale farmers. Cattle manure has been identified to recover plant nutrient deficiency but it is not well managed in order to transfer its benefits to soils (Azeez & Averbek, 2010). Moreover, the combination of mineral and organic fertilizers is not well understood by smallholder farmers and yet it results in increased yields and good soil conditions. The increasing cost of chemical fertilizers and growing environmental concern have created considerable interest for search of alternative cheap sources of plant nutrients (Gmaa, 2015). The use of vermicompost as a source of organic manure increases crop growth, yield and soil nutrient status and nutrient uptake (Shashikumar et al., 2013). Vermicompost is not only rich in plant nutrients but also improves the physical, chemical properties of the soil and it enhances the microbial activity in soil. It is rich in microbial populations and diversity, particularly fungi, bacteria and actinomycetes (Wasma et al., 2016). It also contributes to the increase in the amount of soluble, exchangeable and acid-soluble iron in the soil (Manivannan et al., 2007). Vermicompost is mainly applied due to its properties of improving soil texture, structure, aeration and fertility; it similarly contains most of the nutrients in plant-readily available form such as nitrates, phosphates, exchangeable calcium and soluble potassium and magnesium. On the other hand, it increases beneficial microbial population activity and diversity and contains higher amount of humic acid and biologically active substances such as plant growth regulators, and it is also known to improve soil moisture holding capacity (Azarmi, 2008). Therefore, this research aimed to assess the effect of different levels of vermicompost and NPK (17-17-17) on the growth and yield of bio-fortified beans in Rwanda with specific objective to assess the effect of vermicompost and NPK (17-17-17) on the growth and yield parameters of bio-fortified beans and to test the effect of vermicompost and NPK (17-17-17) on mineral contents of bio-fortified, beans and mineral contents.

Material and methods

Experimental materials

The study was conducted in the farm of University of Rwanda located in Northern province, Musanze district (1° 33' 30 S latitude, 29° 32' 36 E longitude and altitude of 2300 meters above mean sea level) from October 2019 until February 2020, and it was repeated from April-June 2020. The soil is volcanic and the rainfall range from 1400 to 1800mm with the mean temperature of 16.7°C. The recommended vermicompost (10t/ha) and recommended doses (300kgs/ha) of inorganic fertilizer NPK (17-17-17) were used alone and their combination at different proportions. Farmyard manure (10t/ha) combined with 300kg/ha of NPK 17-17-17 was used as control factor to test its efficacy against the vermicompost. Vermicompost was obtained from Golden insects ltd and it was made from mixture of decomposing vegetable, food waste degraded by red wigglers, white worms and earthworms. The inorganic fertilizer and beans' variety known as RWR2245 were purchased from certified agro dealers. Eleven treatments (T) were formulated as follow: T0 as control (no fertilizer applied); T1: 100% NPK 17-17-17; T2 was 100% vermicompost; T3: 100% NPK 17-17-17 +75% vermicompost; T4: 100% NPK 17-17-17 +50% vermicompost; T5: 100% NPK 17-17-17 +25% vermicompost; T6: 100% NPK 17-17-17 +100% vermicompost; T7: 25% NPK17-17-17 +100% vermicompost; T8: 50% NPK 17-17-17 +100% vermicompost; T9: 75% NPK 17-17-17 +100% vermicompost; T10: 100% NPK 17-17-17 + 100% Farmyard manure (10t/ha); T11: 50% NPK 17-17-17 + 50% vermicompost. The experiment was laid out in a randomized completely block (RCBD) design with 11 treatments and 3 replications within two seasons.

Estimating the growth and yield

The sample size was composed of twelve crops per plot. The growth characteristics of beans were assessed at 60th day after sowing (DAS). Plant height, leaf area index (LAI) and number of leaves were estimated. For yield parameters, number of pods per crop were counted at 60 DAS while number of seeds per pod, weight of 100 seeds as well as total yield per each treatment were calculated after harvesting, drying and threshing. The weight of hundred seeds were obtained with aid of electronic balance and total yield (t/ha) was got through extrapolating the yield of each treatment.

Laboratory analysis

Determination of Iron (Fe)

Organic matter in the sample was destroyed by ashing and the resulting ash was dissolved in hydrochloric acid (HCl) and diluted to a known volume with water. Whole of the iron present in the aliquot of ash solution was reduced with hydroxylamine hydrochloride (HONH₂·HCl) and the Fe (II) was determined spectrophotometrically. Absorption of the resulting complex was read at 510nm wavelength and reported as mgFe/100g.

Determination of Zinc (Zn)

Organic matter in the sample was destroyed by wet digestion. The trace elements in the sample were quantitatively measured by atomic absorption spectrophotometer (AAS) at a specific wavelength.

Determination of Calcium (Ca), Potassium (K) and Magnesium (Mg)

Calcium and magnesium in the sample, prepared by ashing the sample and quantitatively measured by atomic absorption spectrophotometer (AAS) at a specific wavelength (Prapasri Puwastien et al., 2011).

Determination of proteins

The protein content was determined from the organic nitrogen content by Kjeldahl method. The various nitrogenous compounds were converted into ammonium sulfate ((NH₄)₂SO₄) by boiling with concentrated sulfuric acid (H₂SO₄). The ammonium sulphate formed was decomposed with an alkali (NaOH) and the ammonia liberated was absorbed in excess of standard solution of acid and then back titrated with standard alkali.

Data analysis

Data were subjected to analysis of variance (ANOVA) using Genstat statistical software and the significant difference between treatments was assessed at 5%. Moreover, significant differences between treatments were identified using Duncan Multiple Range Test (DMRT).

Results and Discussions

Plant growth

Results showed in table 1 indicated that in season A, there was a significant difference in emergence rate (p=0.002). The highest value of emergence rate recorded was 100% in plots fertilized with 50% NPK + 50% vermicompost while the lowest value (31.7%) was recorded in plots fertilized with 100% NPK 17-17-17. For the season B, there was no significant difference in emergence rate (p=0.705) for all treatments. The highest value (97.5%) was recorded in treatment with half rates of combined fertilizers whereas the lowest value (80%) was recorded in treatment with 100% NPK 17-17-17. The low emergence rate is attributed to low moisture under inorganic fertilizer where it holds the currents of soil moisture to allow dissolution. Furthermore, results in season A is explained by optimal rainfall and vermicompost having high water holding capacity, which stimulated emergence

rate. This is in full agreement with Jung et al. (2020) who reported that the performance of seeds in good environmental conditions depends on their genetic potential and pre- treatments. This concurs with Vengadaramana and Jashothan (2012) who reported that an increase in organic matter increases water-holding capacity of a soil affecting seed development.

Table 1. Effect of vermicompost only and in combination with NPK 17-17-17 on emergence rate

Treatments	Emergence rate (%)	
	Season A	Season B
Control (no fertilizer application)	88.3 ^{bc}	86.7 ^a

^aMeans with the same letter are not significantly different

The table 2 depicts the results of beans' growth parameters (plant height, number of leaves and LAI) as influenced by vermicompost and NPK 17-17-17. Results indicated that the tallest crops (54.2cm) were recorded in plots that were fertilized with 50% of inorganic fertilizer combined with of 50% of vermicompost. The smallest crops (36cm) in unfertilized plots. The highest number of leaves (52.4) were recorded in plots that received a half rate inorganic fertilizer in combination with vermicompost whereas the lowest number of leaves (38.7) was obtained in unfertilized plots. All treatments showed no significant difference in terms of LAI (figure 1). Though, the highest LAI (0.18cm²) was recorded in plots with half combination of inorganic and vermicompost fertilizers and the plots that received a combination of full doses of both fertilizers. The lowest LAI (0.13cm²) was recorded in unfertilized plots. The combination of inorganic fertilizers with vermicompost affected the plant growth as they work in synergy. The application of nitrogenous fertilizer increased leaf nitrogen content and hence high photosynthesis efficiency (Prsa et al., 2007). This is also in line with the findings of Joshi et al. (2013) who reported a positive correlation between vermicompost and inorganic fertilizers. Similar results were also found by Kashem et al. (2015) who reported an increase in number of leaves per plant by the application of high rates of vermicompost and NPK in tomato (*Solanum lycopersicum*). Furthermore, the difference in LAI might have been due to the fact that the combination of vermicompost and mineral NPK 17-17-17 promoted cell division in leaves which contributed to the increase in leaf diameter and resulted into high primary photosynthates production and evapotranspiration as an impact of high light intensity captured (Esmaiel et al., 2018).

Plant yield

Results showed that in season A, there was significant difference (p=0.045) in number of pods per crop (table 3). The highest mean number (17.9) was recorded in treatment of 100% NPK17-17-17 combined with 75% vermicompost while during season B, the highest number of pods (22.4) was recorded in plots that were fertilized with 75% NPK 17-17-17 combined with 100% vermicompost. However, when considering the mean number of pods for both seasons, the first combination (100% NPK17-17-17 + 75% vermicompost) proved to be the best. The lowest number of pods was recorded in plots that did not receive any fertilizer for both growing seasons (10.5 and 17 respectively). Therefore, the number of pods per crop are influenced by the levels of combined organic and inorganic fertilizers (Javed et al., 2018). These findings are also in agreement with Biswash et al. (2014) who found a higher number of pod per tree (20) by applying MoP at 20 kg/ha and vermicompost at 8t/ha on mung beans.

The results indicated that there was no significant difference (p>0.05) in both seasons for number of beans per pod. In season A, the highest number of seeds per pod (5.3) was recorded in treatment of 25% NPK 17-17-17 +100% vermicompost whereas the lowest (4.5) was recorded in unfertilized plots. In season B, the highest mean number (5) was recorded in treatment of 50% NPK 17-17-17 +100% vermicompost while the lowest (3.6) was recorded in unfertilized plots. The results showed that there a positive relationship between individual seed weight and total yield (figure 2). The number of seeds per pod is generally influenced by the genetic difference in crop varieties,

but the increase of crop management and proper input application is also of prime importance. Similar results were reported by Channaveerswami (2015) in groundnut.

Results on weight of 100 seeds indicated that there was highly significance ($p=0.001$) in season A. The highest mean weight (55g) was recorded in treatment with 50% NPK 17-17-17 + 50% vermicompost and the lowest mean weight (44.5g) was recorded in control. Furthermore, in season B, the highest mean weight (51.5g) was recorded in treatment with 50% NPK17-17-17+100% vermicompost while the lowest weight (40.1g) was observed in plots that did not receive any fertilizer. The release of ready plant nutrients from inorganic fertilizers supplemented by slow release of plant nutrients from vermicompost explained the difference on beans' weight.

Table 2. Effect of vermicompost only and in combination with NPK 17-17-17 on plant growth at 60th days after sowing (DAS) in two seasons pooled data

Treatments	Plant height (cm)	Number of leaves	Leaf Area index (cm ²)

*Means with the same letter are not significantly different

Yet in control the weight was low compared to the rest of treatments.

The results are similar to those of Yatsenko et al. (2019) who found that vermicompost improved yield, nutritional value and antibacterial properties in garlic (*Allium sativum* L.) and those reported by Singh et al. (2010) who found that application of vermicompost resulted in higher marketable fruits. The results showed that there was significance difference ($p=0.007$) between treatment's effects on total yield in season A. The highest yield (3.7 t/ha) was recorded in treatment with 50% NPK17-17-17 + 50% vermicompost and the lowest weight (2.3t/ha) was recorded in control. In season B there was significant difference at $p=0.019$ and the highest mean weight

(3.8t/ha) was recorded in treatment with 50% NPK17-17-17 + 50% vermicompost while the lowest mean weight (2.3t/ha) was recorded in control. The difference might have been due to the fact that synergism of vermicompost and mineral NPK 17-17-17 improve the physical, chemical and biological properties of soils including supply of almost all the essential plant nutrients for the growth and development of plant which affect both growth and yield parameters. Similar results were reported by Meena et al. (2015) who reported the influence of bioinorganic combinations on yield, quality and economics of mung beans.

Nutritional value of fortified beans

Iron content

Results indicated that there was a highly significant difference ($p < .001$) between treatments in season A on iron content (table 4 and figure 3). The highest iron (10mg/100g) recorded in treatment that received 50% NPK 17-17-17 + 50% vermicompost whereas the lowest quantity (4mg/100g) was recorded in control. Furthermore, in season B, the highest iron content (9.4mg/100g) was recorded in treatment with 50% NPK 17-17-17 + 50% vermicompost while the lowest (5.6mg/100g) was found in control. This may be attributed to the fact that during the decomposition process of vermicompost there are release of micronutrients including iron and roots absorb it and translocate it to the rest parts of the crop. Similar results were found by Chandan and Azad (2015) who stated that growth of vegetable transplants was positively affected by addition of vermicompost, perhaps by altering the nutritional balance of the medium.

Zinc content

The results from laboratory analysis indicated that there was no significant difference ($p > 0.05$) for zinc, in both two seasons (table 4 and figure 3). In season A, the highest zinc (7.9mg/100g) was recorded in plots where 50% NPK17-17-17 + 50% vermicompost was applied while the lowest (5.1mg/100g) was recorded in control. However, in season B the high mean value (7mg/100g) was recorded in treatment treated with 75% NPK 17-17-17 + 100% vermicompost and the low mean value (5mg/100g) was found in control. These results are in line with Chand et al. (2011) who reported an enhanced increase in zinc due the supply of organic and inorganic realizers in rose scented geranium (*Pelargonium* species).

Calcium content

Results indicated that calcium content in beans was significantly different in seasons A ($p = 0.034$). The highest value (187mg/100g) was recorded in treatment that received 50% NPK (17-17-17) + 100% vermicompost whereas low proportions of calcium (126.8mg/100g) were recorded in control (table 4 and figure 3). Yet in season B there was highly significant differences ($p < .001$) between treatments in calcium contents of beans, the highest mean value (187mg/100g) was recorded in treatment with 50% NPK 17-17-17 + 100% vermicompost and the lowest value of 127mg/100g was recorded in control.

The difference in calcium content could be attributed to the fact that the decomposition of vermicompost releases macronutrients including calcium which increase the amount of calcium that are absorbed by beans. In addition, the higher content of Calcium in plots treated with 50% NPK17-17-17 + 100% vermicompost may be resulted from increased uptake of Ca^{2+} ions from the soil. Similar findings were reported by Kumari and Ushakumari (2006) when they assessed the effect of vermicompost enriched with rock phosphate on the yield and uptake of nutrients in cowpea (*Vigna unguiculata*).

Potassium content

Results indicated that there is significant difference ($p < .001$) in potassium content in beans for both seasons (table 4 and figure 3). In season A, the highest mean value of (177mg/100g) was recorded in treatment with 25% NPK 17-17-17 + 100% vermicompost and the lowest value of 129mg/100g in control. The results recorded in season B showed that the highest potassium content (158.7mg/100g) was recorded in treatment with 50% NPK (17-17-17) + 50% vermicompost while the lowest value (150.4mg/100g) was recorded in control. The effect of vermicompost with NPK 17-17-17 was observed. Similar results were reported by Arsalan et al. (2016) reported that there was an increase of phosphorus and potassium which enhance mung beans growth and nutrient uptake.

Magnesium content

Results indicated that magnesium content in harvested beans was significantly different ($p < 0.05$) in both seasons (table 4 and figure 3). In season A, the highest mean value (127.3mg/100g) was recorded in treatment with 100% NPK 17-17-17 + 100% of farmyard manure while the low mean value (111.5mg/100g) was obtained in plot fertilized with 100% vermicompost + 100% NPK 17-17-17. Contrary, the highest value (121.8mg/100g) was found in treatment with 50% NPK17-17-17 + 100% vermicompost and the lowest value of (110.5 mg/100g) was found in control for the results of season B. The effect on magnesium content might have been due the fact that an improved supply of potassium enhances the absorption of magnesium by the crop. This is supported by Altarugio et al. (2017) who reported an increase in magnesium content in rice (*Oryza sativa*) influenced by potassium application in soil.

Proteins

The results showed that there is a significant difference ($p = 0.032$) in protein content for beans cultivated in season A (table 4 and figure 3). The high mean protein content (24g/100g) was recorded in treatment with 50% NPK 17-

17-17 + 50% vermicompost and the low mean value (18.5g/100) was recorded in control. In season B, there was no significant difference ($p>0.05$) and the highest value (23.3g/100g) was recorded in treatment with 75% NPK 17-17-17 +100% vermicompost whereas the low mean value (18.3g/100g) was recorded in control. The effect of fertilizer application on protein content may be resulted from the release of nitrate (NO_3^-) ions from vermicompost plus a fast release of NO_3^- from mineral NPK which is the more available form of nitrogen for plant absorption. Additionally, nitrogen is the basis of amino acids synthesis that are essential components of proteins. These findings are in harmony with Khaim et al. (2013) on soybean and El-Hassan et al. (2013) on green beans who reported an increase of protein contents after application of vermicompost.

Table 4. Effect of vermicompost only and in combination with NPK 17-17-17 on nutritional content

Treatment s	Iron (mg/100g)		Zinc (mg/100g)		Calcium (mg/100g)		Potassium (mg/100g)		Protein (%)		Magnesium (mg/100g)

Conclusions

The improvement of crops' yield is generally correlated with plant's growth. However, the application of inorganic fertilizers without complementing them with organic manure or vermicompost resulted in low yield. The same observations were encountered when the plots received solely vermicompost. The rate of fertilizer's application was not associated with the increase of nutritional content of beans. However, the rate of 150kgs/ha of NPK 17-17-17 in combination with vermicompost at the rate of 5t/ha should be recommended as it has proven its ability to increase plant growth and yield without disheartening the nutritional content of dried beans.

Artificial Intelligence Applications In Livestock

Emre Aydemir¹, İnci Bilge²

¹Department of Animal Science, Faculty of Agriculture, Akdeniz University, 07070 Antalya, Turkey

²Department of Electricity and Energy, Vocational School of Technical Sciences, Mehmet Akif Ersoy University, 15100 Burdur, Turkey

Abstract

Artificial intelligence has begun to be used in almost every field today. One of these areas is animal production. With the help of artificial intelligence in animal production, animal welfare, animal health, disease detection, and classification, yield and performance monitoring, herd management, treatment follow-up, trace and record analysis, epidemiology, herd health, population follow-up, tracking of zoonotic diseases, individual animal behavior, animal It contribute to the access to the most accurate information in a short time on subjects such as interaction, nutrition tracking, and mood. Wearable sensors, functional near infrared spectroscopy measurements, multimode sensors, biometric sensors, video and thermal imaging cameras, microphones and functional near infrared spectroscopy sensors, skin impedance sensors, digital twin modeling, multimode, biometric sensor, respirometers to obtain this information (respiration rate), heart rate monitor, accelerometers and visual sensors are used to obtain information about the animal's condition. This study, it is aimed to give information about artificial intelligence infrastructure applications in animal production.

Hayvancılıkta Yapay Zeka Uygulamaları

Özet

Yapay zeka günümüzde neredeyse her alanda kullanılmaya başlanmıştır. Bu alanlardan biriside hayvansal üretimdir. Hayvansal üretimde yapay zeka yardımıyla hayvan refahı, hayvan sağlığı, hastalık tespiti ve sınıflandırılması, verim ve performans takibi, sürü yönetimi, uygulanan tedavi takibi, iz ve kayıt analizi, epidemiyoloji, sürü sağlığı, popülasyon takibi, zoonotik hastalıkların takibi, bireysel hayvan davranışı, hayvan etkileşimi, beslenme takibi ve duyu durumu gibi konularda kısa sürede en doğru bilgiye erişimi katkı sağlamaktadır. Bu bilgilerin elde edilmesi için giyilebilir sensörler, fonksiyonel yakın kızılötesi spektroskopi ölçümler, çok modlu sensörler, biyometrik sensörler, video ve termal görüntüleme kameraları, mikrofonlar ve fonksiyonel yakın kızılötesi spektroskopi sensörleri, cilt empedans sensörleri, dijital ikiz modelleme, çok modlu, biyometrik sensör, respirometreler (solunum hızı), kalp hızı ölçer, ivmeölçerler ve görsel sensörler kullanılarak hayvanın durumu hakkında bilgi edinilmektedir. Yapılan bu çalışmada hayvansal üretimde yapay zeka altyapılı uygulamaları hakkında bilgi vermek amaçlanmıştır.

Abstract

Artificial intelligence is used in every field, especially in robots, devices, voice assistants, and health services. In addition to these, artificial intelligence applications in the field of animal production have been increasing in recent years. Determining the characteristics of animals such as nutrition, health, efficiency, and performance, artificial intelligence applications provide access to reliable information both easily and in a short time. Thanks to the developed sensors, it is very easy to obtain information about the condition of the animal. However, the number of commonly used sensors, such as disease diagnosis in animals, is limited. One of the sensors used in the diagnosis of diseases in animals is odor sensors. In odor sensors, odor data collection, data preprocessing, feature extraction-size reduction, automatic encoder, classification, evaluation-verification of prediction by classifiers, data preparation, data preprocessing, normalization, and principal component analysis, feature extraction method, automatic encoder, classification, estimation, and verification stages are used. Thanks to the data obtained from these stages, it helps to control animal diseases of domestic and farm animals, prevent economic losses, and to obtain reliable results in a short time. This study, it is aimed to give information about the ways followed in determining the diagnosis of disease by using odor detection sensors and artificial intelligence in animals.

Some Digestive Respiratory And Nervous Diseases Observed In Poultry

Emre Aydemir

Department of Animal Science, Faculty of Agriculture, Akdeniz University, 07070 Antalya, Turkey

Abstract

We consume products of plant and animal origin for a healthy and balanced diet. Among the products of animal origin, products derived from poultry are cheaper than other animal products. Due to its nutrient content and affordable price, its consumption is increasing day by day around the world. With this increasing amount of production, it draws attention to various problems in enterprises. Among these are some digestive, respiratory, and nervous diseases observed in poultry. Diseases such as maw perforation, cloaca prolapse, sinusitis, rupture of the cervicocephalic air sacs, trauma, and Horner's syndrome closely affect the yield and performance of animals. In some cases, it can lead to the death of animals in enterprises. This causes serious economic losses for businesses. This study, it is aimed to give information about some digestive, respiratory, and nervous diseases observed in poultry.

Macro-Anatomical Studies on the Skeletal System of Mammals. II. Ossa Membri Pelvini

Derviş Özdemir¹

¹Department of Anatomy, Faculty of Veterinary, Atatürk University, Erzurum, Turkey

Abstract

The free part of the hind leg is attached to via the os coxae, called the cingulum membrane pelvis. The os coxae of each side both connect with each other via the symphysis pelvina located in the ventro-median, and articulate with the os sacrum inserted between its craniodorsal ends, thus forming a structure called the pelvis. The os coxae is formed by the union of three bones, os ilium, os ischii, and os pubis. The relevant parts of these three bones are fused with each other to form a central and deep pit called the acetabulum. Tuber coxae; equus, it is in the form of a rectangular shape in the middle, in ruminant it has a high center and flattened sides. Incisura acetabuli; It is wide in equus and carnivores, narrow in ruminants and pigs. Tuber ischiadicum; carnivores and pigs have one, equus with two ridges, and ruminant with three ridges. Articulating with the acetabulum, the femur is the longest and thickest of the skeletal bones. Trochanter major is divided into attia incisura trochanterica and pars cranialis and pars caudalis only. Again, only in the middle 1/3 of the length of the femur in the horse, there is the trochanter tertius on the lateral side. Equus and ruminant have fossa supracondylaris, while carnivores and pigs have tuberositas supracondylaris. The patella is a bone located in front of the trochlea ossis femoris and connected to it by joint. Ossa cruris; It consists of the tibia on the inside and the fibula on the outside. On the Tuberositas tibiae is the sulcus tuberositatis tibiae. Skeleton pedis; It consists of ankle bones (ossa tarsitarsus), metatarsal bones (ossa metatarsi-metatarsus) and toe bones (ossa digitorum pedis).

Key Words: Ossa membri pelvini, acetabulum, femur, ossa cruris, skeleton pedis.

Memelilerin İskelet Sistemi Üzerine Makro-Anatomik İncelemeler. II. Ossa Membri Pelvini.

Özet

Arka bacağın serbest olan kısmı cingulum membri pelvini denilen os coxae aracılığı ile omurgaya bağlanmıştır. Her bir tarafın os coxae'sı hem ventro-medianda yer alan symphysis pelvina vasıtasıyla birbiriyle birleşir, hem de craniodorsal uçları arasına sokulmuş olan os sacrum ile eklem yapar, böylece pelvis denilen bir yapı oluşur. Os coxae, üç kemiğin yani os ilium, os ischii ve os pubis'in birleşmesiyle oluşur. Bu üç kemiğin ilgili bölümleri aralarında acetabulum denilen merkezi ve derin bir çukur oluşturacak şekilde birbirleriyle birleşmişlerdir. Tuber coxae; equus'ta ortadan basık bir dikdörtgen şeklinde, ruminant'ta ortası yüksek, yanları basık bir çıkıntılıdır. Incisura acetabuli; equus ve carnivorda geniş, ruminant ve domuzda dardır. Tuber ischiadicum; carnivor ve domuzda tek, equus'ta iki çıkıntılı, ruminant'ta üç çıkıntılıdır. Acetabulum ile eklem yapan femur, iskelet kemiklerinin en uzununu ve en kalınıdır. Trochanter major, sadece attia incisura trochanterica ile pars cranialis ve pars caudalis diye ikiye ayrılmıştır. Yine sadece attia femurun uzunluğu orta 1/3'ünde, lateral tarafta trochanter tertius bulunur. Equus ve ruminant'ta fossa supracondylaris, carnivor ve domuzda ise tuberositas supracondylaris mevcuttur. Patella, trochlea ossis femoris'in önünde yer alan ve ona eklemle bağlanan bir kemiktir. Ossa cruris; iç tarafta bulunan tibia, dış tarafta yer alan fibula'dan oluşur. Tuberositas tibiae üzerinde sulcus tuberositatis tibiae vardır. Skeleton pedis (Arka Ayak İskeleti); ayak bilek kemikleri (ossa tarsi- tarsus), ayak tarak kemikleri (ossa metatarsi-metatarsus) ve ayak parmak kemiklerinden (ossa digitorum pedis) meydana gelir.

Anahtar Kelimeler: Ossa membri pelvini, acetabulum, femur, ossa cruris, skeleton pedis.

Introduction

The free part of the hind leg is attached to the spine via the os coxae. In the ventro-median, the os coxae unite with each other through the symphysis pelvina, and in the craniodorsal they articulate with the os sacrum, which is inserted between its ends, to form the structure called the pelvis (Dursun, 2008; Bahadır and Yıldız, 2008). Os coxae; It is formed by the union of the os ilium, os ischii, and os pubis. The corpuscles of these three bones fuse with each other to form a central and deep pit between them, called the acetabulum. The acetabulum is a pit that articulates with the caput ossis femoris (Evans and Christensen, 1979). The femur is one of the longest and thickest bones of the skeletal bones. It consists of three parts, the upper end, the body and the lower end. The patella is located in front of the trochlea ossis femoris, which is located at its lower end. Patella, m. It is the largest sesame bone in the body, embedded in the tendon of the quadriceps femoris. Ossa cruris; It consists of the tibia on the inside and the fibula on the outside. Skeleton pedis; ossa tarsi, ossa metatarsi and ossa digitorum pedis are divided into three sections (Dursun, 2008; Getty, 1975; Bahadır and Yıldız, 2008).

Materials and Methods

The methods specified in the literature (Taşbaş, 1966) are applied to the bones of the hind legs so as not to damage the bones from the cadaver. The muscle and tissue parts on it are cleaned and the bones are boiled with 100 milliliters of washing soda in 1 liter of water. During the boiling phase, the bones are checked regularly and the meat and cartilaginous structures on the bones are removed. Then, the bones are boiled until the small pieces of meat are completely removed, the water is drained, then washed with soapy water, cleaned and left to dry. The hind leg bones, which are examined macro-anatomically, are photographed from various angles. The terminology was based on Nomina Anatomica Veterinaria (N.A.V.) (Anonymous., 2012).

Results and Discussion

The hind leg articulates with the spine via the os coxae. Left and right, the os coxae unite with each other via the symphysis pelvina located in the ventro-median. Articulating with the os sacrum, which is inserted between the craniodorsal ends, a structure called the pelvis is formed.

Os Coxae

The os coxae is formed by the union of three bones, os ilium, os ischii, and os pubis. The corpus of these three bones are fused with each other to form a central and deep pit between them, called the acetabulum. The acetabulum is a pit that articulates with the caput ossis femoris. Facies lunata on the inner surface of the acetabulum articulate with the caput ossis femoris of the femur.

Os İlium

It shapes the anterior and upper parts of the os coxae. It has two parts: Corpus ossis ilii and ala ossis ilii. There are two shallow areas located ventrolaterally close to the acetabulum. M. rectus femoris to these small, sometimes deep and wide areas, area lateralis m. recti femoris and area medialis m. It is called recti femoris. Ala ossis ilii is the wing-shaped, thin and wide part of the os ileum. It has two faces, called facies glutea and facies sacropelvina, and edges called cranio-dorsal, dorso-medial, and ventro-lateral.

The cranio-dorsal edge of the os ileum is called the crista iliaca. The ventrolateral edge of the os ileum extends to the acetabulum, it is a concave edge. The lateral corner projection between the craniodorsal edge (crista iliaca) and the ventrolateral edge is called the tuber coxae (spina iliaca ventralis), and the medial corner projection between the crista iliaca and the dorsomedial edge is called the tuber sacrale (spina iliaca dorsalis). The third border of the os ileum is the dorsomedial border. It merges with the dorsal edge of os ischii. It has a rough, elongated formation on it. This formation is called spina ischiadica. The notch in front of the spina ischiadica is called incisura ischiadica major, and the notch behind it is called incisura ischiadica minor.

Çevik-Demirkaan et al. (2007) reported that the linea arcuata in chinchillas has a distinct crista shape. Linea arcuata is not prominent in wild boars (Karan, 2012).

Tuber coxae; It is in the form of a rectangular flattened in the horse, a high in the middle and flattened sides in the cattle. Crista iliaca; It is convex in pig and dog, concave in sheep and goat. Spina ischiadica; blunt and low in horse, high in the middle and flattened sides in cattle, spina ischiadica sharp and high in pig, high and sharp in sheep and goat, blunt and low in dog. Incisura acetabuli; It is wide in horse and dog, narrow in ruminant and pig.

Os İschii

The os ischii forms the posterior and lower parts of the os coxae. It has two parts, corpus ossis ischii and ramus ossis ischii. The widest and straightest part of os ischii is called tabula ossis ischii.

Os ischii has two faces and three edges. One of its faces is the inner surface facing the pelvic cavity, the other is the outer surface facing the ventral.

It has three margins, lateral, medial and caudal. Lateral margin extends from acetabulum to tuber ischiadicum, is concave. The caudal edge fuses with the caudal edge of the similar bone of the opposite side, forming a caudale open arch called the arcus ischiadicus. Arcus ischiadicus is narrow and deep in badger (Özdemir and Karan, 2001) and wolf (Girgin et al., 1988), moderately deep in fox (Girgin et al., 1988), porcupine with arrows (Yilmaz et al., 1999) and it has been reported to be superficial in dogs (Girgin et al., 1988). Since arcus ischiadicus is narrow and deep in wild boars, it is similar to badger and wolf.

At the junction of the caudal edge with the lateral edge, there is a protuberance called the tuber ischiadicum. It shapes spina ischiadica at the level of the acetabulum. Tuber ischiadicum; It has two ridges in horses, three in ruminants, and one in pigs and dogs. Tuber ischiadicum has one ridge in porcupine (Yilmaz et al., 1999) and hedgehog (Özkan, 2002), three in ruminants (Getty, 1975), badger (Özdemir and Karan, 2001) and two in domestic pigs (Getty, 1975). has been reported. In wild boars, tuber ischiadicum has three protrusions as in ruminants (Karan, 2012).

Os Pubis

The os pubis forms the anterior and lower parts of the os coxae. It borders the foramen obturatum anteriorly and medially. It has three parts: corpus ossis pubis, ramus cranialis ossis pubis, and ramus caudalis ossis pubis. Corpus ossis pubis is the part of the os pubis that participates in the formation of the acetabulum. It is the body of the bone. The ramus cranialis ossis pubis forms a right angle with the ramus caudalis ossis pubis. It advances to the

acetabulum in front of the foramen obturatum and joins with the corpus ossis pubis, which participates in the formation of this formation. The anterior margin of the ramus cranialis ossis pubis makes a sharp-edged depression. This is called pecten ossis pubis. Again on the same margin, lateral to the pecten ossis pubis and near the acetabulum, there is a ridge on the junction of the os ileum and ramus cranialis ossis pubis, called eminentia iliopubica. Ramus caudalis ossis, there are protuberances on the dorsal and ventral of the angle where the pubis joins with the ramus cranialis ossis pubis, the situations of which vary according to the animal species. The dorsal one is called tuberculum pubicum dorsale, and the ventral one is called tuberculum pubicum ventrale.

Foramen Obturatum

It is a large hole at the base of the os coxae, formed by the os pubis and os ischii. This hole was closed with the membrana obturatoria. Anterior and slightly lateral to the foramen obturatum is the sulcus obturatorius. Since the membrana obturatoria does not partially cover this groove, a channel is formed here, it is called canalis obturatorius. From this channel a. obturatoria, v. obturatorii and n. obturatorius passes. Foramen obturatum; badger (Özdemir and Karan 2001), marten (Atalar and Özdemir, 2002), squirrel (Özdemir and Atalar, 2003), porcupine (Özkan, 2002), wolf, fox, dog (Girgin et al., 1988) and hedgehogs (Özkan, 2002) and wild boars (Karan, 2012).

Skeleton Femoris

Os Femoris

The femur is the longest and thickest of the skeletal bones. The bone consists of three parts, the upper end, the body, and the lower end. At its upper end (extremitas proximalis), there is a spherical structure that is mostly flat and covered with articular cartilage. This structure is called the caput ossis femoris.

The caput ossis femoris faces upward and medially and articulates with the acetabulum. In the posterior lower part of the articular surface, there is a small pit called the fovea capitis. While the trochanter major is in one piece in the ruminant, it is divided into incisura trochanterica and pars cranialis and pars caudalis in the horse. Trochanter major; It is at the level of the caput ossis femoris in dogs, and slightly above the level of the caput ossis femoris in sheep and goats.

In the dog (Evans and Christensen, 1979), the trochanter major is at the same level as the caput ossis femoris; In otters (Dinç et al., 1999), it has been reported to be below the caput ossis femoris level.

Trochanter minor; It is a long and sharp crista in horses, a minor rounded ridge in cattle, and a flattened, broad ridge in pigs.

At the middle 1/3 of the length of the femur, there is the trochanter tertius on the lateral side. Evans and Christensen (1979) found that trochanter tertius was not found in dogs, Özdemir and Karan (2001) in badgers; Dinc et al. (1999) stated that in otters, Atalar and Özdemir (2002) stated that the trochanter tertius is in the form of a crista in marten.

Fossa supracondylaris; very deep in horse, shallow in cattle, tuberositas supracondylaris in place of fossa supracondylaris in pig and dog. Tuberositas supracondylaris in wild boars (Karan, 2012) in dogs, wolves, foxes (Girgin et al., 1988), otters (Dinç et al., 1999), domestic pigs (Getty, 1975) and badgers (Özdemir and Karan 2001). whereas, the fossa supracondylaris lateralis is located at the site of this formation.

Patella

The patella is a bone located in front of the trochlea ossis femoris and connected to it by joint. It is the largest sesame bone in the body, embedded in the tendon of the quadriceps femoris. Patella has two parts called basis patellae and apex patellae, facies articularis and facies cranialis.

Patella; oblong in horse, triangular in cattle, patella of other animals more or less oval.

Skeleton Cruris

Ossa Cruris

Leg bones correspond to skeleton antebrachii in the forelimb. As in the front leg, there are two bones here. Ossa cruris; It consists of the tibia on the inside and the fibula on the outside.

Tibia

This bone is the longest bone in the body after the femur. It is located on the medial side of the leg skeleton. It articulates with the os femoris above and with the ossa tarsi below.

Extremitas proximalis is more voluminous than extremitas distalis. This end carries two large formations, condylus medialis and condylus lateralis. These two condyles are separated from each other by the anterior and external sulcus extensorius and posterior incisura poplitea.

In front of the upper end of the tibia is a projection called the tuberositas tibiae. Above this protrusion is a groove, sulcus tuberositas tibiae, to which the ligamentum patellae intermedium attaches. Getty (12) reported that the tuberculum intercondylare mediale is higher than the tuberculum intercondylare laterale in the equidae and ruminant. Tuberculum intercondylare laterale is higher in wild boars (Karan, 2012).

Corpus tibiae, three margins particularly prominent on the upper half; margo cranialis, margo medialis, margo lateralis and the three faces bounded by these edges show facies medialis, facies lateralis and facies caudalis.

The distal end of the tibia is called the cochlea tibiae. On the inner side of the lower end of the tibia, there is a protrusion that elongates distally, this protrusion is called the malleolus medialis. There is a longitudinal groove,

sulcus malleolaris, on the outer surface of the malleolus medialis. There is also a protrusion on the outer side of the lower end of the tibia. This is the malleolus lateralis. It has been reported that the articular surface of the tibia of the cochlea is divided into two by a sagittal crista in goats (Taşbaş, 1978) and porcupines (Yilmaz et al., 1999), and by an oblique crista in dogs (Girgin et al., 1988).

The surface of the distal end of the tibia, which articulates with the tarsal bones, is divided into two articular pits by means of an oblique (lateral) axis in the equidae and carnivores, and a sagittal ridge in the ruminant.

Atta, there is sulcus tuberositatis tibiae on tuberositas tibiae. Articular surface at the distal end; It is divided into two articular pits by means of an oblique in horse and dog and a sagittal crista in ruminant. In the ruminant, there is a third articular surface specific to the articulation of the os malleolare.

Fibula

It is a thin, long bone located lateral to the tibia. Although it is present in some of the species completely, in some it has been atrophied and in some it has disappeared completely.

The fibula is fully present only in pigs and carnivores. It extends to the distal end of the tibia, or even a little lower. In these species, the fibula is examined by dividing it into two ends and a body. In the equidae, the lower half of the fibula fuses with the tibia at an early age. For this reason, the fibula has an upper end called the caput fibulae and a free part of the tibia that can only reach the middle.

The corpus fibulae of the fibula in the ruminant has completely disappeared. The caput fibulae is found as a small protrusion attached to the lateral condylus of the tibia, or even fused. Its distal end forms a small special bone called the os malleolare.

In pig and carnivores, it consists of three parts. Its upper end is called the caput fibulae. Between the caput and corpus of the fibula is an indistinct collum fibulae. The lower end of the fibula is called the malleolus lateralis. Medial to this end is an articular surface, facies articularis malleoli, which articulates with the talus. A groove called sulcus malleolaris is also seen on the outer surface of the malleolus lateralis.

Demirsoy (1992) stated that the tibia and fibula may be separated or fused in rodents. In porcupines with arrows, the fibula fused with the tibia proximally and formed a joint distally (Yilmaz et al., 1999).

Skeleton Pedis

Skeleton pedis; It consists of ankle bones (ossa tarsitarsus), metatarsal bones (ossa metatarsi-metatarsus) and toe bones (ossa digitorum pedis).

Talus

It is the second largest bone of the tarsal bones after the calcaneus. It is divided into three parts: caput tali, collum tali and corpus tali.

In ruminants and pigs, the caput tali forms a depression between two convex sides in the dorsoplantar direction and between these two edges. Collum tali is the neck part that is wide and short in the equidae and not very prominent in other animals.

The trochlea tali is similar to the articular surfaces of the cochlea tibia, that is, it is bordered by two sides oblique in the equidae and sagittal in the ruminant.

It is in the form of two overlapping trochlea, the trochlea tali ruminant and the susta trochlea tali proximalis and trochlea tali distalis. Trochlea subordinate; In horse the body is oblique with respect to its long axis and there is one, in cattle it is limited by two sides parallel to the long axis of the body and there are two on each other.

Calcaneus

It is the largest of the tarsal bones. It is located behind the talus. The free end of the calcaneus, which is raised and not articular, is called the tuber calcanei. Distal to the margin in front of the free segment proximal to the calcaneus, there is a pointed protrusion elongated anteriorly. This protrusion, called the processus coracoideus, is best seen on the equidae.

Arranged from medial to lateral in the distal row of tarsus bones; There are four bones named os tarsale primum, os tarsale secundum, os tarsale tertium, os tarsale quartum. This number and order only applies to carnivores and sus. Because there is no fusion between bones in these animals. In equidae, os tarsale primum and os tarsale secundum are fused. Therefore, there are three bones in this row. In the ruminant, the distal row bones are two due to the fusion of the os tarsale secundum and the os tarsale tertium and the fusion of the os tarsale quartum with the os tarsi centrale.

It was stated that there is a bone called scaphoide accessoire by Romer and Parsons (1978) in the medial of the os naviculare (os scaphoideum or os tarsi centrale) in the ankle bones of rodents such as Marmota and Myopotamus. The bone in question was also found to be located in the medial of the collum tali and the dorso-medial of the os naviculare in porcupines (Yilmaz, 1999).

Metatarsus

It is located between the tarsal bones and the phalanges. They are arranged parallel to each other and from medial to lateral; It is called os metatarsale primum, os metatarsale secundum, os metatarsale tertium, os metatarsale quartum, os metatarsale quintum.

Equidae has three metatarsus. These are the 2nd, 3rd and 4th metatarsus. The main metatarsus, which is in the middle and number 3 (os metatarsale tertium), and metatarsus number 2 and 4, located on both sides of the plantar surface of the main metatarsus, are the secondary metatarsus. Metatarsus 1 and 5 are absent.

Ruminant has three metatarsus. These are the 2nd, 3rd and 4th metatarsus. Numbers 3 and 4 were fused with each other and a single metatarsus was formed. Metatarsus 2 is attached to the posterior side of the upper end of metatarsus 3 as a small bone. Metatarsus 1 and 5 are absent.

There are four metatarsus in sus. These are the 2nd, 3rd, 4th and 5th metatarsus. The number 1 metatarsus is absent. Metatarsals 3 and 4 are the main metatarsal bones and are adhered to each other, there is no fusion. Metatarsus 2 and 5 are secondary ones.

Carnivores have five metatarsus.

Ossa Digitorum Pedis

These are the bones that come after the metatarsal bones. In species with a full number of fingers (carnivores), they are called the first, second, third, fourth and fifth fingers from the inside out.

The number of fingers is equal to the number of the main metatarsus. Equidae has 1 finger because there is one main metatarsus, and there are 2 fingers because there are two main metatarsus in the ruminant. Each finger has three phalanges. These are phalanx proximalis, phalanx media and phalanx distalis.

Demirsoy (1992) and Yilmaz et al. (1999) found that porcupines have short legs, while Demirsoy (1992) and Oktay (1988) found that there are five fingers on the extremities.

Macro-anatomical Comparison of Celiac Artery in Hasak and Hasmer Sheep

Dervis Ozdemir¹

¹Department of Anatomy, Faculty of Veterinary, Atatürk University, Erzurum, Turkey

Abstract

This research was carried out to analyze the macro-anatomically of celiac artery and its branches, which is the common root of the vessels that provide nutrition to the stomach, liver, spleen and pancreas and the initial parts of the small intestine in hasak and hasmer sheep breeds. Six hasak and hasmer sheep were used in the study. Colored latex and monopolymethymethacrylate were given to the abdominal aorta. In both sheep breeds, it was determined that the first branch of the abdominal aorta in the cavum abdominis was celiac artery. Celiac artery first originated from lineal artery and then hepatic artery and gastric sinister artery as a common root. Branches named rami pancreatic rami, epiploic ramus, ruminal sinister artery and ruminal dexter artery originated from lineal artery. It was determined that hepatic artery gave cystic artery, gastric dexter artery, pancreatic rami and gastroduodenal artery. Gastric sinister artery was continuing its course as a continuation of celiac artery. During its course, the reticular artery was giving off gastroepiploic sinister artery and reticular accessory artery. As a result; It was determined that the veins originating from celiac artery in hasak and hasmer sheep breeds had some differences. It was concluded that these differences may be due to the genetic structure of the breeds.

Key Words: Anatomy, celiac artery, hasak, hasmer, sheep.

Hasak ve Hasmer Koyunlarında Arteria Celiaca'nın Makro-anatomik Olarak Karşılaştırılması

Özet

Bu araştırma, hasak ve hasmer koyun ırklarında mide, karaciğer, dalak, pankreasın ve ince bağırsağın ilk kısımlarının beslenmesini sağlayan damarların ortak kökü olan arteria celiaca'nın ve dallarının makro-anatomik olarak incelenmesi amacıyla yapılmıştır. Çalışmada altışar adet hasak ve hasmer koyun kullanıldı. Abdominal aortaya renkli lateks ve monopolimetilmetakrilat verildi. Her iki koyun ırkında da aorta abdominalisin cavum abdominis içindeki ilk dalının arteria celiaca olduğu belirlendi. Arteria celiaca, önce lineal arterden, daha sonra ortak bir kök olarak hepatik arter ve gastrik sinister arterden köken almıştır. Lineal arterden köken alan rami pankreatik rami, epiploik ramus, ruminal sinister arter ve ruminal dexter arter olarak adlandırılan dallar. Hepatik arterin kistik arter, gastrik dexter arter, pankreatik rami ve gastroduodenal arter verdiği belirlendi. Gastrik uğursuz arter, çölyak arterin devamı olarak seyrine devam ediyordu. Seyri sırasında retiküler arter, gastroepiploik uğursuz arter ve retiküler aksesuar arterden çıkıyordu. Sonuç olarak; Hasak ve hasmer koyun ırklarında çölyak arterden çıkan damarların bazı farklılıklar gösterdiği belirlendi. Bu farklılıkların ırkların genetik yapısından kaynaklanabileceği sonucuna varılmıştır.

Anahtar Kelimeler: Anatomi, arteria celiaca, hasak, hasmer, koyun.

Introduction

Since the past years, breeding studies have been carried out on various sheep breeds in our country. As a result of crossbreeding studies initiated at Bahri Dağdaş International Agricultural Research Institute in 1989; Hampshire Down (HD), German Black-Headed Meat sheep (ASB) and Hasak sheep breed with high meat yield carrying Akkaraman genotype has been developed. Males and females of the sheep breed with a long and thin tail do not have horns (Akmaz et al., 1999). As a result of crossing the German Black Head and Hampshire Down (HD) rams with the Merino sheep, the Hasmer sheep breed was developed in the same Institute. Hasmer sheep breed carries the characteristics of the sheep it is crossbred with and adapts well to environmental conditions. It has a large and robust body, a wide and deep chest structure (Sönmez et al., 2009).

The arteria celiaca supplies the liver, spleen, pancreas, stomach, and the initial part of the duodenum. Arteria celiaca gives off three main branches: arteria gastrica sinistra, arteria hepatica, and arteria lienalis; (Dursun, 2008; Dyce et al., 1987; McCarthy, 1984; Smuts and Bezuidenhout, 1987; Karmona and Kovachec, 1985). Although research has been done on some sheep breeds (Karmona and Kovachec, 1985; Karadağ, 1998; Türkmenoğlu, 1996; Langenfeld and Pastea, 1977; Mohamed et al., 2016), there is no evidence on arteria celiaca in Hasak and Hasmer sheep breeds obtained through breeding studies. It has been determined that no study has been carried out. In this study, arteria celiaca in both Hasak and Hasmer sheep breeds was examined comparatively and its differences with other breeds were investigated.

Materials and Methods

Six hasak and six hasmer sheep, supplied from Konya Bahri Dagdaş International Agricultural Research Institute, Experimental Animals Unit, were used. After washing with 10% saline, red fabric dye and latex were mixed and

injected into the aorta abdominalis. The materials were kept in 10% formaldehyde solution for 24 hours and dissected. The photographs of the materials whose dissections were completed were taken with the Nikon P900 83X Optical Zoom brand camera. The terminology was based on Nomina Anatomica Veterinaria (N.A.V.) (Anonymous., 2012).

Results and Discussion

It was observed that aorta abdominalis passed from cavum thoracis to cavum abdominis via hiatus aorticus. It was determined that arteria celiaca was traveling ventrally at the level of the first lumbar vertebra. It was observed that the first vein branching from arteria celiaca was arteriae phrenicae caudales. Later, it was determined that arteria lienalis, arteria hepatica and arteria gastrica sinistra originated as a common root, respectively. Findings that indicate the origin of arteria celiaca and the first branch of the aorta abdominalis were also found in some sheep (Mohamed et al., 2016) and goat breeds (Mohamed et al., 2017; Youssef, 1991). Özudoğlu et al. (2019) In Konya Merino; While Dursun (2008) and Türkmenoğlu (1996) reported that arteria celiaca originates from between the last thoracic and first lumbar vertebra in the ruminant, Alsafy (2009) and El Gendy (2007) reported that in goats, from the ventral of the aorta abdominalis at the level of the 1st and 2nd lumbar vertebrae. Some researchers (Karmona and Kovachec, 1985; Langenfeld and Pastera, 1977; Alsafy, 2009; Machado et al., 2002) stated in some of the materials that arteria celiaca had a common root with arteria mesenterica cranialis, aorta abdominalis. They reported that it was of origin.

Özudoğlu et al. (2019), Türkmenoğlu (1996) found that arteria hepatica and arteria gastrica sinistra emerged as a common root in three of the sheep they used as material, and Maala et al. (1988) reported that the arteria celiaca branching in goats was in six different ways, and in one of them, arteria gastrica sinistra and arteria hepatica emerged as a common root. In this study, it was determined that arteria gastrica sinistra and arteria hepatica originated from arteria celiaca as a common root. Some authors (Smuts and Bezuidenhout, 1987; Maala et al., 1988; McCarthy, 1984; Dyce et al., 1987) are from arteria celiaca; stated that arteria lienalis, arteria gastrica sinistra and arteria hepatica emerged as three separate branches. Some researchers (Alsafy, 2009; Perez et al., 2016) from arteria celiaca; They stated that they are divided into four branches as arteria lienalis, arteria hepatica, arteria gastrica sinistra and arteria ruminalis sinistra.

It was observed that the artery entering the hilus lienalis as arteria lienalis after giving ramus epiploicus and arteria ruminalis sinistra and arteria ruminalis dextra for the omentum majus after arteria lienalis gave rami pancreatici to the pancreas was divided into two branches. It was stated that similar findings were observed in goat (Alsafy, 2009) and buffalo (Machado et al., 2002).

It was observed that arteria ruminalis sinistra, originating from the left side of the arteria lienalis, followed a caudoventral course and reached the right side of the atrium ruminis. It was determined that this vein, which later passed through the sulcus cranialis of the rumen, gave branches that vascularized the parietal surface of saccus cecus craniodorsalis and saccus cecus cranioventralis in its course in the sulcus longitudinalis sinister. Boccaletti and Borelli (1981) and Mohamed et al. (2016), Mohamed et al. (2017) reported the same findings in goats.

It was determined that arteria ruminalis dextra originates from the right side of arteria lienalis and reaches the visceral surface of the rumen with a caudoventral course. It was determined that the arteria ruminalis dextra, which runs inside the sulcus longitudinalis dexter, extends to the sulcus caudalis and ends by passing through this groove to the parietal surface of the rumen. During its course, it was observed that the rumen gave coronary arteries that vascularized the saccus cecus on the parietal and visceral surface.

Originating from arteria celiaca as a common root with arteria gastrica sinistra, arteria hepatica runs from the visceral side of the liver towards porta hepatis and continues its course as arteria gastroduodenalis after giving vessels named arteria cystica, arteria gastrica dextra and rami pancreatici at the level of porta hepatis. detected. It was determined that this vessel, which was named arteria gastroepiploica dextra after the arteria gastroduodenalis gave the arteria pancreaticoduodenalis cranialis, anastomose with the arteria gastroepiploica sinistra in the curvatura minor of the abomasum. It has been reported in the literature (Dursun, 2008) that arteria hepatica is a thicker vessel than arteria gastrica sinistra. In this study, it was determined that arteria hepatica was thinner than arteria gastrica sinistra.

After separating from the arteria hepatica, it was determined that arteria cystica, which travels on the visceral surface of the liver, dispersed into the vesica fellea. The report of arteria cystica in goat (Alsafy, 2009), ruminant and sus (Getty, 1975) that it travels on the visceral surface of the liver and extends to vesica fellea after starting from arteria hepatica is similar to the research findings.

It was determined that arteria gastrica dextra running on the visceral side of the liver anastomosed with arteria gastrica sinistra after giving arteria lobe caudati for the caudal lobe of the liver. During the course of the abomasum on the curvatura minor, it was observed that it gave the omentum minus and branches feeding this edge.

It was observed that arteria gastroduodenalis, which is seen as a continuation of arteria hepatica, gave arteria pancreaticoduodenalis cranialis and was named arteria gastroepiploica dextra on the curvatura major of abomasum. It was determined that the arteria gastroepiploica dextra ended by anastomosis with the arteria gastroepiploica

sinistra and vascularized the curvatura major edge of the abomasum and the omentum majus during the course of the vessel.

It was observed that arteria pancreaticoduodenalis cranialis, originating from arteria gastroduodenalis, gave branches feeding the duodenum and pancreas in the pars cranialis part of the duodenum. Anastomosis was observed with arteria pancreaticoduodenalis caudalis, a branch of arteria mesenterica cranialis.

It was observed that arteria gastrica sinistra, which originates from arteria celiaca as a common root with arteria hepatica, is in the continuation of the vessel. It was noted for being the thickest of branches given by Arteria celiaca. It was determined that this vessel gave the arteria reticularis first during its course, and after giving the arteria gastroepiploica sinistra and arteria reticularis accessoria in the area between the omasum and the reticulum, it continued its course by giving right and left branches on the visceral surface of the omasum. It was determined that the abomasum was terminated by anastomosis with the arteria gastrica dextra on the curvatura minor side.

It was observed that arteria reticularis, originating from arteria gastrica sinistra, gave branches named ramus ruminalis and ramus reticularis in its course within the sulcus reticuloruminalis. It has been determined that the arteria reticularis, which feeds the atrium ruminis of the rumen and the caudal aspect of the reticulum, originates from the arteria gastrica sinistra. Nayar et al. (1983) goat, Türkmenoğlu (1996) sheep, Smuts and Bezuidenhout (1987) camel, Machado et al. (2002) in the buffalo arteria reticularis from arteria gastrica sinistra; Alsafy (2009) from arteria ruminalis sinistra in goat; Mohamed et al. (2016) reported that they originated from the arteria gastrica sinistra or arteria ruminalis sinistra in sheep.

The arteria gastroepiploica sinistra, which originates in the cranioventral direction from the arteria gastrica sinistra on the atrium ruminis, passes through the sulcus reticulo-omasi and anastomoses with the arteria gastroepiploica dextra on the curvatura major side of the abomasum and during its course and the omentum majus, reticulum and omentum majus, reticulum.

It was determined that arteria reticularis accessoria, originating from arteria gastrica sinistra immediately after arteria gastroepiploica sinistra, gave some branches on the visceral surface of the reticulum and the parietal surface of the omasum.

As a result; It has been determined that there are some differences between each other and according to other sheep breeds from the beginning of arteria celiaca in the aorta abdominalis to the branches that vascularize the organs in Hasmer and Hasak sheep used as research material. It was concluded that the detected differences may be due to racial characteristics.

Macro-anatomical Studies on the Pancreas of Mammals

Derviş Özdemir¹

¹Department of Anatomy, Faculty of Veterinary, Atatürk University, Erzurum, Turkey

Abstract

In mammals, the pancreas is a lobed, gray-pink gland. It has a total length of approximately 410 mm, a width of approximately 10-30 mm, and a maximum thickness of approximately 10 mm. The stomach is located between the liver and duodenum. A large portion of the anterior and upper abdominal cavity is located to the right of the midline, and a small portion is located to the left. It has a salivary gland structure and has internal and external secretions. It has three parts: corpus pancreatis, lobus pancreatis dexter, and lobus pancreatis sinister. Since the pancreas has two drafts, one upper and one lower, in embryonal development, there is also a draining duct belonging to these drafts. These drafts combine to form the pancreas. However, since the ducts of these drafts do not unite, the pancreas has two ducts. One of these channels is the ductus pancreaticus of the lower draft and the other is the ductus pancreaticus accessorius of the upper draft. Most of the pancreas is made up of exocrine tissue. Its external secretion contains a wide variety of digestive enzymes. This secretion is drained into the duodenum by a duct, the ductus pancreaticus, which varies according to the animal species. The part of the pancreas that makes internal secretion (pars endocrina pancreatis) consists of cell clusters called insulae pancreatae, also called islets of langerhans. These cells are called insulocyti.

Key Words: Pancreas, macro-anatomy, microscopy, mammal.

Memelilerin Pankreası Üzerine Makro-anatomik incelemeler

Özet

Memeli hayvanlarda pancreas loplü, gri-pembe renkli bir bezdir. Toplam uzunluđu yaklaşık 410 mm, genişliđi yaklaşık 10-30 mm ve maksimum kalınlıđı yaklaşık 10 mm'dir. Mide, karaciđer ve duodenum arasında yer alır. Karın boşluđunun ön ve üstünde büyük kesimi orta çizginin sađında, küçük bir parçası da sol tarafta bulunur. Tükürük bezi yapısındadır, iç ve dış salgısı vardır. Corpus pancreatis, lobus pancreatis dexter ve lobus pancreatis sinister olmak üzere üç kısmı vardır. Pankreas embriyonal gelişiminde biri üst, diđer alt iki taslađa sahip olduđundan bu taslaklara ait birer de akıtıcı kanalı mevcuttur. Bu taslaklar birleşerek pankreası oluşturur. Oysa bu taslaklara ait kanallar birleşmediklerinden pankreas iki kanala sahip olur. Bu kanallardan biri alt taslađa ait ductus pancreaticus diđer üst taslađa ait ductus pancreaticus accessorius'tur. Pankreasın büyük bölümü, dış salgısını yapan dokudan oluşur. Dış salgısı çok çeşitli sindirim enzimlerini içerir. Bu salgı hayvan türlerine göre deđişiklik gösteren bir kanal, ductus pancreaticus ile duodenum'a akıtılır. Pankreasın iç salgısını yapan kesimi yani (pars endocrina pancreatis), langerhans adacıkları da denilen insulae pancreatae adındaki hücre kümelerinden oluşur. Bu hücreler insulocyti diye isimlendirilir.

Anahtar Kelimeler: Pankreas, makro-anatomy, microscopy, mammal.

Introduction

In mammals, the pancreas is a lobed, gray-pink gland. The pancreas is located between the stomach, liver and duodenum. A large part of the anterior and upper abdominal cavity is located on the right of the midline, and a small part is located on the left (Dursun, 2012). It has three parts: corpus pancreatis, lobus pancreatis dexter and lobus pancreatis sinister (Dursun, 2012; Sisson, 1975a; Konig and Liebich, 2007). The pancreas consists of an exocrine part, which is responsible for the production of some digestive enzymes, and an endocrine part, which produces the hormones insulin and glucagon, which play a role in the regulation of the body's carbohydrate metabolism (Banks, 1986). The exocrine part of the pancreas is a composite tubuloacinar gland that produces digestive enzymes (Frappier, 2007). The endocrine part produces hormones (Hafez et al., 2015).

For decades, the pancreas in experimental animals has been extensively studied in relation to its physiological component. Since the discovery of insulin in 1921 and its direct relationship to glucose metabolism, and research involving inflammatory, ischemic, and neoplastic morbidities, it has been clear that experimental models are needed to better understand local and systemic organic effects (Aghdassi et al., 2011; Cattley et al., 2013; Stan 2014; 2015; 2017). Detailed anatomical studies have been conducted in mice, rats, monkeys, dogs, and mini-pigs (Pandiri, 2014; Tsuchitani et al., 2016), with the exception of domestic animals, where the pancreas has been extensively studied both macroscopically and microscopically.

It is very important to know the anatomy of the pancreas in pancreas transplantation, operations to be performed and in the development of surgical techniques.

Materials and Methods

Pancreatic tissue samples of animals euthanized with high-dose ether anesthesia are taken for histochemical and electron microscopic examinations. Tissues are fixed in Bouin and Carnoy solutions for light microscopic examination. It is then passed through graded alcohols and xylol and blocked with a paraplast. In order to show the general structure of the tissue, sections of 5-6 microns obtained from the blocks, Mallory's triple staining modified by Crossman and aldehyde fuchsin light green orange G (AF) staining is performed to identify A and B cells (Bancroft and Cook, 1984). Tissue samples taken for electron microscopic examinations are kept for 24 hours in the pre-detection of glutaraldehyde-paraformaldehyde (pH 7.4) according to the Karnovsky (1965) method, then washed in cacodylate buffer and fixed in osmic acid for the second time. Araldite is blocked in M by passing through graded alcohols and propylene oxide. Semi-thin sections taken from these blocks are stained with toluidine blue. In semi-thin sections, the regions sought for electron microscopic examinations are marked and thin sections of 300–400 Angstroms are taken. After contrast staining with uranyl acetate and lead citrate, it is examined under a Carl Zeiss EM 9 S-2 model transmission electron microscope.

Results and Discussion

The pancreas was retroperitoneal, close to the second and third lumbar vertebrae, the head was attached to the duodenum, the body was extended transversely from the posterior abdominal wall, and its tail extended to the hilum of the spleen. According to Miyaki et al. (1964) stated that the rat pancreas consists of a body and two (right and left) lobes. The pancreatic body was located along the cranial part of the duodenum. The right lobe extended towards the duodenal ligament, and the left lobe towards the spleen, towards the duodenal ligament. In contrast, Takahashi et al. (1977) reported that the pancreas of the Syrian hamster consists of a head and three well-defined parts: duodenal, gastric, and spleen lobes. Ozdemir (2005) stated that the pancreas is located in the mesoduodenum and consists of three lobes in the hedgehog and badger.

The pancreas has two outlines in its embryonal development, one upper and the other lower. There is also a flow channel for these drafts. These drafts combine to form the pancreas. However, since the ducts of these drafts do not merge, the pancreas has two ducts. One of these channels is the lower ductus pancreaticus and the other is the upper ductus pancreaticus accessorius. Equide, carnivor, and human have both of these channels. Ductus pancreaticus is long and thick in the horse. It opens at the apex of the papilla duodeni major, side by side with the ductus choledochus. Ductus pancreaticus accessorius is slender. Opposite where the ductus pancreaticus opens, it opens into the papilla duodeni minor. The dog has both pancreatic ducts, but the ductus pancreaticus accessorius is larger. This channel is 2-3 cm from the papilla duodeni major. distance, the papilla opens into the duodenum minor. Large ruminant and sus have only ductus pancreaticus accessorius. Starting from the lobus pancreatis sinister, this duct opens into the upper wall of the duodenum, 30-40 cm from the opening of the bile duct in the large ruminant, and 12-25 cm in the pig. The small ruminant has a single draining duct, the ductus pancreaticus. This duct opens into the papilla duodeni major together with the ductus choledochus.

The pancreas does not contain a complete fibrous capsule at its outer border. However, it is covered with a thin layer of loose connective tissue from which septa extend to divide the gland into lobules. The edges of the largest lobules are visible even to the naked eye. Blood and lymph vessels, nerves and excretory ducts are located in the connective tissue septa. The lobules contain a variable number of acini, formed by pyramidal cells, each located in a single layer, covered with a basal lamina and forming a narrow lumen.

The pancreas is divided into some lobules by connective tissue. A series of islets of Langerhans are observed between the pancreatic acini. These islets consist of many endocrine cells. A single endocrine cell can also be distinguished in the exocrine pancreas. The pancreas consists of both exocrine and endocrine regions. A thin connective tissue capsule surrounds the pancreatic islet and separates it from other pancreatic cells. The pancreatic islet is vascularized by numerous blood vessels and capillaries. Each exocrine secretory acini consists of pyramidal-shaped clusters of cells arranged around a small lumen. The endocrine part of the pancreas, the pancreatic islet, is separated from the secretory acini of the exocrine pancreas by a thin connective tissue. The islet of the pancreas does not contain excretory ducts. Instead, it leaves the islet via numerous blood capillaries, which are highly vascularized and contain all secretory products. In contrast, the secretory elements of the exocrine pancreas deliver their secretory products directly to an excretory duct.

Basal parts of the cell are intensely basophilic. The nucleus is localized in the central-basal part of the cytoplasm. The apical cytoplasm is filled with secretory granules, often called zymogen granules, as they contain precursors of pancreatic juice enzymes (Fawcett, 1986; McCuskey and Chapman, 1969; Motta, 1990; Ozdemir, 2005). Junqueira et al. (1998), Tanyolac (1993), stated that pancreatic islets do not contain excretory ducts. Instead, it is highly vascularized and contains a large number of blood vessels. However, the secretory elements of the exocrine pancreas deliver their secretory products directly to an excretory duct.

Evaluation of the effects of drying methods on post aflatoxin infection in maize

Erastus DUSHIMEYESU^{1*}, Sylvestre HABIMANA¹, Fabrice MUSANA RWALINDA¹,

¹Department of Crop Sciences, University of Rwanda, Musanze, Rwanda

*Corresponding Author

Abstract

The cultivation and the usage of maize have been significantly increased across all provinces of Rwanda. Nevertheless, the problem of aflatoxin contamination remains a major factor that renders them to be unfit for animal and human consumption. In this research, the effects of drying methods (sun drying, kitchen drying, dry shelter) post aflatoxin infection in maize were evaluated in Northern Rwanda. A randomized complete block design with four replications was used with maize variety (H628) with drying methods as the main plot. Maize samples were tested for aflatoxin using aflatest. In both seasons (2021A and 2021B) the aflatoxin results show that the aflatoxin infection levels were lower in maize dried with kitchen drying (1.4 ppb) compared to the samples dried with sun drying (1.6ppb) and dry shelter (2.2). Also, it was seen that the three drying methods are good for reducing the aflatoxin infection levels lower than 10ppb as standards limit for East African countries. The aflatoxin infection levels were found to be significant (≤ 10 ppb) as results of kitchen drying than sun drying and dry shelter methods. This research resulted that proper drying such as drying maize on kitchen fire (kitchen drying) produce the lower level of aflatoxin infection in maize.

Key Words: Maize, aflatoxin, drying, methods.

Introduction

Maize is a vital staple crop in most Sub-Saharan African countries including Rwanda producing food that is consumed by the majority of the population in different nature, the small-scale farmers focus on cultivating a lot of quantity of food crops such as wheat, sorghum and potatoes on a large quantity of land, maize is a crop which is very important not only for consumption but also for commercial purpose because Rwanda farmers use to trade them with Tanzania and Uganda (Daly *et al.*, 2016). Northern province of Rwanda produces a half of maize produced in Rwanda where many of them (60%) are processed into other crucial products like maize flour, most of people used to trade them informally where 80 % of maize are commercialized in that way with in the neighboring countries. Aflatoxin contamination has resulted in lower nutritional qualities in Rwandan maize output due to a variety of variables that happened throughout before and after harvesting stage (Nishimwe *et al.*, 2019). Aflatoxin can also be controlled by appropriate drying after harvesting with the appropriate time, insect control which may affect maize during storage after harvesting as well as protecting stores against pests by adopting biopesticides, all of these practices can help to limit mycotoxins upon post-harvest (Niyibituronsa *et al.*, 2020). The aim of this study was to evaluate the best drying method which can be adopted to minimize the level of aflatoxin in maize.

Materials and Methods

Area for research

Experimental fields have been carried in the farm of the College of Agriculture, Animal Sciences and Veterinary Medicine, University of Rwanda situated in the Northern province, Musanze District, Busogo Sector at 72 km from Kigali as Capital city of Rwanda to the North-West. Latitude of 1° 33' 32" South & 29° 32' 57" of Longitude East with an elevation of 2,221 m above sea level. In January, the average temperature in Busogo is 20°C and in May it is 17°C. The soil is relatively productive based on the overall amount of annual rainfall obtained (Meteo Rwanda, 2020).

Experimental Design

During the research, the experiment was conducted for four treatment of fertilizer combination in four replications using a factorial arrangement in Randomized complete block design (RCBD) assigned at random in each replication. Treatments were arranged as **T1** stands for application of only NPK 17-17-17 and DAP, **T2** stands for Application of only Farm yard manure, **T3** stands for application of combined NPK 17-17-17, DAP and Farm yard manure and **T4** stands (control): No fertilizer. All experimental plots were planted with one maize variety (H628) purchased from RAB at a rate of 25 kg/ha. The 16 experimental plots were placed in the same location within two (2) agricultural seasons which are season 2021 A and 2021 B; plots size was set out at 5 m × 5 m (25 m²) in size per treatment and sowing the seed was done with in one day in all plots directly after field preparation where in each hole 2 grains were placed. Spacing of 75 cm between rows and 40 cm with 40 cm between holes. After sowing, 30 tons of organic fertilizer (cow dung) and 100 kgs of DAP were used respectively while urea was applied during weeding (Minagri, 2017).

Drying of maize grains

During this study, issues of maize grain management as well as their storage were examined, in order to evaluate the good drying methods which can favorize small scale farmers, cooperatives or commercial farms to get high quality maize that are free from aflatoxin. During this study, we look out the natural and artificial drying method that are currently used. Finally, different structure of storage and drying methods fluctuating from modest family units to huge commercial units are examined as well as management suggestions for minimizing harm while storing. During this study, the impact of various drying processes on aflatoxin contamination levels after various treatments were evaluated and applied during the tests.

Sun Drying

While conducting this research, sun drying method has been adopted as well-known but old drying method which is putting maize on natural sun. The maize grains produced from the treatments T1, T2, T3, T4 for all replications (4) were put directly under sun on sheeting for the prevention of moisture content from the soil ground to reach the maize grains

Kitchen Drying:

In order for assessing the rate of aflatoxin, we used to adopt the kitchen drying as the other drying methods which is effective by putting maize grains above fire of the kitchen. Kimario (2021) reported that kitchen drying managed to reduce aflatoxin levels in maize at the rate of 78.5%.

Dry shelter:

In this study, dry shelter as one of the drying methods established by the government as post-harvest handling technology was used to evaluate its effect on aflatoxin contamination.

Testing of aflatoxin

With referring to VICAM. L P (1999), we used aflatest (Watertown, MA) of OAC fluorometer. The aflatest was chosen due to its rapidity where with in only 10 min per ton test you get the results, it is also very sensitive consequently providing reading as low as 2ppb to 10 ppb in a sample and continues to read the results until 50 ppb per sample; it is suitable for using it in the same extract instrumentation for other mycotoxins'test; it is easy to use thus it does not require special. Those testing tools are trusted due to less toxic materials they possess in comparison with conventional methods. This method possess in numerical data in ppb can be used to clean HPLC (High performance liquid chromatography).

The test was carried out by blending a crushed sample of the kernels weighing 25 g of blended maize grains mix with 5g of Na Cl and 125 ml of methanol (70%); 30% of distilled water (H₂O) in a blender jar at high speed for 2 minutes in covered blender jar, fluted filter paper was used to filter the extract and collect the filtrate in clean vessel (Neogen (2018)).

Sampling

According to Hamed (2016), simple random sampling method was adopted by collecting and measuring the composite sample equal to the maximum of 1 kg of from each treatment in both seasons (2021A and 2021B) and dividing it into 12 sub samples of roughly 300 g each in each season. For the aflatoxin levels analysis, ground samples of roughly 25g were utilized for each sub sample and the average level was obtained, the sample collection was done with second -season maize which tend to dry out faster on the farm, the average moisture level in each treatment was 12.5%.

Within the 2 seasons of the study, total number of samples collected and tested were twenty-four (24) with combination produce of each treatment (T1, T2, T3, T4) of all replication. In accordance with the protocol used during sampling, samples were collected in polythene bags and transported them to the RSB Laboratory for aflatoxin testing.

Preparation of the sample

For avoiding the mold formation as well as aflatoxin production, maize grains were dried in order reach the moisture content of no more than 13% within 30 days, when maize are affected by aflatoxin there is a chance of getting pollution and the species causing aflatoxin causes those pollution.

According to Noreddine (2020), to address this problem, the entire 1 kg of the sample was grinded and segmented using only a Bunn and constantly fighting grinder (Mann: Bunn-o-Matic corporation Springfield, Illinois in the United States of America) in order to obtain a combined subsample for representing the overall sample characterized with codes associated with them to affiliate the items in the questionnaire.

Sample extraction

During sample extraction ground sample of 25 g weight was used, blended for 2 minutes at high speed with the blender covered with 125 ml of 70% ethanol and 5 g of Na Cl. after filtering the extract with fluted filter paper and then added 30 % of distilled water, in clean vessel the filtrate was collected (Neogen,2018).

Dilution of extract

15 ml of filtered was collected using a pipette and transferred to a clean jar where it has been watered by 30 ml of distilled H₂O then thoroughly mixed, a glass microfiber glass filter was used to filter the diluted extract into a glass syringe barrel labeled with 15ml marking.

Aflatoxin's extraction

During the extraction of aflatoxin, 50 mg of crushed samples was mixed with 250 ml of 65% ethanol (v/v) in a laboratory mixer (IKA, Werker, Germany) and rapidly shaken for 3 minutes. Material was filtering using Whatman No.1 filter paper once it had settled (Whatman international Ltd, Maidstone, UK) (Neogen, 2018).

Quantification of aflatoxin

The samples were analyzed by using an enzyme-linked immunosorbent assay (ELISA) to quantify the total of aflatoxin as indicated by the company's procedures using a Reveal accuscan (Neogen, USA), the ELISA has a quantitative range of 2-150 g total aflatoxins/kg and a lower of detection (LOD) OF 2G/KG (Neogen, 2018).

Statistical analysis

The levels of aflatoxin of four treatments were analyzed in the years of research from 2020-2021. Simple descriptive statistics and the SPSS statistical package from 1993 at $p=0.05$ was used to evaluate data such as mean, range, variance, coefficient of variation and least significant difference. The test statistic was the variance ratio test, the 'F' distribution was used to compare two growth seasons at the same time for significant variations, the selection of it had the advantages of comparing two environments in one period (Mohd, 2017),

Results and Discussion

Impact for methods of drying on aflatoxin infection for the Cropping season 2021A & 2021B.

The results of aflatoxin following the drying methods have shown the great impact on aflatoxin contamination as shown in the Table 1.

Table 1. Aflatoxin levels measured in every treatment resulting all methods of drying within cropping season 2021A & 2021B

Treatments/ Seasons	Results of in ppb of total aflatoxin in various drying techniques for all treatments					
	kitchen drying		Dry shelter		Sun drying	
	2021A	2021 B	2021A	2021 B	2021A	2021 B
T1	2.70 ^{ab}	1.60 ^{ab}	2.70 ^{ab}	3.20 ^{ab}	1.70 ^{ab}	2.90 ^{ab}
T2	3.70 ^a	4.90 ^{ab}	3.00 ^{ab}	5.0 ^{ab}	2.60 ^{ab}	1.80 ^{ab}
T3	1.40 ^{ab}	2.60 ^{ab}	2.2.0 ^{ab}	3.20 ^{ab}	1.60 ^{ab}	2.80 ^{ab}
T4	11.00 ^{ab}	13.00 ^b	10.5 ^b	11.7 ^b	25.50 ^b	26.70 ^b
LSD	8.119	4.531	3.453	6.207	10.319	10.612

T1 stands for inorganic fertilizer application, T2 stands for organic fertilizer application, T3 stands for mixture of inorganic and organic fertilizer application, T4 stands for control (no fertilizer application and LSD stands for Least significant difference

The analysis of variance results shows the significant differences in aflatoxin contamination levels within in the drying procedures such as kitchen drying, sun drying and dry shelter drying in two seasons of the study because with a significant level of 0.05, $F=17.22$ is bigger than F tabulated which is 3.28 meaning that the alternative hypothesis is accepted and null hypothesis is rejected. The results from the same analysis of variance also shows no significant difference on the drying methods effects such as kitchen drying, sun drying and dry shelter between blocks across the two seasons of study which are 2021A and 2021B because with F calculated which is equal to 0.67 is less than F tabulated equal to 2.9 at 0.05 as significance level, so, the conjecture hypothesis was accepted and the research hypothesis was rejected. The difference in aflatoxin infection was examined in both season (2021A and 2021B) from all treatments following drying methods (dry shelter, sun drying, kitchen drying).

Nevertheless, the level of aflatoxin was found to have significant difference contamination in sun drying methods, kitchen drying and drying shelter methods as it is shown in Table 1. the lower aflatoxin infection levels were seen when using kitchen drying (1.6ppb) when the maize is grown with fertilization of mixture of organic and inorganic fertilizers compared to sun drying (1.6ppb) and dry shelter drying method (2.2ppb).

The inconsistency ratio test demonstrated a significant difference in the influence of methods of drying all treatments (T1, T2, T3, T4) on aflatoxin contamination in the seasons 2021A and 2021B. The result shows that treatment T4 the aflatoxin levels were 26.70 ppb when adopted the sun drying, whereas aflatoxin results for T3 was 1.4 when adopted the kitchen drying.

According to Magembe *et al* (2016) Right drying of harvested maize is very crucial, because the ineffective drying methods can increase the growth of fungus as well as reducing the quality of kernels for consumption and reduce the capacity of seeds to germinate for the next season, during harvesting, maize possess the higher moisture content with equivalent to 28-30% and have to be dried up to 12% to prevent fungal growth. According to Zuki (2018) the types of drying methods have great influence on the resistance of maize on fungal contamination which led to the aflatoxin contamination. this is coincided with the actual research assessing the impact of different drying methods currently used in Rwanda on aflatoxin attack on maize, this research has been carried out from the findings of these research mentioned above that both sun drying, kitchen drying, drying shelter drying were good for

minimizing the content of moisture of maize to the level which is recommended ($\leq 12\%$) to get the chances of reducing the intense aflatoxin attack on the kernels. however, kitchen drying method was found to be quick to reduce moisture content of the kernels compared to the sun drying and dry shelter drying methods. This finding was due to the direct exposure of the maize grains above the kitchen fire with short distance from the fire itself and the space where the kernels are put for drying.

Conclusion

The results shown that drying methods have the significant effect on aflatoxin infection, among three (3) drying methods used which are sun drying, kitchen drying and dry shelter, kitchen drying method is the best for reducing aflatoxin contamination in maize.

Sustainable Development Goals of, Environmental Challenges & Global Water Resources Crisis

Aijaz Ali Panhwar

Pakistan Council of Scientific and Industrial Research (PCSIR), Pakistan

Abstract

Water is a blessing and reason of survival on earth for human beings. Without water it is not difficult to live on earth, but it is impossible. Unfortunately, rapidly increasing in population, unplanned agriculture practices and industrial sector, has becomes a serious issue for environment and for future needs. Water is only resource which is unequally shared resources in the world. Water will be very important issue for next generations may face. Safe water access up to 50-100 liters per day for drinking and sanitation is a right of every human being, recognized by United Nations General Assembly in 2010. Approximately six billion people may suffer from scarcity of clean water by 2050. The agriculture sector is largest consumer of fresh water around 70% followed by industry and domestic 19% & 11% respectively. The Global demand of water is gradually increasing by 1% per year. Existing global water demand has been projected about 4,600 km³ every year and estimated may increase up to 20%-30%, in range of 5,500-6,000 km³ every year by 2050. Advancement of technology, excess use of fertilizers is main source of deterioration of water quality and has created serious concerns for environment, such as our drinking water contains various in many cases. About 10 billion tons of freshwater using by human and result severe polluted return to environment. It is estimated that about 80% of wastewater discharged from industries containing utmost hazardous contamination is of biological nature, which causes serious human health problems and may cause death. The nominal treatment is carried out in upper middle-income 38% and worst situation in lower middle-income countries up to 28%, only 8% in low-income countries, undergoes for treatment for reuse.

A Comparative Analysis between Food Affordability and Healthy Life among the Rural and Urban People of Bangladesh

Prodipto Bishnu Angon* and Md. Shafiul Islam

Faculty of Agriculture, Bangladesh Agricultural University, Mymensingh 2202, Bangladesh

*Corresponding author

Abstract

Good health depends on moderate and proper nutritional food. There is a noticeable difference in eating patterns between individuals living in rural and urban regions. The main aspect of this study is to make a comparative analysis of the health of rural and urban people with their eating habits. In February 2022, data were collected from 1,400 people in Bangladesh's major cities through offline and online surveys and analyzed using IBM SPSS Statistics 25 and Microsoft Excel. Three types of correlation are brought out among the selected parameters such as local people will be able to protect themselves from heart disease by consuming vegetables. The paper highlights the staple food of people of all ages in Bangladesh as well as their daily food intake time and quantity through a wide survey. People will be able to adjust their health depending on the type and quantity of food they consume, and they will also be able to know whether urban people are ahead of rural people and vice versa. This research is able to bring good health to the people by reviewing the food habits of the people of the village and the city.

²Institute of hydroponics Agriculture, PMAS Arid Agriculture University Rawalpindi Pakistan.

Abstract

Imminent amount of wastes including field wastes organic in nature such as, food remain, municipal solid waste and manures can be transformed into a usable and safe product that can be utilized as a possible usable fertilizers. Vermicomposting is a microbiological procedure in which earthworms contact with various other microorganisms to alter biologically active chemicals into a humus-like nutrient-rich product. It has a sustainable peat-like material, organic matter is present in plant available form and has a high-water holding capacity and aeration. Moreover, it has high nutrients than the organic material from which it is made because of the biological activities of earthworms, and so serves as a rich source of nutrients for plant development and growth.

The Effect Of The Covid-19 Process On Vegetable Agriculture In Türkiye

Özlem ALTUNTAŞ, Yadigar Leyla DOĞAN

Malatya Turgut Özal University, Faculty of Agriculture, Department of Horticulture, Battalgazi, Malatya

Abstract

The Corona virus, which first appeared in the city of Wuhan, China, has spread almost all over the world, especially in China, and has been declared a global pandemic. As a result of the measures taken, many sectors, including the agricultural sector, were adversely affected. Agricultural production, nutrition and food safety have taken the first place among the concerns of individuals in this process. With the emergence of the pandemic, it has emerged that the agricultural sector is important and a strategic sector all over the world and in our country. The measures taken have disrupted the supply of agri-food products to markets and consumers both within and beyond the borders of the country. There have been significant export restrictions in many countries. Türkiye is one of the rare countries in the world where fruits and vegetables can be grown in good conditions and with high quality thanks to the fertile and wide agricultural areas suitable for production and the ecological differences of different regions. Vegetables produced in our country meet the domestic need at a high rate and in excess, and our vegetable exports are increasing gradually. In terms of seasonal workers, who play a major role in agricultural production, problems have been experienced during the pandemic process. Since the transportation and accommodation of workers will increase the risk of epidemics, it has made it necessary to take measures to prevent them. Since the labor in vegetable production in open areas or greenhouses in large areas is high, vegetable production was affected and this was reflected in the prices. As in the rest of the world, the outdoor eating and drinking sector has almost come to a standstill in our country, and there has been a significant increase in domestic consumption. Vegetable consumption increased by about 15% in a study. On the other hand, the tourism sector is one of the most important components of the demand for agricultural and food products in Turkey. On the Aegean and Mediterranean coasts, there are producers who primarily market the vegetables they produce to hotels hosting foreign tourists. These producers were also directed to other markets that restricted production during the pandemic process. In this paper, agricultural production and vegetable farming in the pandemic process were evaluated with statistical data in general and the difficulties and changes in the process were explained.

Covid-19 Sürecinin Türkiye’de Sebze Tarımına Etkisi

Özet

Dünyada ilk olarak, Çin’in Wuhan şehrinde ortaya çıkan Koronavirüs, başta Çin olmak üzere dünyanın hemen her yerinde yayılma göstermiş olup, küresel bir pandemi ilan edilmiştir. Alınan tedbirler sonucunda aralarında tarım sektörünün de bulunduğu birçok sektör olumsuz etkilenmiştir. Tarımsal üretim, beslenme, gıda güvenliği bu süreçte bireylerin kaygıları arasında ilk sıraya yerleşmiştir. Pandeminin ortaya çıkmasıyla beraber tüm dünyada ve ülkemizde tarım sektörünün önemi ve stratejik bir sektör olduğu ortaya çıkmıştır. Alınan tedbirler hem ülke sınırları içinde hem de sınırlar ötesindeki pazarlara ve tüketicilere tarımsal gıda ürünlerinin arzını aksatmıştır. Birçok ülkede önemli ölçüde ihracatta kısıtlamalar olmuştur. Türkiye, üretime müsait verimli ve geniş tarım alanları, değişik bölgelerin ekolojik farklılıkları sayesinde meyve ve sebzelerinin iyi koşullarda ve kaliteli olarak yetiştiği dünyadaki nadir ülkelerden birisidir. Ülkemizde üretilen sebzeler yurtiçi gereksinimi yüksek bir oranla ve fazlası ile karşılamaktadır ve sebze ihracatımız da giderek yükselmektedir. Tarımsal üretimde büyük rol oynayan mevsimlik işçiler açısından pandemi sürecinde sorunlar yaşanmıştır. İşçilerin taşınması, barınması salgın riskini artıracak için bunların önüne geçmek adına önlemlerin alınmasını zorunlu kılmıştır. Geniş alanlarda açıkta ya da seralarda yapılan sebze üretiminde işçilik fazla olduğu için sebze üretimi etkilenmiş ve bu da fiyatlara yansımıştır. Bütün dünyada olduğu gibi ülkemizde de dışarıda yeme içme sektörü neredeyse durma noktasına gelirken ev içi tüketimde önemli artışlar oldu. Sebze tüketimi yapılan bir araştırmada yaklaşık % 15 artmıştır. Öte yandan, turizm sektörü Türkiye’de tarım ve gıda ürünlerine talebin en önemli bileşenlerindendir. Ege ve Akdeniz kıyısında, ürettikleri sebze öncelikle yabancı turist barındıran otellere pazarlayan üreticiler mevcuttur. Bu üreticilerimiz de üretimi kısıtlamış başka pazarlara pandemi sürecinde yönelmişlerdir. Bu bildiride, pandemi sürecindeki tarımsal üretim ve sebze tarımı genel olarak istatistiksel verilerle değerlendirilmiş ve süreçteki zorluklar ile değişimler anlatılmıştır.

Anahtar Kelimeler: *Tarım sektörü, pandemi, Covid-19, sebze tarımı, ekonomi.*

Giriş

2019 yılının aralık ayında Çin'in Wuhan kentinde ortaya çıkan ve hızla diğer ülkelere yayılan Coronaviridae familyasından olan Koronavirüs bir solunum yolu hastalığıdır. Sars Cov' e yakın benzerliğinden dolayı "Sars-Cov-2" (şiddetli akut solunum sendromu Koronavirüs 2 virüsü) olarak da isimlendirilmiştir (Rismanbaf A., 2020; Muscogiuri G. vd. 2020; Eskici, 2020, Lai vd, 2020; Sun vd. 2020; Akın, 2020). 25 Ocak 2022 tarihi itibarıyla can kaybı 5.600.434'tür ve hala salgın tüm dünya ülkelerinde devam etmektedir (WHO,2022).

Sars-Cov-2 insandan insana bulaşabilen tek zincirli bir RNA virüsüdür (Ahn vd., 2020). Salgının hızlı yayılması ile ilgili artan endişelerden sonra DSÖ tarafından 11 Mart 2020 tarihinde küresel salgın ilan edilmiştir. Covid - 19'un birincil bulaşma yolu kişiden kişiye temas yoluyla (solunum damlacıkları, öksürme, hapşıırma) ve fomitler (havlu, para, giysi, oyuncak gibi eşyalar) tarafından bulaştığı bildirilmektedir (Anonim 2019; Akın ve Akın, 2020). WHO'nun raporunda Korona virüslerin yiyeceklerde çoğalamadığı; çoğalmak için konakçı olarak bir hayvana veya insana ihtiyaç duyduğu belirtilmektedir Koronavirüs zarflı bir virüs olup yağlı bir zar ile çevrilidir, sabun veya bulaşık deterjanı yüzeylerdeki yağı çözmeye, su ise virüsü uzaklaştırmada oldukça etkilidir. Bütün enfeksiyonlarda olduğu gibi gıda da insanlar tarafından sorgulanmaktadır. Bu yüzden kullanılacak gıdalar özellikle meyve ve sebzeler bolca yıkanmalıdır gıdalarda bulaşma bile üretim ortamlarında enfekte olmuş kişilerin temas etmesi ile gıdalar üzerinde virüs canlı kalabilir ve gıdayı tüketecek olan kişi bu yüzeye temas ederek elini ağız, burun veya gözlerine dokundurması ile Cov-19 olabilir, ancak bunun virüsün ana yayılma yolu olmadığı düşünülmektedir (CDC,2020a; Doğan ve Doğan, 2020; Sağdıç vd., 2020).

Tarım yaşamın kaynağı olması nedeniyle insanlığın varoluşundan bugüne büyük önem taşımıştır ve yaşam devam ettiği sürece de önemini koruyacaktır. Son yıllarda ülkeler daha çok sanayi ve Dijital sektörler ağırlık vererek tarım sektörünü geri plana atmışlardır. Covid-19 salgınıyla bu anlayış zayıflamış tarım ve hayvancılık faaliyetlerinin gıdaya ulaşmanın tek dayanak nokta olduğu görülmüştür. Ülke olarak gelişmişlik düzeyi ne olursa olsun tarımsal üretimin sürekliliğinin çok önemli olduğu gerçeği ortaya çıkmıştır. Gelişmiş olan ülkelerde arz yönlü riskler, az gelişmiş ülkelerde ise talep yönlü riskler ortaya çıkmıştır (Kayabaşı, 2020). Ülkeler Pandemi döneminde yayılımın azalması ve gıda krizinin önünü kesmek için ulusal ve uluslararası hareketlilikte kısıtlamalara gitmektedir. Koronavirüs salgını sebebiyle ülkeler hem insan hem ticari mal hareketlerini durdurmak zorunda kaldılar. Bu durum İnsanların yaşamlarını sürdürmek için temel ihtiyaç ürünlerine ulaşmayı zorlaştırdı, temel ihtiyaç maddelerinde dışa bağımlı, ithalata dayalı ekonomilerde gıdaya ulaşım daha da zorlaştı. Özellikle tarımda kendine yetebilen ve İthalat odaklı değil üretim odaklı olan ülkeler bu süreçten daha az zarar görmüşlerdir (Kayabaşı, 2020; Tutar vd.,2021). Küresel salgınlarda ülkeler içe kapanmakta, öncelikli olarak kendi halkının ihtiyaçlarını karşılama yoluna gitmektedir. Ülkelerin aldığı tedbirler kapsamında ithalat ve ihracatta yeni düzenlemelere gidilmiştir. Bu kapsamda birçok ülke ihracatçısı olduğu ürünlerin ihracatını durdurmak veya ithalata kota getirmek gibi önlemler almışlardır. Örneğin Rusya'nın buğday ihracatçısı olmasına rağmen ihracatının durdurulması, Kazakistan, Kırgızistan, Belarus ve Ermenistan'ın pirinç, ayçiçeği ve bazı sebzelerin (soğan) ihracatından kısıtlama kararı alması, büyük tahıl ihracatçılarından olan Ukrayna'nın karabuğday ihracatını belirli süre durdurması, dünyanın 3. büyük pirinç üreticisi olan Vietnam'ın ihracatını durdurması, hasat miktarının iyi olacağını hesapladıktan sonra yasağı kaldırıp ithalata kota getirmesi, Mısır'ın 3 ay boyunca bakliyat ihracatını durdurması ve ülkemizin bazı ürünlerde (soğan, patates, limon) ihracatını özel izne bağlaması, örnek verilebilir (Tutar vd.,2021).

Alınan tedbirlerin başında sokağa çıkma yasağı ile toplumlar izole bir hayata sürüklenmiş ve bu da birçok alanda olumsuzluklara sebep olmuştur. Karantina tedbirlerine bağlı olarak gıda tedarik zincirlerinde aksamalar, tarladan, gıdanın işlenmesine, gıda ticaretinden, ulusal ve uluslararası lojistik sistemlerine, ara ve nihai talebe kadar olan gıda zincirinin tüm halkalarını etkilemiştir. İş gücü arz ve talebinde önemli sorunlar çıkmış, yoğun üretim yapan üreticiler işgücü eksikliğine bağlı üretim ve gelir kaybı yaşarken, işgücü arz edenler ise gelir kayıpları yaşamışlardır (Doğan ve Doğan, 2020; Kayabaşı, 2020; Aydın ve Güner, 2020).

Çizelge 1. Dünya'da ve Seçilmiş Ülkelerde İşsizlik Oranları (+15 Yaş)

Dünya Geneli ve Seçilmiş Ülkeler	İşsizlik oranı (%)		Fark (%)
	2019	2020	
Dünya	5,37	6,47	1,10
Türkiye	13,7	13,2	-0,5
ABD	2,38	5,59	3,21
Kanada	4,41	7,48	3,07

Avrupa Birliği ülkeleri birçok strateji uyguladıktan sonra son olarak sıkı tedbirler kapsamında mevsimlik tarım işçilerine yönelik düzenlemeler uygulamıştır (Yılmaz ve Yıldırım İşler, 2021). Avrupa Birliği ülkeleri için kritik öneme sahip olan bu mevsimlik işçiler salgın sürecinde “kritik işçi” olarak nitelendirilmeye başlamıştır. Bu nitelendirmenin en büyük nedeni tarım sektörünün faaliyetlerini (hasat, ekim ve bakım) salgın sürecinde de sağlıklı bir şekilde sürdürmeye devam etmektir (Çetin ve Yücesoy, 2020).

Çizelge 2. Farklı Ülkelerde GSYİH Büyüme Oranı (Yıllık)

Ülkeler	2018	2019	2020
Brezilya	1,78	1,41	-4,05
Kanada	2,42	1,86	-5,31

20	Portekiz	77,8	+0,1
41	Türkiye	69,8	-0,6

Kaynak: The Economist Group, 2019; TİM, 2021

Ülkelerin salgın öncesi GSYİH büyüme oranı 2018/2019 pozitif bir büyüme seyredirken salgının etkileri 2020 yılında görülmeye başlamıştır. Büyüme rakamlarının çoğunlukla negatif bir oranda gerçekleştiği salgının ekonomik boyutunu ifade etmektedir. Alınan tedbirlerin meydana getirdiği olumsuzluklar ve halkın panik halinde olması arz talep dengesinde ani dalgalanmalara sebep olmuş, bu da gıda fiyatlarına yansımıştır. Dünya genelinde gıda fiyat endeksinde artışlar meydana gelmiştir (FAO,2022). Pandemi döneminde tüketim ihtiyaçlarında ki dönüşüm süreci, tedarikte yaşanan zorluklar ve karantina sebebiyle yaşanan panik dalgası pek çok ülkede market raflarının hızla boşalmasına sebep olmuş ve yerini dolduracak ürün teminin de zorluklarla karşılaşmıştır (TİM, 2021).

Satın alınabilirlik, ulaşılabilirlik, kalite ve güvenlik başlıkları altında derlenen skorların ortalaması sonucunda Singapur 87,4'lük, İrlanda 84'lük ve ABD 83,7'lik skorlarla diğer ülkelerden pozitif olarak ayrılmaktadır. Türkiye ise 69,8 puanla 41. sırada bulunmaktadır.

Pandemi Döneminde Türkiye’de Tarım Sektörünün Durumu

Türkiye’de Covid-19 ilk olarak 2020 yılının mart ayında görülmeye başlamıştır (Tutar vd.,2021). Bu dönem Türkiye’de tarımsal üretimin dolayısıyla tarımsal faaliyetlerin ve mevsimlik işçi göçünün de başladığı bir süreçtir. Yaşamın devamı, sanayi sektörüne girdi sağlama, istihdam ve ihracat açısından öncelikli sektör olan tarım sektörüdür. Ana işgücünü mevsimlik tarım çalışanları ve aileleri oluşturmaktadır (Sarper,2009; Şimşek,2020). Salgın dönemi devam ederken tarımsal üretimin kesintiye uğramaması, yeterli ve sağlıklı gıdaya erişim sağlanması amacıyla çiftçilere özel izinler verilmiş ve tarlada faaliyetlere devam edilmesi bildirilmiştir. Bakanlıkların aldığı tedbir kararı kapsamında işgücü ihtiyacının öncelikli olarak il içinde karşılanması, karşılanmaması durumunda ise yakın çevre illerden mevsimlik tarım işçileri ile tarımsal sürekliliğin sağlanabileceği bölgeye mevsimlik tarım işçilerinin gelmesi durumunda ise ilgili bakanlıkların taşra teşkilatlarının alması gereken sorumluluklar belirtmektedir (Yılmaz ve Yıldırım İşler, 2021). Tarım işçilerinin çalışmak üzere geldikleri bölgelerde salgının yayılımının engellenmesi, gerekli tedbirlerin alınması için il/ilçe Hıfzıssıhha kurulları görevlendirilmiştir.

Tarım işçilerinin ; konaklayacakları alana geldiklerinde il/ilçe emniyet müdürlüğüne haber verilmesi, konaklama alanlarında yatak aralarının en az 1,5 m olacak şekilde ayarlanması, çadırlar arası mesafenin artırılması, yeterli sayıda maskenin işveren tarafından sağlanması, mevsimlik tarım işçilerinin çevrede yaşayanlar ile sosyal iletişiminin kesilmesi, günlük ihtiyaçların sağlanması için temsilci seçilmesi, temsilcinin toplu halde yaşayan mevsimlik tarım işçilerinin tüm ihtiyaçlarını günlük olarak temin etmesi ve temsilci harici kimsenin dışarıdan alışveriş yapmaması, 7-14 günlük periyotlarda mevsimlik işçilerin ateş ölçümlerinin yapılması, konaklama alanlarının yerel yönetimler tarafından düzenli olarak dezenfekte edilmesi, tarım işçilerinin tarlaya gidişte ve dönüşte, işçilerin nakli sırasında araç kapasitesinin yarısı kadar kişi ile seyahat edilmesi kuralına uyulması gerekliliği ifade edilmektedir (Sağlık Bakanlığı, 2020; Yılmaz ve Yıldırım İşler, 2021) .

Salgından korunmada ve tedavide bağışıklık sisteminin rolü büyüktür. Covid-19 hastalarının bağışıklık sisteminin güçlendirilmesi ve akciğer hasarının önlenmesi amacıyla çeşitli besinsel tedavi yöntemleri İleri sürülmektedir Bunlardan bazıları çinko, magnezyum, selenyum, A vitamini, D vitamini, E vitamini ve yüksek doz C vitamini takviyesidir (Kartal vd., 2020).

Birleşmiş Milletler 2021 yılını “uluslararası meyve ve sebze yılı” ilan ederek dünya genelinde meyve ve sebzelerin önemi yıl boyunca vurgulanmıştır. Karşı karşıya olduğumuz sağlık krizinde bağışıklık sistemimizi güçlendirmek için sağlıklı beslenmenin gerekli olduğu belirtilmiştir. Her yetişkinin günlük olarak en az 400 gram meyve ve sebze tüketmesi önerilmektedir (Tarım ve Orman Bakanlığı, 2020, FAO). Bitkisel gıdalar bağışıklık sisteminin yüzde 85’ini oluşturan bağırsak mikrobiyota sağlığının geliştirilmesine ve artırmasına yardımcı olmaktadır (Restrepo 2020; Kartal vd., 2020). Bağışıklık sistemini güçlendirmede etkin rol oynayan besin içeriklerinde A, C, E vitaminleri ve betakaroten başta gelmektedir. Bu besin değerlerinden zengin olan sebzelere baktığımızda A vitamini; ıspanak, havuç, kırmızı biber. C vitamini; kırmızı biber, brokoli. E vitamini; ıspanak ve brokoli. Betakaroten; ıspanak, havuç, kırmızı biber ‘de bolca bulunmaktadır (TÜRKOMP, 2022).

Koronavirüs bireylerin beslenme alışkanlıkları üzerinde de etkili olmuştur. Nitekim Pandemi sürecinde tüketimi en fazla artan ürün grupları arasında meyve ve sebze yer alıyor. Karaman ilinde yapılan bir anket çalışmasında (15 Mart-15 Nisan 2020) katılımcıların beslenmelerinde yemeği arttırdığı gıdalardan sebze ve sebze yemeklerinin oranı %15’tir (Dilber ve Dilber, 2020). Tarım sektörü küresel nüfustaki artış eğiliminden dolayı diğer şartlar sabit olsa dahi hacmini arttıran ve yükselen bir sektördür. Birleşmiş Milletler nüfus tahminlerine göre 2020 yılı için dünya nüfusunun 7 milyar 794 milyon 798 bin 729 kişi olduğu tahmin edildi. Bu tahminlere göre en fazla nüfusa sahip ülke 1 milyar 439 milyon 323 bin 774 kişi ile Çin olurken, bu ülkeyi 1 milyar 380 milyon 4 bin 385 kişi ile Hindistan, 331 milyon 2 bin 647 kişi ile Amerika Birleşik Devletleri (ABD) izledi. Bu üç ülke dünya toplam nüfusunun %40,4’ünü oluşturdu. Türkiye, 83 milyon 384 bin 680 kişi nüfusu ile nüfus büyüklüğüne göre 235 ülke arasında 19. sırada yer alırken, dünya toplam nüfusunun %1,1’ini oluşturdu (TÜİK,2021).

Pandemi Döneminde Ülkemizde Sebze Tarımı

Türkiye geniş ürün yelpazesine sahip, yetiştiriciliğe uygun iklim ve ekolojik özellikleri ile bitkisel üretim açısından avantajlı bir ülkedir. Birçok meyve ve sebzenin yetiştiriciliğinde dünya sıralamasında ilk sıralarda yer almaktadır. Örneğin; domatest 3, kuru soğanda 5, patatest 17. sıradadır (Anonim, 2021). TÜİK verilerine göre 2019 yılında toplam tarım alanı 37.716.000 (Ha), sebze bahçesi olarak kullanılan 790.000 (Ha) iken 2020 yılında toplam tarım alanı 37.762.000 (Ha), sebze bahçesi olarak kullanılan 779.000 (Ha)’ dir. Sebze bahçesi alanlarında sırasıyla Akdeniz, Ege ve Orta Anadolu bölgeleri ilk sıralarda yer almaktadır. Son 3 yılda gerçekleşen bitkisel üretim değerlerine baktığımızda 2018- %41, 2019- %43, 2020- %45 olduğu görülmüştür. Her yıl artış gösteren bitkisel üretim değerlerinin %40 tarla bitkileri, %35’ini sebze üretimi, %25’i meyve üretimi oluşturmaktadır. Dünya sebze üretimi 2000 yılında 684 milyon 733 bin ton iken 2018’de 1 milyar 89 milyon ton olmuştur. Türkiye mevcut sebze üretimi ile dünya sebze üretimi içerisinde yaklaşık %3’lük bir paya sahiptir, Çin (%74), Hindistan (%17) ve ABD (%4)’den sonra dünya üretiminde 4. sırada yer almaktadır.

Bitkisel üretim istatistikleri incelendiğinde sebze üretim miktarı; 2019 yılında 31,1 milyon ton, 2020 yılında 31,2 milyon ton, 2021 yılında ise 31,8 milyon ton olmuştur. Sebze ürünleri üretim miktarı 2021 yılında 2020 yılına göre %1,8 artmıştır. Sebze ürünleri alt gruplarından yumru ve kök sebzeler %6,9 artış göstermiştir. Bu grupta yer alan

kuru soğan üretimi %9,6, kuru sarımsak üretimi ise %13,5 artış göstermiştir. Meyvesi için yetiştirilen sebzelerin üretimi yüzde 0,9 artış göstermiştir. Bu grupta yer alan biber (salçalık, kapyra) üretimi %11,9, hıyar %2 artarken domates üretimi %0,8 azaldı. Ayrıca yaprağı yenen sebzelerden beyaz lahana üretimi %0,6 artarken, ıspanak üretimi %5,7 azaldı. Türkiye’de en fazla üretimi yapılan sebzeler; Domates (13,1 milyon), karpuz (3,5 milyon), biber (2,6 milyon), kuru soğan (2,5 milyon), hıyar (1,9 milyon), kavun (1,6 milyon) tondur (TÜİK,2022). Türkiye’de kişi başına yaklaşık 276 kg sebze tüketimi olmaktadır (Küden ve Daşgan, 2021). Ülkemizde açıkta ve örtü altında sebze üretimi yapılmaktadır. Örtü altında sofralık taze tüketime yönelik mevsim dışı veya turfanda üretim söz konusu iken, açıkta sofralık ve sanayilik sebze üretimi yapılmaktadır. Örtü altı sebzeçiliği bakımından Türkiye, Avrupa’da İspanya’dan sonra ikinci sırada yer alırken Dünya’da ise Çin, Güney Kore ve İspanya’dan sonra dördüncü sırada yer almaktadır. Ülkemizde toplam örtü altı alanı 805.159 da’ dır. Bu alanın 401.795 da plastik sera, 218.326 da alçak tünel, 104.258 da yüksek tünel, 80.779 da ise cam seralar oluşturmaktadır. Örtü altı sebze üretimi 7.771.766 ton’ dur. En fazla üretimi yapılan ürünler ise domates (4.1 ton), hıyar (1.1 ton), karpuz (850 bin)’dir (TÜİK,2022).

Çizelge 4.Türkiye’de örtü altında kullanılan yapılar

Yıllar	Toplam	Cam sera	Plastik sera	Yüksek tünel	Alçak tünel
2017	752 168	85 749	355 121	119 899	191 399
2018	772 091	78 110	368 527	114 232	211 222
2019	789 604	75 495	378 670	111 038	224 400
2020	805 159	80 779	401 795	104 258	218 326

Örtü altı tarımının yaygın bir şekilde iklimin avantajlı olduğu Akdeniz sahil şeridinde yer aldığı görülmektedir. Ancak son yıllarda sera ısıtılmasında jeotermal enerjinin kullanımı ile Ege bölgesi başta olmak üzere ülkenin farklı noktalarında jeotermal enerji ile ısıtılan topraksız üretim yapan büyük ve modern sera işletmelerinin kurulumunun arttığı görülmektedir (Küden ve Daşgan, 2021).

Sebze yetiştiriciliğinde açık tozlanan standart çeşitler ve F1 hibrit çeşitlerin tohumları kullanılmaktadır. Örtü altında yetiştirilen sebzelerin tamamı F1 hibrit çeşitlerden oluşurken açıkta yetiştiricilikte de %70-80'lere varan oranlarda hibrit tohum kullanılmaktadır. Türkiye F1 hibrit sebze tohumlarının geliştirilmesinde çok iyi yol almıştır ve yerli hibrit çeşitler pazarın %65-70'ini karşılamaktadır. Geri kalan oran ise çeşitlilik olması bakımından yabancı firmaların çeşitlerinden oluşmaktadır (Yanmaz ve ark., 2020).

Türkiye’de örtü altı ve açıkta sebze üreticileri gereksinim duydukları fideyi hazır satın alarak üretime başlamaktadır. Ülkemizde yılda 4 milyar adedi aşan hazır fide üretimi yapılmaktadır. 2021 yılı itibarıyla ülkede toplam 183 adet fide üretimi yapan tesis bulunmaktadır. Bu tesislerin çoğunluğu Antalya ilinde konuşlanmıştır. Sebze türleri bazında Antalya ilinde 2020 yılında üretilen hazır fidelerin sebze türlerine göre dağılımı şu şekilde olmuştur: domates: %51,4 biber: % 12,8, hıyar: %7,2, patlıcan: %3,7, karpuz: %5,2, kavun: 2,1, kabak: %3,4, lahana: %1,6, marul:7,6, diğer türler (karnabahar, lahana vb.): %5,0 (Fide birlik E-Bülten, Şubat 2021).

Tarımda kendine yeterlilik durumu her zaman önemlidir. Yeterlilik konusu tohum, gübre, sulama olanakları, tarımsal mekanizasyon ve diğer tarımsal girdiler açısından da önem arz etmektedir. Pandemi sonrası güvenilir gıda temini sağlamak ve iç piyasanın yeterli hale getirilmesi tüketici için yaşamsal değer taşımaktadır (Tutar vd.,2021). Türkiye’de toplam sebze ürünlerinde, 2019-2020 piyasa döneminde yurt içi üretimin, yurt içi talebi karşılama derecesi %107,2 oldu. Sebzelerde en yüksek yeterlilik derecesi havuçta %117,7 olurken, kuru soğanda %113,1, sakız kabakta ise %111,6 olarak gerçekleşmiştir. Kendi kendine yeterli olmak oldukça önemlidir. İç piyasada yeterlilik seviyesine ulaşmak gelecekteki risklere karşı hazırlıklı olmayı sağlamaktadır. Dünyadaki tüm ülkeler için tarım ve gıdada ithalat bir çözüm yolu değildir (TÜİK, 2022).

Ürün denge tabloları, tarımsal ürünlerin arz kaynaklarını ve kullanım şekillerini belirli bir referans dönemi boyunca karşılaştırarak ayrıntılarıyla ortaya koyan tablolardır.

Yeterlilik derecesi; bir bölgenin kullanılabilir üretiminin (iç üretim) o bölgenin talebini ya da yurt içi kullanımını (insan, hayvan ve endüstrinin bütün ihtiyaçlarını) ne ölçüde karşılayacak durumda olduğunu gösterir. Değerin, 100'den küçük olması, üretimin yurt içi talebi tam olarak karşılayamadığı durumu temsil eder. 100'den büyük olan bir değer, normal iç ihtiyaçları geçen, ihraç edilebilir ve/veya stoklanabilir miktarların varlığını gösterir. (TÜİK,2022).

Tüm dünya’ da olduğu gibi Türkiye’de gıda fiyat endekslerinde artış görüldü. Covid-19 ‘un etkisi ÜFE ve TÜFE’ de etkisini gösterdi. ÜFE değerlerinde meydana gelen artış, TÜFE değerleri ile doğrudan ilişkili olduğu görülmektedir. Ülkemiz tarım sektöründe kendine yetebilecek potansiyelde olsa da sorun sadece üretim ile sınırlı kalmamakta (Özdemir, 2020). Türkiye’de çiftçilerin girdi maliyetlerinden (Mazot, elektrik, gübre, tohum, ilaç vb.) dolayı üretim yapmakta zorlandığı görülmektedir. (Yıldırım, 2020; Çetin ve Yücesoy, 2020).

Ocak- Aralık (2021)	1,771,148,925	875,713,825

Kaynak: AKİB,2021

Tarım ve gıda ürünleri dış ticareti iyi yapıldığı takdirde gıda fiyatlarındaki dalgalanmaların olumsuz etkilerini azaltabilmektedir. İhracat, ülke çiftçisine farklı pazarlar bulması, satın alım gücü, ürününü yüksek fiyattan satabilme imkânı sağlaması vb. durumlardan fayda sağlamaktadır. İthalat ise, ülke içinde aşırı fiyat artışlarından halkı korumak, iç piyasada ürün çeşitlendirmek vb. fiyat düşüren uygulamalar düşünülerek yapıldığında oldukça önemli yere sahiptir (Artık, 2020).

2018-2021 yılları arasında en fazla yaş sebze ihracatı yapılan ilk sıralarda yer alan ülkeler; Suriye, Rusya, Irak, Romanya, Ukrayna, Bulgaristan ve Gürcistan'dır. (AKİB;2018- 2021).

Yaş sebze ihracatı yapan illere bakıldığında; 2020 yılında 1.Antalya, 2.Hatay, 3.Mersin, 4.Şırnak, 5.İzmir illere yer almaktadır. 2021 yılında 1.Antalya, 2.Şırnak, 3.Mersin, 4.Hatay, 5.Artvin illerinin olduğu belirlenmiştir. Covid-19 kapsamında alınan önlemler ile ihracatta kısıtlamalar getirilmiştir. Salgının yayılımının önünü kesmek için komşu ülkeler ile sınır kapıları kapatılmış veya sınırlamalar getirilmiştir. Şırnak ilinde bulunan sınır kapısında ise 17 Mart 2020 yılında hayata geçirilen kısıtlamalar 21 Nisan 2020 yılında gevşetilmiş, yaş sebze ve meyve ihracatına devam edilmiştir. 2021 yılında ihracat yapan iller arasında 2. Sıraya çıkmasının sebebi bu durum olabilir. 2020 -2021 yılları arasında en fazla ihracatı yapılan sebzeler ise; domates, soğan, patates, biber, kabak, havuç ilk sıralarda yer alıyor (AKİB, 2021).

Sonuç

Sonuç olarak, pandemi döneminde taze meyve ve sebze tüketme alışkanlığının bağışıklık sistemini güçlendirmek için ne kadar önemli olduğu bir kez daha ortaya konmuştur. Tarım üreticileri ve işçileri için izin pandemi süresince devam etmiş ve üretimde ülkemiz geriye düşmemiştir. Fiyatlar ise dünya genelinde ekonomi olumsuz etkilendiği için artış olmuştur. Ancak insanların alım gücünü aşan fiyatlar görülmemiştir. Ülkemizde tüketilen tüm sebzeleri tüketiciler piyasada bulmakta zorlanmamışlardır. Pandemi dönemi tüm sektörlerde yavaşlama ya da durma yaşanmış ama tarımsal üretim devamlılığını sürdürmüştür. Dünyada bu tür olasılıklara karşı ülkemizde üretim stratejileri geliştirmeli, birinci sınıf tarım arazileri sanayi ya da turizm sektörü için kullanılmamalıdır.

The Effects Of Some Rhizobacteria Species On Plant Development And Fruit Quality In Melons Grown Under Irrigated And Non-Irrigated Conditions

Özlem ALTUNTAŞ, İbrahim Kutalmış KUTSAL

Malatya Turgut Özal University, Faculty of Agriculture, Department of Horticulture, Battalgazi,/Malatya, TURKEY

Abstract

It has been determined in many research results that plant growth promoting rhizobacteria (PGPR) affect yield, plant growth and fruit quality and play an important role. However, the use of biostimulants in agricultural production in Malatya is negligible. In order to contribute to the region's producers, a research was planned directly in the producer's garden in the Malatya/Arguvan region, which is an important melon production center. A trial was established with Arguvan (Narmikan) melon type and Kırkağaç 637 melon cultivars, which are the most grown local cultivars in the summer period of plant growth-promoting rhizobacteria in irrigated and non-irrigated melon cultivation in Malatya-Arguvan conditions, and the trial was repeated for two consecutive years. In the research, *Bacillus subtilis*, *Bacillus megatorium*, *Enterococcus spp.* and cocktail bacteria solutions, which are a mixture of these three bacteria were used. Inoculation of bacteria into seeds was done by soaking the seeds in bacterial solution for 24 hours. The effects of the use of bacteria on the fruit quality of melon in cultivation with the method of seed sowing in the field were determined. In the study, the presented of which are resulted in fruit only pomological properties ; fruit height, fruit weight, fruit flesh thickness, fruit shell thickness, fruit diameter, seed cavity diameter, pH and WTSS contents were examined, and two-year results were presented. The effects of different bacteria on the fruit pomological properties were not found statistically significant except for the TSS values of Kırkağaç 637 cultivars grown under non-irrigated conditions. The effects of different bacteria on the fruit pomological characteristics of Kırkağaç 637 melons grown under non-irrigated conditions were found statistically significant, although there were differences in other parameters, it was not statistically significant. *Bacillus subtilis* bacteria application has been the prominent bacterial application in terms of fruit characteristics.

Key words: Beneficial microorganisms, PGPR, melon, fruit pomological properties

Bitki Büyümesini Arttırıcı Bazı Rhizobakteri Türlerinin Kısıtlı Sulama Koşullarında Yetiştirilen Kavunlarda Meyve Kalitesi Üzerine Etkileri

Özet

Bitki gelişimini teşvik edici rizobakterilerin (PGPR) verim, bitki gelişimi ve meyve kalitesine etki ettiği ve önemli rol oynadığı birçok araştırma sonuçlarında tespit edilmiştir. Ancak biyostimulantların Malatya'da tarımsal üretimde kullanımı yok denecek kadar azdır. Bölge üreticisine katkı sağlaması amacıyla önemli kavun üretim merkezi olan Malatya/Arguvan bölgesinde direkt üretici bahçesinde araştırma planlanmıştır. Malatya-Arguvan koşullarında sulu ve kuru kavun yetiştiriciliğinde Bitki gelişimini teşvik edici rizobakterilerin yaz döneminde yörede en çok yetiştirilen bir lokal çeşit olan Arguvan (Narmikan) kavun tipi ve Kırkağaç 637 kavun çeşidiyle deneme kurulmuş ve iki yıl üst üste deneme tekrarlanmıştır. Araştırmada, *Bacillus subtilis*, *Bacillus megatorium*, *Enterococcus spp.* ve bu üç bakterinin karışımı olan kokteyl bakteri solüsyonları kullanılmıştır. Bakterilerin tohumlara inokulasyonu, tohumların bakteri solusyonunda 24 saat bekletilmesi suretiyle yapılmıştır. Araziye tohum ekimi yöntemi ile yapılan yetiştiricilikte kavunda bakteri kullanımının meyve kalitesine etkileri belirlenmiştir. Burada sadece meyvedeki sonuçları sunulan araştırmada; meyve yüksekliği, meyve ağırlığı, meyve eti kalınlığı, meyve kabuk kalınlığı, meyve çapı, çekirdek evi çapı, pH ve SÇKM içeriklerine bakılmış, iki yıllık sonuçlar sunulmuştur. Farklı bakterilerin meyve pomolojik özelliklerine etkileri susuz koşullarda yetiştirilen Kırkağaç 637 kavunlarının SÇKM değerleri istatistiksel olarak önemli bulunmuş, diğer parametrelerde farklılık olmasına rağmen istatistiksel önemde bulunmamıştır. *Bacillus subtilis* bakteri uygulaması meyve özellikleri bakımından öne çıkan bakteri uygulaması olmuştur.

Abstract

Yoghurt is a dairy product produced by bacteria fermentation of milk sugar into lactic acid. It is often sold with a fruit vanilla or chocolate flavour but can be unflavoured. This study compared the consumers' acceptability and nutritive values of fresh milk yoghurt and powdered milk yoghurt. The pH value of both fresh and powdered milk yoghurts (4.28 and 4.89 respectively) indicates that the pH range for successful yoghurt production was met. Sensory evaluation was conducted on the processed yoghurts to determine the level of acceptability of the product. The sensory quality showed that mouth taste and general acceptability of fresh milk yoghurt were significantly ($P < 0.05$) higher than that of powdered milk yoghurt while there was no significant difference $P > 0.05$ in the colour and aroma of the yoghurt samples. There was a significant ($P < 0.05$) decrease in the titrable acidity of fresh milk yoghurt to that of powdered milk yoghurt. The total solid, temperature and pH of both samples showed no significant difference ($P > 0.05$). The minerals and vitamins content of powdered milk yoghurt were significantly higher compared to that of fresh milk yoghurt probably due to the fortification of powdered milk.

Keywords: *Fresh, Nutrient, Organoleptic, Powder, Yoghurt*

Introduction

Yoghurt is a fermented milk product. The word 'yoghurt' is derived from the Turkish word "yoğurt" which means thickened. Yoghurt is defined as the product being manufactured from milk with or without the addition of some natural derivative of milk, such as skim milk powder, whey concentrates that results from the coagulation of the milk proteins, due to the lactic acid secreted by defined species of bacterial culture (Sfakianakis and Tzia, 2014). When enough lactic acid is produced the milk coagulates and this coagulated milk is called Yoghurt.

Yoghurt is mainly produced from bovine milk, although milk from other mammals may be used for yoghurt production as well. Yoghurt varies in appearance, flavor and ingredients. Yoghurt derived from the milk of species other than bovine tends to vary in several sensory and physicochemical characteristics, due to differences per milk composition. For instance, Yoghurt derived from milk with high fat content as seen in sheep, goat and buffalo has a creamier texture compared to that derived from milk with lower fat content (bovine, mare). Therefore, the species of the milk-producing mammal significantly influence the characteristics of the produced Yoghurt (Tamime and Robisons, 2007). Thus, this study aim to produce and compare the organoleptic and nutritive values of fresh milk yoghurt and powdered milk yoghurt.

Materials and Method

Sample Source

Fresh milk was collected at Aliyu Farm Limited Sokoto and Miksi powdered milk was obtained at old market Sokoto, Sokoto State Nigeria.

Production of Fresh Milk Yoghurt (El-Zubeir et al., 2012)

Two (2) liters of fresh whole cow's milk was pasteurized by placing the milk in a water bath, the milk was stirred continuously, till the milk attained the temperature of 85°C. The milk is held at this temperature for 30 min. At the end of the pasteurization period, the pasteurized milk was cooled to 45°C before inoculating it with 50 ml commercially produced LAB starter culture. The inoculated milk samples were stirred thoroughly and incubation at 45°C for 8 hours. After the fermentation, the yoghurt was cooled down and 0.5 g% of colorant was added and mixed thoroughly.

Production of Powdered Milk Yoghurt (Adam and Moss, 1992)

Eight hundred gram (800 g) of Miksi powdered milk was weighed and transferred into a beaker containing 2 L of sterilized distilled water, the mixture was stirred continuously with a sterile wooden spoon till a homogenous solution was formed. The container was covered with aluminium foil and pasteurized at 85°C for 30 minutes. The pasteurized milk was then cooled to 45°C, 50 ml commercially produced LAB starter culture was added and incubated at 45°C for 10 hours. After the fermentation, the yoghurt was cooled to refrigerator temperature (4-6°C) and 0.5 g% of colorant was added and mixed well.

Sensory Evaluation of the Yoghurt Drink (Ihekoronye and Ngoddy, 1985)

The product samples were evaluated using 5-point hedonic method for sensory characteristics. The overall acceptability was done using 10 pre-trained panels selected randomly. The panels were given a hedonic questionnaire, both samples of fresh milk yoghurt and powdered milk yoghurts. They were asked to compare the sample by testing for taste, aroma, color, and general acceptability. All tests were performed and rated on a 5-point hedonic scale as: Very good = 5; Good = 4; Neither like nor dislike = 3; Dislike = 2; Extremely dislike = 1.

Determination of Titrable Acidity

This was determined using the alkaline titrimetric method of Sadler and Murphy (2003). Following the method, 10 ml of each of the sample was dispensed into a separate conical flask and 1 ml of phenolphthalein indicator was added. The mixture was titrated against standard alkaline solution (0.01N NaOH solution). Titration was done till a persistent faint pink coloration was obtained.

The total titrable acidity was calculated using the formula:

$$\% \text{ Titrable acidity (TA)} = (T \times N/W) \times 100$$

Where,

T = Titre value

N = Normality of titrant

W= Weight of sample used

Determination of Total Solid (AOAC, 2002)

Five (5) gram of both fresh milk yoghurt and powdered milk yoghurt were weighed into separate crucible (w_1) and dried in an oven at 105°C to a constant weight. The dried samples were cooled in a desiccator for 30 minutes and weighed (w_2). The total solid content of each sample was calculated as follows:

Total solid (g/kg) = final weight of dried sample + crucible – weight of crucible/weight of fresh sample in kilogram.

Determination of Mineral Elements (Na, K, Ca, Mg and P)

Sodium (Na^+) and Potassium (K^+) were analyzed by flame photometer (AOAC, 2002). Calcium (Ca^{2+}) and Magnesium (Mg^{2+}) are analyzed using EDTA titrimetric method (AOAC, 2002) while Phosphorus (P) was determined using spectrophotometry method (AOAC, 2002).

Determination of pH and Temperature

The pH of the two yoghurt samples were measured using a pH meter with a glass electrode and thermometer according to the method of AOAC (2002)

Determination of Vitamins

Vitamins A, C, and E were determined following the standard method of Association of Official Analytical Chemists (AOAC, 2002).

Statistical Analysis

All the data obtained were analyzed using student T-test. The significance difference was calculated at 95% level of significance using GraphPad Instat version 3.0.

Results

Table 1 shows the physicochemical properties of fresh and powdered milk yoghurt. There was a significant difference ($P < 0.05$) between the titrable acidity (TA) of the samples. The total solid, temperature and pH of both samples showed no significant difference ($P > 0.05$). The sensory quality showed the taste of fresh milk yoghurt and powdered milk yoghurt as rated by the panelist were significantly difference ($P < 0.05$) while there was no significant difference in the color of the yoghurt samples.

Table 1. Physicochemical Properties of Fresh and Powder Milk Yoghurt

Parameters	Fresh Milk Yoghurt	Powdered Milk Yoghurt
Temperature	5.2±0.05 ^a	5.3±0.05 ^a
pH	4.28±0.01 ^b	4.89±0.03 ^a
Titratable Acidity	0.70±0.01 ^b	0.92±0.01 ^a
Total Solid (g/kg)	110.67±1.45 ^a	109.00±2.08 ^a

Values are mean ± SD of three (3) replicates. The mean with the same superscript on the same row are not significantly difference ($P < 0.05$).

Table 2: Sensory Quality of Fresh Milk and Powdered Milk Yoghurt

Organoleptic Properties	Fresh Milk Yoghurt	Powdered Milk Yoghurt
Aroma	4.80±0.20 ^a	4.60±0.25 ^a
Taste	4.80±0.20 ^a	2.80±0.74 ^b
Color	4.40±0.25 ^a	4.38±0.20 ^a
General Acceptability	4.80±0.20 ^a	3.00±0.55 ^b

Values are mean ± SD of three (3) replicates. The mean with the same superscript on the same row are not significantly difference ($P < 0.05$).

Table 3: Mineral Analysis of Fresh Milk and Powdered Milk Yoghurt

Minerals	Fresh Milk Yoghurt	Powdered Milk Yoghurt
Sodium(mg/kg)	27.67±5.77 ^b	35.00±0.58 ^a
Potassium(mg/kg)	250.00±5.77 ^b	310.00±5.77 ^a
Calcium(mg/kg)	0.84±0.01 ^a	0.83±0.01 ^a
Magnesium(mg/kg)	0.28±0.02 ^a	0.38±0.02 ^a
Phosphorus(mg/kg)	1.53±0.02 ^a	1.55±0.01 ^a

Values are mean ± SD of three (3) replicates. Mean with different superscript on the same row are significantly different at $P < 0.05$.

Table 4: Vitamins content of fresh milk and powdered milk yoghurt

Vitamins	Fresh Milk Yoghurt	Powdered Milk Yoghurt
Vitamin A (mg/dl)	141.98±1.168 ^b	185.50±1.17 ^a
Vitamin C (mg/dl)	5027.40±2.95 ^b	6857.2±5.89 ^a
Vitamin E (mg/dl)	6.10±2.44 ^a	12.19±0.7 ^b

Values are mean ± SD of three (3) replicates. Mean with different superscript on the same row are significantly different at $P < 0.05$.

The mineral content of the fresh milk and powdered milk yoghurts was presented in Table 3. Powdered milk yoghurt was found to have a significantly high mineral content compared to the fresh milk yoghurt. The powdered milk yoghurt contained Sodium (35 mg/kg), Potassium (310 mg/kg), Magnesium (0.38 mg/kg) and Phosphorus (1.55 mg/kg). The vitamins content of fresh and powdered milk yoghurt was presented in Table 4. It was observed that the vitamin content of the powdered milk yoghurt significantly ($P < 0.05$) higher than that of the fresh milk yoghurt.

Discussion

Yoghurt is a fermented milk product with numerous health and nutritional benefits. Yoghurt helps reduce body weight, blood pressure, LDL-cholesterol and lipid peroxidation (Georgakouli *et al.*, 2016). Yoghurt is also a rich source of protein. This study compared the consumers' acceptability and nutritive values of fresh milk yoghurt and powdered milk yoghurt. The pH of the yoghurt produced ranged from 4.28 to 4.89 thereby confirming the acidity of the yoghurt samples. The acidic pH is important in inhibiting the growth of pathogenic microorganisms in yoghurt thereby preventing the yoghurt spoilage and poisoning. The titrable acidity which measures the actual acid value present in the sample was found to be higher in the powdered milk yoghurt and might be due to its high content of vitamin C. Many of the panelists accepted and had preference for the fresh milk yoghurt than the powdered milk, this might be due to its unusual taste and aroma as the use of fresh (cow) milk in yoghurt was not very common. Mineral analysis of powdered milk yoghurt and fresh milk yoghurt revealed the content Sodium, potassium, calcium, magnesium and phosphorus. It was observed in this study that the mineral composition of the powdered milk was higher compared to the fresh milk yoghurt. This could be due to the fortification of the powdered milk to enhance the mineral contents. According to Jesen (1998) fresh cow milk is not considered a rich source of mineral elements except for calcium and phosphorus hence the need to fortify the cow milk. Yoghurt is a very good source of essential minerals needed for human metabolism but the concentration of its major elements depends on the species, the individual animal, the method of feeding, lactation stage, and health condition of the udders (Cashman, 2006). The concentrations of antioxidant vitamins were found to be higher in the powdered milk yoghurt compared to the fresh milk yoghurt. This might be due to addition of vitamins A, C and E during the fortification process of powdered milk.

Conclusion

This study shows that the fresh milk yoghurt is more acceptable based on the sensory qualities. However, the powdered milk yoghurt is richer in minerals compared to fresh milk yoghurt.

Abstract

Soybean is a valuable plant-based protein with several functional food applications such as production of soy yoghurt. This study was aimed at determining the bacteriological quality of soy yoghurt. Soy yoghurt was prepared by standard procedure and was divided into four groups of six samples each excluding day 0 with only one sample. The yoghurt samples were subjected to treatments with 0.5 g% sodium benzoate, 0.5 g% potassium metabisulphate and a combination of both preservatives at 0.25 g% each. Microbial qualities were determined at an interval of a day for 7 days period. The total bacterial count for soy yoghurt treated with potassium metabisulphate (SPM) ranges from 5.00 ± 0.342 to 7.75 ± 0.342 log₁₀cfu/ml and that of sodium benzoate treated soy yoghurt (SSB) ranges from 5.0 ± 0.392 to 7.70 ± 0.392 log₁₀cfu/ml and for the combination of both sodium benzoate and potassium metabisulphate (BOTH) value ranges from 5.00 ± 0.402 to 7.53 ± 0.402 log₁₀cfu/ml. Soy yoghurt untreated (SU) has a range of 5.00 ± 0.367 to 8.00 ± 0.367 log₁₀cfu/ml. For coliform count FSU has 14.0 as most probable number, while SPM and SSB has a value ranging from 14.0 ± 1.078 to 21.0 ± 1.078 while a combination of both has a range of 14 ± 1.00 to 20 ± 1.00 . SU has a range of 14 ± 1.078 to 24 ± 1.078 . The organisms isolated from the samples were *Bacillus spp.* 30.77%, *Shigella spp.* 23.08%, *Salmonella spp.* and *E. coli* with 15% each and *Staphylococcus* and *Streptococcus spp.* with 7.69% each. Only *Bacillus spp.* was isolated in both FSU and BOTH. The results suggest that the use of combined sodium benzoate and potassium metabisulphate preservatives at 0.25 g% each was more effective at eliminating most of the bacteria implicated in soy yoghurt spoilage.

Keywords: Bacterial count, bacteriological quality, protein rich, soy yoghurt, treated.

Introduction

Soybean (*Glycine max*) is an inexpensive and sustainable plant-based protein containing 37 to 40% protein, 5.4% crude fiber, 18.2 to 20% oil and 10% mineral (Iombor *et al.*, 2009; Jayasena *et al.*, 2010). It is generally considered as a highly versatile grain which has many functional food applications such as production of soy yoghurt (Omotayo *et al.*, 2007). Yoghurt is a fermented functional dairy food product rich in nutrients, it is often produced by fermenting fresh milk with lactic acid bacteria (Ye *et al.*, 2013). Yoghurt provides remarkable health benefits such as reduction of serum cholesterol, stabilize gut microflora and stimulate immune system (Shori, 2013).

Soy yoghurt is produced from soymilk an aqueous extract of soybean. It is commonly characterized as having a beany, grassy or soy flavor, it can be improved by lactic acid fermentation as in yoghurt-like products (Jimoh & Kolapo, 2007). Soymilk yoghurt, however, has remained its relatively short shelf life, due to the growth and proliferation of spoilage microorganisms such as bacteria, yeasts and molds. The processing and storage conditions of soymilk extract, however, influence the presence or absence of these spoilage organisms in the extract. For example, yeasts and molds are problematic in foods in that they discolour food surfaces, cause off odours and off flavours as well as produce toxins. Evaluation of the bacterial quality of soy yoghurt become apparent due to the high risk associated with consuming substandard or unhygienic soy yoghurt containing pathogenic organisms.

Materials and Methods

Preparation of Soymilk Extract

Soybean seeds were obtained from Sokoto Central Market, Sokoto State, Nigeria. Soy milk was extracted by method of Onuorah *et al.* (2007). One (1kg) kilograms of healthy and unbroken soybean seeds were soaked in warm water for 12 h and then decanted and rinsed with tap water. The soybean seeds were wet milled with 5 L of water and the slurry was filtered using double layer muslin cloth to obtain the filtrate.

Preparation of Soy Yoghurt

About 5 L of soymilk extract was warm in water bath at 35-38°C for 20 minutes, then 0.5% of gelatin was added under constant rapid stirring. Then the extract was pasteurized at 80°C for 30 minutes in water bath. The pasteurized soymilk extract was then homogenized and cooled to 45°C, then 2% of yoghurt culture was added and the mixture was incubated at 45°C until a pH of 4.0-4.3 was reached. The incubated yoghurt was then refrigerated at 6°C for 12 h, 12 g% (w/v) of sugar and 0.5 g% (w/v) of vanilla flavour were added.

Experimental Design

The soy yoghurt was divided into four groups of six samples each except for day zero (group 1) which has one sample. All the samples were filled into a sterile cork bottles. The groups are as follows:

Group 1: Fresh Soy Yoghurt Untreated (FSU)

Group 2: Soy Yoghurt Untreated (SU)

Group 3: Soy Yoghurt Treated with 0.5 g% Sodium Benzoate (SSB)

Group 4: Soy Yoghurt Treated with 0.5 g% Potassium Metabisulphate (SPM)

Group 5: Soy Yoghurt Treated with equal amount of 0.25 g% Sodium Benzoate and Potassium Metabisulphate (BOTH)

Bacteriological Analysis

Determination of Total Bacterial Counts

Nutrient agar (NA) and MacConkey agar (MAC) were used to culture bacteria and coliform present in the soy yoghurt, respectively. The agars were prepared in accordance with the manufacturer's (Titan Biotech Ltd) instruction. The samples were serially diluted 4 times aseptically using 1 mL of soy yoghurt samples with 9 mL of sterile distilled water to reduce the microbial load. After dilution, 0.1 mL of 10^{-4} dilution factor was inoculated on the surface of solidified agars and bent glass rod was used to spread the sample onto the agars. The inoculated plates were incubated at 37°C for 24 h. Colonies that were formed on the agars were count using colony counter and the results were recorded as $\log_{10}$ colony forming unit per millimeter ($\log_{10}$ cfu/ml) of soy yoghurt.

Purification of Microbial Isolates

Isolated colonies were sub-cultured on NA and MAC and incubated at 37°C for 24 h. After incubation, pure bacterial isolates were stored on NA. The stock cultures were then preserved in a refrigerator at 4°C until used for further microbiological analyses.

Presumptive Test

The primary isolate was carried out using MacConkey broth, sterile syringe was used to inoculate 10 mL, 1 mL and 0.1 mL of the sample into three tubes containing MacConkey broth. The tubes were closed tightly, vortex and then incubated at 37°C for 24 h. Gas and acid formation were observed by colour change from purple to amber yellow and the most probable number (MPN) of coliform was determined on the probability table (Manga *et al.*, 2008).

Confirmed Test

The prepared Eosin methylene blue was poured into sterilized petri dishes. Inoculums were picked with a wire loop from tubes showing positive presumptive test and was streaked into the media. The inoculated petri dishes were placed in the incubator at 27°C for 24 h. After the incubation, colonies were observed.

Completed Test

From plates showing positive confirmatory test, an inoculums were picked and inoculated into tubes of MacConkey broth and Nutrient agar, both tubes were incubated at 27°C for 24 h. Positive complete test was indicated by gas formation in MacConkey broth, inoculation into nutrient agar was used to determine colonies count.

Characterization and Identification of Bacterial Isolates

Bacterial isolates were characterized and identified by observation of colonial and morphological characteristics, gram reaction and biochemical tests. The biochemical tests used for identification were motility, indole, catalase, citrate utilization, Methyl Red (MR), Voges- Proskauer (VP), Triple-Sugar Iron agar (TSI), starch hydrolysis, urease and hydrogen sulfide production were carried out in accordance with standard methods described by Elmahmood & Doughari (2007). The isolates were finally identified using Bergey's Manual of Determinative Bacteriology following the method of Holt *et al.* (2000).

Data Analysis

The analyses were conducted in triplicate and results were expressed as Mean $\pm$ Standard deviation. One-way analysis of variance was used to determine the difference between the mean at 95% confidence limit using GraphPad Instant version 2.0 San Diego, USA.

Results

Figure 1.0 presents the effect of storage time on the total bacterial count of soy yoghurt. There is a significant increase in the bacterial load from day 2 to day 7, most particularly for the untreated sample. The different preservatives have no significant difference on the bacterial load. The bacterial count for SPM ranges from 5.0 ± 0.34 to 7.75 ± 0.34 $\log_{10}$ cfu/mL and 5.0 ± 0.39 to 7.7 ± 0.39 $\log_{10}$ cfu/mL for SSB, while that of combined preservatives range from 5.0 ± 0.40 to 7.53 ± 0.41 $\log_{10}$ cfu/mL. But, for the untreated sample (SU) there is a significant increase in the bacterial count from 5.0 ± 0.37 to 8.00 ± 0.37 $\log_{10}$ cfu/mL as the storage day increase.

Figure 1.0: Effect of Storage Time on Total Bacterial Count of Treated and Untreated Soy Yoghurt
FSU: fresh soy yoghurt untreated, SU: soy yoghurt untreated, SSB: soy yoghurt treated with 0.5 g% sodium benzoate, SPM: soy yoghurt treated with 0.5 g% potassium metabisulphate, BOTH: soy yoghurt treated with equal amount of 0.25 g% potassium metabisulphate and sodium benzoate.

Most Probable Number of Coliform

Figure 2.0 presents the most probable number (MPN) of coliforms. All the treated samples at day 1 have the same MPN of 14 ± 1.00 like that of FSU. However, the MPN of SU significantly increased from 14 ± 1.08 at day 0 to 17 ± 1.08 and 20 ± 1.078 at day 1 and 2, respectively. Both SSB and SPM have a significant increased to 17 ± 1.078 after 2 days of storage. But, the sample with the equal amount of 0.25 g% potassium metabisulphate and sodium benzoate has no significant increase in the MPN after 2 days of storage. At day 3, the only changes found was on the SU where the value for number of coliforms increased from 20 ± 1.078 in day 2 to 21 ± 1.078 . At day 4, SSB and SPM increased to 20 ± 1.078 from 17 ± 1.078 while BOTH increased to 17 ± 1.00 . At day 5, SU significantly increased to 24 ± 1.078 from 21 ± 1.078 , while SSB and SPM and BOTH did not change. At day 6, SSB and SPM increased to 21 ± 1.078 from 20 ± 1.078 while BOTH increased to 20 ± 1.00 from 17 ± 1.00 while SU remained constant at 24 ± 1.078 .

Figure 2.0: Most Probable Number (MPN) of Coliform in Treated and Untreated Soy Yoghurt
FSU: fresh soy yoghurt untreated, SU: soy yoghurt untreated, SSB: soy yoghurt treated with 0.5 g% sodium benzoate, SPM: soy yoghurt treated with 0.5 g% potassium metabisulphate, BOTH: soy yoghurt treated with equal amount of 0.25 g% potassium metabisulphate and sodium benzoate.

Table 1. Morphological and Biochemical Characteristics of Isolated Organisms from Treated and Untreated Soy Yoghurt

Morphological Characterization			Biochemical Characterization												Organism

Table 2. Bacterial Isolated From Treated and Untreated Soy Yoghurt

Bacteria sample	FSU	SU	SSU	SPM	BOTH
<i>Bacillus spp.</i>	+	+	+	+	+
<i>Escherichia coli</i>	-	+	+	-	-
<i>Shigella spp.</i>	-	+	+	+	-
<i>Streptococcus spp.</i>	-	+	-	-	-
<i>Staphylococcus aureus</i>	-	+	-	-	-
<i>Salmonella typhi</i>	-	+	-	+	-

FSU: fresh soy yoghurt untreated, SU: soy yoghurt untreated, SSU: soy yoghurt treated with 0.5 g% sodium benzoate, SPM: soy yoghurt treated with 0.5 g% potassium metabisulphate, BOTH: soy yoghurt treated with equal amount of 0.25 g% potassium metabisulphate and sodium benzoate.

The percentage frequency of occurrence of isolated organism from treated and untreated soy yoghurt is presented in Figure 3.0. A total of six bacteria were isolated from the samples. *Bacillus spp.* has the highest frequency of occurrence with 30.77%, followed by *Shigella spp.* with 23.08% and the organisms with the least frequency of occurrence are *Streptococcus* and *Staphylococcus* with frequency of 7.69%.

Figure 3. Percentage Frequency of Occurrence of Isolated Bacteria

Discussion

Soymilk yoghurt is a creamy, nutritious probiotic drink which contains protein, fat, carbohydrates, vitamins, minerals and live organisms. The nutritious nature of soymilk yoghurt makes it a good medium for microbial growth if not accurately process and preserve. Many microorganisms such as mesophilic aerobic bacteria, coliforms and yeasts are known to be responsible for the spoilage of soymilk yoghurt (Osuntogun and Aboaba, 2004). Soymilk has a great potential to supplement the dairy milk. Chemical preservatives are included in food to prevent microbial spoilage and to minimize the risk of consumer exposure to infection (Sean and Eileen, 2004). These chemical agents affect microorganisms by disrupting critical cell factors e.g they may damage the plasma

membrane or denature various cell proteins while others interfere with the functioning of nucleic acids thus inhibiting cell reproduction (Lansing *et al.*, 2002).

The results obtained from MPN test which is a presumptive test for coliform helps to know the estimated amount of coliform present in a giving sample. It can be used as a test to know how safe a food sample is for consumption. Increase MPN result shows that the soy yoghurt is not safe for human consumption as earlier reported by Paulsen *et al.* (2006); Kunicka (2007). This kind of result was obtained from day 4 to day 6 and it was higher in SU sample which has no preservative, and the low number of coliform in sample BOTH is an indication that the use of the combination of sodium benzoate and potassium metabisulphate is better form of preserving soy yoghurt.

Effects of Preservation on Total Bacteria Count of Soy Yoghurt

Soy yoghurt served as an important source of protein in human diet (Jimoh & Kolapo, 2007). Its nutrient value has made it so irresistible that it is recommended by nutritionists. The greatest problem encountered is that the spoilage organisms survive in preservatives. The decrease in total bacterial count in the sample containing combination of sodium benzoate and potassium metabisulphate could probably be because of the bactericidal effect produced by the preservatives used. This tends to decrease to a higher extent the growth of most bacteria. The total bacterial load of day 0, 1 satisfy the FAO (1979) microbial limit of (4.0 to 5.60log₁₀cfu/mL) for yoghurt. At day 2 and 3, all the samples fall within the fairly good limit of FAO (1979) standard limit of 6.30log₁₀cfu/mL. At day 4, 5 and 6, all the samples fall within the range that is bad for consumption from 7.30log₁₀cfu/mL and above.

Microorganism Isolated from Soy Yoghurt

The bacteria isolated include: *Staphylococcus spp.*, *Streptococcus spp.*, *Shigella spp.*, *Bacillus spp.*, *E. coli*, *Salmonella spp.* The occurrence of *Streptococci* is in line with the works of Chambers (2005) who reported that organisms that contaminate the surface teat and udders of the cow include *Staphylococci*, *Streptococci*, spore formers, coliforms and gram negative bacteria which can survive pasteurization temperature. The isolated organisms present in the soy yoghurt could be from the cow milk yoghurt used as starter culture during the production process. In most foods, the total bacterial count is often an indication for the sanitary quality, safety and utility of foods. It may reflect the conditions under which the product is produced such as contamination of raw materials, the effectiveness of processing and the sanitary conditions of equipment and utensils. *Bacillus spp.* was the dominant bacteria isolated in the yoghurt, they are inhabitant of soil (Van Eeden & Korsten, 2004) and food borne pathogens associated with health hazard (FAO, 1979; Odu and Adeniji, 2013). *Streptococcus* and *Staphylococcal* recorded the least bacterial load. Although, *Staphylococcal* load does not exceed the hazardous level but the presence should be discouraged because it level could increase if poorly stored. The possible source of this organism may be from the nasal passage, skin and other mammals. The presence of *Staphylococcus aureus* in yoghurt may cause *Staphylococcal* food poisoning which is a major type of food toxicity caused by ingestion of improperly stored or cooked food in which *S. aureus* has grown.

Conclusion

It can be concluded therefore that absence of preservative leads to increase in the viable bacterial load and hence quick spoilage of soy yoghurt. Several pathogenic bacteria were found to be responsible for the spoilage of soy yoghurt. The use of the combination of 0.25 g% of sodium benzoate and 0.25 g% of potassium metabisulphate is the most effective way of prolonging the shelf life of soy yoghurt.

Impact Of Climate Change On Global Water Resources, Quality And Challenges For Sustainable Development Goals

Aijaz Ali Panhwar

Pakistan Council of Scientific and Industrial Research Karachi, Sindh, Pakistan

Abstract

Water is a blessing and reason of survival on earth for human beings. Without water it is not difficult to live on earth, but it is impossible. Unfortunately, rapidly increasing in population, unplanned agriculture practices and industrial sector, has becomes a serious issue for environment and for future needs. Approximately six billion people may suffer from scarcity of clean water by 2050. The agriculture sector is largest consumer of fresh water around 70% followed by industry and domestic 19% & 11% respectively. The Global demand of water is gradually increasing by 1% per year. Existing global water demand has been projected about 4,600 km³ every year and estimated may increase up to 20%-30%, in range of 5,500-6,000 km³ every year by 2050. Advancement of technology, excess use of fertilizers is main source of deterioration of water quality and has created serious concerns for environment, such as our drinking water contains various in many cases. About 10 billion tons of freshwater using by human and result severe polluted return to environment. It is estimated that about 80% of wastewater discharged from industries containing utmost hazardous contamination is of biological nature, which causes serious human health problems and may cause death. The nominal treatment is carried out in upper middle-income 38% and worst situation in lower middle-income countries up to 28%, only 8% in low-income countries, undergoes for treatment for reuse.

Keywords: *Agriculture, Climate change, Environmental Challenges, Wastewater treatment, Water Quality*

Introduction

Water is blessing by nature, it a scarce and necessary resource that is crucial to human welfare. It is only renewable when treated correctly. Groundwater has potential to fight against hunger, creates jobs and provides food security and can play vital role in socio-economic development of the world. The share of groundwater in availability of all liquid freshwater on earth is around 99% [WWDR, 2022]. It is fact that more than 1.7 billion people now live in river basins where human demand exceeds natural recharge; two-thirds of the world's population will live in water-stressed countries by 2025. Even while water can pose a significant barrier to sustainable development, water management can play a significant role in strengthening the resilience of social, economic, and environmental systems in the face of rapid and unpredictable change. Water is crucial for sustainable development; because it sustains ecological health, economic growth, and human existence, It is crucial for raising population health, productivity, and wellbeing as well as for reducing the burden of disease worldwide. More than 1.7 billion people currently reside in river basins where water usage exceeds recharge, causing rivers to dry up, groundwater to run dry, and ecosystems and the services they provide to deteriorate [UN sustainable development]. Climate change is altering weather patterns, which causes extreme weather events, variable water supply, a worsening of water scarcity, and contaminated water supplies. These effects can have a big impact on the quantity and quality of water that kids need to survive. By 2050, it is anticipated that the global water demand (measured in withdrawals) would have increased by 55% [OECD 2012]. Over 80% of wastewater is reportedly released without treatment, according to some estimates.

The most economically and socially damaging natural disasters are those that include water. Floods, droughts, and storms have affected 4.2 billion people since the 1992 Rio Earth Summit, accounting for 95% of all catastrophe victims, and have cost USD 1.3 trillion in damage (63% of all damage) [WWDR-2022]. As human populations increase, industrial and agricultural activity increases, and climate change threatens to significantly disrupt the hydrological cycle, declining water quality has emerged as a global problem. Eutrophication, which is caused by high nutrient loads (mostly phosphorus and nitrogen), is the most common issue with water quality on a global scale and significantly reduces the beneficial uses of water. Agricultural runoff, residential sewage (which can also be a source of microbiological pollution), industrial effluents, and air inputs from burning fossil fuels and bushfires are among the main sources of nutrients. Due to their complicated dynamics, relatively longer water residence durations, and function as an integrating sink for pollutants from their drainage basins, lakes and reservoirs are particularly vulnerable to the harmful effects of eutrophication. Nitrogen levels above 5 mg/l of water are frequently signs of contamination from animal and human waste or fertilizer runoff from agricultural areas.

A necessity for water resources are one of the natural resources that can be discovered in sufficient quantities is water. It is a vital source for the continuation of life on Earth. It is frequently utilised for many different things, including drinking, washing, cleaning, cooking, irrigation, and other residential and commercial functions. By 2030, cut the amount of untreated wastewater upto 50 percent, less dumping, restrict the release of hazardous chemicals and materials, enhance recycling and safe reuse and reduce pollution by 2030 [UN sustainable

development]. Every continent already experiences a water shortage. 500 million people, or almost one-fifth of the world's population, are on the edge of experiencing physical scarcity, which will impact about 1.2 billion people. Economic water deficit affects an extra 1.6 billion people, or close to a quarter of the world's population (where countries lack the necessary infrastructure to take water from rivers and aquifers) [UNDP, 2006]. One of the major issues that many cultures and the world will face in the twenty-first century is a lack of clean water. Since this century, water demand has increased at a rate that is more than twice that of population growth. Both a natural and man-made issue, water scarcity; for the seven billion people on the earth, there is enough freshwater available, but it is dispersed unevenly and too much of it is polluted, and handled in an unsustainable manner.

Impact of global climate change on water resources

Water is essential for some important sectors including consumption of human, agriculture crops, production of energy as well as manufacturing of industrial items, all these are water consuming activities. The demand of water for use of different sectors by 2050 will increase upto 70% [WWDR, 2017]. The irrigation land doubled, tripled in livestock and 20 times increase observed in aquaculture [WWDR, 2015]. The population of the world may increase upto 8.6 billion in 2030 and 9.8 billion in 2050. The emphasis should be given on increasing water use efficiency and conservation of water resources to meet the food and nutritional requirements of the population by 2050. To develop global water resources, should be implementation of climate-smart agriculture practices [Sheikh and Karim, 2020]. The variation or increase of temperature will change the pattern of precipitation and humidity by 2050 [Wang, et al. 2013]. The green house gases are largest reason for change pattern of weather [Milly et al, 2011]. Around 0.88 C has been increased between 1880-2012, and by 2100 may accelerate further 0.3-4.8C [Carter et al, 2015]. The climate change effects were observed in different regions such as Hotan River in China [Climate Change 2013; Luo et al, 2017] There is a potential impact of climate change in North Korea [Climate Change 2014]. The climate change impacts were observed as increased in temperature in Europe. The pattern has been changed in precipitation and snow cover and increased in flood and drought condition. The river discharge has affected in Germany and other European countries due to climate change [Lee et al, 2017]. The central and Eastern Europe is experiencing in precipitation, decreasing during last century [IPCC, 2007]. Austria, Poland, Hungary, Germany and Czech Republic are affected by extreme flood during last decade [Klein et al, 2002]. Switzerland and Finland are facing ice cover shorter duration. Due to this situation the Europe may suffer in different sectors such as agriculture, energy production, as well as drinking water [Klein et al, 2002]. The study shows impact of climate change in 22 basins in Australia, and change of precipitation and potential evapotranspiration around 1% may cause a change of runoff by 2.1–2.5% and 0.5–1.0%, respectively [Vose et al, 2016].

World water position and demand

Water availability, Quality and Asia region

Water is the center of the three pillars of sustainable development-economy, society and the environment. Water pollution is a biggest threat to the planet including our ecosystem. Only little amount of industrial and municipal wastewater is treated 8 and 28% in low-income countries and lower-middle-income countries. As it plays a vital role in achieving poverty reduction, in production/ growth, public health, food security. The freshwater is becoming very rare as well as biggest challenge for Asia continent and increasing uncertainty for future needs. Around 16% people are struggling for safe water. UN has projected around 2025 50% countries of the world may face water shortages and around 2050 $\frac{3}{4}$ people of the world will be affected by water shortage. Asia continent is comprises of 50% of population of the world (please add table of figure to compare population) and around $\frac{2}{3}$ population is increasing in the world, it is expected that around 500 million population may increase in 10 years, other side there is a less freshwater resources for Asian people 3920 m³/person/year. Around USD 8 billion are required for the requirement of safe drinking water to meet the millennium development goals. According to the [WHO,2017] 783 million people, or roughly one out of every ten people on the earth, do not have access to safe drinking water, and 2.5 billion people, or more than a third of mankind; do not have access to appropriate sanitation. In Asia, where more than half of the 2.5 billion people do not have access to proper sanitation, the problem is particularly urgent. Farmers will require additional 19 percent more water by 2050, according to the UN Food and Agricultural Organization [FAO,

2009] much of it in countries already facing water scarcity. According to the [FAO, 2009], food output will need to increase by 70% by 2050 to feed a world population that is predicted to increase from 7.3 billion to 9.3 billion people. The average amount of fresh water per person in Asia is 47% of the global average of freshwater/person. However, it is home to 65 percent of the world's population.

Despite having the fourth largest fresh water reserves in the world, China has the world's second lowest per-capita water supply. In 2015, the World Health Organization [WHO, 2017] claimed that 884 million people lacked access to even basic drinking water, with 159 million relying on surface water [WHO, 2017] around 02 billion people used contaminated drinking water containing faecal. By 2025 around 1.8 billion people will live in water scarcity countries (less than 1000m³/person.365 days) and water stressed population will be fifty percent of the world [Mittra 2014; Bain, et al, 2014]. Domestic and industrial sectors demand will increase upto 55% by 2050 [WWAP

2015]. Combination of anthropogenic and nutrient factors is responsible for degradation of water throughout the world. Improper treatment of municipal and industrial effluent and traditional agriculture practices are key responsible for river's pollution. Yangtze River is discharging 0,333 million tons plastic waste into East China Sea. Ganga River is receiving around 0.115 million tons plastic waste per year [D'Mello 2017]; while Yemna River contributes sewage water 3.9 billion liters per day by 21 outlets [Yadav, 2013]. Over exploitation of freshwater resources are damaging upto 1.75 trillion USD to agriculture, biodiversity and ecosystem sectors [Niko, 2013]. In Asia 5.2 billion populations is projected by 2050.

Around 80% of Asian rivers are in poor health, 1.7 billion populations are using lack basic sanitation in 2015. Around 3.4 billion people population will live in water stress areas in Asia continent [ADB 2016]. 2 billion populations can suffer for food security disaster by 2050 and affect more than 1.8 billion population in water stress by 2080 [UN-ESCAP 2015]. 700 million died and 1.7 billion people are affected by different calamities during ten years 2006-2016 [ADB 2016]. Groundwater is a major water supply upto 1/3 in some Asian countries such as Pakistan, India, china and Bangladesh; tube well are 76% & 60% source of water for people of Bangladesh and Cambodia [UNESCO 2015]. It is projected that groundwater irrigation adds upto USD 30 billion per year in Asian countries economy [WWAP 2015]. Hardly 22% of effluent is treated for safe discharge in surface water bodies in Asia [UN WATER 2017]. South Korea and Japan are not 100% treating wastewater; while Pacific island countries 17% central and western Asian countries 34% southeast Asian countries 38% and east Asian countries 57%, are treating their generated effluent in the countries [UN WATER 2017].

Figure 1- Wastewater Treatment by sub-regions in Asia [UN WATER 2017]

Figure 2- Wastewater Treatment by countries in Asia

The water is considered is a precious gift for the world. Due to the excess human demand scarcity of water, the safe water access is a rising a serious issue for environmental protection and sustainability. The irresponsible role of human for consuming of freshwater resources is responsible for deterioration the quality of water resources on this planet.

Figure 3- Top 10 countries without access to safe water [UNDP 2016]

South Asia and Availability of Water

South Asia region is a very populated region as compared to other regions with around 1.6 billion population in 2010, and by 2050 over 2.2 billion, almost more than 33% increase [WB 2013b]. It comprises of regular members Pakistan, India, Bangladesh, Bhutan, Nepal, Sri Lanka, and Maldives. The agriculture sector is major source of livelihood of this region. Nearly 50% of the population is directly or indirectly involved in agriculture sector; it contains 18% in the GDP of south Asia [WB 2013a]. Agriculture crops production depends on the availability of freshwater resources and it's judiciously utilization. The population in 20th century has increased three times; while six times increase in use of the water [FAO 2009]. Due to drought situation the agriculture sector is facing USD 8 billion per year due to crops production, which has affected more population as compared to other natural disasters [Zhang, et al, 2015; Keyantash and Dracup, 2002]. China faces loss of 27 million tons of grains since 20 years [Chen et al, 2014]. Since 1960 the per capita of freshwater resources has declined upto 55% (FAO) Demand for freshwater may further increase upto by 2030r 50% [WWAP 2012]. Global population's 40% is affecting by water scarcity. Pakistan is an agriculture dependent country, 20% of GDP, have one the largest irrigation network but with 60% losses and counted very poor system and using almost 73% of water resources which is one the highest consuming country [Hukka et al, 2010]. In Pakistan the people are suffering from water shortages around among 207 million have no access to safe water [Zulfqar, 2018].

Once pakistan was abundant water country, but at the moment water resources in pakistan is gradually decreasing from 5260m³/capita to 1000m³/capita (1951-2016), which shows the water pressure due to increasing of population and injudiciously use of this resource. It may further decrease upto 869m³/capita by 2025 and ultimately may face water crisis to food security [Nabi et al 2019; Mikosch et al 2020; Ullah et al 2018]. If this situation continuous and reaches to 500m³/capita by 2025 it will become land without water. 24 cities are holding burden of population, with lack of access to clean water i.e. Karachi, Lahore, Faisalabad and Rawalpindi [Kummu, et al 2016]. The global economy may face cost of 500 billion USD, due to insecurity of water [WWAP 2016]. The mangroves ecosystems are severely affected to coastal areas of America and Asia. In 2013 world is witnessed loss of 50 billion USD, in 2013 due to flood management [Guha-Sapir, 20014]. 45 million people are using arsenic contaminated water in Bangladesh [Flanagan et al 2012]. Leakage is one of the biggest issue and nearly 30% loss in abstracted water globally [Kingdom et al 2006]. Also loss 45 million m³ due to poor infrastructure or leakages; this losted water is sufficient for nearly 20 million people [Kingdom et al 2006]. The huge investment is required to improve or maintain, USA need to allocate USD 195 billion by 2040 [ASCE 2011].

Water resources are facing disposal of 2million tons/day human waste [WWAP 2017a], fossil fuel/nonrenewable resources are affecting freshwater resources upto 18 billion m³/year [WWAP 2017b]. While 40% wastewater pollution due to food sector from developed or high income countries as well as 54% from less developed or low income countries [UNEP 2007]. The globally loss may increase upto 19.2 billion USD, from 2020-2050 due to rise of 20C in temperature [WB 2010]. 1/5 of the global population may suffer due to excess BOD and 1/3 from excessive phosphorus and nitrogen by 2050 [Veolia and IFPRI 2015].

Central Asia and Use of Water

Central Asia has been identified as one of the regions with the utmost possibility for conflicts over water [Zhupankhan, et al 2018]. The temperature has increased twice in central Asia since 1970 it is fast as compared to other countries globally [WBGU 2007] further increase of temperature 2-4 °C by 2025 and 3-5 by 2080, projected y IPCC [Lioubimtseva et al 2009; Lutz et al 2013]. Nearly 70% disputes in central Asia are due to scarcity of freshwater resources [Severskiy, 2004]. The central Asia is rich in other natural resources i.e minerals and fossil fuels, however not rich in water, it keeps major role in economic development of Turkmenistan, Kyrgyzstan, Uzbekistan, and Tajikistan [FAO 2015; EEA 2018]. The major water consumer is irrigation sector,

which used nearly 60-90% in central Asian states [FAO 2015; EEA 2018]. The use of water varies as per region and development activities, as per 2006 data, the agriculture sector was biggest consumer of water in world followed by industries and municipal. It is further distributed that in Asia, the agriculture sector is largest consumer, Europe for industrial while equally proportion in North America [FAO 2015].

The two cities Edinburgh and Glasgow of Scotland are facing water quality problems, despite that many rivers flow (Clyde, Forth) in the surroundings of both cities but issues are stagnant [SEPA 2007]. In north eastern part river basin area may create environmental issues due to agricultural activities. Nearly 40% of Scottish water does not meet the environmental standards for good ecology [SEPA 2007]. The main reason for this situation is agricultural pollution, sewer over flow and contaminates water run off by roads [SEPA 2007]. In 2008 and 2009 (summer season) monitoring of streams and rivers were identified by EPA in USA. The water quality was almost found unsatisfactory due to high percentage 40% of phosphorus and 27% for nitrogen; due to excess use of fertilizers and wastewater. The biological communities were also at high risk due to higher percentage of phosphorus and nitrogen [EPA 2014a]. Globally, it has been estimated that between 5 and 20 million hectares of land are irrigated with untreated wastewater [Drechsel, et al 2010].

Conclusion

Economic development cannot declare wholly responsible for the deterioration of water quality as well as not solution of all problems. Some other steps are also very essential such as watershed management, which is very important for the water quality, water availability increase, and recharge of groundwater and helpful for reduction of other impacts. It is recommended to manage irrigation water to use and implementation of climate-smart agriculture practices and protects the water resources and quality. Allocation of water for agriculture is very hard/core issue and accurate data can play very important role for water conservation/saving due to this many lives can save, cost reduction, and minimize other impacts on water resources/reservoirs. It is recommended to be a creative mind for the water management system such as municipal, industrial and irrigation. The policy should be formulated on every country's basis. The focus should be on the latest techniques of irrigation system/techniques such as Deficit irrigation, micro irrigation, Drip and Sprinkler irrigation system should be introduced/ implemented to replace the traditional irrigation system. Crops with high yield on lowest water use should introduce to feed the population of around 9 billion by 2050; because due to increase of population by 2050 will severely affect water resources and may reduce availability of water. For policy making it is necessary for data availability of wastewater generation, its discharge without treatment or treated, without complete or proper information it is very difficult to make action plan, protection of environment resources from wastewater pollution. Given the importance of water we need to save water and change our lifestyle to minimize use of water.

It is difficult to imagine life on the earth without water. We should adopt agriculture mechanization, high yielding seeds and crops will have to be cultivated on less water, replacing new irrigation techniques including drip irrigation and sprinkle irrigation. Because with water savings to cope with the growing population by 2050. With improving irrigation efficiency, the usage of freshwater can reduce. It is recommended to monitor the entire water management system including agriculture to prevent from a severe crisis of water management and for that we should be more creative than we ever were. For efficient usage of water there is a need for the development of Global Monitoring Information System for water which can provide necessary information on water management and progress monitoring of desirable targets. Development of this system will provide us the wide spectrum of information from different levels, like from local to national and ultimately the global level. Hurdles to research, technology and innovation applications is due to the lack of financial resources for improvement of existing technologies in developing countries but also the lack of awareness for promoting the research and innovation in the countries which are already developed to shift to the new and efficient technologies for large-scale applications. The high costs of high-end technologies hamper their widespread application, especially in developing countries. It is because of the quick depletion of the available resources of water and its impact on climate change, conventional irrigation systems must be revised because of it cannot sustain in many areas around the globe. The incomplete data is a hurdle to make policies for water resources in Asia. We should change technologies for rice, and sugarcane crops to save water. Considering the dire circumstances of scarcity and quality deterioration of freshwater quality in world, it is recommended that necessary steps should be taken on urgent basis and vehemently to address the issues at hand to adopt policy-based solutions to address the challenges in supply and demand side management of water resources to approach for reduction in water use; reuse and recycle apply at supply side for wastewater reclamation.

Response of NPK split application for Irish potatoes derived from the nutrients' uptake pattern

Eric Dushimirimana¹

¹Crop Sciences, Crop production, University of Rwanda, Musanze, Rwanda

Abstract

For all food crops, including Irish potatoes, harvestable biomass is largely carbon, from the atmosphere, accumulated through the photosynthesis. Thus, the nutrient-deficiency stress-induced yellowing of leaves may result in substantial yield losses. We know that the premature aging of actively photosynthesing leaves may be caused by early and mid-season soil nutrients depletion, a very probable problem in most open field conditions, particularly heavy-rainfall-and mountainous regions, which is the case for major Irish potatoes growing areas of Rwanda. With the split application of the inorganic fertilizers, we may, however, be able to prevent the condition and achieve good yields. The practice ensures that sufficient levels of soil nutrients, especially nitrogen, phosphorus, and potassium, are available to the crops during the nutrient-deficiency sensitive development and growth stages. International Plant nutrition Institute recommends applying a right rate of a right fertilizer type at a right growth stage in a right place. In this study, basing on the nutrients uptake pattern of the potato plant, we derived and tested three NPK.17.17.17 splits (T1: 23%-77%, T2:41%-59%, and T3:59%-41%) following a three-replication single-factor Completely Randomized Block Design under relatively young volcanic loam soil of the northern province of Rwanda, Busogo sector. Except for the control, T0, to which a whole rate (100%) of 28 grams per plant were applied at planting, for the other experimental conditions, the first fraction was applied 30 days after planting and then the remaining 30 days afterwards. Results, from data on vegetative growth, chlorophyll index 60 and 90 days after planting, the number of tubers, and total tuber yields, show that applying 59% of a right rate of NPK.17.17.17 first and then the remaining, 41%, afterwards may be recommended under the study area and other spots with similar soil-climatic conditions.

Introduction

As the knowledge on Irish potatoes (*Solanum tuberosum* L.) improves, it is increasingly becoming clear that Irish potatoes are an important food source. They have a high-biological-value (BV) protein (Kowalcwski et al.,2019). Their protein has a biological value of 90. More importantly, the potatoes, per unit area, produce more food than any known major crop; and they are more water-efficient than cereals (Sun et al., 2015). Not surprisingly, they are the third most important food in the world (International Potato Center, n.d). And, fortunately, thanks to their outstanding agronomic plasticity (Celis-Gamboa, 2002), over 100 countries are able to grow Irish potatoes (International Potato Center, n.d). Undoubtedly, the potatoes have potential to take the human race to a higher level of the food security ladder. As an important food source, Irish potatoes have captured great attention of the scientific community. Even so, yields are still far lower than the attainable.

Our inorganic fertilizers application methods need to be revised. For Irish potatoes, tuber yield substantially depends on the source capacity. In order words, growing tubers chiefly rely on photosynthesis to accumulate storage material in order to reach their potential maturity sizes. The source capacity is a function of the number and lifespan of photo-synthetically active leaves. Under leachy-and mountainous environments, which is the case for Rwanda's potato growing regions, the early and or mid-season soil nutrients depletion is almost always possible. And it is known that the early and mid-season nutrients-deficiency conditions cause premature aging of foliage and, as a consequence, negatively affect tuber growth. Jenkins & Mahmoods (2003) show that soil deficiency stresses of nitrogen, phosphorus, and potassium can cause 26-63% of the fresh tuber yield loss. Under most open field conditions, without the proper split application of the leachable and volatile inorganic NPK fertilizers, high Irish potatoes yields may be impossible. International Plant Nutrition Institute advocates the 4Rs principle: that a right rate of a right fertilizer type should be applied at a right growth stage in a right place (with compatible soil-climatic conditions).

This research, therefore, sought to develop a split application technique of the fertilizer for Irish potatoes. The objective was to answer the question, "Given a right rate of NPK.17.17.17, basing on the nutrients uptake pattern of the crop, how can the rate be split into two fractions, one of which is to be applied at a certain time and then the remaining afterwards?"

To arrive at such a technique, the nutrients' uptake pattern of potato plant was used to derive, quantitatively, three NPK.17.17.17 splits: 23%-77%, 41%-59%, and 59%-41%.

The fertilizer rate per plant used was 28 grams. The first fraction was applied 30 days after planting and then the remaining 30 days afterwards. The experimental conditions were tested under relatively young volcanic loam soil of Busogo sector, Musanze district, of the Northern province of Rwanda during both the short rainy season (27th March 2019 – 27th July 2019) and long rainy season (25th October 2019 – 25th February 2020). The timing of the fertilizer application was not a part of the work, however.

The experiment revealed that, with an appropriate inorganic fertilizers split application practice, high yields, 50-100 tons/ha, of Irish potatoes are not remote possibilities even under ordinary rain-fed field conditions.

Materials and Methods

The study was conducted in the northern province of Rwanda, Musanze district, Busogo sector. The location is characterized by young volcanic loam soil. The average annual temperature is 16.2^o C. The site receives 1,420 mm, as annual precipitation. The previous crop was peas for the year 1 experiment (27th March 2019-27th July 2019, season B). For the year 2 experiment (25th October 2020-25th February 2020, season A), the field had been under fallowing.

The test subject was the local popular variety, Kinigi. The 70cm x 30cm spacing was used during planting. Potato seeds were planted to a depth of 10 cm. Ample cow manure per plant was applied as a basic fertilizer for all the experimental conditions. Following the single-factor Completely Randomized Block Design, the treatments were applied as follow: T0-100 % of 28 grams per plant at planting; T1-23 % of the 28 grams 30 days after planting and then 77 % of the 28 grams 60 days after planting; T2-41% of the 28 grams 30 days after planting and then 59 % of the 28 grams 60 days after planting; T3-59 % of the 28 grams and then 41 % of the 28 grams of the 28 grams 60 days after planting. During the administration of the experimental conditions, a complete circular shallow depression around each plant was created, approximately 10 cm from the main stem. The fertilizer was then hand-applied and reasonably uniformly distributed around each plant. A “light ridging”, done as weeding, and earthing-up were done 30 days and 60 days after planting, respectively. The ridging and earthing-up were coupled with the administration of the experimental conditions so that we could cover the fertilizer with ample soil, to reduce volatilization of the fertilizer. For disease management, on emergence, the fungicides, Ridomil and dithane (following the recommendations) were applied and then dithane on a weekly basis until two weeks before harvesting.

Chlorophyll index 60 and 90 days after planting was measured using SPAD. Data on yield, number of tubers and total tuber weight per plant, were also collected. Ten plants per treatment were randomly selected. The total tuber yields were calculated as follows: total tuber weight per the 10-plants sample multiplying by 10,000 square metres divided by the area occupied by the ten plants at the 70cm x 30cm spacing. All the data were arranged and summarized using Microsoft Excel 2019, and analyzed using SPSSv16. ANOVA (Analysis of Variance), and the post-hoc test, were used to compare the experimental conditions.

Results

Chlorophyll index 60 days after planting (CI60).

For the first-year experiment (see Figure 1 and Table 1), T2 resulted in the highest chlorophyll index (T2, 43.67; T0, 43.12; T3, 43.09; T1, 41.29). The treatment differed statistically significantly only from T1, however. For the second-year experiment (see Figure1 and Table 2), T3 produced the highest chlorophyll index, and it was significantly different from T0 and T2 (T3,46.7; T2, 46.0; T0, 46.0; T1, 45.3).

Figure 2.Effect of NPK.17.17.17 split levels on Chlorophyll index 60 days after planting--the season A experiment

Chlorophyll index 90 days after planting (CI90)

For the first-year experiment (see Fig. 3), chlorophyll index 90 days after planting did not differ significantly for the experimental conditions. For the second-year experiment (see Fig. 3 and Table 3), however, T3 significantly differed from only T0. T3 was insignificantly different from T1 and T2. T1 and T2 were also insignificantly different from T0.

Figure 3. Effect of NPK.17.17.17 split levels on chlorophyll index 90 days after planting--the season B experiment

Total tuber number per plant

For the first-year experiment, statistically significant differences were observed (see Table 4 and figure). The second-year experimental data revealed that T3 resulted in a significantly greatest number of tubers. The number of tubers for T3 was greater than that of T1 and T0 (T₀, 15 tubers; T₁, 17 tubers; T₂, 19 tubers; T₃, 20 tubers) (See Table 5 and figure 5).

Total tuber weight per plant

For the first-year and second-year experiment (see Table 6 and Table 7 and Fig. 4), statistically significant differences were observed. T3 resulted in the highest total tuber weight per plant. Total tuber weight per plant were T3y1=59t/ha and T3y2=124 t/ha, T1y1=51t/ha and T1y2=114t/ha, T0y1=52t/ha and T0y2=110t/ha, T2y1=46t/ha and T2y2=105t/ha). (The indices, y1 and y2 stand for year-one experiment and year-two experiment, respectively).

Figure 7. Effect of NPK.17.17.17 split levels on total tuber weight--the season A experiment

Discussion

Overall, split application significantly increased total tuber number (TTN) per plant and total tuber weight (TTW) per plant. Specifically, T₃, to which 59% of NPK.17.17.17 at the rate of 28 grams per plant 30 days after planting was applied and then the remaining, 41%, of the fertilizer, 30 days afterwards satisfactorily consistently resulted in the greatest total tuber number and total tuber weight per plant compared to the other treatments and the experimental condition, T₀, to which 100% of the fertilizer (28grams per plant) at planting was applied: total tuber numbers for the second-year experiment were T₃=20 tubers, T₂=19 tubers, T₁=17 tubers, T₀=15 tubers; total tuber weight per plant were T₃y₁=59t/ha and T₃y₂=124 t/ha, T₁y₁=51t/ha and T₁y₂=114t/ha, T₀y₁=52t/ha and T₀y₂=110t/ha, T₂ y₁=46t/ha and T₂ y₂=105t/ha). (The indices, y₁ and y₂, stand for year-one experiment and year-two experiment, respectively.) The findings are in harmony with other investigators (Vos, 1999; Al-Moshileh et al., 2005; Turamyenyirijuru, 2013; Mutubuki et al., 2015; Purnendu et al., 2019). The observation that delaying applying the first portion of the fertilizer did not compromise vegetative growth of the crop for most of the splits suggests that the “at-planting-time” application of the fertilizer may not be an economically effective and efficient option to achieve vigorous vegetative growth and higher yields under the study area field conditions and similar environments.

When the fertilizer is applied at planting time, the loss may be unbearably high. At planting time, and dozens of days afterwards, there is very low canopy cover and zero-or small root volume and density. For most crops, the period would therefore be characterized by low rates of nutrients uptake. Thus, applying the leachable fertilizer at planting would significantly increase in-season cumulative nutrients loss. And the higher in-season cumulative loss of the fertilizer, the more it would be likely that a plant is starved during nutrients-deficiency sensitive late development and growth stages. For Irish potatoes, the amounts of mid-season available nutrients, particularly potassium, phosphorus, and nitrogen, significantly affect tuber yield. Potassium is known to be essential for translocation of sugars for starch synthesis. Besides, the element activates a number of enzymes that are important for tuber growth processes such as starch and protein assembling (Lindhaeur & De Fekete, 1990), whereas phosphorus is necessary for the phosphorylation of the sugars, one of the essential steps for starch production (Fernandes et al., 2015). Nitrogen is also an irreplaceably important element for the tuber growth process, as it is the building blocks of proteins.

Jenkins & Mahmoods (2003) reveal that the nutrients deficiency conditions of the elements can cause substantial fresh weight tuber yield losses: 26-47 %, 30 %, and 34-63 % for nitrogen, phosphorus, and potassium, respectively. Nutrients deficiency stress can also reduce tuber number. Celis-Gamboa (2002) explored the “Temporal relationships between plant development and tuber formation processes”. For the potato, according to the research, a maximum number of tubers will have been determined by 75-89 days after planting. Considering this, T₀ would have produced the highest total number of tubers per plant, however, the opposite was observed: there is a phenomenon called tuber reabsorption, by which small growing tubers undergo reversed growth (Celis-Gamboa, 2002). Some tubers may have undergone reabsorption due to the competition for nutrients among growing tubers and, thus, early depletion of the soil nutrients. In fact, while T₀ subjects may have enjoyed sufficient amounts of the nutrients during early tuber development and growth stages (stolon formation, stolon elongation, stolon branching, tuber induction, and tuber initiation), which would have resulted in the highest tuber number, only few formed tubers must have been able to mature due to the mid-season nutrient-deficiency. In this study, the one part of the fertilizer Applied 30 days after planting and then the remaining part applied at 30 days afterwards must have significantly reduced nutrients loss, maximized nutrients uptake, availed ample nutrients during the mid-season nutrient-deficiency sensitive tuber growth period, and as a result, contributed to the high tuber yields.

It was observed, however, that the split applications, T₁ and T₂, did not significantly out-yielded T₀: during the growth process of a crop there must be “a point of no return”, the point beyond which application of nutrients to a

nutrients-starved crop cannot satisfactorily restore vegetative growth to a level that will meet nutrients demands of sinks (growing tubers), particularly for crops, such as Irish potatoes, whose yield is limited by source capacity. For T1, only 23 % of 28 grams of NPK.17.17.17 was applied. Considering that a significant part of the fertilizer was lost due to leaching, immobilization, fixation, runoff, and volatilization, there is a possibility that during the early active vegetative stages rhizosphere nutrients levels became so low that vegetative growth was so compromised—and reached the “point of no return”. In fact, chlorophyll indices were consistently lower for the experimental condition, T1. This can also account for lower tuber yield observed for T2 (to which 41 % of the fertilizer was applied 30 days after planting) compared to T3 (to which 59 % of the fertilizer was applied during the early active vegetative growth stage).

Calculations, based on the nutrients (nitrogen, phosphorus, and potassium) uptake pattern of the crop show that at least 53 %, 61 %, and 57 % of nitrogen, phosphorus and potassium, respectively, are required to sustain the early active vegetative growth stages and a part of the tuber growth stage. Obviously, T1 and T2 could not meet the demands under the leachy field conditions of these experiments.

From the results, we can conclude that applying 59 % of a right rate of the fertilizer at 30 days after planting and then the remaining fraction (41%) at 60 days after planting is a recommendable practice under the study area and other spots with similar soil-climatic conditions. Author acknowledges, however, that since this research followed the single-factor experimental design and thus largely focused on only one question “If we were to divide an NPK fertilizer rate into two fractions, one of which is to be applied at a certain date after planting and then the remaining afterwards, what would be the two fractions?” thirty days and 60 days after planting may not be the best dates for the fertilizer application. Nevertheless, this study does satisfactorily show that any potato nutrition practice involving the leachable inorganic fertilizer application at planting time may not be effective and efficient under the experiments conditions. It was found that, instead, it is possible to have our crops, even heavy feeders, such as potato, “wait” for the “fast food” (the leachable and volatile inorganic fertilizer) until dozens of days without compromising their vegetative growth and yield.

For future studies, there is still growing list of agronomical and food safety questions this investigation could not answer:

- ❖ If, for the inorganic leachable fertilizer, splitting a rate into, say, two fractions one of which is to be applied at a certain time after planting and then the remaining afterwards is better. Exactly, at what dates?
- ❖ How does the split application affect nutritional quality of tubers (protein, starch, reducing sugars, vitamins, minerals, nitrate and nitrite, harmful heavy metals, free amino acids content)?
- ❖ Under compatible field conditions, given a right rate and a right fertilizer type, are all the parameters (agronomical, agro-physiological, and economic efficiency) achievable with split application?
- ❖ How do different varieties respond to inorganic fertilizers split application techniques?

Acknowledgment

We thank Dr. Obedi Nyamangyoku Ishibwela, Dr. Sylvestre Habimana, and Dr. Saidi Rumanzi Mbrak. Without the three men, in particular Dr. Sylvestre, this research would not have won a spot at this conference. They were helpful in the research journey. Author, however, takes full responsibility for any scientific or linguistic shortcomings of this work.

We also thank the organizers of the sixth International Anatolian Agriculture, Food, Environment and biology Congress for affording us a chance to expose the research to the other spots of the world.

The Monitoring of the Resistance Genes Associated with BCMV and BCMNV in Promising Common Bean Lines

Orkun Emiralioğlu¹, Mehmet Zahit Yeken¹, Ali Çelik², Vahdettin Çiftçi¹

¹ Department of Field Crops, Faculty of Agriculture, Abant İzzet Baysal University, Bolu, Turkey

² Department of Plant Protection, Faculty of Agriculture, Abant İzzet Baysal University, Bolu, Turkey

Abstract

Bean common mosaic virus (BCMV) and Bean common mosaic necrosis virus (BCMNV) are important virus diseases that are common in bean plants around the world and cause critical yield losses. The use of resistant varieties is one of the most effective and economical methods of combating these pathogens. Gene and molecular markers associated with resistance to BCMV and BCMNV factors have been identified in the world and they have been widely used by researchers in breeding studies. In this study, resistance sources of 43 promising common bean lines selected in previous projects (TUBITAK: 115R042 and 109O163) to BCMV and BCMNV were investigated by using different molecular markers (SW-13, SBD-5, ROC11) in our country. Findings revealed that 21 common bean lines contained different resistance gene combinations (*I* and *bc-1²* genes), while 8 common bean lines had *bc-1²* and *bc-3* genes. In addition, 13 common bean lines were found to contain a single resistance gene. It is thought that the resistance genes determined in common bean lines can be used as an important source of resistance in the development of resistant breeding materials against the BCMV and BCMNV diseases.

Ümitvar Fasulye Hatlarında BCMV ve BCMNV ile İlişkili Direnç Genlerinin İzlenmesi

Özet

Fasulye yaygın mozaik virüsü (BCMV) ve fasulye yaygın mozaik nekroz virüsü (BCMNV), dünya genelinde fasulye bitkilerinde yaygın olarak görülen ve kritik verim kayıplarına neden olan önemli virüs hastalıklarıdır. Bu patojenlerle mücadelede en etkili ve ekonomik yöntemlerden birisi dirençli çeşitlerin kullanılmasıdır. BCMV ve BCMNV etmenlerine karşı dayanıklılıkla ilişkili gen ve moleküler belirteçler dünyada tanımlanmış ve araştırmacılar tarafından ıslah çalışmalarında yaygın olarak kullanılmaktadır. Bu çalışmada, ülkemizde daha önceki projelerde (TUBİTAK: 115R042 ve 109O163) ümitvar olarak seçilen 43 fasulye hattının farklı moleküler markörler (SW-13, SBD-5, ROC11) kullanılarak BCMV ve BCMNV'ye karşı direnç kaynakları araştırılmıştır. Elde edilen sonuçlar, 21 fasulye hattının farklı direnç gen kombinasyonlarını (*I* ve *bc-1²* genleri) içerdiği, 8 fasulye hattının ise *bc-1²* ve *bc-3* genlerine sahip olduğu belirlenmiştir. Ayrıca, test edilen fasulye hatlarının 13'ünün tek bir direnç genini içerdiği tespit edilmiştir. Fasulye hatlarında belirlenen dayanıklılık genlerinin BCMV ve BCMNV hastalıklarına karşı dirençli ıslah materyallerinin geliştirilmesinde önemli bir dayanıklılık kaynağı olarak kullanılabileceği düşünülmektedir.

Cytotoxic and Genotoxic effects of Bisphenol S on different Model Organisms

Muhammad Muddassir Ali¹, Ayesha Tariq¹, Ahmed Riaz Khan¹, Muhammad Ijaz¹

University of veterinary and animal sciences, Lahore, Pakistan

Abstract

Bisphenol S (BPS) is an alternative for Bisphenol A (BPA) which has been introduced to the industry. Bisphenol S is an organic compound and is used in the production of many products used in daily life. Long-term exposure to these compounds causes different types of health problems and cytotoxic and genotoxic effects on both animal and human beings. But the research on its toxic effects is limited. BPS also has estrogen, antiandrogen, and anti-thyroid hormone properties, which might unfavorably affect the reproductive system, endocrine system, and nervous system of *C. elegans* and humans, and may cause oxidative stress. It has been demonstrated that BPS can interrupt the balance of sex steroid hormones and damage the normal reproduction of adult zebrafish. Studies in mammals show that BPS unpleasantly disturbs 5 α -R3 mRNA levels in the brain of female rats, prevents steroid gene transcripts, and shows antiandrogenic action in H295R cells of the human and rodent fetal testis. Bisphenol S is a genotoxic substance that damages DNA in BEAS-2B cells (bronchial epithelial cells). Bisphenol S has toxic effects on hepatic cells and the endocrine system and causes genotoxicity by causing DNA double-strand breaks. Cytotoxicity of Bisphenol S was tested on hepatocyte and renal cells of the mouse. BPS increases the amount of ROS (reactive oxygen species) in the cell and causes cytotoxicity. Bisphenol S causes abnormalities in the fetus or embryo during pregnancy because it can cross the placental barrier when the mother came into contact with contaminated food. So, this review shows that Bisphenol S is used in daily life products, food packaging, etc. It has genotoxic, cytotoxic, and estrogenic activity and has adverse effects on living organisms at the cellular as well as organ level. It can cause different types of disorders. Such as obesity, hormonal imbalance, DNA damage, developmental disorders in the embryo, and reduce egg and sperm quality. Different studies show different toxic effects of BPS on different organisms.

Application of Rhizobium and its Exopolysaccharides in drought and disease control

Akpeji Stephanie, Odunayo Olawuyi and Bukola Adebayo-Tayo

Department of Microbiology, University of Ibadan, Ibadan, Oyo State, Nigeria

Department of Botany, University of Ibadan, Ibadan, Oyo State, Nigeria

Abstract

Biologically synthesized Exopolysaccharides (EPS) from Rhizobia and Arbuscular Mycorrhizal Fungi (AMF) can serve as biocontrol agents which tolerate biotic and abiotic stresses. However, there is limited information on their application to non-leguminous plants. The biocontrol potentials of Rhizobia, Rhizobial-exopolysaccharides (*Bradyrhizobium japonicum* USDA 110) and AMF (*Glomus clarum*), singly and in combination on *Bipolaris maydis* (BM) infection and drought tolerance in two maize varieties (TZml1466 and TZml1297) were evaluated in screen house experiments using a complete randomized design with three replicates. The growth, root and shoot biomass and disease incidence data were collected and analysed by descriptive statistics and one-way ANOVA at $\alpha_{0.05}$. Seed treatments with EPS had the highest significant effect on BM (1.67) and drought in maize. The effect of Rhizobia, exopolysaccharide and AMF treatments against BM showed that Rhizobia alone significantly suppressed the BM effect on the growth character. The exopolysaccharide improved all the growth parameters during water stress, while AMF-treated plants improved the plant height (43.41 ± 2.30), leaf area (114.08 ± 7.89) and stem diameter (2.58 ± 0.10). Maize variety TZml1297 performed best for the number of leaves (8.48 ± 0.12) and leaf area (116.97 ± 2.94) but not significantly different from the rest TZml14466 growth characters. Microbial inoculants had significant effect on drought stress in maize thus ensuring enhanced crop productivity. The EPS produced and AMF had preventive ability against drought.

³KolaDaisi University, Ibadan, Oyo State, Nigeria

Abstract

Selenium Enriched *Lactobacillus pentosus* ADET MW861694 (LP-SeNPs) nanoparticles were intracellularly biosynthesized, characterized, used to fortify formulated blends, and the nutritional and shelf-life of the blends stored at room temperature for 30 days were evaluated. The LP-SeNPs, *Lactobacillus pentosus* (LP) plus Sodium Selenite and Non-selenium LP was used to ferment formulated blend comprising of Acha, Soybean, Tigernut, and Date palm fruit powder in the ration 70:20:5:5 respectively. Blends fermented with LP-SeNPs, LP plus sodium selenite, Non-selenium LP was labelled Nanofood 1, Nano-food 11 and Blend 1 while the Unfortified Blend labelled Blend 1 serves as control. SEM and SEM showed intracellularly deposited selenium around the outer membrane of *Lactobacillus pentosus* and a spherical SeNPs with 11.7 nm in diameter. The EDX, XRD and DLS analysis ascertain the presence of elemental selenium atom, the crystalline nature and an average particle size of 106.1 nm and polydispersity index (PDI) of 0.295 of the nanoparticles. The pH and lactic acid content of the formulated blends ranged from 3.27-5.52 and 0.09 - 0.25 mg/L. Nanofood I had the highest crude protein, crude fibre, and carbohydrate content (3.38±0.010%, 0.79±0.03%, and 16.54±0.30%). Nanofood 1 and 11 had the highest potassium content and Blend I had the highest phosphorus, iron, calcium, and selenium content. Biofortification improve the nutritional composition and bio-preserved the formulated blends during storage.

Phytofabrication and biological evaluation of silver nanoparticles of *Bridelia ferruginea* extracts

Alao Omoniyi Solomon¹, Jadesola Fawzhia Sanusi² and Bukola Christianah Adebayo-Tayo¹

Department of Microbiology, Faculty of Science, University of Ibadan, Ibadan, Oyo state, Nigeria

Department of Biological Sciences, Crescent University, Abeokuta, Ogun State, Nigeria

ABSTRACT

Globally, medicinal plants are gaining attentions as alternative sources of phytochemicals and metabolites that have enormous therapeutically benefits to mankind. Nanoparticles have progressively become an important area of research with unique properties that have been employed in different fields of science and medicine in the treatment of various infections. Phytochemical, phytofabrication of silver nanoparticles (SNPs) using methanol extracts of *Bridelia ferruginea* (MBF) bark and leaves (MBF_B and MBF_L), and their biological evaluation were investigated. The phytofabricated bark and leaves extracts silver nanoparticles (MBF_BSNPs and MBF_LSNPs) were characterized using standard methods. Antibacterial, anti-tubercular, antioxidant and cytotoxicity effects of the extracts and their SNPs were investigated. Alkaloids, flavonoids, tannins, phenols, saponins, cardiac glycoside, terpenoids were present in the extracts. MBF_B, MBF_BSNPs and MBF_L, MBF_LSNPs had the highest antagonistic activities (14.0mm, 20.0mm, 12.0mm and 21.0mm) against *K. pneumoniae* 8309, *K. pneumoniae* 8309, *P. aeruginosa* 15422 and *S. typhi* 13311 respectively. MBF_B and MBF_L had 87.6% and 84.6% DPPH scavenging activity and TAC, TPC and FRAP activities in a dose dependent manner. MBF_B and MBF_L exhibited 100% ant-tubercular activities against rifampicin resistant *M. tuberculosis* (RR-TB) H37RU, 2390 and 916 and *M. tuberculosis* (RR-TB) 2570 and 916 respectively. MBF_B and MBF_L exhibited 100% ant-tubercular activities against Multi-drug resistant *M. tuberculosis* (MDR-TB) 1934, 237, 866 and 885 and *M. tuberculosis* (MDR-TB) 866 and 885 at 20mg/mL respectively. MBF_B and MBF_BSNPS had 100% cytotoxicity effects against A549, 75% activities on Hela and MCF7 cancer cell lines. In conclusion, the plants extracts and their had phytochemicals with high biotechnological values and their silver nanoparticles.

An Impact Assessment of Covid-19 Lockdown Period on the Sediment Quality of Meriç - Ergene River Basin in Türkiye

Cem Tokatlı

Evrenos Gazi Campus, Trakya University, İpsala, Edirne, Türkiye

Abstract

The aim of this research was to evaluate the impact of the Covid-19 lockdown period on sediment quality of Meriç – Ergene River Basin by determining the potentially toxic elements (PTEs) in sediment samples collected from 25 stations in the basin. Some significant ecological indicators including Potential Ecological Risk Index (PERI), Contamination Factor (CF), Pollution Load Index (PLI), Biological Risk Index (BRI) and Geo – Accumulation Index (I_{geo}) and some significant statistical indicators including Pearson Correlation Index (PCI), Factor Analysis (FA) and Cluster Analysis (CA) were applied to detected data. As a results of this research, all the investigated PTEs in sediments of the basin show quite significant differences between the pre-lockdown and lockdown periods. PTE contents have considerably decreased between the rates of 12.8 – 45.4% during the lockdown period. Similarly, the values of sediment quality risk assessment indices have decreased between the rates of 22.4 – 35.8%. In the lockdown period, reduction of industry of many industrial facilities located in the basin reduced the amount of effluents, leading to significant improvement in sediment quality of the basin.

Which Organism is More Suitable as a Toxic Metal Accumulation Bioindicator – Fishes or Diatoms: A Case Study of an A Class Wetland in Türkiye?

Cem Tokatlı

Evrenos Gazi Campus, Trakya University, İpsala, Edirne, Türkiye

Abstract

The aim of this research was to compare the diatoms as the first step and the fishes as the last step of the food chain as toxic metal accumulation bioindicator in Gala Lake an A Class wetland in Meriç Delta in Türkiye. For this purpose, bioaccumulations of potentially toxic elements (PTEs) were determined in liver, gill and muscle tissues of two commercially consumed fish species *Carassius gibelio* and *Cyprinus carpio* and in frustules of epiphytic diatom communities living on submerged macrophytes. Biotic samples were collected seasonally from the Gala Lake considering the paddy harvest period that is a major stress factor for the ecosystem. Also, potential human health risks associated with the consumption of fishes and consumption – dermal contact of diatoms were evaluated both for summer – before paddy harvest (BPH) and autumn – after paddy harvest (APH) periods. As a result of this research, the investigated toxic metal concentrations were increased significantly in diatoms in the APH period, while less significant exchanges were recorded in fishes. The data showed that although the fishes bioaccumulate the PTEs in their tissues much higher than the diatoms, diatoms are much more sensitive to changes in the environmental conditions than fishes.

The Carotenoids in Aquatic Animals

Semra Küçük

Adnan Menderes University, Faculty of Agriculture, Department of Aquacultural Engineering, South Campus, 09100, Aydın/Turkey

Abstract

World aquacultural production will be consist of 46 of global fishery productions and projected 196 million tons in 2025. Global fishery consumption will be increased from 20 kg to 22 kg per capita, as well. Carotenoids are an important component to increase growth rate, immune system activities, and reproduction behavior in fish. Carotenoids are called also tetraterpenoids, which are organic pigments (yellow, orange, and red) and produced by plants, algae, bacteria and fungi in ecosystem. Many marine and freshwater animals, including fish and crustaceans are taken them from diets (feed) and stored in the fatty tissues. But, carnivours are used only from animal oil to hold in themselves. They can not be formed by fish and they should be added to fish meal. Theses components have different forms. Fish and other aquatic animals have two forms of them, which are called astaxantin and cantaxantin. They have a very important function to protect the poly-unsaturated fatty acids-PUFA in aquatic animals. Since UV (ultra-violet) has a negative effect on PUFA in order to oxidate. There are important reasons to take for human wellness. In this study, it is going to be given a more detail information about the definition, mechanism, functions of carotenoids, and indication about the previous studies being done on the carotenoids for aquatic animals.

Akuatik Hayvanlarda Karotenoidler

Özet

Dünya akuakültür üretmi 2035 yılında 46 global balıkçılık ürünlerinden ve 196 milyon tonluk üretimden oluşacaktır. Global su ürünleri tüketimi de kişi başı 20 kg'dan 22 kg'a yükselecektir. Karotenoidler büyümeyi, bağışıklık sistemin güçlenmesini ve üreme davranışlarının artması için önemli komponentlerdir. Karotenoidler organik pigmentler (sarı, oranj ve kırmızı) olarak isimlendirilen tetraterpenoidlerdir ve bitkiler, algler, bakteriler ve funguslar tarafından üretilirler. Balık ve kabukluların içinde bulunduğu birçok deniz ve Tatlısu hayvanlaronları diyetlerinden (yem) alırlar ve yağ dokularında tutarlar. Fakat, karnivorlar bunların hepsini tutmak için yalnızca hayvansal yağları kullanırlar. Bunlar balıklar tarafından oluşturulamaz ve balık yemlerine ilave edilmelilerdir. Bu komponentler farklı formlara sahiplerdir. Balık ve diğer akuatik hayvanlar onlardan astaxantin ve cantaxantin olan iki formuna sahiptir. Onlar, akuatik hayvanlarda bulunan çoklu doymamış yağ asitlerini (PUFA) korumak için çok önemli bir fonksiyona sahiplerdir. Çünkü UV'nin (Ultra-Viyolet) okside olması için PUFA üzerine negatif bir etkiye sahiptir. İnsan sıhhati için alınmasının önemli sebepleri vardır. Bu çalışmada, karotenoidlerin tanımı, mekanizması ve fonksiyonları ve akuatik hayvanlar için karotenoidler hakkında şimdiye kadar yapılmış çalışmalar üzerine detaylı bilgiler verilecektir.

Impact of Cumin on Physiological function of Body, Review

Hira Ishaq, Wajahat Mehmood

Department of Anatomy and Histology, University of veterinary and animal sciences, Lahore, Pakistan
Corresponding Author

Abstract

Herbal plants have been used for numerous purposes in daily routine like in food additives due to their availability, benefits, and use for pharmaceutical purposes and preparation of drugs without side effects on the human body. Among herbal plants, one of the best herbals is Cumin due to its unique properties and positive impact on the function of the body. *Cuminum cyminum* L. (cumin) from the Apiaceae family is located in the Mediterranean region and is used in the structure of traditional medicine. Cumin contains many dietary minerals and vitamins like B and E and iron which plays a role in the physiological function of the body. Cumin shows antioxidant properties that make it unique and useful in the treatments of many diseases which is related to GIT, brain, blood, and respiratory-related issues like indigestion and jaundice, epilepsy, and whooping cough, also works as a coagulant in the body. Currently, many herbal drugs are used to treat obesity, which has many adverse effects and are more expensive, But Cumin seeds are nutritionally rich with a high amount of monounsaturated fats, proteins, and dietary fibers. Previous experiment revealed that taking 300 mg of Cumin for eight weeks results in a significant decrease in weight, body mass index (BMI), and insulin level in the body. Cumin also has wide usage in the beverage, food, liquor, medicine, perfume, and toiletry industries. The objective of this work is to highlight the latest and most precise review of the benefits of using cumin and its impact on the physiological function of the body without side effects.

Caviar Technology

Pınar Oğuzhan Yıldız¹

¹Fisheries of Faculty, Atatürk University, Erzurum, Turkey

Abstract

Fish roe (caviar), which has a high nutritional value among aquatic products, has an important place in the balanced diet of people. Caviar is a delicious and economically valuable food product made from different fish species in different geographies in the world and named in different ways. Fish eggs contain high concentrations of lipid and protein. Fish roe are processed with various technologies, giving a difference to the palate. Even small mistakes during the preparation of caviar greatly affect the quality. In order to obtain good quality caviar, it is necessary to be careful and meticulous at every stage of the processes such as taking the eggs and washing them. This is related to the experience of the person who prepares the caviar. Although it is a less common product obtained from sturgeon species, it is one of the snack foods on the tables. Black caviar from sturgeon roe occupies an important position in the food market with high nutritional and commercial value, and in other research areas, including cosmetics, due to its high-quality content. In this review, caviar species, nutritional value and production technology will be discussed.

Key Words: *Caviar, Fisheries, Roe, Nutritional value, Production technology*

Havyar Teknolojisi

Özet

Su ürünleri arasında besin değeri yüksek olan balık yumurtası (havyar), insanların dengeli beslenmesinde önemli bir yere sahiptir. Havyar, dünyanın farklı coğrafyalarında bulunan farklı balık türlerinden yapılan ve farklı şekillerde isimlendirilen lezzetli ve ekonomik değeri olan bir gıda ürünüdür. Balık yumurtaları yüksek konsantrasyonlarda lipid ve protein içerirler. Balık yumurtası çeşitli teknolojilerle işlenerek damak tadına farklılıklar katmaktadır. Havyarın hazırlanması sırasında yapılan küçük hatalar bile kaliteyi büyük ölçüde etkiler. Kaliteli havyar elde etmek için yumurtaların alınması, yıkanması gibi işlemlerin her aşamasında dikkatli ve titiz olmak gerekir. Bu durum havyarı hazırlayan kişinin tecrübesiyle alakalıdır. Mersin balığı türlerinden elde edilen daha az yaygın bir ürün olmasına rağmen sofraların aperatif yiyeceklerinden biridir. Mersin balığından elde edilen siyah havyar, besin ve ticari değeri yüksek ve yüksek kaliteli içeriği nedeniyle kozmetik dahil diğer araştırma alanlarında önemli bir konuma sahiptir. Bu derlemede havyar türleri, besin değeri ve üretim teknolojisi ele alınacaktır.

Anahtar Kelimeler: *Havyar, Su ürünleri, Besdin değeri, Üretim teknolojisi*

Introduction

Fish and other aquatic products are among the foods recommended for the prevention and treatment of diseases with their high nutritional properties. Due to the increase in fish consumption and its high nutritional and commercial value, the demand for fish caviar has increased in recent years. Caviar, which is a name given to fish eggs in general, is a delicious and economically valuable food product made from different fish species in different geographies in the world and named in different ways. "Caviar" is defined in the dictionary meaning as "fish (mostly sturgeon) roe in the case of paste prepared with salt" (Özden et al., 2018).

Although the word caviar is accepted as the general name of fish eggs, the first thing that comes to mind when caviar is mentioned is the egg of sturgeon. Sturgeon eggs are used to make genuine caviar. Eggs of fish other than sturgeon, prepared in the same way as real caviar, are called fish roe, not caviar. According to many sources, the word caviar is of Turkish origin. Known as "Caviar" in English and "Ikra" in Russian, caviar is of Persian origin. It is derived from the compound word "Haye", which consists of the Persian word "Haye" meaning egg, and "Var" meaning "like" (Şengör et al., 2002; Özpolat, 2006; Kaba et al., 2013).

It has been known that caviar has been made since the 13th century, and it has been recorded that Russia has produced caviar since the 16th century. With the development and industrialization of fisheries towards the end of the 19th century, the caviar technique also developed. As in the past, today, Russia and Iran, which border the Caspian Sea, produce the most caviar. In addition, it started to be produced in significant quantities in the Amur River in China. In addition, in recent years, Japan, the United States and Canada have advanced significantly in caviar production. In our country, caviar production has not reached an economic level yet. While Turkey's caviar production was 6-10 tons in the 1930s, today Turkey has become an exporter in fish roe production while it is an importing country. 200 million out of 600 million caviar produced in a year are exported (Özpolat, 2006; Anonymous, 2022a).

Due to the fact that caviar is an expensive product, it has not gained much space in Turkish cuisine. American consumers, on the other hand, do not consume fish eggs much because they are very salty and contain high cholesterol. The fact that the product is expensive is also one of the reasons why it is not preferred. However, fish roe maintains its feature of being the main presentation of rich and distinguished tables, especially in Europe. In Japan, where fish roe is a popular product, the eggs of almost all sea creatures are eaten. Especially herring eggs on moss are very popular. Collecting herring eggs on seaweed has been an important industry in Alaska (Turan, 2006).

Caviar Technology

Although salted sturgeon roe are generally accepted as caviar, caviar is also produced from the eggs of different fish species. For this purpose, the eggs of the trout family, mullet and carp are mostly used. According to some researchers, seafood processing technology starts from the egg of the fish. Fish roe are also processed with various technologies, adding a difference to the palate. For this purpose, apart from salting, technologies such as freezing, smoking, canning and sausage production are used. Even small mistakes during the preparation of caviar greatly affect the quality. In order to obtain good quality caviar, it is necessary to be careful and meticulous at every stage of the processes such as taking the eggs and washing them. This is related to the experience of the person preparing the caviar (Özpolat, 2006).

Turkish standard caviar; Eggs obtained mostly from sturgeon, mullet, trout, pearl mullet and carp by milking while they are still alive or by splitting their bellies are washed and cleaned, then boiled for half an hour in 2-3% (m/m) salt water or salted with dry or wet salting. prepared by separating the eggs from the ovaries by smoking and adding additives if necessary; It is defined as a product that is made durable by heat treatment and consumed as raw, fried or grilled [7-8]. The main types of fish roe available in the market are as follows, and all of them are described as "caviar" by TSE (Turan, 2006).

Fish eggs are basically passed through some processing steps. The two important reasons for the implementation of these steps are to reduce the water activity (aw) by removing the water from the egg, which causes rapid spoilage and negatively affects the shelf life, and to prevent rancidity (bitterness) in the oil by reducing the contact with oxygen. As a result, it is tried to preserve the taste and quality of the product by waxing, pressing or vacuuming. Salting method is used at almost every stage of caviar production. Salting is basically divided into two as dry salting and brine salting. When preparing fish roe, these two methods are generally used and it is called "mixed salting". Although salting methods vary from country to country, the aim is to reduce water activity and thus prevent bacterial growth. Besides the salting method, the quality and composition of the salt to be used is also very important. Color change, hardening of the product surface and crystalline structures can be seen in eggs treated with salt containing iron and copper (Turan, 2006; Duyar et al., 2008; Mol and Turan, 2008).

Nutritional Value of Caviar

Not all fish eggs have the same chemical composition. The type of fish, egg condition and maturity, harvest time and location are the most important factors affecting the chemical composition of fish eggs. Caviar is also a source of high-quality protein, as it contains high levels of essential amino acids. fish roe; It contains 22-29% protein, 28-36% fat, 14-30% water, 6-13% ash and 3-10% carbohydrates, and depending on the fish species, they can have a black, yellow, orange or transparent appearance. Their diameters vary between 0.3 mm and 0.5 cm, depending on the species. Since it is difficult to keep fish eggs fresh, they must be processed. Salting amount and application time in fish eggs are one of the most important factors affecting the quality of caviar (Turan, 2006; Özden et al., 2018).

Caviar is a one-of-a-kind food product that contains a significant number of vitamins and minerals such as Omega-3, which ensures a healthy and stable immune system for the human body. 30% of caviar is easily digestible protein; One serving (25 grams) can meet half of the body's daily protein needs. This unique product contains vitamins B12, B6, D and more. Caviar is also rich in amino acids, micro and macronutrients. A 100-gram serving contains plenty of B12, iron, calcium and vitamin A. Caviar can be useful in the treatment of some health conditions; it also helps to strengthen bone tissue and improve the immune system (Anonymous, 2022b).

Caviar is also a source of high-quality protein, as it contains high levels of essential amino acids. With the consumption of approximately one teaspoon of caviar in one serving, 2-3 g of protein is obtained. It also contains a significant amount of polyunsaturated fatty acids. The dominant fatty acid in caviar is oleic acid and its amount varies between 32.9 and 42.6%. It was determined that n-3 polyunsaturated fatty acids in sturgeon caviar were 3 times higher than n-6 polyunsaturated fatty acids. Trout caviar 6-8% total lipid, 24-27% protein, 21% saturated fatty acids, 34% monounsaturated fatty acids, 15% omega-6 polyunsaturated fatty acids, 22% It consists of omega-3 polyunsaturated fatty acids and contains an energy value of approximately 180 kilocalories. The most important fatty acids are eicosapentaenoic acid and docosahexaenoic acid, which are present in roe at levels of 6% and 12%, respectively (Özden et al., 2018).

Types of Caviar

"Black caviar" obtained from sturgeon eggs takes the first place in world caviar production. This is followed by caviar obtained from the eggs of other fish (capelin, lumpfish, trout, salmon, mullet, carp, etc.) (Şengör, 2002).

Almas: It is a very rare type of caviar known as Golden (Golden) caviar. It is produced from albino sturgeon or an Osetra sturgeon that is at least 60 years old. Its taste is described as soft delicacy, creamy and very light in color.

Beluga: Caviar produced from Acipenser huso type sturgeon eggs. It is the highest quality type of caviar. This coarse-grained caviar is black or dark gray in color. It has a melt-in-your-mouth structure and a fishy flavor. The grain sizes are larger than the others.

Kaluga: Caviar produced from Huso dauricus eggs. It is one of the largest sturgeon species and is found in the Amur and Harbor Rivers in China. The eggs are similar to the eggs of young Acipenser gueldenstaedtii and are processed with 6% salt.

Osetra: It is caviar produced from the eggs of Acipenser gueldenstaedtii, known as Russian sturgeon. Its color is lighter gray-green or brown compared to Beluga caviar. It has a pleasant "nutty and creamy" flavor.

Schip: It is caviar produced from Acipenser nudiventris eggs. It is usually packaged as Sevruga or Osetra depending on the egg size, but its eggs are more sensitive to processing.

Sevruga: It is the smallest grained caviar produced from Acipenser stellatus eggs. These gray-black eggs are fine and small-grained and very tasty. It is considered to be of lower quality than Osetra and Beluga caviar.

Sterlet: Caviar produced from Acipenser ruthenus eggs. It is small grained and blackish.

Tarama: It is a product obtained from carp eggs. The eggs are passed over the screening sieve and separated from the membranes and subjected to the washing process. It is mixed in a bowl with the addition of olive oil until it reaches a creamy consistency. Then salt is added. This product is specially made in Greece (Şengör et al., 2002; Özpolat, 2006; Özden et al., 2018).

Waxy caviar: It is obtained from mullet eggs. It is obtained by pressing dried mullet eggs and coating them with wax.

Use of Dietary Fibers in Fish and Fish Products

Rahimeh Jaberi¹, Pınar Oğuzhan Yıldız²

^{1,2}Fisheries of Faculty, Atatürk University, Erzurum, Turkey

Abstract

Fish and fish products are high quality and easily digestible proteins and contain other essential nutrients such as polyunsaturated fatty acids beneficial to health and vitamins and minerals essential for human nutrition. Despite its high nutritional value, seafood is one of the nutrients that tend to deteriorate quickly due to the loose connective tissue and the polyunsaturated fatty acids they contain. For this reason, manufacturers add or additives to prevent these problems. Low-calorie, healthy meat and meat products are produced with the addition of functional components (dietary fibers) with many beneficial properties in order to avoid unwanted substances such as fat and salt or to reduce them to appropriate limit values. Today, functional foods that protect health and minimize the risk of disease while feeding, attract more attention by consumers. Various functional components are used in order to improve the sensory properties of the product, to reduce the production cost, and to take more place in the diets of consumers, in addition to their positive effects on health. In addition to its high technological properties, dietary fibers have found the opportunity to be used in processed meat and meat products, as they have a protective effect against many diseases such as cardiovascular diseases, hypertension, diabetes, obesity, constipation problems, and various types of cancer. In this review, use of dietary fibers in fish and fish products will be mentioned.

Key Words: *Dietary Fibers, Fish, Health*

Balık ve Balık Ürünlerinde Diyet Liflerinin Kullanımı

Özet

Balık ve balık ürünleri, yüksek kaliteli ve kolay sindirilebilir proteinler olup, sağlığa faydalı çoklu doymamış yağ asitleri ve insan beslenmesi için gerekli olan vitamin ve mineraller gibi diğer gerekli besinleri içermektedir. Besleyicilik değeri yüksek olmasına rağmen su ürünleri gerek bağ dokusunun gevşek olması gerekse içerdikleri çoklu doymamış yağ asitleri sebebiyle çabuk bozulmaya eğilimi gösteren besin maddelerindendir. Bu nedenle üreticiler bu problemleri önleyecek işlemleri veya katkı maddeleri ilavesini yapmaktadırlar. Düşük kalorili, sağlıklı et ve et ürünleri, yağ ve tuz gibi istenmeyen maddelerden kaçınmak veya bunları uygun sınır değerlere indirmek için birçok faydalı özelliğe sahip fonksiyonel bileşenlerin (diyet lifleri) eklenmesiyle üretilir. Günümüzde sağlığı koruyan ve beslenirken hastalık riskini en aza indiren fonksiyonel gıdalar tüketiciler tarafından daha fazla ilgi görmektedir. Ürünün duyuasal özelliklerini iyileştirmek, üretim maliyetini düşürmek ve tüketicilerin diyetlerinde daha fazla yer almak için sağlığa olumlu etkilerinin yanı sıra çeşitli fonksiyonel bileşenler kullanılmaktadır. Diyet lifleri kalp-damar hastalıkları, hipertansiyon, diyabet, obezite, kabızlık, kolon kanseri çeşitli kanser türlerine karşı koruyucu etkiye sahip olduğundan işlenmiş et ürünlerinde kullanım imkanı bulmuştur. Bu derlemede diyet liflerinin balık ve balık ürünlerinde kullanımına değinilecektir.

Anahtar Kelimeler: *Havyar, Su ürünleri, Besdin değeri, Üretim teknolojisi*

Introduction

In this modern age, intense work life and physical fatigue have increased people's tendency to foods that can be prepared practically without wasting much time (Kılınççeker and Karahan, 2019). In addition, people have begun to give more importance not only to foods that meet their nutritional needs, but also to foods that are richer in nutritional value, prevent diseases that may occur in the body and improve health (Kesemen, 2018). Consumers prefer foods that are suitable for health and low in calories. In recent years, consumers prefer easy-to-prepare and standing food (Kılınççeker and Karahan, 2019).

- the materials used in the product,
- production methods,
- they also take into account the energy provided by the product

The food industry has started to offer alternatives for people with diseases such as celiac, diabetes, cardiovascular diseases or digestive disorders by producing different products (Keskin and Kaplan-Evlice, 2015). Also, recently the meat industry has focused on producing healthier meat products by reducing components that are commonly perceived as "negative" and/or adding health benefits (Fernandez-Lopez et al., 2021). Today, a balanced diet for a healthy life has become an increasingly common habit. Since consumer preferences are also directly effective on food producers, different applications have been made especially in meat and products (Kılınççeker and Karahan, 2019).

Various flours are used in meat, fish cakes and similar products in order to increase the physical, chemical and sensory properties of the product, due to its water-binding and barrier properties against oil absorption. The addition of different plant-based flours to food products is increasing day by day due to its components and benefits to human health. Plant-based flours can extend the shelf life of fish products due to their high protein, starch and fiber content (Kılınççeker, 2015). Fish meat is rich in nutritional content and is a very important food, especially in terms of protein, fatty acids and minerals. Despite its high nutritional value, seafood is one of the nutrients that tend to deteriorate quickly due to the loose connective tissue and the polyunsaturated fatty acids they contain. For this reason, manufacturers add processes or additives to prevent these problems (Kılınççeker and Karahan, 2019). Since dietary fibers have a protective effect against various types of cancer such as cardiovascular diseases, hypertension, diabetes, obesity, constipation, colon cancer, they have found the opportunity to be used in processed meat products (Ergene and Bingöl, 2019). Seafood contains high-quality and easily digestible proteins, polyunsaturated fatty acids beneficial to health, and vitamins and minerals necessary for human nutrition (Jayasinghe et al., 2013). Despite these functional properties, fish products do not contain fiber. Adding fiber to fish products is receiving a lot of attention, not only as a way to improve the functionality of food products, but also as a way to create functional foods with health benefits (Borderias et al., 2005).

Dietary Fibers

In the production of various meat products, fibers are used as filler, binder and fat replacer. Dietary fibers are the most widely used in foods and are accepted as providing functional content in food (Borderias et al., 2005).

Various studies have been carried out on this subject by including various fiber sources such as oats, sugar beet, soy, peas, and psyllium in the formulation of some meat products such as meatballs and sausages (Mehta et al., 2013).

Dietary fiber is a class of compounds that cannot be decomposed and digested by the human body, such as cellulose, hemicellulose, pectin, lignin, gums, resistant starch, and other non-carbohydrate components. Scientific studies of nutritionists have shown that human health is inextricably linked with eating habits, and high dietary fiber intake can reduce many health hazards such as obesity, diabetes type II, cardiovascular complications, gastrointestinal disorders, and some types of cancer (Lin et al., 2019).

Adding fiber to meat products can have the following technological effects (Zinina et al., 2019):

- 1) increase the moisture holding capacity of minced products,
- 2) improve the stability of emulsions,
- 3) changing the used oil or reducing the oil content
- 4) increase the yield of the product,
- 5) improve the texture of meat products,
- 6) maintaining the shape of the product after heat treatment and
- 7) increasing storage time by stabilizing fats and proteins

Dietary fibers, dried fruits, vegetables and cereal fibers isolated from various plant sources have been used in the food industry and have shown promising results (Mehta et al., 2013).

Besides different dietary fibers such as pea, apple, sugar beet, soy and citrus fibers, inulin and gums are now included in foods due to their nutritional properties or functional and technological properties.

In addition, from a technological point of view, the addition of fibers, especially in cases where the raw material used is of low functional quality, products made with minced muscle (Borderias et al., 2005);

- Water binding,
- Volumizing,
- Emulsion capacity,
- Gelling properties,
- It improves the texture of the product

With Use of Dietary Fibers in Fish and Fish Products Related Studies

Amalia et al. (2016), in a study on the use of mangrove fruit in the processing of fish nuggets, mangrove fruit flour used in different ratios (0%, 20%, 30%, 40%) instead of wheat flour had a significant effect on the water, oil, protein and ash content of the product effect has been reported. It has been reported that higher substitution of mangrove fruit meal increases the protein content of fish nugget products, thus mangrove fruit meal has the potential to increase the nutritional value of fish nugget.

Santillan-Alvarez et al. (2017), in a study investigating the effects of adding 0-8 g/100 g chia seeds to carp meat on physicochemical and sensory properties, carp meat prepared with the addition of chia had higher nutritional value (higher fiber and protein content) than the control group. It was determined that it showed better cooking properties (higher cooking efficiency and moisture retention). In addition, it was determined that the addition of chia increased the a* and b* values of the samples and decreased the L* values. The hardness value of the samples increased with the addition of chia, however, it was reported that results similar to the control group were obtained in the samples prepared with 4% or 8% chia in terms of sensory.

Kılınççeker (2015) examined the quality characteristics of the samples in their study with carp fish balls produced with different flours of plant origin. In the raw samples, the lowest pH was found in the group prepared with pepper seed flour, while the number of thiobarbituric acid was reported to be lower in the groups containing control, wheat, barley, oat and pepper seed flours. It was determined that the moisture content of the fried fish balls in the group with oat flour and the oil content in the groups with barley and rye flour decreased significantly.

Ali et al. (2019), pumpkin puree or mashed potatoes were used in the formulation of tilapia fish burger in their study, and their cooking properties, chemical quality, color, texture and sensory properties were examined. Fish burgers formulated with different substitution levels of pumpkin or potatoes puree had higher moisture and carbohydrate content and lower protein, fat, ash and energy value than the control fish burger. Total volatile nitrogen (9.45–11.20 mg N/100 g), trimethylamine (2.24–2.59 mg N/100 g) and thiobarbituric acid (0.185–2.51 mg malonaldehyde/kg) values in fish burgers formulated with pumpkin or potatoes puree were found to be lower in the control group.

Kılınççeker and Karahan (2019) mixed carp (*Cyprinus carpio*) meatballs with breadcrumbs and teff flour in different proportions (100% breadcrumbs (control), 1:2 tambourine: breadcrumbs, 2:1 tambourine:breadcrumbs and In the study examining the effects of adding 7% (100% teff flour) to some properties, it was reported that teff flour did not affect the L* and a* values in raw samples and reduced the b* value. While it increased the diameters of the fried samples, it decreased the color criteria a* and b* values when added at a high rate. In addition, it had a similar effect with breadcrumbs on the yield, L* value, moisture retention and oil absorption properties of fried meatballs, and showed an increasing effect on the smell, which is only a sensory feature. According to the results, it was determined that the ratio of teff flour: breadcrumb flour, especially 1:2 and 2:1 ratios, can provide some physical and sensory advantages in fish cake production.

Carbon Footprint

Gökhan Arslan¹, Pınar Oğuzhan Yıldız¹

¹Fisheries of Faculty, Atatürk University, Erzurum, Turkey

Abstract

Climate change and global warming are among the most discussed issues in the global sense in recent years. The main culprit of global warming is the very rapid increase in the rate of gases that cause greenhouse effect in the atmosphere. Carbon dioxide (CO₂) gas, which is emitted into the atmosphere by the use of fossil fuels (petroleum, coal, natural gas), is one of the gases that create the greenhouse effect. Carbon footprint is a measure of the damage caused by human activities to the environment in terms of the amount of greenhouse gas produced, measured in units of carbon dioxide. Carbon footprint is the largest component of the total ecological footprint on a global scale, as well as the most important part of Turkey's Footprint constitutes. In this study, it is aimed to explain the carbon footprint in detail.

Key Words: Greenhouse gas, Carbon dioxide, Carbon footprint

Karbon Ayak İzi

Özet

İklim değişikliği ve küresel ısınma son yıllarda küresel anlamda en çok tartışılan konuların başında gelmektedir. Küresel ısınmanın nedeni atmosferde sera etkisine neden olan gazların oranındaki hızlı artıştır. Fosil yakıtların (petrol, kömür, doğal gaz) kullanılmasıyla atmosfere salınan karbondioksit (CO₂) gazı, sera etkisi yaratan gazlardan biridir. Karbon ayak izi, birim karbondioksit cinsinden ölçülen, üretilen sera gazı miktarı açısından insan faaliyetlerinin çevreye verdiği zararın bir ölçüsüdür. Karbon ayak izi, küresel ölçekte toplam ekolojik ayak izinin en büyük bileşeni ve Türkiye'nin ayak izi bileşenlerinin de en önemli parçasıdır. Bu çalışmada karbon ayak izinin detaylı olarak anlatılması amaçlanmaktadır.

Anahtar Kelimeler: Sera gazı, Karbondioksit, Karbon ayak izi

Introduction

Climate change and global warming are among the most discussed issues in the global sense in recent years. The main culprit of global warming is the very rapid increase in the rate of gases that cause greenhouse effect in the atmosphere. Carbon dioxide (CO₂) gas, which is emitted into the atmosphere by the use of fossil fuels (petroleum, coal, natural gas), is one of the gases that create the greenhouse effect. The concept of "footprint", which has been developed by environmental scientists in the last ten years, generally refers to the measurement of how much natural resources are used by people. Ecologists measure human footprints in three dimensions. These; ecological footprint is expressed as carbon footprint and water footprint (Birkan, 2013; Bıyık and Civelekoğlu, 2020). The most important component of the ecological footprint in Turkey is the carbon footprint with a rate of 46% (Erden Özsoy, 2015).

Historically, the definition of carbon footprint comes from the definition of ecological footprint, of which it is a branch. The concept of ecological footprint emerged in the 1990s; The agricultural land footprint was defined as the combination of carbon footprint, structured area footprint, forest footprint, grassland footprints and fishing field footprints. The result of carbon footprint calculations is kg or tonne equivalent CO₂ in units expressed in terms. The carbon equivalent indicates how many times greater the heat storage potential of non-carbon greenhouse gases than the same amount of carbon. Thus, by bringing together all greenhouse gases in an equivalent denominator, the measurement of actual emissions is understandably simplified (Karakaş, 2021).

Figure 1. Carbon footprint (Anonymous, 2022)

The carbon footprint is calculated by determining the amount of CO₂ that a person releases into the environment in a year. Transportation, heating, eating, drinking, etc. The amount of carbon formed as a result of the products produced and consumed by the activities determines the carbon footprint. The carbon footprint determines the share of people in global warming. In other words, a carbon footprint is the ratio of the greenhouse gases released to the nature as a result of a person, institution or any product in the overall total. Carbon footprint calculation, total distance traveled by vehicles, amount of energy used for heating, etc. It includes many parameters. In this regard, care should be taken when determining the primary and secondary traces of carbon. (Kumaş et al., 2019). Carbon footprint is examined in two groups as personal and corporate carbon footprint.

1. Personal carbon footprint: It is a term that evaluates the amount of individual liability resulting from the emission released to nature as a result of anthropogenic activities. The aim here is to create personal awareness and to start the reduction of emissions from individuals. Personal carbon footprint is also divided into two groups among themselves.

- **Primary Carbon Footprint:** It is the amount of CO₂ emissions caused by fossil fuels consumed by humans in homes or vehicles (car, airplane, etc.).

- **Secondary Carbon Footprint:** The products used by human beings indirect CO₂ in the cradle-to-grave cycle is the amount of emissions.

2. Corporate Carbon Footprint: It is the concept that shows the emissions that organizations leave to the nature as a result of their activities during the year. The corporate carbon footprint is divided into three groups;

- **Direct Carbon Footprint:** The fossil fuels used by the vehicles owned by the institution or the institution and the emissions indicating the environmental impact of the fossil fuels used for heating and the production process are within the scope. The organization must calculate direct greenhouse gas emissions and removals from facilities located within its boundaries.

- **Indirect Carbon Footprint:** Obtained from an institution by another institution. Emissions caused by hot water, cooling water and steam are included in this scope.

- **Other Indirect Carbon Footprint:** It is the most difficult footprint to calculate since the availability of the required information is related to the affiliated organizations. (Birkan, 2013; Karakaş, 2021).

Figure 2. Elements and ratios of carbon footprint (Argun et al., 2019)

On the other hand, dividing the carbon footprint into certain categories will affect individuals' resource use and facilitates the monitoring of their sustainability. However, these categories are creates awareness that they need to take more responsibility in terms of the component. Moreover individuals, under these categories, their individual and social status as determined by the Kyoto protocol. By evaluating it within the framework of emission standards, it has the chance to compare with other countries and have the opportunity to create solutions (Yaka et al., 2015).

Carbon Footprint is calculated in terms of forest area, which is the land type that provides the highest absorption in Footprint calculations. According to the NFA methodology, there is no separately calculated carbon biocapacity,

instead, there must be forest land that is not used for forest product production in order to store every tonne of carbon released into the atmosphere. If the size and productivity of this forest land is not sufficient to store the amount of carbon released into the atmosphere, carbon sequestration ecological deficit occurs in the category. Carbon Footprint, as well as being the largest component of the total Footprint on a global scale, also constitutes the most important part of Turkey's Footprint. 46-49% of the total Ecological Footprint from consumption in Turkey (per capita) 1.24-1.36 kha) is the Carbon Footprint. About 21% of CO₂ emissions in the country come from products, 19% from personal transportation and 17% from food consumption. Apart from Personal Footprint, capital accumulation also has a significant share and constitutes 20% of the total Carbon Footprint (WWF, 2012).

Carbon Footprint in the World

The carbon footprint is a tool that enables the monitoring and measurement of greenhouse gas emissions as well as the control of abatement practices at different scales. The carbon footprint caused by greenhouse gases, the effects of which became evident with the spread of industrialization in the 1930s, was 9411 MtCO₂ in 1960, while it was measured as 36153 MtCO₂ in 2017. While the 5 countries with the highest total greenhouse gas emissions were the USA, Russia, Germany, China and England in 1960, the top 5 countries in 2017 were China, USA, India, Russia and Japan, respectively. While the total amount of emissions of the 5 countries that caused the most greenhouse gas emissions in 1960 was calculated as 5955 MtCO₂, this amount reached 20474 MtCO₂ in 2017 (Ahmetoğlu, 2019).

As a result, it is very important for the measures to be taken to reduce the carbon footprint. In order to prevent carbon emissions caused by the consumption of natural gas, renewable energy sources should be used and buildings should be insulated. Electricity consumption is generally due to the use of heating, cooling, office vehicles and elevators. Using energy-saving lamps, turning off unnecessary office equipment, choosing high-efficiency air conditioners, and choosing stairs instead of elevators for both the environment and our health will reduce carbon emissions from electricity. Low-volume engines and energy-saving vehicles should be used to reduce emissions caused by fuel consumption. A minimum level of energy consumption should be ensured by taking into account the daily distances used by staff and students.

Effect Of Amrec Technologies Of Federal University Of Agriculture Abeokuta On Income Level Of Cassava And Soya-Bean Farmers In Ogun-State, Nigeria

John Oyetoro¹, Williams Adewole²

¹Department of Agricultural Extension and Rural Development, Faculty of Agricultural sciences, Ladoke Akintola University of Technology, Ogbomoso, Nigeria.

²Department of Agricultural Extension and Rural Development, Faculty of Agricultural sciences, Ladoke Akintola University of Technology, Ogbomoso, Nigeria.

Abstract

The study analysed the effect of Agricultural Media Resources and Extension Center (AMREC) technologies of Federal University of Agriculture Abeokuta (FUNAAB) on income level of cassava and soya bean farmers in Ogun-state, Nigeria. The study describes the socio-economic characteristics of the respondents, examines the utilization level of AMREC technologies on cassava and soya beans transferred to farmers, Communication methods used to reach respondents on these technologies, and the problems encountered by farmers towards utilization of AMREC innovations. A total of 120 respondents constituted the sample size. Descriptive statistics such as frequency counts and percentages were used to describe the data. However, T-test analysis were used in to establish the significance difference between the variables. The study found out that most of the respondents 61.7% were between ranges of 41-60years and majority of the respondents 73.3% were male and married. Also, (66.7%) of the respondents highly utilized cassava hybrid, 43.3% of the respondents utilized soya bean hybrid. All the respondents (100%) claimed that individual contact, radio, television were not used to reach them. T-test analysis shows that there is significant difference in the amount realized per annum (₦) from cassava and soya-bean productions before and during benefiting from AMREC technologies ($t = 18.102$, $p = 0.003$). Conclusively, there is improvement in the amount realized per annum during their participation in AMREC project. The study therefore recommended that efforts should be made by AMREC to sustain transferring of technologies related to cassava and soya-bean production because of its significance contribution to their income level.

Key Words: *AMREC, Technology, Cassava and Soya-bean, Income level, Innovation*

Introduction

The Federal University of Agriculture, Abeokuta (FUNAAB), as one of the specialized Universities of Agriculture in Nigeria, had at its inception in January 1988, the tripartite mandates of Teaching/Training (Manpower Development), Research (particularly Problem Directed and Result Oriented Research) and Extension Services (Transfer of Proven Technologies and Community Development). The Agricultural Media Resources and Extension Centre (AMREC) is the leg upon which the extension mandate rests. Agricultural extension services have crucial roles to play in agricultural development employ strategies that involve training, demonstration, adaptive research and communication to help farmers and other stakeholders in agriculture form opinions and adopt new knowledge and technologies that will enhance agricultural productivity and ultimately improve their livelihoods (AMREC, 2019)

In an effort to spread AMREC extension activities, Tribune Online (2022) reported that the Agricultural Media Resources and Extension Centre (AMREC) of the Federal University of Agriculture, Abeokuta, (FUNAAB) has extended skill acquisition to farming families and out-of-school youths in Alagbede community and its environs in Odeda Local Government Area of Ogun State. The training workshop, under the programme, tagged: 'Gender Issues and Youth Development' (GIYD) was targeted toward empowering primary school students and the general populace of the community. Similarly, The Guardian (2019) reported that AMREC of Federal University of Agriculture, Abeokuta Ogun State, in collaboration with Premier Feed Mills, has enlightened secondary school students in Abeokuta, on importance of egg to human health. One could conclude that technology transfer is the hub of extension activities.

Application of scientific discoveries to solve or ease problem(s) is termed technology. Most people use one or combination of technology every day of their lives. Indeed, (2022) observed that there are many different types of technology, and each one has unique functions that aim to make certain processes more efficient. Technology is the product of transferring scientific knowledge to practical use. Different forms of technology are the result of people trying to find more efficient ways to do things and testing new ideas. Technology is constantly improving and generally aims to make processes easier for people. Technology cut across several sectors such as electrical, communication, computer and agriculture.

The scale of demand for agricultural products and resources has grown so much that it has become impossible to meet these requirements with manpower only. As a result, agricultural technologies appeared on the market to

streamline and automate farming activities, and by those technologies, it means every tech-based solution that helps farmers to manage fields, treat crops, and monitor them. Technologies that focus on local farmers condition are classified as appropriate technologies. Appropriate technology is an approach based on scalable and sustainable solutions that improve smallholder farmers' livelihood and protect the environment. (Bartosinska, 2021).

Agricultural technology development are the works of agricultural research institutes, Universities of Agriculture, Faculties or colleges of Agriculture and veterinary medicines. Kyama (2015) stated that Universities need to become even more productive in terms of generating research – around seed technologies, better planting methods, ways of analyzing soil, and understanding and mitigating the impacts of climate change – because much of what is going to happen in the agricultural sector has to do with operating within a knowledge-based global economy. Universities have been accused, in Africa and elsewhere, of not responding quickly enough to changing market needs in terms of skills. However, many are starting up incubators aimed at creating new technologies that can be commercialized and contribute towards industrial growth.

Linquip Technews (2022) revealed that in the agricultural sector, innovation doesn't start in the farms or factories. It rather starts in universities. From there, it spreads to: the farms, transportation systems of agricultural produce, manufacturing and distribution systems. The university research departments play an important role in innovation. They invest resources into each department. Researchers collaborate with students to innovate new technologies. Students learn from the researchers and teachers. And when they develop new technologies, the researchers and teachers learn from them too.

Nigerian universities have played roles in the development of agriculture, especially in the research and extension spheres. Five universities have been designated as agricultural universities and specifically train graduate and post graduate students in agriculture and food security. Many other universities have faculties of agriculture, where they train graduate and postgraduate students in different agricultural disciplines. However, the response to this challenge is constrained by inadequate research and training facilities (Okolo, 2010).

Cassava and Soybean were among the crops given attention by AMREC. Cassava production is usually faced with myriad of problems ranging from pests and diseases (cassava mosaic disease, cassava bacterial blight, cassava anthracnose disease, cassava bud necrosis, root rots, mealybugs, green mite, weather related problems, poor soil, land dilapidation, damage by livestock, danger imposed by excessive use of fertilizers, scarcity of cuttings, poor accessibility to markets, and all these problems affects the yield (Emmanuel, 2016). Olufolaji (2018) reported that challenges in the Nigeria crop production sector are numerous, some of which include: Post-harvest handling (sorting, grading and cold storage); low utilization of improved seeds and seedlings (Nigeria uses 5%; East Africa 25% and Asia uses 60% improved seed/seedlings); low rate of fertilizer usage: Nigeria uses an average of 13kg/hectare (Western World uses 100kg/hectare and Asia uses 150kg/hectare); low yield: Crop yield in Nigeria is only

Ekott (2021) reported that the central problem responsible for perennial low cassava production is that Nigerian farmers use local varieties that yield poorly. Nigeria produces less than 10 tonnes per hectare whereas top exporters like Thailand produce up to 40 tonnes per hectare. Nigeria is ranked largest producer of cassava in the world based on its annual production, not yield per hectare. Another problem is poor control of weed, a major inhibitor of cassava productivity that can cause as high as 90 per cent of yield loss and insecurity of farmers due to herdsmen invasion.

Donley (2021) stated that Soybean production and imports in Nigeria continue to rise as the country's demand for the oilseed is expanding for both food and feed use. Although soybean production is mostly cultivated in the northern parts of the country, Nigeria's northern states are experiencing security challenges, resulting from Boko Haram activities as well as conflict between pastoralists and farmers. This study therefore evaluated the effect of Agricultural Media Resources and Extension Center (AMREC) technologies of Federal University of Agriculture Abeokuta (FUNAAB) on income level of cassava and soya bean farmers in Ogun-state, Nigeria. Specifically, the study describes the socio-economic characteristics of the respondents, examines the utilization level of AMREC technologies on cassava and soya beans transferred to farmers, Communication methods used to reach respondents on these technologies, and the problems encountered by farmers towards utilization of AMREC innovations.

Materials and Methods

Text The study was carried out in AMREC catchment areas of Ogun state, Nigeria. Britannica (2020) described Ogun state, western Nigeria as a state created in 1976 and comprising former Abeokuta and Ijebu provinces of former Western state, the latter carved out of former Western region in 1967. Ogun is bounded by Oyo and Osun states to the north, Lagos state to the south, Ondo state to the east, and the Republic of Benin to the west. It is covered predominantly by tropical rain forest and has wooded savanna in the northwest. Agriculture, the economic mainstay of Ogun, produces rice, corn (maize), cassava (manioc), yams, plantains, and bananas. Cocoa, kola nuts, rubber, palm oil and palm kernels, tobacco, cotton, and timber are the main cash crops.

AMREC is an extension arm of Federal University of Agriculture Abeokuta. The University commenced extension and outreach services in 1990 while the AMREC was inaugurated and established in November 1, 1991 and charged with the responsibility of fulfilling the extension mandate of FUNAAB to stakeholders (Extensionists,

Farmers, Processors, Industrialists and Marketers among others) across the Southwestern states of Nigeria. AMREC's approach to extension activities involves the adoption of model extension villages and the use of an Inter-disciplinary Extension System in agricultural technology transfer. The overall governing body of the Centre is the AMREC Policy Board under the Chairmanship of the Vice-Chancellor. The Board is to ensure that AMREC runs its activities in line with the laid down regulations of the University, relates closely with the various Colleges within the University as well as Research Organizations, Agencies and Institutions in the Country, with a view of jointly proffering lasting solutions to identified farmer-centred problems from time to time (AMREC, 2019).

The study focused on cassava and soya-bean farmers benefited from AMREC project. Simple random selection was used to select 10% respondents from the list of beneficiary (1196) provided, thus 120 respondents constituted the sample size. Interview schedule was used to collect data from selected towns and village benefitted from the project such as: Odeda, Osiele, Oluga, Olugbo, Ilugun, Olodo, olokemej, Obantoko, Adao and Alabata. The dependent variable is the effect of AMREC technologies of Federal University of Agriculture Abeokuta on production level of cassava and soya bean farmers. It was measured by asking the respondents amount realized from cassava and soya-bean before and during benefiting from AMREC technologies. Descriptive statistics such as frequency counts and percentages were used to describe the data. However, T-test analysis was used in to establish the significance difference between amounts realized per annum from cassava and soya-bean productions before and during benefiting from AMREC technologies.

Results and Discussion

Socio-economic characteristic of the respondents

Table 1 reveals that (73.3%) of the respondents were male while (26.7%) were female. This means that male dominated the beneficiary of AMREC project. Also, (6.7%) of the respondents were between the age of 25-30 years, those between the age of 31-40 years were (21.7%), those between 41-50 years were (26.7%), those between 51-60 years were 35% and the respondents with ages from 61 above were (10%). This means that most of the respondents were middle aged which implies that they will be able to cope with rigorous activities on the farming activities. The data represented on Table 1 also showed that (6.7%) of the respondents were single, 8.3% were separated, (6.7%) were divorced, (5.0%) were widowed and (73.3%) were married. This means that most of the respondents in the study area were married which implies that there will be availability of family labour to assist in farming activities.

Table 1 also showed that respondents with household number from the range of 5-10 persons were (28.0%) while (71.7%) fell between the range of less than or equal to five (≤ 5) persons. This means that respondents in the study area were having small household size. The table further showed (66.7%) of the respondents had no formal education, (21.7%) had primary education, (6.7%) had secondary education (3.33%) had tertiary or post-secondary education, (1.67%) had adult education. This means that most of the respondents were illiterates which could distort extension information communicated to them. Similarly, table 1 revealed that (56.7%) of the respondents are Christians, (36.7%) are Muslims while (6.7%) are traditionalists. This implies that religion is not a barrier to benefit from AMREC project. The table also indicates the primary occupation of the respondent in which farming constituted (91.7%), (1.7%) were civil servants, while the artisans were (6.7%). This implies that agricultural production constitute major economic activity in the area. Also table 1 showed the secondary occupation of the respondents in which farming recorded (3.31%), (41.7%) were traders, (45.0%) were artisans. This means that respondents engaged in other income generating activities.

Also, 66.7% of the respondents belong to social organizations while 33.3% of the respondents does not belong to any social organization.

Utilization level of AMREC technologies transferred on Cassava and Soya-bean production

Table 2 revealed that (66.7%) of the respondents moderately utilized cassava hybrid. This implies that respondents accepted cassava hybrids in the area. (50.0%) of the respondents utilized cassava spacing. This implies that the respondents averagely utilized cassava spacing. (53.3%) of the respondents highly utilized chemical weeding. Use of chemical weeding could be linked to affordability and availability of these chemicals. Also, (33.3%) of the respondents practiced right time cassava harvesting. When hybrid cassava tubers were left for long period in the soil, it tends to deteriorate. Also, (38.3%) of the respondents utilized cassava processing technology. AMREC provided big container to assist them in processing cassava tubers to local swallow called *fufu* which is in high demand in the area.

Furthermore, 43.3% of the respondents moderately utilized soya bean hybrid, (38.3%) of the respondents never utilized modern soya bean spacing. This implies some respondents still utilized the local/previous spacing of soya-bean. Also, (36.7%) never utilized chemical weeding for soya-bean. This could be attributed to technicalities involved in the use of chemical to control weed in soya-bean farm. Similarly, 38.3% of the respondents never utilized timely soya bean harvesting. Most of the respondents (61.7%) never practiced soya bean processing. This behavior could be linked to the fact that some sponsors of AMREC bought their produce directly from the farmers.

Table 1: Distribution of respondents by their socio-economic characteristics, n=120

Socio-economic characteristics	Frequency	Percentage (%)
Gender		
Female	32	26.7
Male	88	73.3
Age (years)		
25-30	8	6.7
31-40	26	21.7
41-51	32	26.6
51-60	42	35
61 and above	12	10.0
Marital status		
Single	8	6.7
Separated	10	8.7
Divorced	8	6.3
Widowed	6	5.0
Married	88	73.3
Household size (number of persons)		
≤ 5	86	71.7
5-above	34	28.3
Educational status		
No formal education	80	66.7
Primary education	26	21.7

Communication methods used to reach respondents on agricultural innovations

Table 3 showed that all of the respondents (100%) claimed that individual contact, radio, television, and internet were not used to reach respondents in the study area. Few (13.3%) of the respondents were reached using demonstration plots while (100%) of the respondents claimed use of seminars. This implies that seminars and demonstration plots were used to reach the respondents in the study area.

Table 3: Distribution of respondents according to communication methods used to reach respondents on agricultural innovations, n=120

*Communication methods	Frequency	Percentage (%)
Individual contact	0	100
Seminar	120	100
Demonstration	16	13.3
Radio	0	100
Television	0	100
Internet	0	100

Problems encountered toward utilization of AMREC technologies

Table 5 shows that (100%) of the respondents claimed that they had no problem regarding language used to disseminate innovation, (95.0%) of the respondents claimed that they had a mild problem on sustainability of the innovation. The table also shows that majority (91.7%) of the respondents experienced severe financial constraint. Almost half, (51.6%) of the respondents claimed that they had a mild problem in relating to the university agents. Also, 53.3% of the respondents claimed that they had no problem with the teaching methods used by university agents. Majority, (83.3%) of the respondents experienced severe infrastructural problem such as electricity. This means that respondents experienced combination of problems with different levels of severity which could influence the utilization of AMREC technologies.

Table 5: Distribution of respondents according to problems encountered towards the utilization of AMREC technologies.

*Problem	Severe problem	Mild problem	Not a problem

T-test analysis showing the significant difference between amounts realized per annum from cassava and soya-bean productions before and during benefiting from AMREC technologies.

T-test analysis shows that there is significant difference in the amount realized per annum (₦) from cassava and soya-bean productions before and during benefiting from AMREC technologies ($t = 18.102$, $p = 0.003$). This means there is improvement in the amount realized when the respondents are benefiting from the project. This improvement could be credited to utilization of AMREC technologies from Federal university of Agriculture Abeokuta transferred to them.

T-test analysis showing the significant difference between amounts realized per annum from cassava and soya-bean productions before and during benefiting from AMREC technologies.

Amounts realized (₦) per annum	mean	t-value	p-value	remark
from cassava and soya-bean productions				
Before	575,112	18.102	0.003	Significant
During	1,710,003			

Source: Computed Data, 2021.

Conclusion and recommendations

Conclusively, respondents utilized several technologies such as hybrid cassava and agro chemicals for weed control. There is improvement in the amount realized per annum during their participation in AMREC project. The study therefore recommended that

- There should be improvement in radio programmes to create awareness about AMREC programmes.
- Efforts should be made by AMREC to sustain transferring of technologies related to cassava and soya-bean production because of its significance contribution to their income level.

Acknowledgements

The study appreciates the cooperation of AMREC staff members during collection of this data.

The Effect of Drying Methods on Drying and Thermo-Physical Properties of Apricot Kernels

Burcu Aksüt^{1*}, Hakan Polatcı¹, Muhammed Taşova¹

^{1*}Tokat Gaziosmanpaşa Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü, Sürdürülebilir Tarım Programı, Tokat /Türkiye

¹Tokat Gaziosmanpaşa Üniversitesi Ziraat Fakültesi Biyosistem Mühendisliği Bölümü, Tokat/Türkiye

Abstract

Apricot kernels are used in medicine as pain reliever, antimutagenic, anti-inflammatory and antimicrobial. In addition, the sweet ones of apricot kernels are consumed as snacks, and the bitter ones are used as raw materials in the cosmetics industry. It is important to determine the effect of the methods in the apricot kernel drying process, which is thought to affect the usage areas indirectly or directly. In this study, apricot kernels were dried in an oven (50, 60, 70 °C) in an air-conditioning cabinet at 30 % relative humidity at 50, 60, 70 °C and in the shade. When the drying times of the drying processes were examined, the longest drying was found in the shade drying method with 22 hours, and the shortest drying was determined in an oven at a drying temperature of 70 °C with 4 hours. According to the mathematical model data, Page estimated the best Midilli-Küçük model ($R^2:0.9999$) among the drying data among Yağcıoğlu and Midilli-Küçük drying models. When the color values are examined, it has been determined that the methods closest to the color values of fresh apricot kernels are the processes carried out at 70 °C 30% RH in the air-conditioning cabinet and at 70 °C in the oven. In thermo-physical properties, the highest specific heat, thermal conductivity and thermal diffusivity values were determined in the shade drying method, while the highest specific mass values were determined in the samples that were dried in an oven at 60 °C.

Kayısı Çekirdeğinin Kuruma ve Termo-Fiziksel Özelliklerine Kurutma Yöntemlerinin Etkisi

Özet

Kayısı çekirdeği ağrı kesici, antimutajenik, iltihap önleyici ve antimikrobiyal olarak tıp alanında kullanılmaktadır. Ayrıca kayısı çekirdeklerinin tatlı olanları çerez olarak tüketilmekte, acı olanları ise kozmetik sanayisinde hammadde olarak değerlendirilmektedir. Kullanım alanlarını dolaylı veya doğrudan etkileyeceği düşünülen kayısı çekirdeği kurutma işleminde yöntemlerin etkisinin belirlenmesi önemlidir. Bu amaçla yapılan çalışmada, kayısı çekirdekleri etüvde (50, 60, 70 °C) iklimlendirme kabininde %30 bağıl nemde 50, 60, 70 °C ve gölgede kurutulmuştur. Kurutma işlemlerinin kuruma süreleri incelendiğinde en uzun kuruma 22 saat ile gölgede kurutma yönteminde, en kısa kuruma ise 4 saat ile 70 °C kurutma sıcaklığında etüvde tespit edilmiştir. Matematiksel model verilerine göre Page, Yağcıoğlu ve Midilli-Küçük kurutma modelleri arasında kuruma verilerinin genelinde en iyi Midilli-Küçük modeli ($R^2:0.9999$) tahmin etmiştir. Renk değerleri incelendiğinde taze kayısı çekirdeğinin renk değerlerine istatistiksel açıdan en yakın yöntemler iklimlendirme kabininde 70 °C %30 RH ve etüvde 70 °C sıcaklıkta yapılan işlemler olduğu tespit edilmiştir. Termo-fiziksel özellikler de ise en büyük özgül ısı, termal iletkenlik, termal difüzyivite değerleri gölgede kurutma yönteminde belirlenirken, en büyük özgül kütle değerleri ise etüv 60 °C de kurutulan örneklerde belirlenmiştir.

Anahtar kelime: *Kayısı çekirdeği, Kurutma işlemi, renk özellikleri, kuruma parametreleri*

Impacts of Insects As Feedstuffs on Animal Immune System

Kadir Erten¹, Aylin Ağma Okur¹, H. Ersin Şamlı¹

¹Dept. of Animal Science, Agricultural Faculty, Tekirdağ Namık Kemal University, Tekirdağ, Turkey

Abstract

Recent studies emphasize that insects can be used as an alternative feed source in animal nutrition. In addition to the nutrient contents of insects, some studies indicate that they can be a source of valuable compounds that have positive effects on the immune system. Researches focus on which compounds can be effective on the immune system. Among these, it is stated that antioxidant peptides, chitin, and antimicrobial peptides in the structure of insects can stimulate the immune system and regulate the intestinal microbiome in animals that consume it. In this context, it is stated that the consumption of edible insects may have effects by increasing gastrointestinal health and immune functions, thereby reducing the risk of bacterial infection. Scientific studies, especially on antimicrobial peptides, are increasing in the fields of medicine, food, and feed production. It is stated that the risk of bacterial resistance to antimicrobial peptides that can be obtained from insects is low. On the other hand, it is thought that bactericidal insect antimicrobial peptides can protect animals against viruses and fungi. Another view on this subject is that chitin, which is a component of the exoskeleton of insects, and chitin derivatives can stimulate immune cells. It is also known that lauric acid, a medium-chain fatty acid found in insects, has antiviral and antibacterial activity. In terms of animal nutrition, it is necessary to carry out comprehensive and multidisciplinary studies to determine the nutrient content of insects as well as to reveal their effects on the immune system. Only in this way can the effects on the health and performance of the animal be reflected comprehensively and accurately.

Yem Hammaddesi Olarak Böcek Kullanımının, Hayvanların Bağışıklık Sistemi Üzerine Etkileri

Özet

Son yıllarda yapılan çalışmalar, böceklerin hayvan beslemede alternatif bir yem kaynağı olarak kullanılabilirliğini vurgulamaktadır. Böceklerin besin madde içerikleri yanı sıra, yapılan bazı çalışmalarda bağışıklık sistemi üzerinde olumlu etkileri olan değerli bileşiklerin kaynağı olabilecekleri üzerinde durulmaktadır. Yapılan araştırmalar, hangi bileşiklerin bağışıklık sistemi üzerine etkili olabileceği üzerinde yoğunlaşmaktadır. Bunlar arasında böceklerin yapısındaki antioksidan peptitler, kitin ve antimikrobiyal peptitlerinin bağışıklık sistemini uyarabileceği ve tüketen hayvanlarda bağırsak mikrobiyomunu düzenleyebileceği belirtilmektedir. Bu kapsamda yenilebilir böceklerin tüketimi; gastrointestinal sağlığı ve bağışıklık fonksiyonlarını artırarak, bu sayede bakteriyel enfeksiyon riskini azaltıcı etkileri olabileceği belirtilmektedir. Özellikle antimikrobiyal peptitler üzerine yapılan bilimsel çalışmalar tıp, gıda ve yem üretimi alanlarında giderek artış göstermektedir. Böceklerden elde edilebilecek antimikrobiyal peptitlere karşı bakteri direnci oluşma riskinin düşük olduğu ifade edilmektedir. Diğer yandan bakterisidal etkili böcek antimikrobiyal peptitlerinin, hayvanı virüslere ve mantarlara karşı da koruyabileceği düşünülmektedir. Bu konudaki bir başka görüş de böceklerin dış iskeletinin bir bileşeni olan kitin ve kitin türevlerinin bağışıklık hücrelerini uyurabildiği yönündedir. Yine böceklerde bulunan orta zincirli bir yağ asidi olan laurik asidin antiviral ve antibakteriyel aktiviteye sahip olduğu da bilinmektedir. Hayvan besleme açısından, böceklerin besin madde içeriklerini belirlemenin yanı sıra bağışıklık sistemi üzerine olan etkilerinin de ortaya konabilmesi için geniş kapsamlı ve multidisipliner araştırmaların yapılmasının gerekliliği ortaya çıkmaktadır. Ancak bu sayede, hayvanın sağlığı ile performansı üzerindeki etkileri kapsamlı ve doğru bir şekilde yansıtılabilir.

Anahtar Kelimeler: *Böcekler, Bağışıklık sistemi, Yem katkı maddeleri, Protein kaynakları*

Giriş

Hayvanlar aleminde toplam hayvan biyokütlesinin %95'ini böcekler oluşturmaktadır, bu sayede de yaygın olarak üretimi ve tüketimi mümkün olabileceği düşünülmektedir (De Castro ve ark., 2018). Böcek üretiminin avantajları olarak; tükettikleri besinleri hızlı şekilde verime çevirme, hayvan ve insan atıklarını değerlendirmeleri ile ekolojik kirliliğin önüne geçilmesi, çiftlik hayvanlarına göre sera gazı üretimine daha az oranda katkıda bulunması, yüksek protein üretimi için daha az suya ve araziye gereksinimin bulunması gösterilebilir (Van Huis ve ark., 2013; Van Huis, 2017; Mulia, 2019; Barbi ve ark., 2020). Böcekler; yüksek düzeyde protein içermekte, bununla birlikte esansiyel aminoasitler, esansiyel yağ asitleri ve çeşitli vitaminler açısından da zengin bir kaynak olmaları sebebiyle değerli bir besin kaynağı olarak kabul edilmektedir. Böcek türlerine ve oluşum evrelerine göre

değişiklik göstermekle birlikte, kuru maddede %10'a kadar kitin içerdikleri de bildirilmiştir (Rumpold ve Schlüter, 2013; Belluco ve ark., 2013; Tzompa-Sosa ve ark., 2014; Belluco ve ark., 2017; Paul ve ark., 2017).

Tablo 1. Avrupa Birliği' nde 7 Eylül 2021 itibari ile yürürlüğe giren İşlenmiş Hayvansal Proteinlerin (İHP) yemlerde kullanım kısıtlamaları

AB'nde (2021/1372 sayılı) 7 Eylül 2021 itibari ile hayvansal protein kaynaklarının yemlerde kullanımı kısıtlamaları	Kürk hayvanları dışındaki çiftlik hayvanları için yem					Pet ve kürk hayvanları için yem
	Ruminantlar	Tek mideli hayvanlar (Balık hariç)			Balıklar	
		Domuzlar	Kanatlılar	Diğerleri		
▪ Ruminantlardan elde edilen İHP (kan unu dahil)						
▪ Ruminantlardan elde edilen kan ürünleri						
▪ Ruminantlardan elde edilen jelatin ve kolajen		2021	2021	2021	2021	
▪ Hidrolize proteinler (tek mideli hayvanlardan ve ruminantların deri ve postlardan elde edilenler dışındakiler)						
▪ Domuzlardan elde edilen İHP			2021		2013	
▪ Kanatlılardan elde edilen İHP		2021			2013	
▪ Diğer tek mideli hayvanlardan elde edilen İHP (kan unu dahil, fakat balık unu hariç)					2013	
✓ Böceklerden elde edilen İHP		2021	2021		2017	
▪ Balık unu						
▪ Tek midelilerden elde edilen kan ürünleri						
▪ Hayvansal orijinli di ve trikalsiyum fosfat						
▪ Hayvansal proteinler (tabloda adı geçen ürünlerin dışında kalanlar)						
▪ Hidrolize proteinler (Tek midelilerden ve ruminantlardan elde edilen deri ve postlardan elde edilenler)						
▪ Tek midelilerden elde edilen jelatin ve kolajen						
▪ Yumurta, yumurta ürünleri, süt, süt ürünleri, kolostrum						

Avrupa Birliği (AB) komisyonunun 2021/1372 sayılı ve 17 Ağustos 2021 tarihinde tek mideli çiftlik hayvanlarının yemlerinde hayvansal protein kaynağı kullanımına yönelik olarak hazırladığı düzenleme ile birlikte 7 Eylül 2021 tarihi itibari ile kanatlı hayvanların yemlerinde böcek türlerinden elde edilen işlenmiş ürünlerin kullanılabileceği belirtilmiştir. Bununla birlikte, ruminant hayvanların yemlerinde kullanımlarına henüz izin verilmemektedir (Tablo 1).

Farklı Yetiştirme Evrelerindeki Böcek Türlerinin Besin Madde İçerikleri

Kara asker sineğinin yaşam döngüsü; yumurta, larva, pupa ve ergin fazları olmak üzere dört faza ayrılabilir (Liu ve ark., 2017). Şekil 1'de böceklerin yaşam döngüsüne örnek olması amacıyla, Kara asker sineğinin (*Hermetia illucens*) yaşam döngüsü verilmiştir (Chia, 2019).

Şekil 1. Kara asker sineğinin yaşam döngüsü (Chia, 2019)

Grafik 1. Kara asker sineğinin yaşam döngüsüne bağlı olarak besin madde içeriği ve biyokütle birikimindeki değişimler (Liu ve ark., 2017; Tüm sonuçlar kuru kütle olarak verilmiştir. G-L: günlük yaştaki larva.

Böcekler; yaşamlarının değişik dönemlerinde, farklı besin madde içeriklerine sahiptirler. Grafik 1’de Kara asker sineğinin yaşam evresine göre besin madde içeriği ve biyokütle değişimleri ortaya konmuştur. Tablo 2’de ise ham protein (%), ham yağ (%), ham kül (%) içeriklerindeki değişimler gösterilmiştir. Ham protein içerikleri ise tüm dönemler incelendiğinde en düşük %38 (12 günlük yaştaki larva), en yüksek ise %57,6 (ölüm sonrası ergin birey) olarak ortaya konmuştur. Ham yağ içeriği yumurta evresinde %16; 14 günlük yaştaki larva döneminde %28; prepupa döneminde %24-28; Pupa döneminde %7-8; ergin dönemde %30-32 olarak belirtilmiştir. Ham kül içerikleri bakımından ise en düşük değerler, ergin dönemdeki Kara asker sineklerinde saptanmıştır (Liu ve ark., 2017).

Tablo 2. Kara asker sineğinin besin madde içeriği değişimleri (Liu ve ark., 2017)

Yaşam döngüsü	Ham protein (%)	Ham yağ (%)	Ham kül (%)
Yumurta (<12 saat)	45,0±0,12 ^e	15,8±0,06 ^f	4,0±0,15 ^{gh}
1 günlük yaştaki larva	56,2±0,06 ^b	4,8±0,08 ^j	5,0±0,17 ^g

Soya fasulyesi küspesi	44,51	1,84	6,13
Balık unu	66,0	10,8	21,8

E-prepupa: erken prepupa, G-prepupa: geç prepupa, E-pupa: erken pupa, G-pupa: geç pupa, P-ergin: ölüm sonrası yetişkin.

Veriler ortalama ± S.E olarak ifade edilir; farklı üst simgelere sahip bir sütun içindeki değerler birbirinden farklıdır (P<0.05).

Liu ve ark. (2017) yaptıkları çalışmada, Kara asker sineğinin yaşam döngüsündeki doymuş ve doymamış yağ asit miktarı Grafik 2’de gösterilmiştir. Buna göre 6 günlük yaştaki larva döneminden itibaren doymuş yağ asiti içeriklerinin arttığı, doymamış yağ asiti içeriklerinin ise azaldığı gözlenmiştir.

Grafik 2. Kara asker sineğinin içerdiği doymuş ve doymamış yağ asitlerinin değişimi (Liu ve ark., 2017; Tüm sonuçlar kuru kütle ile hesaplanmış haliyledir.)

Soya, tavuk ve palm yağı gibi yaygın kullanılan yağlar ile *H. illucens*, *T. molitor*, *Z. morio*, *B. mori* böceklerinden elde edilen yağların, yağ asit profilleri Grafik 3’te derlenmiştir.

Grafik 3. Böcek yağlarının ve kullanımı yaygın olan yağlardan bazılarının yağ asiti profilleri (Benzertiha ve ark., 2020a)

Kitin

Tek mideli canlılar tarafından sindirilemeyen bir bileşen olan kitin; eklembacaklıların dış iskeletinde bulunan bir polisakkarittir. Ham selüloz özelliğinde olup, β 1-4 glikozidik bağlarına sahip bir polimerdir. Kitin kompozisyonunun türlere ve gelişim dönemlerine göre farklılık gösterdiği bildirilmiştir. Örneğin; çekirgelerde %8,7; *Cirina forda* larvasında ise kitin miktarının %9,4; Kara asker sineğinin larvasında ise %5-8,7 olduğu belirtilmiştir (Sánchez-Muros ve ark., 2014; Kar ve ark., 2018).

Günümüzde araştırmacılar, kitin ve kitosanın yem katkısı olarak kullanımının biyolojik açıdan yararlı etkilerine ortaya koyan çalışmalara yönelim göstermektedir. Bu yararlı etkilerinin arasında büyüme performansını olumlu etkilemeleri ve serum kolesterol düzeyini azaltmaları sayılabilir. Bununla birlikte araştırmalarda birbirinden farklı sonuçlar da saptanmıştır. Bu sebeple, kitin ve kitosanın etkilerinin ortaya konulabilmesi için daha çok araştırmaya ihtiyaç duyulmaktadır (Lokman ve ark., 2019). Lokman ve ark. (2019) çalışmalarında çekirge ve karidesden elde edilen kitin ve kitosanın ayrı ayrı etlik piliçlerin yemlerine 0,5 g/kg ilavesi ile performans üzerindeki etkilerini ortaya koymayı amaçlamışlardır. Muamele grupları; kontrol, çekirge kitin (0,5g/kg), çekirge kitosan (0,5g/kg), karides kitin (0,5g/kg), karides kitosan (0,5g/kg) şeklinde planlanmışlardır. Çekirge kitin ve kitosanın kendileri ekstrakte ederken, karidesinkini ticari bir firmadan (Sigma-Aldrich, ABD) satın almışlardır. Etlik piliçlerin büyüme döneminin ilk 21 gününde performans değerleri bakımından muameleler arasında bir farklılık gözlenmemiştir. Performans döneminin tamamı göz önüne alındığında (0-42 gün) ise çekirge kitin ilavesi ile

büyüme performansı, karkas kalitesi ve organ karakteristikleri çekirge kitosan tüketen gruptan istatistiki olarak daha iyi olarak saptanmıştır. Kontrol grubunun canlı ağırlık artışı ve yağ düzeyi yüksek bulunmuştur. Çekirge kitini tüketen hayvanlarda ise yağ oranı en düşük olarak saptanmıştır ($p<0,05$). Yine aynı dönemde çekirge kitini, kontrol, karides kitin ve kitosanı tüketen gruplar arasında canlı ağırlık ve canlı ağırlık kazancı bakımından istatistiki olarak bir farklılık gözlenmemiştir.

Antimikrobiyal peptidler (AMP)

Böceklerin yapısında yüksek oranlarda bulunan antimikrobiyal peptidler (AMP), doğal antibiyotikler olarak da adlandırılmaktadır ve son yıllarda ilgi çeken bilimsel araştırma konularından biri haline gelmiştir. Genel olarak en önemli özelliklerinden birinin bakteriyel direncin gelişimine yol açmaması olduğu düşünülmektedir. Böceklerin yapısında bulunan AMP'lerin çoğunun küçük, katyonik protein yapısında oldukları, bakteri ve/veya funguslara, belirli bazı parazitlere ve virüslere karşı etki gösterdikleri bildirilmiştir. Buna ilave olarak, AMP'lerin bakteri hücresi üzerindeki antibakteriyel etkisinin, bakteri hücre zarfının yok edilmesini içerdiği ortaya konmuştur. Böcek AMP'lerinin en büyük grubu defensinler olup, bunlar altı korunmuş sistin içeren 34-51 kalıntıdan oluşan peptitler olarak bildirilmiştir. Böcek defensinleri, esas olarak Gram pozitif bakterilere (*Micrococcus luteus*, *Aerococcus viridians*, *Bacillus megaterium*, *Bacillus subtilis*, *Bacillus thuringiensis* ve *Staphylococcus aureus* dahil olmak üzere) karşı aktif olduğu gözlenmiştir. Bunun yanı sıra, Gram negatif bakterilere (*Escherichia coli* gibi) karşı da aktif olanlar ve anti-fungal özellikler ortaya koyanlar da saptanmıştır. Böcek antimikrobiyal peptitleri, antibiyotiklere karşı artan küresel bakteriyel direnç sorunu nedeniyle büyük umut vaat etmektedir. Böcek AMP'lerinin antimikrobiyal mekanizması, uzun yıllar boyunca şekillenmiş ve çok konservatif yapıdadırlar. Bu durum ise, bakteri direncinin gelişimini hızla indükleyen antibiyotiklerin aksine, AMP bileşiklerinin pratikte kullanılmalarının bakterilere karşı etkili kalabileceği şeklinde açıklanmaktadır (Józefiak ve ark., 2016; Józefiak ve Engberg, 2017).

Kitin ve AMP nin bağışıklık sistemi üzerindeki etkileri

İmmunoglobulinler, plazma hücreleri tarafından üretilen glikoprotein molekülleridirler, antikor gibi davranırlar ve antijenlere yanıt olarak sentezlenirler. İmmunoglobulinler, 5 ana sınıfa (IgG, IgM, IgA, IgD, IgE) ayrılırken, kanatlı hayvanlarda ise IgA, IgM ve IgY (=IgG) gruplarına rastlanmaktadır (Carlander ve ark., 1999; Benzertiha ve ark., 2020b).

Józefiak ve ark. (2018), etlik piliçlerin sindirim kanalında olası patojenik bakterilerin inhibisyonunun ve mikrobiyotanın pozitif modülasyonunun, potansiyel olarak salinomisin gibi iyonofor grubu koksidiyostatların etkilerine benzer şekilde sonuçlar ortaya koyan tam yağlı böcek unlarından kaynaklanabileceğini bildirmişlerdir. Ayrıca, Kar ve ark. (2018) kitinin, sekum florasını etkilediği ve ortamda yüksek bütirik asit üretimine sebep olduğunu ifade etmişlerdir. Bütirik asitin ise, bağırsak hücreleri için önemli bir enerji kaynağı olduğu, bağırsak mukozası kan akışını arttırdığı bildirilmiştir. Buna bağlı olarak, doku oksijenasyonunun ve emilimin arttığını öne sürmüşlerdir (Kar ve ark., 2018).

Benzertiha ve ark. (2020b) yürüttükleri çalışmalarında, tam yağlı böcek unlarıyla beslenen muamele gruplarında immünoglobulin sınıflarından IgM ve IgY'nin seviyelerinin azaldığını saptamışlardır, bunun da AMP'ler ve kitin gibi böcek bileşenlerinin antimikrobiyal etkileri ile açıklanabileceğini belirtmişlerdir. Ayrıca, çalışmalarının sonuçları, nispeten küçük tam yağlı böcek unu ilavesinin salinomisine benzer şekilde immünoglobulin seviyelerini azaltabileceğini göstermiştir. IgA, sindirim kanalındaki seromukus sekresyonlarda bol miktarda bulunur, ve sindirim kanalında IgA, birçok bakteri ve virüse karşı ilk savunma hattı olarak görev yapar (Pleass ve ark., 2001). Benzertiha ve ark. (2020b), yürüttükleri her iki çalışmada da, salinomisin ilaveli gruplarda ve tam yağlı böcek unları ile takviye edilmiş gruplarda IgA seviyeleri üzerinde bir etkinin gözlenmemesinin sebebi olarak, hayvanlarda devam eden sindirim kanalı iltihabının olmamasını belirtmişlerdir.

AMP'lerin ise, bağışıklık savunmasının ilk hattında yer aldığı ve farklı mekanizmalar yoluyla enfeksiyöz ajanlara karşı inhibe edici aktiviteye sahip oldukları belirtilmiştir. Bu nedenle, Benzertiha ve ark. (2020b) çalışmalarındaki immünoglobulin seviyelerinin, böceklerin AMP içerikleri ile de ilişkili olabileceğini bildirmişlerdir. Ayrıca, birinci çalışmalarında IgM salgısındaki azalma ile canlı ağırlık artışıdaki ($r=-0,4845$) ve yem tüketimindeki ($r=-0,4986$) artışın, hayvanların sağlık durumuyla ilişkili olabileceğini ilave etmişlerdir. Sonuç olarak ise, etlik piliçlerin diyetine az miktarda (%0,2 ve %0,3) *T. molitor* ve *Z. morio* tam yağlı unlarının ilave edilmesinin, büyüme performansını iyileştirebileceğini ve bağışıklık sistemi özelliklerini değiştirebileceğini saptamışlardır.

Böceklerin, Hayvan Beslemede Yem Hammaddesi ve/veya Yem Katkısı Olarak Kullanımlarının Etkileri

Son yıllarda yapılan çalışmalar ile böceklerin hayvan beslemede alternatif yem kaynağı olabileceği vurgulanmaktadır. Böceklerin besin madde içeriklerinin yanı sıra, hayvan sağlığını olumlu yönde etkileyen ve böylece hayvansal üretimde antibiyotik kullanımını azaltılmasına imkan sağlayacak, değerli bileşiklerin kaynağı olabilecekleri üzerinde durulmaktadır. Yem katkı maddesi olarak böceklerdeki antioksidan peptitler, kitin ve

antimikrobiyal peptitlerinin bağıışıklık sistemini uyarabileceğı ve hayvanlarda bağırsak mikrobiyomunu modüle edebileceğı belirtilmektedir (Gasco ve ark., 2020). Yapılan alıřmalarda bceklerin, probiyotik zellikleri olan bakterileri arttırdığı (Stull ve ark., 2018; De Carvalho ve ark., 2019), anti-inflamatuvar etki gsterdiği, LDL-kolesterol seviyesini dřrdğ, antioksidan enzimlerin aktivitesini arttırdığı (Ahn ve ark., 2014), hipertansiyonu azalttığı (Vercruyssen ve ark., 2005), anti-diyabetik etki gsterdiği saptanmıştır (Jung ve ark., 2010; Han ve ark., 2016; Nongonierma ve FitzGerald, 2017). Kitin ve kitin trevlerinin de bağıışıklık hcrelerini uyarabildiğı ifade edilmektedir. rneğın, karides kabuklarından ekstrakte edilen kitin veya kitosanın yemlere eklenmesinin bağıışıklık sistemini uyardığı ve yosun orfoz *Epinephelus bruneus*’ ta enfeksiyonlara karřı direnci sağıladığı belirlenmiştir (Gasco ve ark., 2018). Ayrıca kitinin prebiyotik etki gstererek, gastrointestinal sağılığı iyileřtirdiğı, bağırsakta yararlı mikrobiyotanın oğalmasını teřvik ettiğı, gıda kaynaklı mikrobiyal hastalık etmenlerinin ve gıda sindirim glklerinin nlenmesine yardımcı olduğı bildirilmiştir (Fernandes ve ark., 2008; Selenius ve ark., 2018; Benzertiha ve ark., 2020b). Yapılan alıřmalarda *Salmonella typhimurium*, *Escherichia coli* ve *Vibrio cholera* gibi patojenik mikroorganizmaların, bağırsaklarda gelişimini azalttığı da tespit edilmiştir (Fernandes ve ark., 2008; Selenius ve ark., 2018). Bunlara ilave olarak, bceklerin yapısında bulunan orta zincirli bir yağı asidi olan laurik asidin (C12:0) anti-viral ve anti-bakteriyel aktiviteye sahip olduğı da belirtilmiştir. Bceklerin bulundukları evreye gre, çerdikleri laurik asit miktarlarında değıřim grlmektedir. Gasco ve ark. (2018), bu yağı asitinin gram pozitif bakterilere karřı da etkili olduğunu bildirmişlerdir.

Bceklerin, çerdikleri besin maddelerinin ve sağılığa yararlı etkilerinin yanı sıra, beslendikleri ortama ve materyale bağılı olarak eksojen ve endojen risk faktrleri tařıyabildikleri de belirtilmiştir. rneğın; doğıal ortamlarından toplanan bceklerin pestisit kalıntısı tařıyan bitki rts veya ekinler ile beslenebilecekleri (Saeed ve ark., 1993; Gao ve ark., 2014; Charlton ve ark., 2015; Houbaken ve ark., 2016; Van der Spiegel, 2016; Poma ve ark., 2017) ya da tkettikleri yemlerin mikotoksin barındırabilecekleri bildirilmiştir. Pestisitler ve mikotoksinler ise, akut ve kronik etkilerinden dolayı sağılığa zararlı olabilirler (Simpanya ve ark., 2000; Braide ve ark., 2011; Musundire ve ark., 2016; Wynants ve ark., 2017; Van der Fels-Klerx ve ark., 2018). Bunun yanı sıra bceklerin, tkettikleri yemlere bağılı olarak anti-besleme faktrleri tařıyabilecekleri de bildirilmiştir. Ayrıca, bazı alıřmalar ile kimi bcek trlerinde anti-besleme faktrlerinden fitat ve tanenler de tespit edilmiştir (Eko ve ark., 2010; Musundire ve ark., 2014). Bunlara ilave olarak, bceklerin evresel faktr ve tkettikleri yemler ile birlikte ağıır metalleri, patojenik mikroorganizmaları ve parazitleri tařıyabildiklerini belirten alıřmalar da bulunmaktadır (Chai ve ark., 2009; Zhang ve ark., 2009; Banjo ve ark., 2010; Schabel ve ark., 2010; Garofalo ve ark., 2017; Vandeweyer ve ark., 2017). Nyangena ve ark. (2020) ise sz edilen tm bu olumsuz etkili olabilecek etmenlerin, bceklerin kızartma, kaynatma, kavurma, kurutma vb. iřlemler grmesi ile ortadan kaldırılabilceğini bildirmişlerdir. AB’nin ynetmeliğinde (2021/1372) de “iřlenmiş bcek unları” řeklinde ifade edilmektedir.

Yapılan bir arařtırmada yemlik olarak kullanılan bcek unlarının (*Tenebrio molitor*), balıkların bağıışıklık dzeyine olan etkileri arařtırılmıştır. alıřma sonucunda larva unu ile beslemenin Kk Avrupa levreklerinde (*Dicentrarchus labrax*) anti-inflamatuvar etkilere sebep koyduğı gzlenmiştir. Bu durum ise; bcek unlarının bağıışıklık sistemi zerindeki etkilerinin, hastalıklara karřı geliřtirilmiş bir dirence dnřme durumunun ortaya konulabilmesi iin bakteriyel veya parazitik faktrleri ieren daha fazla arařtırmaların gerekliliğine dikkat ekmektedir (Henry ve ark., 2018a).

Etlık pililerde yapılan bir alıřmada, hazırlanan bazal yemin zerine tam yağılı bcek larva unları (*Tenebrio molitor* ve *Zophobas morio*) ilave edilmiştir, arařtırmada hayvanların byme performansı ile bazı kan ve bağıışıklık sistemi parametreleri incelenmiştir. alıřma sonucunda larva unlarının %0,2 veya %0,3 oranlarında ilavesinin byme performansını arttırdığı ve bağıışıklık sistemi zelliklerini değıřtirdiğı sonucuna varılmıştır (Benzertiha ve ark., 2020b). Un Kurdu (*Tenebrio molitor*) ile yapılan bařka bir alıřmada ise bağırsak mikrobiyotasındaki *Lactobacillus* ve *Bifidobacterium* bakterilerin canlılığı ve metabolik aktivitesi zerindeki etkisi incelenmiş, bcek ununun probiyotik bakteri canlılığı ve bymesi zerindeki etkileri aısından hibir olumsuz etkisinin saptanmadığı ve kısa zincirli yağı asitleri ile laktat retiminde ise bir artıř olduğı tespit edilmiştir (De Carvalho ve ark., 2019).

Beagle kpekleri zerinde yapılan bir alıřmada %0,1 ve %0,2 dzeyinde diyetlerine Kara asker sineğı larvası ilave edilmiştir. Kara asker sineğı’nin diyetle kullanımının artması ile albmin ve glutatyon peroksidaz (GPx) dzeyleri ykselmiş, tmr nekroz faktr- konsantrasyonu ise lineer olarak azalmıştır. Bu alıřma ile bcek proteinlerinin, tek mideli hayvanlarda antioksidan olarak etki gsterme potansiyeline sahip olabileceğı bildirilmiştir (Lei ve ark., 2019). Henry ve ark. (2018b)’nın yrttğ alıřmada ise, Gkkuřağı alabalığı (*Oncorhynchus mykiss*) diyetlerine %25 ve %50 oranında sarı un kurdu larvalarının (*Tenebrio molitor*) ilave edilmesinin sonucunda, antioksidan bağırsak enzimleri aktivitesinin arttığı ve lipid peroksidasyonunun ise azaldığı tespit edilmiştir. Ayrıca, kanda tripsin inhibisyonunun ve antibakteriyel aktivitenin de hızlı bir řekilde arttığı gzlenmiştir.

Sonuç ve Öneriler

Dünya nüfusunun her geçen yıl artmasının etkisi ile gıda talebinde ve tüketiminde de artış görülmektedir. İnsanların artan tahıl ve bakliyat ihtiyacı sebebiyle, çiftlik hayvanlarının beslenmesinde insan gıdası olarak kullanılan hammaddelerin kullanımlarını azaltmak, sürdürülebilirlik için ön plana çıkmıştır. Bu durum, bilim insanlarını çiftlik hayvanlarının beslenmesi için alternatif yem hammaddeleri arayışına yönlendirmiştir. Yem hammaddesi olarak, çeşitli böcek türlerinin kullanımının sebepleri ve avantajları olarak; Hayvanlar aleminin büyük bir kısmını oluşturmaları, yemden yararlanma oranlarının ve verimliliklerinin yüksek olması, gıda artıklarını değerlendirmeleri ile hem ekonomik hem de ekolojik olarak fayda sağlanması, sınırlı alanlarda fazla miktarlarda üretimlerinin yapılabilmesi, çiftlik hayvanları ile karşılaştırıldığında üretim sürecinin ekoloji üzerindeki etkisinin daha az olması, yüksek miktarda protein, esansiyel aminoasit, esansiyel yağ asitleri içermeleri sayılabilir. Bu nedenlerden dolayı böcek türleri, çiftlik hayvanları için üzerinde durulması gereken bir yem hammaddesi olarak önem kazanmakta ve dikkat çekmektedir. Bunun yanı sıra kanatlı hayvanlar açısından bakıldığında, doğal yaşam ortamlarında böcekleri yediklerini de hayvan refahı ve ihtiyaçları bakımından da göz önünde bulundurmakta fayda bulunmaktadır. Yapılan araştırmalar sonucunda, rasyonlara yem hammaddesi olarak böcek unları veya katkı maddesi olarak böceklerden elde edilen kitin ve AMP ilavelerinin, verim ve immün sistem üzerine olumlu etkileri olduğu ortaya konmuştur. Hayvan yemlerinde büyüme faktörü olarak antibiyotik kullanımının 2006 yılından itibaren yasaklanması ile birlikte gereksinim duyulan bakteriyel rezistansa sebep olmayan, doğal yem katkısı ihtiyacını karşılayabilecekleri düşünülmektedir. Bu sayede hayvanların sağlık ve refahını olumlu yönde etkileyerek, sağlıklı hayvan ve sağlıklı hayvansal gıda elde edilmesi amacına ulaşılmasına yardımcı olabileceği potansiyeline sahiptirler. Böceklerin hayvan beslemede kullanımına dair çalışmalar son yıllarda artış göstermiş olmakla birlikte, etki mekanizmalarını ortaya koymaya yönelik daha çok sayıda araştırmaya ihtiyaç duyulmaktadır.

Economic, Cultural and Environmental Impacts of EXPO`21 HATAY in the Scope of Sustainability

Sertaç Güngör¹, Sabriye Melis Çiçinoğlu²

¹Department of Landscape Architecture, Faculty of Architecture and Design, Selcuk University, Konya, Turkey

²Ph.D. Candidate of Landscape Architecture, Graduate School of Natural and Applied Sciences, Selcuk University, Konya, Turkey

Abstract

EXPO, which is used as the abbreviation of the word 'exposition', which means 'World Exhibition' or 'World's Fair' in English; It is a global event that has been organized around the world since the 19th century and aims to promote the city and country in which it is held in the national and international arena, raise awareness, educate the public, share innovations, produce, support development and encourage cooperation.

Our country participated in this event for the first time with the 1851 London Expo Organization during the Ottoman Empire Period. It was hosted for the first time with the Expo Organization held in Antalya in 2016, and it is the host country for the second time with the Expo organization held in Hatay on April 1, 2022.

Expo 2021 Hatay, whose full name is 'International Horticulture Fair Hatay, Turkey 2021'; It was accredited as a Class B international Expo by the International Association of Horticultural Producers (AIPH) on January 23, 2017 and registered according to the decision of the AIPH Board of Directors.

Within the scope of this study, the economic, cultural and environmental effects of the EXPO'21 Hatay organization, which is a very important tool for the national branding and development of Hatay, were evaluated, and suggestions were made about the correct reuse of the fairgrounds and their sustainability after the organization was over.

Key Words: *Expo, Turkey, Hatay, Sustainability, Landscape Architecture*

EXPO`21 HATAY'ın Sürdürülebilirlik Kapsamında Ekonomik, Kültürel ve Çevresel Etkileri

Özet

İngilizcede 'Dünya Sergisi' ya da 'Dünya Fuarı' anlamlarına gelen 'exposition' sözcüğünün kısaltılmış şekli olarak kullanılan EXPO; dünya genelinde 19. yüzyıldan bu yana düzenlenen, düzenlendiği kenti ve ülkeyi ulusal ve uluslararası arenada tanıtmayı, farkındalığı arttırmayı, halkı eğitmeyi, yenilikleri paylaşmayı, üretmeyi, kalkınmayı desteklemeyi ve işbirliğini teşvik etmeyi amaçlayan küresel bir etkinliktir.

Bu etkinliğe ülkemiz ilk kez Osmanlı Devleti Döneminde 1851 Londra Expo Organizasyonu ile katılmıştır. 2016 yılında Antalya ilinde düzenlenen Expo Organizasyonu ile ilk kez ev sahipliği yapmış olup, 1 Nisan 2022 tarihinde Hatay'da açılışı gerçekleştirilen Expo organizasyonu ile de ikinci kez ev sahibi ülke olarak yer almaktadır.

Tam ismi 'Uluslararası Bahçe Bitkileri Fuarı Hatay, Türkiye 2021' olan, Expo 2021 Hatay; 23 Ocak 2017 tarihinde Uluslararası Bahçe Bitkileri Üreticileri Birliği (International Association of Horticultural Producers / AIPH) tarafından B sınıfı uluslararası Expo olarak akredite edilmiş ve AIPH Yönetim Kurulu kararına göre tescil edilmiştir.

Bu çalışma kapsamında, Hatay'ın ulusal markalaşması ve kalkınması yolunda çok önemli bir araç olan EXPO'21 Hatay organizasyonunun ekonomik, kültürel ve çevresel etkileri değerlendirilmiş olup, organizasyon bittikten sonra da fuar alanlarının doğru bir şekilde yeniden kullanımı ile sürdürülebilir olması konusunda önerilerde bulunulmuştur.

Determination and Evaluation of Field Adequacy by Ankara Göksu Park Users

Sertaç Güngör¹, Elif Nur Doğan²

¹Department of Landscape Architecture, Faculty of Architecture and Design, Selcuk University, Konya, Turkey

²M.Sc. Candidate of Landscape Architecture, Graduate School of Natural and Applied Sciences, Selcuk University, Konya, Turkey

Abstract

Centrally located, one of the biggest city parks of Ankara, people can easily reach in daily use, walking, jogging, sitting, picnic, play, etc. Göksu Park, which provides opportunities for activities such as, is built on the old Susuz pond in Eryaman. The park was opened in 2003. In this study, a 3-stage method was applied to determine and evaluate the area adequacy of the park. In the first stage, the first picture selection was made with the team of landscape architects in the park, using the nominal group technique, among the photographs taken in the area, obtained from the municipality and received the most likes from social media accounts with many followers. In the second stage, the criteria for the evaluation of field adequacy with the Delphi technique were determined in consultation with the faculty members in the Department of Landscape Architecture, Faculty of Agriculture, Ankara University, who were selected as experts on the subject. Then, using the observation and comparison tables, the survey questions were prepared and after the application of the survey to the visitor group and park staff, as the third step, the survey data was based on whether the difference between the observed frequencies (GF) and expected frequencies (BF) was statistically significant with the help of SPSS 25 statistical program. Chi-square independence analysis, which is a test, and linear regression analysis were performed. By counting the frequencies, the relevant photographs will be examined and the relationship between density and field adequacy has been interpreted. With this study, it will contribute to the plans and designs of new projects so that the green areas and parks that people need due to the increasing population and urbanization can be used adequately in the future..

Key Words: *Göksu Park, Field adequacy, Landscape Architecture, City Park, Ankara*

Ankara Göksu Parkının Kullanan Kişiler Tarafından Alan Yeterliliğinin Tespit Edilmesi ve Değerlendirilmesi

Özet

Merkezi konumda yer alan, Ankara'nın en büyük kent parklarından biri olan, insanların günlük kullanım içinde rahatlıkla ulaşabilecekleri, yürüyüş, koşu, oturma, piknik yapma, oyun vb. gibi aktivitelere olanak sağlayan Göksu Parkı, Eryaman'daki eski Susuz göleti üzerine kuruludur. Park, 2003 yılında hizmete açılmıştır. Bu çalışmada parkın alan yeterliliğinin tespit edilmesi ve değerlendirilmesi için 3 aşamalı bir yöntem uygulanmıştır. Birinci aşama, alanda çekilen, belediyeden temin edilen ve çok takipçili sosyal medya hesaplarından en çok beğeni almış fotoğraflar arasından nominal grup tekniği ile parkta bulunan peyzaj mimarları ekibi ile ilk resim seçimi yapılmıştır. İkinci aşama da Delphi tekniği ile alan yeterliliğinin değerlendirilmesindeki kriterlerin konunun uzmanı olarak seçilen Ankara Üniversitesi Ziraat Fakültesi Peyzaj Mimarlığı bölümündeki öğretim üyelerine danışılarak belirlenmiştir. Daha sonra gözlem ve karşılaştırma tabloları kullanılarak, anket soruları hazırlanmış ve anketin ziyaretçi grup ve park çalışanlarına uygulanmasının ardından üçüncü aşama olarak anket verilerinin SPSS 25 istatistik program yardımıyla gözlenen frekanslar (GF) ile beklenen frekanslar (BF) arasındaki farkın istatistiksel olarak anlamlı olup olmadığı temeline dayanan bir test olan Ki-kare bağımsızlık analizi, doğrusal regresyon analizi yapılmıştır. Frekansların sayımı yapılarak ilgili fotoğraflar incelenecek ve yoğunluk ile alan yeterliliği arasındaki ilişki yorumlanmıştır. Yapılan bu çalışma ile artan nüfusa ve kentleşmeye bağlı olarak insanların ihtiyaç duyduğu yeşil alanlar ve parkların gelecekte de yeterli şekilde kullanılabilmesi için yeni projelerin plan ve tasarımlarına katkı sağlanacaktır.

Research on Measuring the Healthy Nutrition Knowledge Levels of Gastronomy Students

Mehmet Cem Beyhan¹, İbrahim Gönen²

¹Department of Gastronomy and Culinary Arts, Nişantaşı University, Institute of Post Graduate Studies, Maslak Campus, İstanbul/ Turkey

²Tourist Guiding Department, Maslak Campus, School of Applied Sciences, Nisantasi University, İstanbul/ Turkey

Abstract

This study was planned and carried out in order to determine the extent of healthy nutrition knowledge of the students of the Gastronomy Department and to make suggestions in terms of Gastronomy education

A total of 196 students from each class of Gastronomy Departments of Universities in İstanbul participated in the research using the Google Form. In addition to the demographic characteristics, nutritional habits, weight and height measurements which has been stated by participants and “YETBİD scale, which is a healthy nutrition knowledge level scale developed for adults has been included in the questionnaire. The data collected during the research were recorded in the IBM SPSS Statistics 25.0 program for analysis, and appropriate statistical analyzes were made accordingly. In the research, 38.8% of the participants were male, and 61.1% were female. 86.7% of the participants stated that they had received education in healthy nutrition, and it was detected that 50.0% of them received this education within the scope of the course in the curriculum of the department. Body Mass Indexes calculated from the height and weight values stated by the participants were determined as 25.3 ± 4.74 and 23.1 ± 4.35 kg/m² for men and women, respectively ($p=0.000$). Male and female individuals got 52.2 ± 7.00 and 53.6 ± 7.18 points out of 80 full points, which is the YETBİD scale Basic Nutrition Score ($p>0.05$). It was also found that they scored an average of 38.5 ± 6.23 points out of 48 full points on YETBİD scale of Food Preference score. There is no significant difference between the mean scores of Basic Nutrition and Food Preferences and their marital status, class of education, place of residence ($p>0.05$). The average food preference score of individuals who received healthy nutrition education was higher than the average score of individuals who did not receive nutrition education ($p=0.009$). In line with the data obtained from this research, it has been determined that the students studying in the Gastronomy departments, including the grades when they have the education, mostly have a moderate level of healthy nutrition knowledge. Considering how the awareness and practice of healthy nutrition marks the significance for the graduates who will continue this profession in the future, it has been understood that it is extremely important to include both theoretical and practical courses such as "Healthy Nutrition, Nutrition Principles and Applications" in the curricula of Gastronomy Departments.

Keywords: *Gastronomy, Healthy nutrition, YETBİD, Body Mass Index, Nutrition Preference*

Gastronomi Öğrencilerinin Sağlıklı Beslenme Bilgi Düzeylerinin Araştırılması

Özet

Bu çalışma Gastronomi Bölümü Öğrencilerinin sağlıklı beslenme bilgi düzeylerini saptamak ve Gastronomi eğitimi açısından bu konuda öneriler getirmek amacıyla planlanmış ve yürütülmüştür. Araştırmaya İstanbul'da bulunan Üniversitelerin Gastronomi Bölümlerinin her sınıfından toplam 196 öğrenci Google Form ile katılmıştır. Araştırmada kullanılan soru formu katılımcıların demografik özellikleri, beslenme alışkanlıkları, beyana dayalı ağırlık ve boy ölçümlerinin yanı sıra, yetişkinler için geliştirilmiş sağlıklı beslenme bilgi düzeyi ölçeği olan “YETBİD” ölçeği uygulanmıştır. Araştırma sırasında toplanan veriler IBM SPSS Statistics 22 programına analizi yapılması için kaydedilmiş, uygun istatistiksel analizleri yapılmıştır. Araştırmada katılımcıların %38,8'inin erkek, %61,1'inin kadındır. Bunların %86,7 gibi bir çoğunluğu sağlıklı beslenme eğitimi aldığını belirtmiş, bunların da %42,3 kadarının bu eğitimi, bölüm müfredatında bulunan ders kapsamında aldıkları saptanmıştır. Katılımcıların beyana dayalı olarak belirttikleri boy ve ağırlık değerlerinden hesaplanan Beden Kütle İndeksleri erkek ve kadınlarda sırasıyla $25,3 \pm 4,74$ ve $23,1 \pm 4,35$ kg/m² olarak belirlenmiştir ($p=0,000$). Erkek ve kadın bireylerin, YETBİD ölçeği Temel Beslenme Puanı olan 80 tam puan üzerinden $52,2 \pm 7,00$ ve $53,6 \pm 7,18$ puan aldıkları ($p>0,05$) tespit edilmiş olup, YETBİD ölçeği Besin Tercihi Puanı olan 48 tam puan üzerinden de ortalama $38,5 \pm 6,23$ puan aldıkları bulunmuştur. Bu puanlar puan sınıflamasında çoğunlukla orta düzeydedir. Temel Beslenme ve Besin Tercihi puan ortalamaları ile, medeni durum, öğrenim görülen sınıf ve yaşanan yere göre anlamlı bir farklılık yoktur ($p>0,05$). Sağlıklı beslenme eğitimi alan bireylerin besin tercihi puan ortalaması, beslenme eğitimi almayan bireylerin puan ortalamasına göre daha yüksektir ($p=0,009$). Bu araştırmadan elde edilen veriler doğrultusunda eğitim görülen sınıf da dahil, Gastronomi bölümlerinde eğitim gören öğrencilerin çoğunlukla orta düzeyde bir sağlıklı beslenme bilgisine sahip olduğu, sağlıklı beslenme bilinci ve uygulamasının, ileride bu mesleği sürdürecek mezunlar için ne denli önemli olduğu düşünüldüğünde, Gastronomi Bölümlerinin müfredatlarında “Sağlıklı Beslenme, Beslenme İlkeleri ve Uygulamaları” gibi teorik ve pratik derslerin yer almasının son derece önemli olduğu anlaşılmıştır.

Anahtar Kelimeler: *Gastronomi, Sağlıklı beslenme, YETBİD, Beden kütle İndeksi, Besin tercihi*

Giriş

Gastronomi eğitimi birçok bilim dalı ile multidisipliner bir ilişki içerisinde (Bodur 2015). Günümüzde Gastronomi bilimi ile besin, sağlıklı beslenme/sağlıklı mutfak uygulamaları önem kazanmıştır. Bu önem toplum sağlığı açısından sağlıklı beslenmenin son derece temel faktör olmasından da kaynaklanmaktadır. Günümüzde tüketiciler de yedikleri yiyecek ve içeceklerde doyuruculuk, lezzet ve görünümün yanı sıra sağlıklı ve güvenilir olmasına da önem vermektedirler (Bilici 2008, Baysal 2011, Whang 2016, Sezen 2018, Samancı 2020).

Sağlıklı beslenme, sağlıklı çevre ve sürdürülebilir uygulamalar kapsamında ABD’de Boston’da 1990 yılında restoranlara bu açıdan sertifikasyon programları düzenlemek amacıyla “Green Restaurant Association” adında bir birlik/organizasyon/dernek kurulmuştur (Gruia et al 2018).

Geleceğin yetişkinleri olacak olan üniversite gençlerinin sağlıklı beslenme bilincini ve beslenme alışkanlıklarını araştıran çalışmalarda, gençlerin çoğunlukla sağlıklı beslenme bilgisi ve alışkanlıklar yönünden yetersiz oldukları ileri sürülmüştür. Bu durum toplum sağlığı açısından önemli olduğu kadar, geleceğin şefleri konumunda olacak olan gastronomi alanında yetişen üniversite öğrencileri açısından çok daha önem arz etmektedir. Zira günümüzde Gastronomi alanında “sağlıklı mutfak, sağlıklı beslenme” eğilimi giderek ön plana çıkmaktadır (Tomas 2021).

Üniversite öğrencilerinde sağlıklı beslenme bilgisi ve alışkanlıkları üzerine yapılmış birçok araştırma olmasına rağmen, geleceğin şefleri konumunda olacak olan Gastronomi öğrencileri ile ilgili bir çalışmaya rastlanmamıştır. Buradan yola çıkarak ve “Gastronomi Öğrencilerinin Sağlıklı Beslenme Bilgi Düzeylerinin Araştırılması” üzerine çalışma yapma ihtiyacını da göz önünde bulundurarak, bu araştırma planlanmış ve yürütülmüştür

Materyal ve Yöntem

Bu araştırma üniversitelerin Gastronomi Bölümü öğrencilerinin sağlıklı beslenme bilgi düzeylerini belirlemek amacıyla yapılmış, nitel bir çalışmadır.

Araştırmının evrenini araştırma olanağı bulunan, farklı üniversitelerin Gastronomi bölümünde 2021-2022 eğitim öğretim döneminde eğitim gören öğrenciler oluşturmıştır. Örneklem büyüklüğü Power Analiziyle 192 olarak saptanmış olup, toplam 196 öğrencide araştırma tamamlanmıştır. Örneklem büyüklüğü hesabında lisanslı MedCalc istatistik paket programı 2021 yılı sürümü kullanılmıştır. Katılımın gönüllülük esasına göre yapılmasına özen gösterilmiştir.

Veri toplama aracı olarak 2 bölümden oluşan anket uygulanmıştır. Anket formu ve ölçek katılımcılara Covid-19 pandemi sürecinin halen devam ediyor olması ve yüz yüze görüşme olanaklarının sınırlı olması nedeniyle internet ortamında, daha önce oluşturulan Google Form aracılığı ile uygulanmıştır. Anketin ilk bölümünde araştırma kapsamına alınan bireylerin, demografik özellikleri, sigara, alkol alışkanlıkları, yaşadıkları yer, antropometrik ölçümleri (boy/cm, kilo/kg.) ve beslenme düzenleri sorgulanmıştır.

Beyana dayalı olarak öğrencilerden alınan boy (cm), ve ağırlık (kg.) verilerinden yararlanılarak, bireyin beslenme durumunun pratikte kolay saptanma yollarından birisi olan “Beden Kütle İndeksleri” (BKİ) hesaplanmıştır. Kilogram cinsinden ölçülen beden ağırlığının santimetre cinsinden ölçülen boyun karesine bölünmesi ile elde edilen BKİ’nin 18,5-24,9 arasında olması normal iken; 25-29,9 arası kilolu, 30 ve üstündeki değerler ise obez olarak kabul edilmiştir (WHO 2001).

Anketin ikinci bölümü öğrencilerin beslenme bilgi düzeylerini ölçen ve kısaca “YETBİD” ölçeği adı verilen “Yetişkinler İçin Beslenme Bilgi Düzeyi” ölçeğinden oluşmuştur. Öğrencilerin sağlıklı beslenme konusundaki bilgi düzeylerini ölçmek amacıyla kullanılan bu ölçek, Batmaz (2018) tarafından geliştirilmiş ve geçerlik güvenilirlik çalışması yapılmış bir ölçektir. Bu ölçek “Temel Beslenme Besin Sağlığı” başlığı altında “20” ve “Besin Tercihi” başlığı altında 12 olmak üzere toplam “32” sorunun yanı sıra, 2 adet de değerlendirme sorusundan oluşmaktadır.

Kullanılan ölçekten alınan puanlar “Tablo 1” deki ölçütlere göre değerlendirilmiştir (Batzmaz 2018)

Elde edilen veriler, IBM Statistical Package for the Social Sciences (SPSS) 22 sürüm programının veri tabanına aktarılmıştır. Anketlerden elde edilen sürekli değişkenler ortalama ($\bar{x}$), standart sapma (SD), alt-üst ile kesikli değişkenler sayı (n) ve yüzde (%) olarak ifade edilmiştir. Verilerin normal dağılıma uygunluğu Kolmogorov-Smirnov testi ile analiz edilmiştir. Kategorik değişkenlerde gruplar arasındaki ilişkinin analizi “ki kare testi”, normal dağılıma uygun olmayan verilerde iki grup arasındaki anlamlılığın analizi için “Mann Whitney U” testi, ikiden fazla grup arasındaki anlamlılığın analizi için “Kruskal Wallis” testi” kullanılmıştır. Sayısal ölçümlerin arasındaki ilişkinin analizi için normal dağılıma uygun olan verilerde “Pearson Correlation” testi” kullanılmıştır. Testlerde istatistiksel anlamlılık düzeyi olarak $p < 0,05$ alınmıştır.

Bulgular ve Tartışma

Gastronomi ve Mutfak Sanatları lisans öğrencilerinin, sağlıklı beslenme bilgi düzeylerinin belirlenmesi amacıyla planlanan çalışmanın verileri, analiz edilmiş ve bu bölümdeki tablolarda sunulmuştur.

Tablo 1. Katılımcıların Cinsiyete Göre Demografik Özellikleri (n:196)

	Erkek		Kadın		Toplam		P

**Mann Whitney U Testi , +Fisher's Exact Testi, •Ki Kare Testi

Tablo 2. Beslenme bilgi düzeyi ölçeğinin değerlendirilme ölçütleri

Puan Aralığı	Sınıflandırma
Temel Beslenme (toplam puan 80)	
<45	Kötü Orta
45-55	İyi
56-65	Çok iyi
>65	
Besin Tercihi (toplam puan 48)	
<30	Kötü Orta
30-36	İyi
37-42	Çok iyi
>42	

(Batmaz 2018)

Tablo 1’de görüldüğü gibi, çalışmaya katılan katılımcıların %38,8’i erkek, %61,2’i kadındır ve yaş ortalamaları sırasıyla 22,6 $\pm$ 6,58 ve 22,3 $\pm$ 5,73’dir; çoğunluğunu kadın öğrenciler ile 1. sınıf öğrencileri (%40,3) oluşturmuştur. Öğrencilerin sınıflara ve cinsiyete göre dağılımları arasında istatistiksel olarak anlamlı bir fark bulunamamıştır (p>0.05). Evde yalnız ve arkadaşıyla yaşama oranı erkeklerde daha yüksek orandadır (p<0.05).

Birinci sınıftan dördüncü sınıfa kadar üniversite öğrencileri üzerinde yapılan diğer çalışmalarda da, öğrencilerin yaş ortalamaları bizim çalışmamızla benzerlik göstermektedir (Tütüncü ve Karaismailoğlu 2013, Erçim 2014, Ülker 2021).

Güldiken ve Özekicioğlu (2004), öğrencilerin barınma yerleri ve sorunları konusunda yaptıkları bir çalışmada, kiralık evde barınan öğrencilerin, kiraların yüksek olması, evde kalan öğrenci sayısının 3’ten fazla olması nedeniyle yeterince ders çalışma imkânlarının olmadığını; devlet yurtlarında kalan öğrencilerin de temizlik, TV izleyememe, ders çalışamama ve giriş-çıkış saatleri gibi bazı sorunlarının olduğunu saptamışlardır. Bizim çalışmamızda aile yanında yaşayanların oranının kadın öğrencilerde erkeklere göre daha fazla olması (p<0.05), erkek öğrencilerin de çok yüksek olmamakla birlikte, yaklaşık dörtte birinin evde yalnız yaşıyor olması, üniversite öğrencilerinin barınmadan kaynaklanabilecek olası sorunları yaşamamaları açısından olumludur.

Tablo 2’de, katılımcıların cinsiyete göre sağlıklı beslenme eğitimi ile ilgili bilgilerinin dağılımı gösterilmiştir. Öğrencilerin %86,7’sinin sağlıklı beslenme eğitimi aldığı, bu eğitimin de bireylerin çoğunluğunca (%42,3) konu ile ilgili ders kapsamında olduğunun belirtildiği görülmektedir.

Kadınlarda daha yüksek oranda olmak üzere bireylerin %69,9’u, temel beslenme eğitimi almak istediklerini belirtmişlerdir (p<0.05).

Tablo 2. Katılımcıların Cinsiyete Göre Sağlıklı Beslenme Eğitimi ile İlgili Bilgileri

	Erkek		Kadın		Toplam		p
	n (76)	% 38,8	n (120)	% 61,2	n (196)	% (100)	
Sağlıklı beslenme ile ilgili bilgi alma durumu							
Evet	66	86,8	104	86,7	170	86,7	0,972*
Hayır	10	13,2	16	13,3	26	13,3	
Sağlıklı beslenme bilgisinin edinildiği yer							
Konuyla ilgili ders kapsamında	38	50,0	45	37,5	83	42,3	0,182*
Diyetisyenden	11	14,5	24	20,0	35	17,9	
Diğer sağlık personelinin	4	5,3	3	2,5	7	3,6	
Basın yayın organlarından	6	7,9	20	16,7	26	13,3	
Sosyal medya	7	9,2	12	10,0	19	9,7	
Temel beslenme dersi almayı isteme durumu							
Evet	44	57,9	93	77,5	137	69,9	0,004 ⁺
Hayır	32	42,1	27	22,5	59	30,1	
Toplam	76	100	120	100	196	100	

*Ki Kare Testi

Sağlıksız beslenme alışkanlığının temelini, genellikle kişilerin yetersiz beslenme bilgisine sahip olunması oluşturmaktadır. Yeterli besin ve ekonomik olanaklar olsa bile, beslenme bilgisi yetersizliği bireyin yanlış beslenme alışkanlıklarına sahip olmasına neden olmaktadır (Şanlıer, Konaklıoğlu, ve Güçer, 2009). Bireyde beslenme bilgisinin yetersiz olması, onda yanlış beslenme tutum ve davranışlarına yol açmakta, bu alışkanlıkların giderek yerleşmesi de bu yanlış alışkanlıkların düzeltilmesi olasılığını da azaltmaktadır (Çekal, 2008).

Çalışmamızda öğrencilerin beslenme konusunda, çoğunlukla bilgi sahibi olduklarını belirtmeleri olumlu bir bulgudur. Buna rağmen, bu bilginin ancak yarıya yakınının gördükleri ders kapsamında öğrenildiğinin belirtilmesi, yiyecek içeceklerle ilgili bir bilim dalı olan Gastronomi Bilim alanında eğitim gören öğrencilerde, bu oranın daha yüksek oranda olması beklenen ve istenen bir durum olması açısından önemlidir.

Tablo 3' te katılımcıların BKİ sınıflamasına göre dağılımları verilmiştir.

Tablo 3. Katılımcıların BKİ sınıflamasına göre dağılımı

	Erkek		Kadın		Toplam		p*
	n	%	n	%	n	%	
BKİ sınıflandırması							
Zayıf (< 18,5 9 kg/m ²)	4	5,3	12	10,0	16	8,2	0,019
Normal (18,5-24,9 kg/m ²)	36	47,4	77	64,2	113	57,7	
Hafif Şişman (24,9-29,9 kg/m ²)	23	30,3	19	15,8	42	21,4	
Obez (≥30 kg/m ²)	13	17,1	12	10,0	25	12,8	

*Ki kare testi

Tablodan da görüldüğü gibi, araştırmaya katılan bireylerin %57,7'si normal (E: %47,4, K: %64,2) BKİ sınıfında yer almaktadır. Hafif şişman ve obez erkeklerin oranı sırasıyla; %30,3 ve %17,1 olarak belirlenmiştir. Kadınlarda ise bu oranlar sırasıyla; %15,8 ve %10,0 olarak saptanmıştır. Cinsiyet ve BKİ sınıflaması arasında istatistiksel olarak anlamlı bir fark olduğu saptanmıştır (p<0.05).

Pamukkale Üniversitesi öğrencileri üzerinde yapılan bir çalışmada, BKİ sınıflandırmalarına göre öğrencilerin; normal ağırlık sınıflamasında olanların %71,8 olarak, bizim çalışmamızdakinden daha yüksek bulunmuştur (Ülker 2021). Bu sonuç yiyecek içeceklerle ilgili bir bölüm olan Gastronomi Bölümlerinde eğitim gören öğrencilerin beden ağırlığı ile ilgili farkındalıklarının daha yüksek düzeyde olması gerektiğini düşündürmektedir.

TBSA 2017 verilerinde (TBSA 2019) ve ülkemizde gerçekleştirilen diğer ulusal çalışmalarda ise, obezite sınıflamasında bizim çalışmamızdan daha yüksek oranlarda BKİ değerleri ve şişmanlık görülürken, bizim çalışmamızın aksine kadınlarda şişmanlık oranının erkeklerle göre daha yüksek oranda olduğu saptanmıştır (Dinççağ ve ark., 2017, TBSA 2019).

Bu durum, gastronomi öğrencilerinin vücut ağırlığı yönünden farkındalıklarının, toplumun diğer kesimlerinden daha yüksek düzeyde olduğunu göstermektedir. Tablo 4' te cinsiyete göre öğrencilerin YETBİD ölçeğinden aldıkları puan sınıflamasına göre dağılımları görülmektedir.

Tablo 4. Katılımcıların Cinsiyete Göre YETBİD Ölçeğinden Aldıkları Toplam Puan Sınıflaması

	Erkek		Kadın		Toplam		p
	n (76)	% 38,8	n 120	% (61,2)	n 196	% 100	
Temel Beslenme (toplam puan 80)							0,111*
Kötü (<45 puan)	7	9,2	12	10,0	19	9,7	
Orta (45-55 puan)	50	65,8	59	49,2	109	55,6	
İyi (56-65 puan)	17	22,4	41	34,2	58	29,6	
Çok iyi (>65 puan)	2	2,6	8	6,7	10	5,1	
Besin Tercihi (toplam puan 48)							0,464*
Kötü (<30 puan)	5	6,6	8	6,7	13	6,6	
Orta (30-36 puan)	26	34,2	30	25,0	56	28,6	
İyi (37-42 puan)	22	28,9	46	38,3	68	34,7	
Çok iyi (>42 puan)	23	30,3	36	30,0	59	30,1	

*Ki kare testi

YETBİD ölçeği Temel Beslenme puan sınıflaması kötü, orta, iyi ve çok iyi olan bireylerin oranı sırasıyla; %9,7, %55,6 %29,6 ve %5,1 olarak belirlenmiştir. Cinsiyet ve Temel Beslenme puan sınıflaması arasında anlamlı bir fark saptanamamıştır ($p>0,05$).

Katılımcıların, Besin tercihi puanı; kötü, orta, iyi ve çok iyi olan bireylerin oranı sırasıyla; %6,6, %28,6, %34,7 ve %30,1 olarak belirlenmiştir. Cinsiyet ve Temel Beslenme puanları sınıflaması ile, Besin Tercihi puan sınıflaması arasında anlamlı bir fark bulunamamıştır ($p>0,05$). Gastronomi öğrencilerinden her iki cinsten de YETBİD puanları, puan sınıflaması açısından orta düzeyde bulunmuştur.

Pamukkale Üniversitesinin çeşitli bölümlerinden öğrencilerin dahil edildiği bir çalışmada, bizim çalışmamızda uygulamış olduğumuz YETBİD testi öğrencilere uygulanmış, temel beslenme bölümünde kadın ve erkek öğrencilerin bilgi seviyeleri arasında anlamlı bir fark bulunmazken ($p=0,085$); besin tercihi bölümünde anlamlı fark olduğu ($p=0,002$) saptanmış, kadın öğrencilerin bilgi düzeylerinin erkek öğrencilerinkinden daha yüksek olduğu belirlenmiştir (Ülker 2021). Ülker'in yaptığı bu çalışmada YETBİD puanlarının her iki cinsten de düzeyinin, bizim çalışmamızdan daha yüksek olması, yiyecek içeceklerle ilgili eğitim alan gastronomi öğrencileri açısından düşündürücüdür.

Katılımcıların demografik özelliklerine göre YETBİD ölçeği toplam puan ortalaması Tablo 5' te verilmiştir.

Tablo 5. Katılımcıların Demografik Özelliklerine Göre YETBİD Ölçeği Toplam Puan (80) Ortalaması

*Man Whitney U Testi, *Kruskal-Wallis Testi

Bizim çalışmamıza benzer şekilde beslenme bilgi düzeyi ile çeşitli değişkenler arasındaki ilişkinin incelendiği, Tütüncü ve Karaismailoğlu'nun (2013) Sağlık Yüksek Okulu Öğrencilerinde yaptığı bir çalışmada, öğrencilerin cinsiyet, sınıf, beden kütle indeksi durumuna göre beslenme bilgi puanları arasında farklılık olmadığı bulunmuştur ($p>0,05$). Beslenme eğitimi alma durumunun, beslenme bilgi puanını olumlu yönde etkilediğini gösteren çalışmalar bizim çalışmamızın sonuçlarını destekler niteliktedir. (Şimşek 1991, Karayormuk 2002, Güler 2003, Erten 2006, Miller et al. 2015, Koldaş 2017). Nitekim Kızıltan (2000) bu konuda, beslenme eğitimi alan öğrencilerle almayanlar arasındaki farkı gösteren bir çalışma yapmıştır. Üniversite öğrencilerinin beslenme bilgi düzeyi ve beslenme eğitiminin, beslenme durumuna etkisini inceleyen bu çalışmada, BKİ'lerine göre beslenme eğitimi öncesi ve sonrası kız öğrencilerin %24,3'ünün zayıf, erkeklerin ise %14,3'ünün şişman olduklarını saptamıştır. Bu çalışmada, sağlıklı beslenme eğitimi sonrasında, şişman kız ve erkek öğrencilerin BKİ değerlerinde önemli bir azalma olmasının, konu ile ilgili verilen eğitimin ne denli etkili olduğunu göstermesi açısından önemli bir sonuç olarak ileri sürülmüştür.

Çalışmamızdan ortaya çıkan veriler doğrultusunda, özellikle eğitim alanı yiyecek içeceklerle ilgili bir alan olan; yiyecek ve içeceklerle, dolayısıyla iyi yemek yeme kavramını odak noktası alan Gastronomi Bölümlerinde öğrenim gören gastronomi öğrencilerinin, sağlıklı beslenme bilgi ve beceri düzeylerinin daha üst düzeye çıkarılması gerekmektedir. Bunun için müfredatlara temel beslenme, Beslenme İlkeleri vb. derslerin her sınıfta zorunlu ve/veya seçmeli derler olarak eklenmesi, gastronomi mezunlarının, hem topluma bu yönden hizmet verecek meslek mensupları olmaları, hem de topluma rol model olmaları açısından ayrı bir önem taşımaktadır.

Abstract

This study was performed to determine the effect of egg weight (heavy and light) and hatching system (house and hatcher) on hatch time, hatchability and some gosling quality traits. A total of 389 eggs (fertile of candling) from 2-year-old Turkish Native Goose were used in the study. Before the incubation process, all eggs were individually numbered and weighed. Eggs were divided into light (<160 g) and heavy (≥160 g) eggs according to average weight (160 g), and these eggs were placed in similar numbers in two hatching system. Pip time was delayed for about 7 h and 5 h in heavy and house eggs compared to light and hatcher, respectively. With regard to hatch time, it was calculated approximately 12 h and 8 h delay for the eggs in the heavy and house compared to the light and hatcher, respectively. Weight and length of goslings that hatched from heavy eggs were higher than those that hatched from light eggs. The activity and navel score of goslings in the house and hatcher systems were 3.38, 5.59 and 9.54, 11.06, respectively, at 32 d. The study results showed that the pip and hatch-time was delayed in heavy and house system eggs. It has been determined that the goslings hatched from heavy eggs were heavier and longer. House hatching system also negatively affected the activity and navel score of goslings.

Key Words: *Egg weight, Gosling quality, Hatchability, Hatching system, Pip time*

Türk Kazlarında Yumurta Ağırlığı ve Çıkım Sisteminin Çıkış Zamanı, Kuluçka Randımanı ve Palaz Kalite Özellikleri Üzerine Etkisi

Özet

Bu çalışma, yumurta ağırlığı (ağır-hafif) ve çıkım sisteminin (çıkım makinesi-kümes) çıkış zamanı, kuluçka randımanı ve bazı palaz kalite özellikleri üzerine etkilerini belirlemek amacıyla yürütülmüştür. İki yaşlı Yerli Türk kazlarından elde edilen toplam 389 yumurta (lamba döllülüğü) kullanılmıştır. Kuluçka öncesinde tüm yumurtalar bireysel olarak numaralandırılıp tartılmıştır. Ortalama yumurta ağırlığına göre (160 g) yumurtalar hafif (<160 g) ve ağır (≥160 g) olmak üzere iki gruba ayrılmıştır ve çıkım dönemi benzer sayıda yumurtalar iki çıkım sistemine bölünmüştür. Pip zamanı ağır yumurta ve kümes çıkımında hafif ve makine çıkımına göre sırasıyla 7 ve 5 saat gecikmiştir. Çıkış zamanı da benzer şekilde 12 ve 8 saat gecikmiştir. Ağır yumurtalardan çıkan palazların ağırlık ve uzunlukları hafif yumurtalardan çıkanlara kıyasla daha yüksek bulunmuştur. Kuluçka bitiminde (32. gün) palazların aktivite ve göbek skorları kümes ve makine çıkım sistemlerinde sırasıyla 3.38, 5.59 ve 9.54, 11.06 olarak hesaplanmıştır. Çalışma sonuçlarına göre ağır yumurta ve kümes çıkım sisteminde pip ve çıkış zamanı gecikmiştir. Ağır yumurtalardan daha ağır ve uzun palazlar elde edilmiş ve ayrıca kümes çıkım sistemi palaz kalite özelliklerini (aktivite ve göbek skoru) olumsuz etkilemiştir.

Anahtar Kelimeler: *Yumurta Ağırlığı, Palaz Kalite, Kuluçka Randımanı, Çıkım Sistemi, Pip Zamanı*

Ukraine – Russian Conflict Creates a Series Food (Grain) Security Threat for Turkish Agriculture/Economy and Vulnerability Evaluations on Innovated Per Adult Human Unit Method (PAHUM) vs. Per Capita

Sümer Haşimoğlu¹, İbrahim Ak², Metin GÜldaş³, Nizamettin Şenköylü⁴

Abstract

There's no doubt that the war in Ukraine is having a tremendous toll on civilians. Since 24th of February, after Russia's horrific invasion of Ukraine, we're seeing the acute impact on food insecurity for Ukrainians as they are forced to hide or flee their homes. And the emerging signs of the impacts on global food insecurity are becoming more evident. Take wheat, for example: Russia is the world's largest wheat exporter; together, according to U.N Food and Agriculture Organization Ukraine and Russia account for 14 percent of the global supply of wheat. Turkey imports more than one-third of its grain from those two nations. And that the grain poor nations (Middle East and North African countries) are seeing its worst food crisis in the past decade and millions of people are going hungry. In addition to devastating short-term increases in hunger, the long-term impacts of the war on food security and the global food supply are echoing around the globe. Most of the economists and politicians indicate that global prices, already on the rise, are only going to continue to spike as the war interrupts planting and harvesting seasons, affects access to fuels and ports, and reduces labour availability especially in Ukraine and to some extent in Russia. Russia's attacks on Ukraine the high wheat trade volume with these two countries are shown as the main reason for this problem. While Turkey meets 78% of its wheat import from Russia and Ukraine, the war between the two countries causes a crisis not only in wheat market also in barley that is used as livestock feed and for the brewery sector. As a matter of fact, wheat prices saw the highest level since 2012, when Russia started to invade Ukraine. We suggest evaluations of major foodstuff (cereal, oil and other foodstuffs) made on innovated Per Adult Human Unit Method PAHUM = Age and gender corrected PC^{agc} (Copyright©1989 – Hasimoglu-USA) instead of error bound PC will be more realistic because the PAHUM considers the age and gender differences of the target populations, but the PC used as a UNIT does not.

Key words: Grain, cereal, Per Adult Human Unit Method, Per Capita, Food consumption

Opportunity Cost and Hindrances to Climate Adaptation among Cassava Farmers in Southwest, Nigeria: A Panacea for Food Security

Adewale Isaac Olutumise^{1*}, Babatunde Peter Ekundayo², And Olanrewaju Olaniyi Omosehin²

¹Department of Agricultural Economics, Adekunle Ajasin University, Akungba-Akoko, Ondo State, Niheria

²Department of Agricultural and Resource Economics, Federal University of Technology, Akure, Ondo State, Nigeria

Abstract

This study analyses adaptation to climate change among cassava farmers in Southwest Nigeria. The primary data used for this study were collected through a well-structured questionnaire and Focus Group Discussion sessions (FGDs). The analytical tools used were descriptive statistics, paired samples test and exponential multiple regression. The results showed that majority (72%) of the sampled respondents claimed that temperature has been on increase over the years with 57%, 80% and 80% of the sampled respondents from Ondo, Ogun and Oyo States, respectively. Results also showed that about 56% of them perceived that rainfall has been decreasing over the years with about 63% and 69% of the sampled respondents from Ondo and Ogun States respectively. About 55% of the respondents in Oyo State perceived that rainfall has been increasing over the years. Analysis also revealed that majority (55%) of the sampled cassava farmers employed: Planting Different Varieties and Use of Agrochemicals as their main adaptation strategies. The results revealed that inadequate funds and shortage of labour were the major constraints to adaption in the study area. The results of opportunity cost on net revenue and costs using paired samples test revealed that cassava farmers derived and perceived utility and the net benefit from using adaptation measures than when it is not used. The result of exponential multiple regression showed age, experience, family size, farm size and temperature were the main determinants of net revenue in the area. The study, therefore, suggests the costs of adaptation resources should be subsidized by the Government at affordable prices to the farmers.

Key Words: *adaptation, climate change, farmers, perceptions, opportunity cost, Nigeria*

Introduction

Achieving the goal of food security by reducing the number of undernourished people has been a major challenge to the Nigeria's government and the world at large (FAO, 2016). Despite the advances in food production and technologies that could lead to adequate food at a reduced cost (Hwang et al., 2005), the ubiquitous role of climate change has been a major challenge of achieving food security due to the incidence of high temperature, erratic rainfall regimes, coupled with low adoption of modern technologies (IPCC 2007; World Bank, 2010; Issahaku and Abdulai, 2019). Nigeria and other developing countries' development prospects are closely linked to climate and this makes them the most vulnerable to the negative effects of climate change, as the regions heavy reliance on rain-fed agriculture (Tol, 2018; Issahaku and Abdulai, 2019). Due to the susceptibility of Nigeria's agriculture to the vagaries of climate change, food production has drastically decreased with negative profits over the years (Oyebola et al., 2018). The country faces varying degrees of climate risk such as rising temperature, changing rainfall

pattern, distribution and volume, and extreme climate events (BNRCC, 2011; Onyeneke et al., 2019). These risks affect the production of food crops in the country and also threaten the objective of meeting the food needs of over 200 million of Nigerians.

Again, diverse ecological problems being observed in the country have been directly linked to continuous climate change (Adefolalu, 2007; Fellmann, 2018). Erosions caused by excessive rainfall, as an example, pose danger to crops and farmlands. According to Nhemachera & Hassan (2007), in a bid to mitigate the negative impacts of these climatic conditions, cassava farmers, like other crop farmers, adopt certain adaptation methods which include the planting of new crop varieties and stocking improved livestock species that are better suited to drier conditions, irrigation, crop diversification, adoption of mixed crop and mixed farming systems and changing planting dates. The outcomes of these adaptation measures have had little or no effect on food availability as the cost associated with these adaptation measures (especially in the case of small holder farmers with weak adaptive capacity) could be a major factor for non-impressive yield. Intergovernmental Panel on Climate Change [IPCC] (2014) likened 'adaptation' to adjustment in natural or human systems in response to actual or expected climate stimuli or their effects which moderate harm or exploits beneficial opportunities. Cassava is of interest in this study because the crop is multipurpose and could be described as 'hunger breaker' as it plays a key role in poverty alleviation, value-addition, job creation and revenue generation.

Studies on adaptation strategies from Uddin, Wolfgang, and Jason (2014); Hoa., Loi,Phuong and Tuan (2017); Muzamhind, Mtabhen , Jiri, Mwakiwa, Hanyani-Mlambo (2015); Ojo and Baiyegunhi (2018); Alhassan et al.(2018) employ Logistic and OLS regression models to address factors influencing farmers' decisions to adopt climate change adaptation measures; perceptions of the farmers on climate change effects and the adaptation

strategies employed by the farmers. None of these studies addresses cost-benefit analysis on adaptation strategies. This study introduces the concept of opportunity cost (OC) in addressing cost-benefit analysis of adapting to climate change effects with a focus on the cassava farmers. Findings from this research are expected to aid the understanding of farmers' responses and adaptation strategies to climatic variation, help in designing appropriate policy framework that will enhance adaptive and sustainable coping strategies as well as food security. In filling this gap, the study empirically addressed the following specific objectives which are to:

- i. ascertain the awareness of the farmers about climate change;
- ii. examine the perception of the farmers about the changes in climate;
- iii. identify the main adaptation strategies used by the farmers;
- iv. describe the main hindrances to adaptation to climate change in the area;
- v. estimate the opportunity cost of adopting adaptation strategies for inputs and output outcomes; and
- vi. determine the effect of climate change adaptation on the net revenue of the farmers.

Materials and Methods

This study was conducted in Southwest, Nigeria comprising Ogun, Osun, Ondo, Oyo, Lagos and Ekiti States. The study area is agrarian and agriculture remains the hub of the economy providing employment for over 70 percent of the population. Primary data used for this study were collected through direct personal interview schedule and Focus Group Discussion session (FGDs) with the aid of structured questionnaire. A multi-stage sampling procedure was used for the selection of the respondents. Stage one involved the purposive selection of three (3) States (Ondo, Ogun and Oyo) in Southwest Nigeria, being the leading cassava producing States in the area. The second stage involved a random selection of three (3) Local Government Areas (LGAs) from each State. In the third stage, five (5) communities were randomly selected from each LGA. Finally, stage four involved a random selection of five (5) registered cassava farmers from each community, therefore making a total of 225 respondents but 221 respondents' data were valid and employed for this study. Opportunity cost approach, Ordinary Least Squares (OLS) and descriptive statistics such as percentages, mean, standard deviation, and tables with a Likert Rating Scale (LRS) were used for the analysis of this study.

The Concept of Opportunity Cost: Opportunity Cost exists when there are at least two courses of action and the decision maker can select either course. The value of the rejected choice is sacrificed or given up by the decision maker and this sacrificed value is the (opportunity) cost of the choice. A fundamental principle of economics is that every choice has an opportunity cost. OC focuses on the quantitative evaluation of adaptation strategies impacts on cassava farmers' revenue. This approach identifies the adaptation strategies employed in the households and for each adaptation strategy, the total costs incurred and benefits accrued before and after the strategy were compared using Paired Samples Test.

Paired samples test of difference of two means was used to determine whether the mean differences in the net revenue and costs as proxy to opportunity cost of adopting an adaptation measure are significant or not. It is given as:

$$T = \frac{x_1 - x_2}{\sigma \sqrt{1/n_1 + 1/n_2}} \quad (1)$$

$$\sigma = \sqrt{\frac{n_1 s_1^2 + n_2 s_2^2}{n_1 + n_2 - 2}} \quad (2)$$

Where:

T = the Paired Samples test distribution

Degree of Freedom (df) = $n_1 + n_2 - 2$

x_1 = mean (costs and revenue) before adoption of adaptation strategies

x_2 = mean (costs and revenue) when adopting adaptation strategies

σ = Standard deviation of x_1 and x_2

n_1 and n_2 = number of observations

s_1 = standard deviation before adoption of adaptation strategies

s_2 = standard deviation when adopting adaptation strategies

Model Specification for OLS: An estimated Production function was used to estimate how socioeconomic and climate factors affect the net revenue of the crop farmers in the study area. The implicit form of the regression model is expressed as;

$$Y_i = f(X_1, X_2, X_3, X_4, X_5, X_6, X_7, X_8) \quad (3)$$

The regression model is stated explicitly and the model variables are defined as follows.

$$Y_i = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + b_8X_8 + U_i \dots\dots\dots (4)$$

Where,

Y_i = Net Farm Revenue (Naira)

X_1 = Age (years)

X_2 = Family size (numbers)

X_3 = Farm size (hectares)

X_4 = Education (years of schooling)

X_5 = Experience (years)

X_6 = adopt Adaptation strategies (dummy: yes = 1, and 0, otherwise)

X_7 = Perceived rainfall (dummy: increased = 1, and 0, otherwise)

X_8 = Perceived temperature (dummy: increased = 1, and 0, otherwise)

U_i = error terms

The production function was estimated using the ordinary least square regression technique. The following functional forms were estimated for the production function and the one that best satisfies the theoretical, statistical and econometric criteria for a production function was selected as lead equation. The functional forms that were estimated are: Linear, semi log, double log and exponential.

Linear function:

$$Y_i = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + b_8X_8 + U_i$$

Semi-Log:

$$Y_i = b_0 + b_{1\log}X_1 + b_{2\log}X_2 + b_{3\log}X_3 + b_{4\log}X_4 + b_{5\log}X_5 + b_{6\log}X_6 + b_{7\log}X_7 + b_{8\log}X_8 + U_i$$

Exponentials:

$$\log Y_i = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_4X_4 + b_5X_5 + b_6X_6 + b_7X_7 + b_8X_8 + U_i$$

Double log

$$\log Y_i = b_0 + b_{1\log}X_1 + b_{2\log}X_2 + b_{3\log}X_3 + b_{4\log}X_4 + b_{5\log}X_5 + b_{6\log}X_6 + b_{7\log}X_7 + b_{8\log}X_8 + U_i$$

Results and Discussion

Awareness of Effects of Climate Change on Cassava Production

The results in Table 1 indicated that about 89% of the respondents were aware of climate change impacts on cassava production while 11% of them claimed that they were not aware that changes in climate affect production of cassava over the years. It was also observed across the States that 93%, 85% and 89% of the respondents from Ondo, Ogun and Oyo States respectively were aware of climate change in the area. Again, the study went further to investigate the level of awareness on how climate change affects cassava production from those that claimed to be aware of the changes in climate. Majority (54%) of the respondents claimed to have moderate level of awareness followed by about 32% of them that had high level of awareness and then 14% of the sampled respondents had low level of awareness in the area. In Ondo State, it was recorded that about 12%, 67% and 21% of the respondents claimed to have low, moderate and high level of awareness of climate change effects on cassava production in the area over the years respectively. Moreover, results from Ogun State revealed that nearly 11%, 44% and 44% of the respondents affirmed low, moderate and high level of awareness of climate change effects on cassava production in the area respectively. In Oyo State, about 19%, 49% and 31% of the respondents attested to low, moderate and high level of awareness of climate change effect on cassava production respectively in the area. Though the results depicted a varied level of awareness, a considerable increase in the awareness of the respondents was observed; more still needs to be done to enlighten them on the impacts of climate change on cassava production. This will guide respondents in adopting necessary adaptation measures to combat negative impacts of climate change on cassava production and as well channel their thinking towards mitigating strategies that could revert the environment to normalcy as also reported by Fatuase (2016) and Olutumise et al. (2017).

Perceptions of Respondents on Selected Climatic variables (Temperature and Rainfall)

The perceptions of the respondents were sought on temperature and rainfall over the years. Therefore, Table 2 presents the perceptions of the respondents in the study area on the selected climatic variables. The results of the analyses on cassava farmers' perceptions on temperature showed that majority (72%) of the sampled respondents claimed that temperature had been on increase over the years while about 20% of them claimed that temperature had been decreasing over the years in the study area. About 4% of the respondents perceived that temperature had remained the same over the years and 3% reported that they do not know whether temperature has changed or not. Looking through the States, it was observed that nearly 57%, 78% and 80% of the sampled respondents perceived that temperature has increased over the years in Ondo, Ogun and Oyo States respectively and this formed the majority in the study area. In the case of rainfall, the results showed that many (56%) of the respondents perceived that rainfall had been decreasing over the years while 36% of them perceived that rainfall had been on increase over the years. Nearly 3% of the respondents perceived that rainfall had remained the same over the years and 5% reported that they do not know whether rainfall has changed or not. Moreover, across the States, it was observed that about 63% and 69% of the sampled respondents perceived that rainfall decreased over the years in Ondo and Ogun States respectively and this formed the majority in the study area. Majority (55%) of the respondents in Oyo State perceived that rainfall has been increasing over the years as against the response from other States.

Major Adaptation Measures Commonly Employed by Cassava Farmers in the Study Area

According to Hannah et al. (2017), Bouroncle et al. (2017) and; Eitzinger et al. (2017), adaptation measures that farmer choose may be profit driven rather than climate change driven. This study, as also established by Fatuase and Ajibefun (2014), assumed that their actions are driven by climate factors. As indicated in Table 3, majority of the cassava farmers (51%) identified use of agrochemical as means of adaptation strategy used in the study area. The greater use of agrochemicals as an adaptation method could be associated with the availability of agrochemicals and its effectiveness when applied by farmers. It has also caused reduction in the use of change of farmland in the area. Again, about 50% of the respondents employed mixed cropping as an adaptation in the study area. The reason suggested by farmers was that it serves as a supplement to the income accrued from cassava production when they plant other crops with cassava. About 45% of the cassava farmers adopted planting different varieties as their adaptation measure while 32% of them employed the method of different planting dates so as to guide against uncertainty in the area. About 41%, 20% and 15% of the sampled respondents employed soil management technique, moving to different site and practicing crop diversification respectively as adaptation strategies in the study area. These adaptation measures mentioned by farmers were similar to the other findings in the literature (Donatti et al., 2017 and Ullah et al., 2017). In Ondo State, it was observed that majority (38.9%) of the respondents employed mixed cropping as their adaptation strategies to combat effect of climate change followed by 36.1% of them who used planting of different varieties and then 34.7% who employed mixed cropping as their adaptation measure in the area. Nearly 44.6% of the respondents in Ogun State formed the majority of respondents that used mixed cropping as their means of adaptation measure while 40.5% apiece stated that they used soil management techniques and use of agrochemicals in the area. In Oyo State, it was observed that 72.0% of the respondents formed the majority that employed the use of agrochemicals as a means of adaptation measure followed by mixed cropping as adaptation measure which was 70.7% of the respondents and then 60.0% of the respondents adopted planting different varieties as the adaptation measure in the area.

Table 3: Major Adaptation Measures Employed by Cassava Farmers in the Study Area

Main Barriers to Adaptation Strategies in the Study Area

The analysis of major barriers to adaptation to climate change among cassava farmers in the study area is presented in Table 4. It showed that ten main constraints were identified by the farmers in the area. These constraints were identified by some farmers as an impediment to adaptation while others identified them as a result of their inadequacy or shortage of the measures in the area. They include: inadequate funds, inadequate information, shortage of labour, shortage of land, inadequate technology knows how and others such as bad road network, lack of good and resistant planting materials, rapid infestation of pests and diseases, and non-availability of agrochemicals. Most of these constraints are associated with poverty and negligent of agricultural sector by the government (Fatuase and Ajibefun, 2014). The results showed that 63.3% of the sampled cassava farmers attested those inadequate funds were their main hindrance in adopting adaptation strategies in the area. The trend was similar across the States where 66.7%, 45.9% and 77.3% of the respondents from Ondo, Ogun and Oyo respectively complained inadequate funds.

The probable reason for this complaint by majority of the respondents could be attributed to the fact that money limits and incapacitates farmers from getting the necessary resources most especially inputs and technologies needed to facilitate adaptation to climate change. About 55.7% of the respondents complained shortage of labour as their main barriers to adaptation to climate change. This also reflected across the States where 51.4%, 47.3% and 68.0% of the respondents from Ondo, Ogun and Oyo attested that shortage of labour was their main challenges in adopting adaptation measures. Adaptation to climate change is costly (Mendelson, 2004 and Deressa *et al.*, 2008) and the need for intensive labour use may contribute to this cost.

Thus, if farmers do not have sufficient family labour or the financial means to hire labour, they cannot adapt. Farmers in the study area are now losing their family labour to other sectors of the economy most especially education to the extent that youths find it hard to engage in farming activities as they now see it as a dirty job (Fatuase and Ajibefun, 2014). Again, nearly 43.9% of the respondents affirmed that poor road network and transportation problem were the main constraints to adaptation strategies in the area. It was also noted that 52.5%, 44.6% and 34.7% of the respondents from Ondo, Ogun and Oyo States respectively also claimed to be affected by same problem. It was reported that most of the roads that lead to their farms are in bad condition, unmotorable and inaccessible. Farmers in this study area are not poor neither are they rich but cannot afford to invest on the construction of roads and purchase of new technologies to adapt to climate change. Non-availability of agrochemicals was observed to be a constraint by 49.0% of the respondents while 44.4% and 13.5% of the respondents from Ondo and Ogun States attested to same problem. About 31.2% of the sampled cassava farmers claimed that shortage of land was responsible for their inability to adopt adaptation strategies in the area.

Added to this, 50.0%, 14.9% and 29.3% of the sampled respondents from Ondo, Ogun and Oyo States also agreed with the shortage of land as a constraint. It was observed from the study area that shortage of land has been associated with communal land tenure system practice and development of other sectors such as infrastructures, residential houses, institutions and among others. These have forced farmers to farm on a small plot of land and impede them from adaptation practices that compete with agricultural land. Inadequate climate information was also identified by 29.9% of the respondents where 47.2%, 27.0% and 16.0% of the respondents from Ondo, Ogun and Oyo States respectively also shared the same view. Inadequate information on appropriate adaptation options could be attributed to the dearth of research on climate change and adaptation options as well as inefficient meteorological stations in the country. The information on climate change is not reaching farmers who are the major stakeholder in this scene because the means of disseminating the climate information is inaccessible and

unaffordable to the farmers. Rapid infestation of pests and diseases accounted for 25.8% of the respondents where 44.4% and 33.8% of the respondents from Ondo and Ogun attested to the same problem. Other constraints mentioned by the respondents were poor potentials for irrigation (24.0%), lack of good and resistant planting materials (27.6%) and inadequate technology know-how (19.0%). Again, the levels of technological know-how of these farmers are very low when compared with developed countries. They identified inadequate technological know-how as one of the local knowledge gaps to adapt to climate change.

Table 4. Main Hindrances to Adaptation Strategies in the Study Area

SN	Hindrances/barriers to adaptation	State of the Respondents						Pool Sample	
		Ondo State		Ogun State		Oyo State		Freq.	Percent
		Freq.	Percent	Freq.	Percent	Freq.	Percent

Opportunity Cost of Adaptation Strategies of the Costs and Returns by the Farmers

The study examined the costs and benefits before and after using adaptation measures in the area. Table 5 revealed that cassava farmers incurred additional cost of N2, 386.38 on labour utilization as a result of adopting any of the adaptation measures identified in this study. It was further observed that the difference was not statistically significant ($P > 0.05$) using paired samples test. Again, despite insignificant difference in cost of fertilizer incurred by the farmers, it was noted that additional costs of N5,085.06 was incurred by the farmers as a result of adopting adaptation to climate change. In case of area expansion under cultivation, a statistically significant difference ($P < 0.05$) was observed and additional costs of N10, 550.00 were recorded. Additional cost incurred on pest management was N2, 648.49 and it was not statistically different. As regards planting materials, there was a statistically significant difference ($P < 0.05$) on additional cost incurred before and when using adaptation (N13, 217.87).

Moreso, the benefits derived from the using climate adaptation strategies were also presented in the Table. It was noted that an average of about N18,242.46 per hectare (35,937.64/1.97) was additional income accrued from cassava stem cutting as a result of using adaption strategies in the area, while N255,395.37 per hectare (503,128.88/1.97) was additional revenue accrued from the sales of cassava tubers when using adaptation strategies in the area. The mean difference between the values of revenue accrued before using adaptation strategies and when using adaptation strategies showed significance at 1% level. This implies that cassava farmers made additional N237,637.83 per hectare when using adaptation strategies in the area. It is an indication that adaptation strategies significantly boost the production of cassava vis-à-vis increase the revenue per hectare in the area. The results were expected because agricultural technology adoptions are based on farmers' utility or profit maximizing behaviors (Weersink and Fulton, 2020). Deressa et al. (2011) and Fatuase (2016) opined that farmer adopts a new technology only when the perceived utility or profit from using this new technology is significantly greater than the traditional or the old method. Thus, households with higher income and greater assets are in better position to adopt new farming technologies which is used as proxy to adaptation strategies in the case of cassava farmers in the study area.

Table 5. Distribution of respondents by Costs and Benefits on Adaptation Strategies

Items	Before Adaptation	When using Adaptation	Difference	t-value	Sig.
Average Costs Incurred					
Labour (N)	38,120.0	40,506.38	2,386.38	0.348	0.201

Effect of Climate Change Adaptation on the Net Revenue of the Farmers

The variable estimates were analyzed using a multiple regression model and presented in Table 6. The data were subjected to various functional forms with a priority to climate variables. The exponential model gave the best fit and was chosen as the lead equation with a coefficient of multiple determination (R-Squared) of 0.861 which implies that about 86.1% variations in the effect of climate change adaptation on the net revenue of the farmers are explained by the explanatory variables. The estimated functions were evaluated in terms of the statistical significance of the R-squared, F-value, the significance of the coefficient, and the signs of the coefficients. The estimated variables of age, farm size, and experience were positive and statistically significant while, that of family size, education, and perceived temperature were negative but statistically significant in explaining the farmers' net revenue.

The coefficient of age was positive and statistically significant. This implies that a unit increase in the age of the respondents would lead to a 2.8% increase in the net revenue of the respondents at a 1% significant level. This might be due to the farmers' continued economic and productive age, which would allow them to contribute to the impact of climate change adaptation. The results of Alam et al. (2016) agree with this, but contradict that of Ali & Ereinstein (2017), who found that the age of the household head was inversely correlated with the adoption of climate change adaptation strategies. At the 1% level, the family size coefficient was negative but statistically significant. This suggests that a family size increase would result in a 3.5% loss in net revenue. This further implies that when family size drops, farmers' net income in the research area likewise decreases, along with the availability of family labour and the facilitation of actions to adapt to climate change. This, however, conflicts with research from Arshad et al. (2018) and Keshavarz and Moqadas (2021). At a significant level of 5%, farm size and net revenue were positively correlated. This suggests that a unit increase in farm size would lead to a 3.3 percent rise in the net revenue of the respondent. This may be explained by the fact that larger farms tend to experience the effects of climate change adaptation more frequently than smaller ones. The results of Thinda et al. (2021); Langyintuo and Mungoma (2008) lend credence to this assumption. With a 5 percent statistical significance, the coefficient of experience was positive. This indicates that an increase in experience among the respondents of one unit would result in an increase in net revenue of 4.8%. This further suggests that seasoned cassava farmers in the study area possess a high level of expertise in farm management techniques as well as the capacity to manage risk when confronted with fluctuations in climate change, which increases their net income. The results of Arshad et al. (2018) advance credence to this claim. Finally, a statistically significant negative association between perceived temperature increase and net revenue at a threshold of 5% was found. This suggests that a unit rise in the perceived temperature will lead to a 9.7 percent loss in the net revenue of cassava farmers in the study area. This assumption is corroborated by the findings of Huong et al. (2019).

The study concluded that there is a moderate level of awareness and perceptions of climate change as it affects cassava production in the area. It was also concluded that cassava farmers perceived that temperature is increasing over the years while amount of rainfall were perceived to be decreasing over the years. It was observed that cassava farmers perceived that climate change had effect on cassava production over the years, and thereby employed adaptation measures to combat its effects. The main adaptation strategies employed by the cassava farmers are planting different varieties, practicing crop diversification, mixed cropping, soil conservation techniques, use of agrochemicals, and move to a different site. There was evidence of opportunity cost in the adoption of adaptation strategies. Furthermore, socio-economic factors such as (age, farm size, experience, and family size) and climatic factor i.e., perceived temperature positively and negatively influence the net revenue of cassava farmers in the study area. It is therefore concluded that cassava farmers derived and perceived utility and net benefit from using adaptation measures than when it is not used. Based on these findings, policies aimed at organizing and strengthening training programmes on climate change awareness and coping strategies since the farmers derived additional benefits from their choice of coping strategies. This could be achieved through the extension agents and

the meteorologists by using different media such as farm demonstration/show, seminar, radio, TV and social media. Since it has been established in the study that farmers are aware and perceived that climate is changing, substantive credit scheme should be provided by the Government to the cassava farmers in order to enhance their adaptation strategies. This should be made available, accessible and affordable to the farmers. Government should provide improved varieties of cassava that are very tolerant and resistant to the effects of drought and flood; and other modern techniques of cultivating cassava through the research institute and ministry of agriculture. The costs of improved varieties should also be subsidized by the Government to the farmers.

RASFF (Rapid Alert System for Food and Feed) Notifications for Food and Food Contact Materials in 2021

Nil Irmak Kugu, Kübra Yılmaz, Derya Deniz Şirinyıldız, Aşlı Yorulmaz

Aydın Adnan Menderes University, Department of Food Engineering, Aydın, Turkey

Abstract

Rapid Alert System for Food and Feed (RASFF); is a system that provides rapid information flow between European Union member states when a risk threatening public health arises in terms of food safety. In this study, notifications originating from food and food contact materials for 2021 in the RASFF database were examined. All the data obtained were evaluated under the headings of notification basis, notification classification, risk decision, notification by, product category, notification subject, distribution status and measures taken using Microsoft Excel 2010 program and a detailed report was prepared. A total of 4438 notifications were detected. 4167 notifications were recorded for foods and 271 notifications were recorded for food contact materials. 30.82% of the notifications (n=1368) had emerged as a result of official controls in the market. When the notifications were classified, it was observed that 1455 notifications were alert notifications. This was followed by border rejection (n= 1433), information notification for attention (n=972), information notification for follow-up (n=564) and news (n=13) notifications. 58.29% of all notifications had serious risk. Germany was the most notifying country (n=725), followed by Spain (n=526) and the Netherlands (n=444). The food category with the highest number of notifications was fruits and vegetables with 952 notifications (21.45%). When all notifications were examined, it was determined that the main problem was pesticides. It had been reported that in the biggest portion of the cases the products were not (yet) placed on the market (n=1223). The most frequently taken measure was withdrawal of products from the market (n=603), followed destruction (n=542) and official detention (n=527).

Key Words: Food Safety, Pesticide, Rapid Alert System for Food and Feed, RASFF, RASFF Notifications

Gıda ve Yem için Hızlı Alarm Sistemi'nde Yer Alan 2021 Yılı Gıda ve Gıda ile Temas Eden Madde Bildirimleri

Özet

Gıda ve Yem İçin Hızlı Alarm Sistemi (RASFF); gıda güvenliği açısından halk sağlığını tehdit eden bir risk ortaya çıktığında, Avrupa Birliği üye ülkeleri arasında hızlı bir şekilde bilgi akışını sağlayan sistemdir. Bu çalışma kapsamında, RASFF veri tabanında 2021 yılına ait gıda ve gıda ile temas eden madde kaynaklı bildirimler incelenmiştir. Elde edilen tüm veriler bildirim kaynağı, bildirim türü, risk derecesi, bildirimde bulunan ülke, ürün kategorisi, bildirim konusu, ürünün dağıtım bilgileri ve uygulanan yaptırım başlıkları altında Microsoft Excel 2010 programı kullanılarak değerlendirilmiş ve ayrıntılı bir rapor hazırlanmıştır. Toplam 4438 bildirim tespit edilmiştir. 4167 bildirim gıdalar için, 271 bildirim ise gıda ile temas eden maddeler için oluşturulmuştur. Bildirimlerin %30.82'si (n=1368) piyasadaki resmi kontroller sonucunda ortaya çıkmıştır. Elde edilen bildirimler sınıflandırıldığında 1455 bildirimin alarm bildirimi olduğu gözlenmektedir. Ardından sınır iadesi (n=1433), dikkat gerektiren bilgi (n=972), takip gerektiren bilgi (n=564) ve haber (n=13) bildirimleri gelmektedir. Tüm bildirimlerin %58.29'u ciddi risk derecesine sahiptir. Almanya en fazla bildirimde bulunan ülke iken (n=725), onu İspanya (n=526) ve Hollanda (n=444) takip etmiştir. Hakkında en fazla bildirim bulunan gıda kategorisi 952 bildirim (%21.45) ile meyve ve sebzeler olmuştur. Tüm bildirimler incelendiğinde temel problemin pestisitler olduğu belirlenmiştir. Risk tespit edilen ürünlerin büyük bir kısmının (henüz) piyasaya sürülmediği (n=1223) bildirilmiştir. En sık alınan önlem ürünlerin piyasadaki çekilmesi (n=603) olmuştur, ardından imha edilmesi (n=542) ve resmi olarak alıkonması (n=527) gelmiştir.

Anahtar Kelimeler: Gıda Güvenliği, Gıda ve Yem için Hızlı Alarm Sistemi, Pestisit, RASFF, RASFF Bildirimleri

Combination of biochar with antagonistic microbes to control plant parasitic nematodes in different crops: A way forward to green plant protection strategies

Muhammad Amjad Ali¹, Usman Arshad¹, Halil Toktay²

¹Department of Plant Pathology, University of Agriculture, Faisalabad, Pakistan

²Department of Plant Production and Technologies, Nigde Omer Halisdemir University, Nigde, Turkey

Abstract

Tomato (*Lycopersicon esculentum* Mill) is the second most produced and consumed vegetable worldwide and in Pakistan after potato. It is consumed on daily basis directly as raw and in the form of various processed items. Tomato is the most important vegetable after potato worldwide. Similarly, wheat is the mainstay of global food security. In spite of an increasing trend in the use of inputs and the adoption of new technologies, productivity of these crops is not responding in terms of yield growth. Tomato is affected by a variety of bacterial, fungal and viral pathogens. In addition to these diseases, root knot nematode (*Meloidogyne incognita*) has emerged as a serious threat to several vegetable crops with special reference to the tomato production in Punjab. *Meloidogyne incognita* is the most dangerous plant parasitic nematode on the earth planet because of very high host range of this nematode species. It infects more than 3000 plant species worldwide with very devastating effects especially in tomato. Root knot nematodes (*Meloidogyne* spp.) are serious problem involved yield and quality reduction in tomato and other vegetable crops. Likewise, root lesion nematode *Pratylenchus thornei* is an important wheat pest and causes significant losses. They are mostly controlled by using various nematicides which not only hazardous to the environment but also have negative impact on human health. The present study represents an easy to use and eco-friendly solution to this problem by amending the soil with biochar. Biochar is a carbon rich product obtained through pyrolysis of biomass and can be used for carbon sequestration by applying large amounts of carbon very resistant to decomposition. In the present study, the interaction of tomato and root knot nematode *Meloidogyne incognita* has been used as model system. In the study, the potential of three feedstocks (wheat straw, cotton sticks and green waste) at different concentrations were evaluated to control root knot nematodes in pot experiments. The biochar developed from best feedstock at best concentration was evaluated in the field using nematode sick beds in the department research area. Moreover, the best biochar was applied to tomato along with certain population of nematodes in addition to biocontrol agents to study the activation of defense related genes in tomato. The best biochar for growth promotion and nematode resistance was rice husk biochar which was added with bacterial (*Bacillus* sp.) and fungal (*Trichoderma* sp.) afterward. Our results from nematode resistance test and gene expression for defense related genes from different treatments demonstrated that 3% rice husk biochar in combination with *Bacillus* sp. was found best for growth promotion, nematode resistance and activation of defense related genes. Similar results were found in wheat in response to root lesion nematode *Pratylenchus thornei* for biochar treatments. This study could be a way forward for organic management of root-knot nematodes in tomato.

Key Words: Tomato, Root-knot nematodes, Biochar, Antagonists, Resistance

Digitalisation In Aquaculture Management

Suat Dikel, İbrahim Demirkale, Ece Evliyaoğlu*

Abstract

Aquaculture is an economic production activity of fish, shellfish and aquatic plants with a certain investment in a certain period of time, taking into account many technical factors. Basically, these aquatic species are grown until the market and finally harvested, taking into account the welfare of these aquatic species. It is among the fastest growing industries in the world today. Production performance and quality depend on a combination of different factors, such as the quantity and periodicity of food, temperature, life cycle, and characteristics of the water used. With the increase in demand in recent times, the increase in production amounts and the development of the industry are realized with the use of many technological systems. These technological systems have increased the production and quality to the desired levels with the help of their sensors and communication network and programs containing advanced data analysis. In order to make the production and post-production quality management safer, the consumer and the seller have the opportunity to work with a safer product, thanks to the monitoring studies carried out to monitor the production and supply. Thus, while the producer can prove how high quality his production is, it is ensured that the consumer gets away from their concerns and possible misinformation. In addition, although digital technology requires an investment at first, it also has the effect of reducing the production cost over a long period of time. Because it is getting harder to find a high quality workforce day by day, and the need for personnel decreases as the digitalization infrastructure increases due to the possibility of success in production parallel to the success of the personnel. By providing almost all control through the measurements and data collected, estimates are produced at very close levels to the reality, thus ensuring a more efficient use of resources and much less exposure to possible diseases and risks. Thanks to digital data collection and processing, businesses are both easier to control and follow a more transparent production process. As the manufacturer digitizes, it gains the power to participate in the competition in the market, and it also becomes compatible with many applications, including Blockchain technology.

Key words: *Digitalisation, Aquaculture, Technology, Production control, Production management*

Su Ürünleri Yetiştiriciliği Yönetiminde Dijitalleşme

Özet

Su ürünleri yetiştiriciliği, balık, kabuklu deniz ürünleri ve su bitkilerinin belli bir zaman dilimi içinde belli bir yatırımla birçok teknik faktör gözetilerek yapılan ekonomik bir üretim faaliyetidir. Temel olarak bahsedilen bu sucul canlıların refahları gözetilerek Pazar boyuna kadar yetiştirilir ve sonunda hasat edilir. Günümüzde dünyanın en hızlı büyüyen sektörleri arasındadır. Üretim performansı ve kalitesi, gıda miktarı ve periyodikliği, sıcaklık, yaşam döngüsü ve kullanılan suyun özellikleri gibi farklı faktörlerin kombinasyonuna bağlıdır. Son dönemlerde talebin artmasıyla birlikte üretim miktarlarının artması ve endüstrinin gelişmesi, birçok teknolojik sistemin kullanımı ile gerçekleşmektedir. Bu teknolojik sistemler sahip oldukları sensörler ve iletişim ağı ile gelişmiş veri analizlerini içeren programlar yardımıyla üretimi ve kaliteyi istenilen seviyelere çıkartmıştır. Yapılan ölçümler ve toplanan veriler aracılığıyla neredeyse tüm kontrol sağlanarak gerçeğe çok yakın seviyelerde tahminler üretilerek, hem kaynakların daha verimli kullanılması sağlanmakta hem de olası hastalık ve risklerden çok daha az etkilenilmektedir. Üretimde ve üretim sonrası kalite yönetiminin daha güvenli yapılabilmesi için, üretimin ve tedarikin takibi için yapılan izleme çalışmaları sayesinde tüketici ve satıcı daha güvenli bir ürün ile çalışma olanağı bulunmaktadır. Böylece üretici üretimini ne kadar kaliteli yaptığını ispatlayabilirken, tüketicinin kaygıları ve olası yanlış bilgi ediniminden uzaklaşması sağlanmaktadır. Ayrıca dijital teknoloji ilk başta bir yatırım gerektirmesine karşın üretim maliyetini geniş zamanda düşürme etkisine de sahiptir. Zira yüksek kalitede işgücü bulmak günden güne zorlaşmakta, üretimde başarı personelin başarısına paralel olası nedeniyle dijitalleşme altyapısı arttıkça personel gereksinimi de bir o kadar azalmaktadır. Dijital veri toplama ve işleme sayesinde işletmeler hem daha kolay kontrol edilmekte hem de daha şeffaf bir üretim prosesi takip etmektedirler. Üretici dijitalleştikçe piyasadaki rekabete katılma gücü elde etmekte bunla birlikte Blockchain teknolojisi dâhil birçok uygulamaya uyumlu hale gelmektedir.

Anahtar Kelimeler: *Dijitalleşme, Su Ürünleri yetiştiriciliği, Teknoloji, Üretim Kontrolü, Üretim Yönetimi*

Application of Blockchain Technology in Fisheries and Aquaculture Production Sector

Suat Dikel, Ece Evliyaoğlu*, İbrahim Demirkale

Abstract

Blockchain is a distributed database shared among the nodes of a computer network. As a database, a blockchain stores information electronically in digital form. Blockchains are best known for their important role in crypto currencies like Bitcoin to keep a secure and decentralized record of transactions. The innovation in blockchain is that it guarantees the fidelity and security of a data record and establishes trust without the need for a trusted third party. Today, blockchain combats commercial fraud by documenting long and complex production cycles for seafood and monitoring critical chain of custody, analysing by considering coastal, port, processing and end-market. These are crucial as fishery products pass through national and international supply chains, from harvesting, transshipment, landing and processing to the final consumer market. Every part of the country requires general control elements that must be in place, often forming the basis for traceability, tracking and data collection, and ensuring consumers have complete confidence in seafood. Aquaculture has become one of the most traded food groups worldwide and provides a livelihood for millions of people around the world. The growth rate of exports in developing countries has increased rapidly in the last ten years due to globalization and the transformation of the world economy with technological developments. With almost one-third of global fish stocks being overused, the ecological footprint of aquaculture and fisheries highlights the balance of the sustainable supply chain.

Key words: *Blockchain, Aquaculture Industry, Quality Management, Food Safety*

Blockchain Teknolojisi'nin Su Ürünleri Üretim Sektöründe Uygulaması

Özet

Blokchain (Blok zinciri), bir bilgisayar ağının düğümleri arasında paylaşılan dağıtılmış bir veri tabanıdır. Bir veri tabanı olarak, bir blok zinciri, bilgileri elektronik olarak dijital biçimde saklar. Blok zincirleri en iyi, güvenli ve merkezi olmayan bir işlem kaydını tutmak için Bitcoin gibi kripto para sistemlerindeki önemli rolleriyle bilinir. Blok zincirindeki yenilik, bir veri kaydının aslına uygunluğunu ve güvenliğini garanti etmesi ve güvenilir bir üçüncü tarafa ihtiyaç duymadan güven oluşturmaktır. Bugün blokchain, deniz ürünleri için uzun ve karmaşık üretim döngülerini belgelemek ve kritik gözetim zincirini izlemek, kıyı, liman, işleme ve son Pazar gibi konuları dikkate alarak analiz yapmak suretiyle ticari olarak sahtekârlıkla mücadele etmektedir. Bunlar, balıkçılık ürünleri hasat, aktarma, karaya çıkarma ve işlemeden nihai tüketici pazarına kadar ulusal ve uluslararası tedarik zincirlerinden geçtiği için çok önemlidir. Ülkenin her bölümü, yerinde olması gereken genel kontrol öğelerini gerektirir, bunlar genellikle izlenebilirlik, izleme ve veri toplama için temel oluşturur ve tüketicilerin deniz ürünlerine tam olarak güvenmesini sağlar. Su ürünleri yetiştiriciliği, dünya çapında en çok ticareti yapılan gıda gruplarından biri haline gelirken dünya çapında milyonlarca insanın geçimini sağlamaktadır. Gelişmekte olan ülkelerde ihracatın büyüme hızı, küreselleşme ve dünya ekonomisinin teknolojik gelişmelerle birlikte dönüşmesi nedeniyle son on yılda çok hızlı bir artış göstermiştir. Küresel balık stoklarının neredeyse üçte birinin aşırı kullanımıyla, su ürünleri yetiştiriciliği ve balıkçılığın ekolojik ayakizi, sürdürülebilir tedarik zincirinin dengesine dikkat çekmektedir.

Determination Of Zinc (Zn) Sorption Properties Of Gytja, Leonardite And Compost

Muhammed Alhashemi¹, Kadir Saltali¹

Soil Science and Plant Nutrition, Faculty of Agriculture, Kahramanmaraş Sutcu Imam University, K.Maras, TÜRKİYE

Abstract

Leonardite and compost are used as soil regulator materials. Gytja is a material which contains 30-40% lime and 40-50% organic matter with a reserve of approximately 4.8 billion tons in Afşin-Elbistan Thermal Power Plant basin. These materials are used in the production of organomineral fertilizers. Zinc (Zn) is one of the micro plant nutrients that plants need. Available Zn deficiency is observed in approximately 49% of Turkish soils. The aim of this study is to determine the Zn adsorption properties of gıdya, leonardite and compost used in organomineral fertilizer production. The study was conducted under laboratory conditions. In order to determine the optimum adsorption conditions, the effect of pH, particle size, temperature, shaking time and solution concentration were determined. Then, adsorption properties were determined using linear Langmuir and Freundlich isotherm under optimum conditions. According to Langmuir isotherm, the maximum sorption capacity (q_{max}) was found to be 14.10 mg g⁻¹ for gıdya, 13.74 mg g⁻¹ for leonardite and 15.67 mg g⁻¹ for compost. In conclusion, gıdya, leonardite and compost Zn sorption values were consistent with Langmuir and Freundlich isotherms. The maximum sorption capacity (q_{max}) of these materials is very close to each other. When these data are taken into consideration, it is seen that 1 kg of organic material can hold about 15 g Zn. It is useful to take these basic data into account in organomineral fertilizer production and sustainable Zn fertilization.

Key Words: Gytja, leonardit, compost, zinc, adsorption

Gıdya, Leonardit Ve Kompost'un Çinko (Zn) Adsorpsiyon Özelliklerinin Belirlenmesi

Özet

Leonardit ve kompost toprak düzenleyicisi olarak kullanılan materyallerdir. Gıdya ise Afşin-Elbistan Termik Santrali havzasında rezervi yaklaşık 4.8 milyar ton olan %30-40 kireç ve % 40-50 organik madde içeren bir materyaldir. Bu materyaller organomineral gübre yapımında kullanılmaktadır. Çinko bitkilerin mutlak ihtiyaç duyduğu mikro bitki besin elementlerinden birisidir. Türkiye topraklarının yaklaşık % 49'unda bitkiler tarafından alınabilir çinko (Zn) noksanlığına rastlanmaktadır. Bu çalışmanın amacı, organomineral gübre yapımında kullanılan gıdya, leonardit ve kompostun Zn adsorpsiyon özelliklerini belirlemektir. Çalışma laboratuvar koşullarında yürütüldü. Optimum adsorpsiyon koşullarını belirlemek için adsorpsiyonu etkileyen faktörlerden pH, tanecik iriliği, sıcaklık, çalkalama süresi ve çözelti konsantrasyonunun etkisi belirlenmiştir. Daha sonra optimum koşullarda linear Langmuir ve Freundlich izotermi kullanılarak adsorpsiyon özellikleri saptanmıştır. Langmuir izotermine göre maksimum sorpsiyon kapasitesi (q_{max}) gıdya için 14,10 mg g⁻¹, leonardit için 13,74 mg g⁻¹ ve kompost için 15,67 mg g⁻¹ bulunmuştur. Sonuç olarak, gıdya, leonardit ve kompostun Zn sorpsiyon değerleri Langmuir ve Freundlich izotermine uyum göstermiştir. Bu materyallerin maksimum adsorpsiyon kapasiteleri (q_{max}) birbirine çok yakındır. Bu veriler dikkate alındığında, 1 kg organik materyalin yaklaşık 15 gr Zn tutabileceği görülmektedir. Organomineral gübre üretiminde ve sürdürülebilir Zn gübrelemesinde bu temel verilerin dikkate alınmasında fayda vardır.

Anahtar Kelimeler: Gıdya, leonardit, kompost, çinko, adsorpsiyon

Determination of Antibacterial and Antioxidant Activities of *Eisenia fetida* (Savigny, 1826) Against Mastitis Pathogens

Aysel Kekillioglu¹, Kutbettin Arslan², Fatma Soysaldi¹, Gulten Okmen²

¹Nevşehir Hacı Bektaş Veli University, Department of Biology, Nevşehir, TÜRKİYE

²Mugla Sıtkı Kocman University, Faculty of Science, Department of Biology, Mugla, TÜRKİYE

Abstract

Eisenia fetida (Savigny, 1826) taxon, which has high environmental adaptation and reproductive capacity, can also show high tolerance and resistance to organic pollutants. Due to the sticky secretions they produce and the conversion of organic matter in the soil, these earthworms can increase microbial activity and nutrient availability of organic matter. *E. fetida* is the most commonly used species in the production of “vermicompost,” which is an organic soil conditioner that is important for agricultural sustainability. In this study, it was aimed to determine the antibacterial activity of different extracts obtained from *E. fetida* species against mastitis pathogens as well as their non-enzymatic antioxidant activities. In this study, 150 *E. fetida* samples were obtained from Nevşehir Hacı Bektaş Veli University Biology Research Laboratory. Mastitis pathogens used in the study were obtained from Mugla Sıtkı Kocman University Microbial Biotechnology Research Laboratory. In this study, different extracts of *E. fetida* (ethanol, methanol, water) were obtained by soxhlet apparatus. The antibacterial activity studies were determined by disk diffusion and Minimum Inhibitory Concentration (MIC) methods. The non-enzymatic antioxidant activity studies were determined using 2,2'-azino-bis(3-ethylbenzothiazoline-6-sulfonic acid) (ABTS*), and 2,2-diphenyl-1-picrylhydrazyl (DPPH*) radicals. In this study, the highest antibacterial activity was determined as 9 mm against *Staphylococcus aureus*-18 from the methanol extract, while an inhibition zone diameter of 9 mm was obtained from the ethanol extract against Coagulase-negative *Staphylococcus*-36 (CNS-36). The lowest MIC value of *E. fetida* extracts was 3250 µg/mL, and it was detected in *S. aureus*-18. The highest ABTS radical scavenging activity was determined as 78% from the methanol extract of *E. fetida*. However, the highest DPPH radical scavenging activity was obtained from the ethanol extract of *E. fetida* and was determined as 55%. As a result, it is suggested that *Eisenia fetida* extracts have antibacterial activity against mastitis pathogens and can be used in the fight against these pathogens. In addition, it was determined that *E. fetida* extracts had high antioxidant activity.

Key Words: *Eisenia fetida*, mastitis pathogens, antibacterial activity, MIC, DPPH, ABTS

***Eisenia fetida* (Savigny, 1826)' nın Mastitis Patojenlerine Karşı Antibakteriyel ve Antioksidan Aktivitelerinin Belirlenmesi**

Özet

Yüksek çevresel adaptasyon ve üreme kapasitesine sahip olan *Eisenia fetida* (Savigny, 1826) taksonu, aynı zamanda organik kirleticilere karşı yüksek tolerans ve direnç gösterebilme yeteneğine de sahiptir. Ürettikleri yapışkan salgıları ve topraktaki organik maddeleri dönüştürmesi sayesinde bu toprak solucanları mikrobiyal aktiviteyi ve organik maddelerin besin mevcudiyetini artırabilmektedir. *E. fetida*, “vermikompost” olarak adlandırılan ve tarımsal sürdürülebilirlik bakımından önemli organik bir toprak düzenleyicisi olan solucan gübresinin üretiminde en çok kullanılan türdür. Bu çalışmada *Eisenia fetida* türünden elde edilen farklı ekstraktların mastitis patojenlerine karşı antibakteriyel aktivitesi ve ayrıca enzimatik-olmayan antioksidan aktivitelerinin belirlenmesi amaçlanmıştır. Bu çalışmada, *E. fetida* örnekleri 150 adet olup, Nevşehir Hacı Bektaş Veli Üniversitesi Biyoloji Araştırma Laboratuvarından sağlanmıştır. Çalışmada kullanılan mastitis patojenleri Muğla Sıtkı Koçman Üniversitesi Mikrobiyal Biyoteknoloji Araştırma Laboratuvarından temin edilmiştir. Bu çalışmada soksalet cihazı ile *E. fetida*' nın farklı ekstraktları (etanol, metanol, su) elde edilmiştir. Antibakteriyel aktivite çalışmaları disk difüzyon ve Minimum İnhibitör Konsantrasyon (MİK) yöntemleri ile saptanmıştır. Enzimatik-olmayan antioksidan aktivite çalışmaları 2,2'-azino-bis(3-etilbenzotiazolin-6-sulfonik asit) (ABTS*) ve 2,2-difenil-1-pikrilhidrazil (DPPH*) radikalleri kullanılarak belirlenmiştir. Bu çalışmada, en yüksek antibakteriyel aktivite metanol ekstresinden *Staphylococcus aureus*-18' e karşı 9 mm olarak belirlenirken, Koagülaz negatif *Staphylococcus*-36'ya (CNS-36) karşı etanol ekstresinden 9 mm inhibisyon zon çapı olarak saptanmıştır. *E. fetida* ekstraktlarının en düşük MİK değeri 3250 µg/mL olup, *S. aureus*-18' de saptanmıştır. En yüksek ABTS radikal süpürme aktivitesi *E. fetida*' nın metanol ekstresinden %78 olarak tespit edilmiştir. Ancak en yüksek DPPH radikal süpürme aktivitesi *E. fetida*' nın etanol ekstresinden elde edilmiş ve %55 olarak saptanmıştır. Sonuç olarak, *E. fetida* ekstraktlarının mastitis patojenlerine karşı antibakteriyel aktiviteye sahip olduğu ve bu patojenlerle mücadelede kullanılabileceği önerilmiştir. Ayrıca *E. fetida* ekstraktlarının yüksek antioksidan aktiviteye sahip olduğu belirlenmiştir.

Anahtar Kelimeler: *Eisenia fetida*, mastitis patojenleri, antibakteriyel aktivite, MİK, DPPH, ABTS

Research on The Bio-Ecology and Biological Control Process of *Eurytoma amygdali*, Enderlein (Hymenoptera: Eurytomidae)

Aysel Kekillioğlu¹, Ümmügülsüm Yakupoğlu²

^{1,2} Nevşehir Hacı Bektaş Veli University, Faculty of Science Department of Biology, Nevşehir, TÜRKİYE

Abstract

Eurytoma amygdali, Enderlein (Hymenoptera: Eurytomidae), known as almond borer, is an important pest of almond trees in different countries located in Southeast Europe and the Middle East, including Turkey. While *E. amygdali* causes significant damage to almond orchards in Turkey, it is seen in all areas where almonds are grown. It is known that the chemical control of *E. amygdali*, which is widely applied by almond producers in Turkey, is mostly unsuccessful. The main reason for this is that the pest has differences in terms of biological, ecological and damage. In this context, the main purpose and content of the study is about the biological control process against *E. amygdali* (almond heartworm), within the scope of analyzing the bio-ecology of the organism to get the data obtained from the observations and examinations carried out during 2022 in two different almond orchards in Nevşehir province Avanos district Köy Bağı Mevkii and Yukarı Mahalle Mevkii.

Key Words: *Eurytoma amygdali*, Almond, Parasite, Bio-ecology, Biocontrol, Nevşehir

***Eurytoma amygdali*, Enderlein (Hymenoptera: Eurytomidae)' Nın Biyo-Ekolojisi Ve Biyolojik Mücadele Süreci Üzerine Araştırma**

Özet

Badem içkurdu olarak bilinen, *Eurytoma amygdali*, Enderlein (Hymenoptera: Eurytomidae), türü ; Türkiye'nin de içinde bulunduğu Güneydoğu Avrupa ve Ortadoğu' da konumlanan farklı ülkelerde badem ağaçlarında görülen önemli bir zararlıdır. *E. amygdali*, Türkiye'de badem bahçelerinde önemli zarar oluştururken badem yetiştirilen tüm alanlarda görülmektedir. Türkiye'de badem üreticilerinin yaygın olarak uyguladıkları *E. Amygdali*'nin kimyasal mücadelesinde çoğunlukla başarısız olduğu bilinmektedir.. Bunun temel nedeni, zararlının biyolojik, ekolojik ve zarar verme bakımından farklılıklara sahip olmasıdır. Bu bağlamda çalışmanın temel amaç ve içeriğini; *E. amygdali*, (badem iç kurdu) ile biyolojik mücadele sürecinde öncelikle canlıların biyo-ekolojisinin analiz edilmesi kapsamında; Nevşehir ili Avanos ilçesi Köy Bağı Mevkii ve Yukarı Mahalle Mevkii'lerinde bulunan iki farklı badem bahçesinde 2022 yılı süresince gerçekleştirilen gözlem ve incelemelerden elde edilen veriler oluşturmaktadır.

Anahtar Kelimeler: *Eurytoma amygdali*, Badem, Parazit, Biyo-ekoloji, Biyokontrol, Nevşehir

Giriş

Böcekler, Hayvanlar alemi içerisinde nitel ve nicel biyoçeşitliliği yüksek canlılardır. Ekosistemin dengeli işleyişinde kaynak potansiyel taşırlar. Bunlar içerisinde Hymenoptera takımı yeryüzünün çok farklı habitatlarında varolabilen, ekolojik ve ekonomik etkisi önemli böcek takımlarındandır (Kekillioğlu; A., 2019).

Dünyada badem üretimi çoğunlukla Akdeniz'e kıyısı olan ülkelerde yoğunlaşmıştır. Dünya badem dikim alanlarının %61.63'ü Akdeniz'e kıyısı olan ülkelerde bulunmaktadır. Dünyada en fazla badem dikimi yapan ülkeler ise İspanya (544.518 ha), ABD (380.405 ha), Tunus (184.500 ha) ve Fas (165.817 ha) 'tır. Bu ülkeleri 33 bin hektar ile Türkiye 7. sırada takip etmektedir . Badem İçkurdu, Türkiye'nin her yerinde yılda tek döl veren (univoltine) monofag bir zararlıdır. Kışı, yere düşen bulaşık badem meyveleri içerisinde veya ağacın üzerinde mumyalaşmış bulaşık badem meyvelerinin içerisinde olgun larva döneminde geçirir. (Çağlar ve Işıkber , 2021)

Türkiye'de bulaşık meyve içerisindeki kışı geçiren olgun larvalar baharda pupa olmaya başlarken bulaşık meyvelerden erginlerin çıkışı delik açarak bahar ortasında (Nisan) başlayıp erken baharın sonlarına (Mayıs) kadar devam ettiği görülmektedir. Ergin dişiler, ovipozitörlerini kullanarak genç badem meyvelerinin (çağla) ekzo ve mezokarpı (meyve eti) delerek endokarpın iç kısmına yumurta bırakırlar. Her dişinin 80 yumurta bıraktığı bilinmektedir. Meyve etinin içerisindeki yumurtadan çıkan larva meyve özüne (embriyo) inerek meyvenin içini tamamen tahrip eder. Meyve özünü tamamen yiyen larvalar yazın sonunda olgun larva dönemine ulaştıktan sonra sonbaharda zarar görmüş meyve içerisinde kışı geçirmek üzere diapafoza girerler. (Barut, 2007; Çağlar ve Işıkber, 2021). Zarar görmüş meyveler ağaç üzerinde kalarak sağlam meyvelerden daha erken sararmakta, sonbahar ve kışın ağaç üzerinde kalarak siyahlaşır. Badem İçkurdu'nun mücadelesine yönelik bir strateji geliştirilmesi, zararlının biyonomisi (biyolojisi ve ekolojisi) hakkında bilgi sağlayarak başarılabilir. Bu zararlının gelişmesi ve hayatta kalması çevresel faktörlerle özellikle sıcaklıkla yakından ilişkilidir. Sıcaklık özellikle birinci ve ikinci (son) diapafoz larva dönemlerinin tamamlanması veya sonlandırılmasında önemli bir etkiye sahiptir. Bu bağlamda bulaşık meyvelerdeki olgun larvaların diapafozu tamamlanarak ergin çıkış zamanlarının belirlenmesi kimyasal mücadelenin başarısında büyük öneme sahiptir.

Materyal ve Yöntem

Bu çalışma nisan 2020 ile mayıs 2022 arasında yürütülmüştür. Çalışma iki farklı badem bahçesinde gerçekleştirilmiştir. Çalışmada araştırma sahası ve çevresinde yaygın olarak uygulanan mücadele yöntemi incelenmiştir.

Nevşehir ilinin Avanos ilçesi Köy Bağı mevkiinde *nounpreial* (yumuşak kabuklu badem) ve *teksas* (sert kabuklu badem) 10 yaşında, 120 adet badem ağacından oluşmaktadır. Tüm ağaçlar sulama sistemi ile sulanmaktadır. Nevşehir ilinin Avanos ilçesi Yukarı Mahalle mevkiinde bir *nounperial* bir *teksas* badem ağacı vardır. Bu iki ağaç 25 yaşında olup yağmur suyu ile sulanmaktadır.

Ergin bireyler yumuşak kabuklu *nounperial* bademleri delebildiği için onların içine yumurta bırakırlar. Badem İçkurdu'nun ergin çıkışlarını takip etmek amacıyla 15X15X15cm ve 30X30X30 (en - yükseklik - boy) boyutlarında alt tarafı sunta, etrafı sinek teliyle kafesler kullanılmıştır. Ağaçların güney-batı yönünün ergin çıkış zamanına ve pupa gelişimine etkisini belirlemek için badem ağacının dalların kafesler asılmıştır.

Uygulama sürecinde en önemli faktör, ergin çıkış zamanının belirlenmesidir. Buna bağlı olarak da verimli ürün alabilmenin koşulu olarak uygulanan ilaçlama zamanının belirlenmesidir.

Aynı sene hasta bademler toplanarak gözlem kulelerine yerleştirilmiştir. Gözlem kuleleri güney batı yönünde üç noktaya 20 nisan 2020 de asılmıştır. 12 mayıs 2020 bademlerden çıkan ergin böcekler görülmüştür. Aynı gün *Lance* isimli ilaç ile 100 litreye 60 gr şeklinde ilaçlama yapılmış don sebebiyle ürün alınamamıştır.

Bir sonraki yıl 8 mayıs 2021 günü zararlının uçtuğunu görülmüştür. Yine aynı gün ilaçlama yapılmıştır. Bu kez *Ninja 5EC* isimli ilaç 100 litreye 60 gr dozunda kullanılmıştır. Ürün alınmıştır.

Sonraki yıl ise 10 mayıs 2022 günü zararlının uçtuğunu görülmüş, ilaçlama işlemi üreticinin kişisel sebeplerinden dolayı yapılamamış. Don sebebi ve ilaçlama yapılamaması ile ürün alınamamıştır. Ağaçlarda daha önce hiç görülmemiş olan şirin oluşmuştur.

Çalışma esnasında Nevşehir /Avanos Köy bağı mevkiinde badem iç kurdunun 8-12 mayıs zaman aralığında ilk erginlerinin görüldüğü tespit edilmiştir. Bu dönem çıkan ergin badem iç kurdu, ağaçlardaki yeni ürünlere yumurta bırakmak üzere devamlılığını sağlamıştır. Erginler badem üzerinde küçük yara izi bıraktığı belirlenmiştir. Yumurta bırakılan ürünlerin bir süre sonra kuruduğu, renginde sararma olduğu, bazılarının da ağaçtan döküldüğü gözlenmiştir. Badem içinde, 3-4 haftada yumurtadan çıktığı tespit edilmiştir. Bunu müteakip 12 günde de bademin içeriğini tamamen boşalttığı izlenmiştir.

Çalışmanın böcek materyali Badem İçkurdu (*Eurytoma amygdali* Enderlein)'nün erginlerinden ve diğer dönemlerini (diyapozdaki larva, beyaz krem pupa (erken dönem pupa) ve siyah pupa (geç dönem pupa) içeren bir yıl önceden (2021) kalan bulaşık badem meyvelerinden oluşmuştur.

Bulaşık mumyalaşmış badem meyveleri Nevşehir ilinin Avanos ilçesi Yukarı Mahalle mevki ve Köy Bağı mevki badem bahçelerinde hasattan sonra ağacın üzerinden veya toprak yüzeyinden toplanmıştır. (Büken A., 2022)¹. Badem İçkurdu'nun ergin bireyleri ve pupaları önceki yılın badem meyvelerinden elde edilmiştir.

Bulgular ve Tartışma

Taksonomi

Üst âlem:	Eukaryota
Âlem:	Animalia
Alt âlem:	Eumetazoa
Şube:	Arthropoda
Alt şube:	Hexapoda
Sınıf:	Insecta
Takım:	Hymenoptera
Alt takım:	Apocrita
Üst familya:	Chalcidoidea
Familya:	Eurytomidae
Alt familya:	Eurytominae
Cins:	Eurytoma
Tür:	<i>Eurytom. amygdali</i>

¹ Çalışma kapsamında, bahçe sahibi A. Büken'in görüş ve uygulamalarından yöntemsel olarak yararlanılmıştır.

Biyo – Morfoloji

Ergin: Ergini siyah renkli bir arıcık olup, dış görünüşü ile tamamen kanatlı bir karıncayı andırır. Ön kanatlar hemen hemen üçgen şeklinde, saydam, renksiz, petrol parıltılı ve ortası hafif kahverengimsidir. Arka kanatlar böbrek şeklindedir. Dişileri erkekler göre iri vücutlu olup karın nihayetinde belirgin bir yumurta koyma borusu taşırlar. Siyah renkte, sadece femur ve tibialarının uçları ile tarsi sarı renkte; kanatlar saydam ve madeni pırıltılı, başta integument nokta şeklinde çukurcuklar içerir, antenler 10 segmentli; abdomen erkekte yumurta şeklinde, dişide uca doğru sivrileşir, ovipozitör (yumurta koyma borusu) iyice belirgindir. Dişi 7-7.5; erkek 5.5-6 mm boyundadır.

Yumurta: Yumurtalar gayet küçük oval yapılı ve süt beyazı renginde olup biri kısa, diğeri uzun olan iki uzantıya sahiptirler.

Larva: Larvaları beyaz renkli ve bacaklıdır. Boyları normal duruşlarında (kırık) 4-5 mm, açılmış olarak 7-8 mm dir. Üzerleri vücut renginde seyrek kıllarla kaplıdır. Olgun larva beyaz renkte, bacaklı hafif kırıktır; boyu 6.0- 8.0 mm kadardır.

Pupa: Pupa başlangıçta beyaz renktedir. Zamanla kirli sarı bir renk alır, renk gitgide koyulaşır ve siyah olana kadar devam eder. Mevcut biyomorfolojik tanımlamalarımız; incelenen literatürlerden özellikle (Özbek vd., 1998; Barut 2007; Yeşilyaprak, 2015; Şimşek 2016) ile paralellik göstermektedir.

Biyo – Ekoloji

Dişi yumurtalarını her meyveye bir tane olmak üzere kabuk altına yerleştirir. Bir dişi 80 kadar yumurta yapar. Yumurtalar 3-4 haftada açılır, çıkan larvalar 12 gün içinde meyvede beslenir ve çekirdek evini tamamen tahrip eder. Kurtlu meyveler renk değiştirir, sararır sağlamlara oranla daha erken kurur. Sonbahar ve kış aylarında genelde, ağaçta kalan bu meyvelerin yüzeyi siyahlaşır. Badem içkurdu kışı ağaç üzerinde kalmış ya da yere dökülmüş badem meyvesi içinde olgun larva döneminde geçirir ve meyve içinde pupa olur. Larvalar ilkbaharda pupa olur, birkaç hafta sonra da erginler yaklaşık 2 mm çapında bir delikten dışarı çıkarlar. Doğada ilk erginlerin görünme zamanları Nisan ayı ortalarından Haziranın ilk haftasına kadar değişiklik gösterir. Doğu ve Güneydoğu Anadolu'da Mayıs başından itibaren başlamakta olup, daha sıcak bölgelerde çıkış biraz daha erken (Nisan) olmaktadır. Larvalar olgun hale geldikten sonra, ertesi ilkbahara, bazen de daha sonraki ilkbahara kadar kuru meyvelerde bekleyebilirler.

Konakçıları: Ana konakçı *badem* olsa da *erik* ve *kayısı* ağaçlarında da bulunurlar.

Zararı: Ergini, yumurtasını meyvenin içine koyarken, meyve üzerinde çok küçük yara izi oluşturmaktadır. Ancak meyve gelişimiyle birlikte iz belli olur. Asıl önemli zararı larvalar yapar. Larva saldırısına uğramış bademler sağlamlardan daha çabuk kuruyarak renk değiştirir. Üst kabuktaki açık yeşil renk kaybolur. Kış aylarında ise üst kabuk rengi tamamen esmerleşir. Beslenme ilerledikçe zamanla iç kısmını tamamen yiyerek boşaltırlar ve sadece meyve içinin kabuğu kalır. Erginin çıkış yaptığı meyvelerin kabuk kısmında yaklaşık 2 mm çapında çıkış deliği görülür. (Özbek vd., 1998)

Düşmanları (Larva Parazitoidleri):

Adontomerus amygdali (Torymidae; Hymenoptera)

Aprostocetus bucculentus (Eulophidae; Hymenoptera)

Avcıları

Chrysoperla carnae (Chrysopidae; Neuroptera)

Coccinella septempunctata (Coccinellidae; Coleoptera)

Scymnus pallipediformis (Coccinellidae; Coleoptera)

Propylaea quatuordecimpunctata (Coccinellidae; Coleoptera)

Oenopia (Synharmania) conglobata (Coccinellidae; Coleoptera)

Syrphus spp. (Syrphidae; Diptera)

Orius spp. (Anthocoridae; Heteroptera)

Nabis spp. (Nabidae; Heteroptera)

Ülkemizde Uygulanan Mücadele Süreçleri;

Kültürel Mücadele: Badem ağaçlarında çeşitlere göre meyvenin kurtlanma oranında farklılıklar olduğu bilinmektedir. Eğer bu kurtlanmayan çeşitler pomolojik özellikleri uygunsa, yeni tesis edilecek bademliklerde bu çeşitler tercih edilmelidir. (Türkiye’de en çok kurtlanan badem çeşitleri: Nonpareil ve Picantily)(Günaydın ve Ekici, 1969)

Mekanik mücadele: Badem içkurdu ile bulaşık tüm bahçelerde hasat sırasında veya kış aylarında ağaçlar üzerindeki ve yere dökülen kurtlu bademleri toplayarak yakmak veya çok derin şekilde toprağa gömmek zararlıya karşı en etkin mücadele yöntemidir. (Nizamlioğlu, 1962)

Kimyasal mücadele: Kullanılacak ilaçlar ve dozları hakkında en yakın il veya ilçe müdürlüklerine başvurulmalıdır. Araştırma yaptığımız Avanos Bölgesi’nde bu yöntem geleneksel olarak kullanılmaktadır. (Büken A., 2022)

Sonuç

Sonuç olarak bu çalışmada Nevşehir ilinin Avanos ilçesi Yukarı Mahalle mevkii ve Köy Bağı mevkiinde farklı lokasyondaki badem bahçelerindeki ilk ergin çıkışlarının badem meyvesinin mercimek iriliğinde olduğu 8-12 Mayıs tarihlerinde olduğu belirlenmiştir. Bu tarihlerde bölgede yaygın olarak kullanılan mücadele yöntemi, ilaçlama ile ekonomik zararın büyük oranda önüne geçildiği tespit edilmiştir. İlaçlamanın olmadığı ya da gözlem düzgün yapılmadığından geç ilaçlama yapıldığı zaman, sadece badem iç kurduna bağlı ekonomik kaybın %50’nin üzerine ulaştığı görülmüştür. Bölgede zaman zaman nisan/mayıs aylarında görülen don olayları; erken çiçeklenen badem bitkisini verim yönünden oldukça etkilediği bilinmektedir. Bununla birlikte badem iç kurduna karşı kimyasal mücadele de yapılmazsa verim kayıplarının %100’e ulaştığı da bilinmektedir.

Teşekkür

Bu çalışmada emeğini esirgemeyen çalışan babam Abbas Büken ‘ e teşekkür ediyorum (ÜY).

Abstract

Research is achieved for the sake of contribution towards science and getting information systematically, starting from the collection, passing through interpretation and final evaluation of data and all that, in an organized manner which is called scientific research. Biotechnology includes the application both of older biological knowledge, which is based on structures, functioning, and development of animals and plants in their ecological setting, and of newer approaches, which are based on an understanding of genetics and on the cellular and subcellular processes. The development of biotechnology has given society an awesome new power and an equally awesome responsibility to use it wisely. Biotechnology is being applied in different areas of science such as agriculture, health, the environment, and many other aspects of science and industry. Most of these applications and developments are centered in the developed countries and the research is established by these notions. Currently, it has been obvious that biotechnology is crucial for nation's economic growth and sustainable development. Yemen, as one of the most developing countries, is suffering to emerge molecular biotechnology research in universities and research units. This is because of many issues that affect the society, government, and ultimately the entire country, including society, human resources, facilities, infrastructure and environment resources, and stability. To conclude, the researchers in Yemen are surrounded by many challenges, which are starting in society and ending up in the laboratory. The research has very low priority on a long list of priorities such as food, stability, security, and healthcare. All the challenges can be solved, but it will need a more educated society and serious government policy toward research as a tool to build a strong society.

Alkali Extraction Of Phenolic Compounds From Tomato Peel: Optimization Of Extraction Conditions And Investigation Of Phenolic Profile By Lc-Ms/Ms

Özlem Kızılırmak Esmer, Erinç Koçak ,Alp Efe Cevrem, Orhan Kicikoğlu

Food Engineering, Faculty of Engineering, Ege University, Izmir, Turkey

Abstract

With the increasing world population, the food need of humanity is increasing proportionally. Agricultural wastes constitute an important potential for the global economy as they contain components that are less preferred to be consumed as food due to their low bioavailability due to their indigestion in the human body or due to their sensory properties, but that may be beneficial to human health such as antioxidant substances and antimicrobial agents. The benefits of using these wastes in terms of economy and reducing environmental pollution are obvious. Tomato, which is one of the most used agricultural products in our country and in the world, is processed by removing its skins in the processing of many products. Tomato skins cause serious environmental problems and economic losses unless they are valorized. In this regard, this study aims to optimize the extraction efficiency, the antioxidant capacity and total phenolic content of the tomato peel extract according to the independent variables of temperature and time, while the alkaline extraction process applied to tomato skins is cheap and industrially applicable. Using response surface methodology, highest extraction yield (28.77 g/100 g dry extract), total phenolic content (3819,32 mg GAE/100 g dry extract), and total antioxidant capacity (2737.82 µmol Trolox/100 g dry extract) were obtained under extraction conditions at 100°C for 5.26 hours. According to LC-MS/MS results, tomato skins treated with alkali contain various phenolic acids and some flavonoids. The phenolic component found in the highest amount in the tomato peel extract was determined as p-coumaric acid (429.99 ± 38,53 mg/100 g dry extract). Other important phenolic components are ferulic acid (12.44 ± 2.06); 4-hydroxy benzoic acid (7.13 ± 1.01) and vanillin (2.47 ± 0.22) mg/100 g dry extract.

Key Words: *Tomato Peel, Antioxidant Capacity, Optimization, Alkaline Extraction, Phenolic Profile*

Domates Kabuğunun Alkali Ekstraksiyon Yöntemiyle Fenolik Bileşiklerinin Ortaya Çıkarılması: Ekstraksiyon Koşullarının Optimizasyonu Ve Fenolik Profilin Lc-Ms/Ms İle İncelenmesi

Özet

Artan dünya nüfusu ile birlikte insanlığın gıda ihtiyacı da orantılı olarak artmaktadır. Tarımsal atıklar küresel ekonomi için önemli bir potansiyel oluşturmaktadır çünkü bu atıklar antioksidan maddeler ve antimikrobiyal maddeler gibi insan sağlığına faydalı olabilecek bileşenleri içermektedir. Ancak bu bileşenlerin insan vücudunda sindirilebilirliklerinin düşük olması veya duyuşal özellikleri, tarımsal atıkların gıda olarak tüketimini daha az tercih edilir kılmaktadır. Bu atıkların ekonomiye kazandırılması ve çevre kirliliğinin azaltılması açısından faydaları ortadadır. Ülkemizde ve dünyada en çok kullanılan tarım ürünlerinden biri olan domates, birçok ürünün işlenmesinde kabuğu çıkarılarak işlenmektedir. Domates kabukları değerlendirilmediği takdirde ciddi çevre sorunlarına ve ekonomik kayıplara neden olmaktadır. Bu bağlamda, bu çalışma, domates kabuklarından ucuz ve endüstriyel olarak uygulanabilir bir teknik olan alkali ekstraksiyon işlemi ile elde edilen ekstraktın ekstraksiyon verimini, antioksidan kapasitesini ve toplam fenolik madde miktarını sıcaklık ve zaman bağımsız değişkenlerine göre optimize etmeyi amaçlamaktadır. Yanıt yüzey metodolojisi kullanılarak en yüksek ekstraksiyon verimi (28.77 g/100 g kuru ekstrakt), toplam fenolik madde (3819,32 mg GAE/100g kuru ekstrakt) ve toplam antioksidan kapasite (2737.82 µmol Trolox/100 g kuru ekstrakt) elde edilmiştir. 5.26 saat boyunca 100°C'de ekstraksiyon koşulları altında LC-MS/MS fenolik profil sonuçlarına göre alkali ile muamele edilen domates kabukları çeşitli fenolik asitler ve bazı flavonoidler içermektedir. Domates kabuğu ekstraktında en yüksek miktarda bulunan fenolik bileşen p-kumarik asit (429,99 ± 38,53 mg/100 g kuru ekstrakt) olarak belirlenmiştir. Diğer önemli fenolik bileşenler ise ferulik asit (12.44 ± 2.06); 4-hidroksi benzoik asit (7.13 ± 1.01) ve vanilin (2.47 ± 0.22) mg/100 g kuru ekstrakt.olarak tespit edilmiştir.

Vertical Axis Maglev wind Turbine having Various Designs

Harshit Bhavsar¹

¹Assistant Professor, Department of Mechanical Engineering, SAL College of Engineering, Ahmedabad, Gujarat, India

Abstract

Renewable energy sources like turbines are gaining additional importance in recent years as apprehension of setting pollution has increased. Several developments have taken place to utilize star and wind energy. Wind is gift all over in the slightest degree time however wind turbines are present in few places to get power. An effort has been created to create use of wind even from tiny regions by developing paradigm of vertical axis wind turbine mistreatment railroading suspension to harness power. A new approach of getting placed the magnets (double finished arrangement) has been experimented during this work. The aim is to use straightforward material as turbine blade and generate power by magnetically levitated system. A brand new means of putting the ND magnet and coils were deployed on the wind turbine plates and experimented during this work. On rotation of the wind turbine the magnetic arrangement would produce axial flux whereas passing over copper coil arrangement.

Keywords: turbine-Blades, Magnetic Levitation, Magnets, Wind Energy,

Introduction

Presently a day, we will eventually have to look for inexhaustible or basically limitless fuel hotspots for the human turn of events to proceed. Environmentally friendly power is for the most part power provided from sources, for example, wind power, sunlight based force, geothermal energy, hydropower and some others. The requirement for the environmentally friendly power is high from most recent couple of a long time because of the weariness of regular power age strategies. The utilization of environmentally friendly power is the as it were thing that diminishes the reliance of human on petroleum products. Among the wide range of various environmentally friendly power sources Wind Energy is one of the quickest developing fuel sources which is developing at the pace of 30% yearly diagram.[2]

The breeze speeds in Asian nations is extremely low, particularly in the urban areas, and this much measure of wind speed isn't sufficient to begin the breeze factory. This undertaking presents structure and guideline of the proposed attractive levitation wind turbine for better use of wind energy. In Maglev Wind turbine there is no grating, and subsequently it can deal with low speed. The Maglev wind turbine configuration is a huge take off from customary propeller plans. Its fundamental preferences are that it utilizes frictionless orientation and an attractive levitation plan and it doesn't have to tremendous spaces needed by more regular breeze turbines. It additionally requires nearly nothing if any support. The Maglev wind turbine was first uncovered at the Wind Power Asia display in Beijing 2007. The exceptional working standard behind this plan is through attractive levitation. Attractive levitation is as far as anyone knows an incredibly proficient framework for wind energy. The vertically situated edges of the breeze turbine are suspended noticeable all around supplanting any requirement for metal rollers.(T G Sriganesh, G J Naveen, Vishnu P)

Wind power terminology:

Figure 8 Maglev Vertical Axis Wind Turbine

Sujata R. Ingle, Ambika prasad O. Chaubey have shown the effectiveness of the breeze turbine is subject to wind availability, in the event that the measure of wind is adequate breeze turbine sharp edges are turning continuously. The wind is hits the cutting edges of the turbine, the force age by the cutting edges can be determined as, Dynamic energy (K.E) = $\frac{1}{2} mv^2$ Measure of Air cruising is given by,

$$m = \rho AV \quad (1)$$

Subbing this estimation of the mass in articulation of K.E,

$$K.E = \rho Av^3 \text{ Watts} \quad (2)$$

To change control over to kilo watt a non-dimensional proportionality steady k is presented where,

$$k = 2.14 \times 10^{-3}$$

$$\text{Along these lines, Force in KW (P)} = 2.14 \rho Av^3 \times 10 \quad (3)$$

Where,

m = Mass of air navigating

A = Area

Air Density (ρ) = 1.2 kg/m³

Cleared by the sharp edges of the turbine

Speed (V) = wind speed with condition over, the force being created can be determined, anyway one should take note of that it is preposterous to expect to change over all the intensity of the breeze into power. The turbine assimilates the breeze energy with their individual edge will move more slow that the breeze speed. The distinctive speed creates a drag power to drive the sharp edges. The drag power for following up on one sharp edge is determined as

$$F_w = Cd2A \frac{U_w - U_b}{2}$$

Where,

A - Swept territory of the cutting edge

ρ - Air thickness (about 1.225 kg/m³ adrift level)

U_w - Wind speed

C_d - The drag coefficient (1.9 for rectangular structure)

U_b - The speed on the edge surface.

Figure 9 Drag- Based Wind Turbine Concept

Principle and types of magnetic suspension:

research on Magnetic suspension way that an item is suspended through magnetic enchantment and/or repulsion forces to reap non-touch guide and low-friction in motion.

Due to no mechanical contact in the attractive bearing, it has numerous points of interest, including no wear, no defilement, reasonable for long haul use in vacuum and destructive climate, no mechanical grinding, low commotion, low force misfortune and no need of grease or fixing. In this manner, attractive suspension innovation can be utilized for fast applications to kill mechanical issues identified with oil and force misfortune.

Attractive levitation is a technique wherein an article is suspended with no help other than attractive fields. The attractive power created is utilized to neutralize the impacts of gravitational power and lift up the item. By putting these two magnets on top of one another with like polarities confronting one another, the attractive shock will be solid enough to get both the magnets a good way off far from one another. There are numerous preferences for using attractive levitation that is to limit contact, make power estimation, plan, and engaging gadgets. As of late,

this development innovation is applied into transportation framework in which non-leading vehicle travel securely at extremely rapid while suspended, guided, and moved over a guide path by attractive fields. The idea of attractively suspended vehicle invigorated the turn of events of helpful application in different fields, for example, power age.

Figure 10 Free body diagram of magnetically levitated object

Working Principle:

This is the overall schematic graph of attractive levitation vertical hub wind turbine by which the force is created by utilizing Faraday's first law of acceptance which expresses that "Any place a conductor is put in a fluctuating attractive field, emf are instigated which is called incited emf, if the conductor circuit are shut, current are likewise actuated which is called initiated current." The breeze energy turns the breeze turbine cutting edges which are fixed to circle and to which magnets are fixed and attractive motion of these magnets joins with the loop which is put on the base of the maglev wind factory.[3]

Figure 4 Sketch and components of maglev wind turbine

Figure 5 Block diagram of maglev wind turbine

Advantages:

- A monstrous pinnacle structure isn't needed, as VAWT's are mounted nearer to the ground.
- These are found nearer to the ground and subsequently simpler to keep up.
- No such oil requirements.
- Capable of creating power from wind speeds as low as 1.5 m/s and answered to work in breezes arriving at 40 m/s.
- Producing 20% more energy than a regular turbine, at once shrinking operational expenses by half over the customary draft turbine.
- Better response to quickly evolving winds.
- Lighter weight towers

Future Scope:

Future work could involve examination of the impact of following points of view talked about beneath on the presentation of the current rotor.

- By utilizing modernized cutting edges for Savonius rotor, the force of the rotor can be expanded to deliver more force at even low speeds.
- Design identified with self-flexible End Plates can be created to draw in more air to go through the cutting edges via programmed formation of weight differential across gulf and source.
- In this plan we can put Solar Plate and can get multiplied power with a similar spot being use

Conclusion

The idea of vertical hub wind turbine utilizing attractive levitation effectively worked. Contrasting with customary even wind turbines, single maglev wind turbine having enormous limit gives more yield. The turbine productivity is improved by usage of magnets assisting with turning with quick speed with insignificant grinding as it offsets the weight on the shaft of the turbine. The standard windmills having set of 1000 windmills powers 5 lakh homes while single maglev wind turbine is fit providing capacity to 7.5 lakh homes. The necessary zone for single maglev windmill is under 100 sections of land while field of 1000 windmills require in excess of 64000 sections of land. From this perception we can say that a solitary maglev wind turbine is conservative contrasted with traditional breeze turbine.

Regarding huge scope power creation, vertical hub wind turbines have not been known to be appropriate for these applications.. A mortgage holder would have the option to separate free clean energy subsequently encountering a decrease in their utility cost and furthermore add to the "Environmentally friendly power Energy" mindfulness that is progressively picking up ubiquity.

Express Determination Of Ecotoxicant Volume Substances In Waste Water Formed In The Process Of Hydrogen Purification Of Petroleum Oils

Huseynli Atlas

Baku State University, Ecological chemistry, Baku, Azerbaijan Republic

Abstract

The hydrogen treatment plant for petroleum distillates and other oil distillates at the Heydar Aliyev Oil Refinery is considered to be more environmentally and economically efficient than the old classical technological plants. As it is known, so far the complete reduction of emissions has not been achieved during the technological processes of oil refining in the developed countries of the world oil industry

One of the main directions of our research is the initial assessment of the environmental impact of wastewater generated at the facility. The following analyzes were performed for this purpose.

Spectral analysis of volatile ecotoxicants in water samples taken from wastewater formed during the hydrogenation of Autol 8 and Autol 15 oil distillates as catalysts as the main raw material was carried out in the above-mentioned facility [1-3].

We use gas chromatography-mass spectrometry method for the analysis of aromatic hydrocarbons in polystyrene wastewater; optical emission spectrometry method for metals; spectrometry method for phenols, dyes and fluorine; nephelometry method for turbidity; gravimetry method for common suspended particles.

The results obtained during laboratory measurements by taking water samples from the general wastewater outlet of the facility in accordance with the known methods are shown below (Table 1).

As can be seen from the results obtained from the tables, the reasons for the formation of all volatile organic and inorganic substances with all ecotoxicant properties in the water sample taken from the plant of the refinery can be explained as follows:

- Chemical transformations of hydrogen gas with Autol 8 and Autol 15 distillates due to the presence of sulfur, nitrogen, oxygen, phosphorus organic compounds, various mixtures of hydrocarbons and metal salts and catalysts, pressure and temperature up to 280-310°C. resulting in volatile ecotoxicants.
- Although the individual quantities of the refinery are less than normal, as can be seen from the table, their total amount is very high and toxic.

Table 1. Results of analysis of industrial wastewater

Assigned indicator	Amounts. mg/l
Polycyclic aromatic hydrocarbons	
Naphthalene	9.8
Acenaftilen	0.06
Acenaften	0.06
Fluoren	0.17
Fenantren	0.27
Anthracene	0.18
Fluorant	0.23
Pyrenees	0.36
Benz (a) anthracene	0.34
Krizen	0.53
Benz (b + j + k) fluorescent	0.30
Benz (a) pyrene	0.18
Inden (1,2,3-cd) pyrene	0.08
Benz (ghi) perilen	0.09
Dibenz (ah) anthracene	0.09
Σ 16 Polycyclic aromatic hydrocarbons	12.7

Role of lactic acid bacteria in food preservation

Ahmed Abdirahman Ahmed^{1,*} and Gökçen Yıldız¹

Bursa Technical University, Faculty of Engineering and Natural Sciences, Food Engineering Department, 16310, Bursa, Türkiye

Abstract

Organic molecules are used as electron acceptors and/or donors to generate energy in food fermentation process. The preservation of food products by using lactic acid bacteria (LAB) has gained increasing interest since it is cheap and typically requires no or medium heat. LAB are Gram-positive, non-spore-forming, microaerophilic or anaerobic bacteria that produce lactic acid as the major end product of fermentation. LAB are typically catalase and cytochrome negative, fastidious, aerotolerant, and acid tolerant. LAB are classified into two groups as *homofermentative* and *heterofermentative bacteria*. While the homofermentative LAB (all species of *Lactococcus*, *Pediococcus*, lactic *Streptococcus*, and some species of *Lactobacillus*) convert most sugars to lactic acid quantitatively, the heterofermentative LAB (all species of *Leuconostoc* and some species of *Lactobacillus*) produce ethanol/acetic acid and carbon-dioxide in addition to lactic acid. Several food products including meat and fish, dairy, vegetables, cereals and fruits have gone through fermentation process where the existence of lactic acid bacteria due to their distinctive metabolic properties. The aim of this review is to discuss the importance of lactic acid bacteria in food preservation and give information about some significant fermented foods.

Keywords: *lactic acid bacteria, fermentation, food preservation*

Introduction

Food fermentation is the process of utilizing microorganisms to produce food or modify its properties. Production of fermented foods is one of the earliest methods on food processing techniques. Methods used for fermenting meats, milks, and vegetables have been documented since the beginning of civilization. The earliest records were dated to 6000 BC and the civilizations of the Fertile Crescent in the Middle East (Fox, 1993).

Fermentation was carried out coincidentally which led to low efficiency and uncertain final product quality in the past. The traditions developed by processing and preserving specific raw materials in a particular way led to the formation of foods which has desirable and attractive properties organoleptically in addition to preserving the food quality. Nowadays, a few starting cultures are used in industrial production. On the other hand, traditional food products generally rely on the spontaneous fermentation (Leonard et al., 2021).

Not many fermented foods are safe to consume immediately since the occurrence of some biochemical changes. Due to the development of certain flavoring chemicals, such as carboxylic acids, diacetyl, aldehydes, ketones, and esters, the maturation process helps to food products to achieve stability and improve the sensory quality. These factors are useful on fermented foods to become more acceptable by consumers in addition to the health benefits and better sensory qualities of these foods (Admassie, 2018).

Preservatives are food additives, in accordance with European Union (EU) regulations, which protect the foods against the microorganisms (fungi and/or bacteria) and extend the shelf life of foods. Sodium chloride, also known as salt, is likely the oldest preservative which still in use today. Organic acids used as preservatives in foods have a low pH include acetic acid (E260), propanoic acid (E280), benzoic acid (E210), and sorbic acid (E200). Nitrates and nitrites are used to prevent *Clostridium botulinum* growth in foods containing raw meat, such as salamis, ham, bacon, and sausage. On the other hand, sulphur dioxide (E220) and sulphites (E221-E226 and 224-228) are frequently added to dry fruits, juices, and wines to inhibit the growth of microbes. Antibiotics like nisin (E234) and natamycin (E235) are also used to prevent the growth of bacteria and fungi in a variety of foods (Silva & Lidon, 2016).

Chemical preservatives can show an adverse effects on some food products according to the several studies. For instance, the EU's Scientific Committee for Food (Directive 2008/7/CE, 2008) reported (on September 22, 1995) that nitrates in meat products are transformed into nitrites (i.e. by heating). Voss (2002), claimed that sulfur dioxide may led to degradation of thiamine, and using this chemical might result with vitamin B₁ loss. In addition, sorbic acid and sorbates can lead to possible allergies and are typically defined as urticarial (Voss, 2002; Abdulmumeen et al., 2012). The use of microorganisms and their metabolites in a biological way to preserve food, termed as biopreservation, has received a lot of attention in recent years as a result of consumers' growing knowledge of the risks of chemical preservatives to their health. Several characteristics are needed to be met by microorganisms for natural preservation such as safety, the production of non-toxic metabolites, retaining high activity during storage, and the lack of any detrimental effects on the product's sensory attributes (Muhialdin et al., 2020a).

The aim of this study is to provide information on the effectiveness of lactic acid fermentation in boosting food safety as well as the activity of LAB against pathogens such as bacteria, yeast, and filamentous fungi. The role of lactic acid bacteria in food preservation will be addressed, and some noteworthy fermented foods will be mentioned.

LAB

Lactic acid fermentation is used to acidify milk, which results in the creation of fermented dairy products including cheese, yogurt, butter, sour cream, etc (Muhialdin et al., 2020b). Additionally, the method is utilized to mature cold cuts and is responsible for the production and stabilization of vegetable silage and sourdough. Both homo- and heterofermentative LAB are involved in the fermentation process. The bacteria belonging to the genera *Lactococcus*, *Streptococcus*, *Lactobacillus*, *Leuconostoc*, *Pediococcus*, *Weissella*, and *Bifidobacterium* are the most common cultures employed in the processes of lactic acid fermentation.

Some LAB strains perform homofermentation by converting disaccharides to nearly pure lactic acid. On the other hand, in heterofermentation process, ethyl alcohol, carbon dioxide, hydrogen peroxide, diacetyl, acetoin, and acetic aldehyde are produced in addition to lactic acid as a result of the breakdown of lactose compound (Mandha et al., 2021). The basic fermentation method is lactic acid fermentation. Due to the predominance of LAB, which can adapt to the low pH easily, the natural pH decrease during the fermentation process does not have a harmful effect on the effectiveness of biochemistry (Wang et al., 2007).

LAB show the specific characteristics as nonsporulating, Gram-positive, rods and cocci. Lactic acids are one of the main fermentation products. They can only phosphorylate substrates at the level of the molecule to produce energy since they lack cytochromes and porphyrins and are unable to perform electron transport phosphorylation. They belong to the group of obligatory or relative anaerobes and can survive in acidic pH values (Hurtado et al., 2012).

In addition to being used in the food industry and generally recognized as safe (GRAS), LAB also make up the natural microflora of human intestines. Even though they produce a variety of metabolites with antimicrobial action during the growth and fermentation processes, LAB are crucial in the context of biopreservation. These metabolites include lactic acid, hydrogen peroxide, acetic acid, low molecular weight substances (diacetyl, fatty acids, reuterin, and reutericyclin), antifungal compounds (phenyl lactate, propionate, and hydroxyphenyl lactate), and bacteriocins (Castellano et al., 2017).

Lactic acid bacteria's metabolic activity

Although lactic acid bacteria can grow at temperatures as low as 5°C and as high as 45°C, they are mostly classified as mesophilic. Similar to this, some strains are active at pH 9.6 and others are at pH 3.2, while the bulk of bacteria grow between pH 4.0-4.5. For the microbial growth, strains are typically lipolytic and proteolytic and needed preformed amino acids, purine and pyrimidine bases, as well as B vitamins (Stamer, 1976). Since none of the lactic acid bacteria have functional heme-linked electron transport chains or functioning Krebs cycle, they all create lactic acid from hexoses and get their energy through substrate level phosphorylation.

The lactic acid that is created can either be L (+), D (-), or a combination of these two. Since D (-) lactic acid cannot be metabolized by humans, it should not be given to infants or young children (World Health Organization, 1974).

Homofermentative and heterofermentative lactic acid bacteria are classified according to the mechanisms through which hexoses are metabolized:

Fig 1. The scheme for lactic acid bacteria to ferment glucose (Caplice & Fitzgerald, 1999).

Mechanisms of lactic acid bacteria-mediated antibiosis

The production of organic acids, carbon dioxide, diacetyl, hydrogen peroxide, broad-spectrum antimicrobials like reuterin in addition to bacteriocins are only a few of the specific antimicrobial processes of lactic acid bacteria that are used in the biopreservation of food products (Vuyst & Vandamme, 1994a). These factors are believed to contribute to the inhibitory impact of Microguard. To prevent the growth of molds and gram-negative bacteria, *Propionibacterium freudenreichii* subsp. *shermanii* ferments skimmed milk. This product is then pasteurized and added as a generally recognized as safe (GRAS) food preservative to the most cottage cheese production in the United States.

Bacteriocins

The majority of the proteins in the bacteriocins group are generally thermostable and have antibacterial capabilities. Bacteriocins are considered to be used by adhering to phosphate residues on the target cells' cell membranes, which opens pores and activates an enzyme called autolysin which breaks the bacterial cell walls (Papagianni & Anastasiadou, 2009). Bacteriocins are cationic and hydrophobic peptides that range in size from 20 to 60 amino acids. Furthermore, ribosomal machinery is the foundation of their synthesis. Operons in plasmids, chromosomes, and other genetic organelles are home of the bacteriocin-encoding genes (Hernández-González et al., 2021).

Bacteriocins' ability to combat bacteria, fungi, viruses, parasites, and other natural structures like biofilms is one of its most significant characteristics. The classification of bacteriocins produced by LAB based on three primary classes was proposed by Alvarez-Sieiro et al. (2016). Modified, heat-stable, and low-molecular-weight peptides consist of uncommon amino acids like lanthionine are included in class I. Unmodified thermostable, low molecular weight bacteriocins make up class II. And finally, only the last class contains high molecular weight and thermolabile compounds (Pérez-Ramos et al., 2021). Their actions can be bactericidal or bacteriostatic toward species connected to the strain. Bacteriocins are produced in response to environmental factors such as nutrient availability, bacterial cell density, acetic acid, and the presence of signal peptides. Their main structure serves as the foundation of their activity mechanism. Other bacteria's gene expression and protein synthesis can be effected by some bacteriocins when they enter their cytoplasm. However, some of them have the ability to act on the cytoplasmic membrane, causing the release of essential chemicals from sensitive microorganisms and resulting in cell lysis.

Additionally, a number of bacteriocins show synergistic effects with antibiotics, lowering the side effects and impairing the focus. It is widely known that they have synergistic effects on *Listeria monocytogenes* and *Staphylococcus aureus* when combined with other biomolecules like citric acid and nisin. However, it is crucial to note that the resistance of the aforementioned bacteria to bacteriocins is modest in comparison to that of the bacteria to conventional antibiotics (Soltani et al., 2021).

Organic acids and acetaldehyde

Organic acids such as lactic, acetic, and propionic, which may be formed by lactic acid bacterial fermentation of foods, have well-known antibacterial properties directly (Davidson et al., 2012). The impact of the acids on the bacterial cytoplasmic membrane, which interferes with the preservation of membrane potential and hinders active transport, is thought to be the cause of the antagonistic interaction (Cherrington et al., 1991). At a given molar concentration, not all of the acids exhibit the same antibacterial effect. Bacteria, yeasts, and molds can all be inhibited by acetic acid, which is more inhibitory than the lactic acid (Blom & Mørtvedt, 1991). Propionic acid, which is present in Microguard, inhibits bacteria and fungi and is also present in Bioprofit, a commercial product where the combination of a *Propionibacterium freudenreichii* strain and *Lactobacillus rhamnosus* increases the inhibitory activity against fungi and some gram-positive bacteria. Since the flavor threshold is significantly lower than the amounts to be required to enable microbe suppression, acetaldehyde's contribution to biopreservation is minimal (Frank & Marth, 1977).

Carbon dioxide

Some aerobic food microorganisms are poisoned by carbon dioxide, which is produced during heterolactic fermentation and can directly produce an anaerobic environment. It also has the ability to lower the internal and external pH, which has a negative impact on some aerobic food bacteria. Some bacteria may grow more rapidly when it is present in low concentrations (Vuyst & Vandamme, 1994b).

Hydrogen peroxide (H₂O₂)

True catalase, which is required to degrade the hydrogen peroxide produced in the presence of oxygen, is absent in lactic acid bacteria. According to some studies, H₂O₂ can build up and hinder some microorganisms. The high oxidizing action on cell proteins and membrane lipids mediates inhibition. By forming hypothiocyanate and other antimicrobials, hydrogen peroxide may also activate the lactoperoxidase system in fresh milk. It is unclear how much H₂O₂ contributes to antibacterial action in vivo because other enzyme systems, such as flavoproteins and peroxidases, can break down the H₂O₂ (Nagy et al., 1991).

Fermented foods

Foods produced or preserved by the action of microorganisms include a variety of fermented foods. When used in this context, the term "fermentation" usually refers to the conversion of sugar to alcohol using yeast. However, other fermentation processes, including the production of foods like yogurt and sauerkraut, also require bacteria like lactobacillus. Today, people's diet includes several fermented foods. The primary raw materials used in the industrial production of most well-known fermented foods are listed as milk, meat, cucumber, and cabbage. These produce a vast array of yoghurt and fermented milk drinks, fermented sausages and salamis, pickles, and sauerkraut (Jay et al., 2008).

Table 1. Common fermented foods

Type	Main Ingredient	Microorganism(s)	Country	References

Conclusion

In the placement of chemical and/or physical methods which are typically seen as harmful to the product's quality and consumer health in the food preservation, biopreservation may provide a biological alternative to these methods. Considering the capacity to enhance nutritional content of food products by producing some vitamins, organic acids, and other substances, biopreservation based on the utilization of LAB and their metabolites may be linked with an improvement in food safety as well as other advantages for human health. Many food products all over the world are benefited from lactic acid fermentation in terms of safetiness, nutritional content, shelf life, and

acceptability of food products. It can be described as useful technology since it combines economical household-level techniques to extend the shelf life, improve the sensory characteristics, increase the safety, and boost the nutritional content of foods. More research on technological advancement, technology transfer and socioeconomic effects of lactic acid fermentation are needed to maximize the potential of this technology.

Phosphate solubilizing bacteria (PSB) isolation from tomato rhizospheres at Koka district, Ethiopia.

***Dereje Haile, Bizuayehu Tesfaye and Fassil Assefa**

School of Plant and Horticultural Science, College of Agriculture, Hawassa University, Hawassa, Ethiopia.

Abstract

Phosphorous is an essential macronutrient for plant growth and development. Most of the soil is deficient in plant available phosphorous and due to economic limitations majority of Ethiopian farmers applied inadequate fertilizers. It is essential to stabilize a mechanism to access P for plants with an efficient, cheap, and eco-friendly approach for enhanced crop growth and production. The main objective of this study was to screen efficient phosphate solubilizing bacteria from tomato rhizosphere soil. Using halo zone formation on PVK agar medium more than 400 PSB were isolated from 13 rhizosphere soil samples. By evaluating SI, texture in the culture-re-culturing process, liquid medium pH change efficiency, OD reading and CFU, upmost three promising PSB isolates (K-1-29, K-10-27, and K-10-41) were selected. Five days of incubation of isolates in PVK broth showed significant pH reduction. For instance, isolate K-10-41 showed significant pH reduction (4.02) which indicates organic acid production. Isolation and evaluation of efficient phosphate solubilizing bacteria maintain soil fertility, promote plant growth, induce plant response to pathogens, reduce agrochemical consumption and promote sustainable agriculture. Therefore, these selected PSB isolates need further detailed study for taxonomic identification, plant growth promotion, host range, and phytopathogen response. Local isolation improves environmental adaptation and indigenous competition.

Abstract

Drought is one of the most serious environmental, social, and economic issues facing the world today. This study looked at the pattern and temporal variation of drought in East Wollega Zone, Western Ethiopia, from 1981 to 2017. The daily rainfall data of seven stations for 37 years (1981-2017) was collected from National Meteorological Agency of Ethiopia. The study utilized multi-index approach drought indexes such as Standardized Precipitation Index (SPI), Standardized Precipitation Evapotranspiration Index (SPEI), Rainfall Anomaly Index (RAI), Palmer Drought Severity Index (PDSI), Deciles Index (DI), Reconnaissance Drought Index (RDI), Percent Normal Precipitation Index (PNI), Z-Score (ZSI) and Precipitation Concentration Index (PCI) using R and DrinC software. The result of the study revealed a declined trend of rainfall while the trend and frequency of drought increased. All of the drought indexes agreed that the years 1999-2005 were the worst hit by drought. The trend of annual rainfall deviation from normal was increased while it was decreased on seasonal basis. The temporal precipitation distribution of the area was moderate for 22 years (59.46%) and irregular rainfall distribution for 15 years (40.54%). The diminishing rainfall and increased trend and frequency of drought should be taken into account when making agricultural system decisions and planning adaptation in the area.

Abstract

Meat is an important component of modern diet and perishable food commodity. In 2021 all over the world 346.14 million tons meat was consumed and expecting to increase 453 million tons within 10 years. So it gain greater attention, proper processing and packaging practices are need to extend its shelf life and reduce the quality degradation of meat. In quality preservation, packaging is a supreme important factor but there is a need that packaging material should be environment friendly and non-toxic to human health. As consumer also demands for high quality, low cost, sustainable and natural food packaging. In this regard there is an increasing demand of organic and edible source based film and coatings that reduces the packaging waste. The organic compounds used in edible packaging are protein (milk, collagen and soy protein), polysaccharides (cellulose, pectin and starch) and lipids (essential oil and waxes). They act as barrier properties against water, light and gasses with excellent transparency, mechanical strength, sensory perceptions and extend the shelf life. The functionality of edible film and coating can be improved by adding the novel agents such as antioxidants (essential oils), antimicrobial (gallic acid and lactoperoxidase) and plasticizers (glycerol and sorbitol). Application of edible film and coatings in the meat industry by foaming, spraying, casting, brushing, wrapping and rolling. The purpose of study is to briefly explain the novel component of edible film and coatings; their formulation, application methods, research and developments of film wrapped or coated meat or meat products and their future trends.

Abstract

Ergene River is the most significant aquatic ecosystem of Thrace Region of Türkiye. But unfortunately, it is being exposed to an intensive pollution. In this research, water quality of Ergene River Basin was evaluated by using River Pollution Index (RPI). Surface water samples were taken from 25 stations selected on the watershed in summer season of 2020. Total of 4 variables including dissolved oxygen (DO), biological oxygen demand (BOD), suspended solids (SS) and ammonium (NH₃) were measured and RPI scores were calculated for all the investigated potamic habitats. Also, Geographic Information System (GIS) was used to provide a visual summary of the RPI results. According to detected data, 20% of the basin components were found as "Highly Polluted", 24% of the basin components were found as "Moderately Polluted", 28% of the basin components were found as "Less Polluted" and 28% of the basin components were found as "Unpolluted" in general.

Keywords: *Ergene River Basin, Water quality, River Pollution Index*

Introduction

Water pollution is among the most important problems of the world especially in recent years. Especially freshwater habitats are significantly affected by developing technology and population growth. New methods are developed for the evaluation of the contamination levels on the water ecosystems. Also in especially recent years, the synergistic effects of different parameters are being evaluated using various indices. The River Pollution Index (RPI) is an effective water quality assessment tool and being widely used all over the world (Akın et al., 2010; Chen et al., 2012; Çiçek et al., 2013; Wang et al., 2014; Onur and Tokatlı, 2020; Köse et al., 2020; Tokatlı, 2021; 2022; Yüksel et al., 2022; Varol et al., 2022).

The Ergene River originates from the Yıldız Mountains on the Black Sea coast of the Marmara Region and merges with the Meriç River and discharges into the Aegean Sea. Safaalan, Çorlu, Ahmetbey, Köprüaltı, Ana, Hayrabolu, Büyükdere, Kuleli, Anadere, Hasanağa and Sazlıdere Streams constitute the most important tributaries. Meriç – Ergene River Basin is the most significant potamic habitat of the Thrace Region of Türkiye. But as in many aquatic habitats, it is being adversely affected from industrial and agricultural pollution (Tokatlı and Ustaoglu, 2020; Tokatlı and Varol, 2021; Tokatlı et al., 2022; Varol and Tokatlı, 2022). The aim of this research was to evaluate the water quality of Ergene River Basin by using RPI.

Material And Methods

Sample Collection

In this study, water samples were collected from 25 stations located on the Ergene River Basin in the summer season of 2020. The topographic map of Ergene River Basin and selected stations on the watershed are given in Figure 1.

Chemical Analysis

Dissolved oxygen (DS) parameter was determined by using a multi – parameter device (Hach Lange – HQ40D) in the field studies; suspended solids (SS) parameter was determined by using a colorimeter device (Hach Lange – DR890) in the laboratory studies; ammonium (NH₃) parameter was determined by using a spectrophotometer device (Hach Lange – DR3900) in the laboratory studies; biological oxygen demand (BOD) parameter was determined by using a BOD device (Hach Lange – BOD Track) in the laboratory studies.

Figure 1. Ergene River Basin and selected stations

River Pollution Index (RPI)

The RPI is a simple method for assessing river water quality, which is calculated by using levels of 4 parameters; dissolved oxygen (DO), biological oxygen demand (BOD), suspended solids (SS) and ammonium (NH_3). Each parameter is converted into a four-state quality score given in Table 1, and the RPI is calculated by using the following equation (Liou et al., 2004; Chen et al., 2012);

$$RPI = 1/4 \sum_{i=1}^4 Si$$

Table 1. River Pollution Index scores

Parameters	Unpolluted	Less polluted	Moderately polluted	Highly polluted
DO (ppm)	>6.5	4.5-6.5	2.0-4.5	<2.0
BOD (ppm)	<3	3-5	5-15	>15
SS (ppm)	20	20-50	50-100	>100
NH_3 (ppm)	0.5	0.5-0.9	0.9-3.0	>3.0
Index Score (Si)	1	3	6	10
Sub-index Score	<2	2-3	3-6	>6

GIS Based Analysis

Geographical Information System (GIS) was used in all phases of the collection, storage, analysis and assessment of surface water samples in the Ergene River Basin area. The spatial information of the stations, whose coordinates were gathered with the portable GPS device, was stored as feature layers in a geodatabase established specifically for this study using gis software. In addition, Stream Network data was produced according to Strahler order with 30 m resolution Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) digital elevation model. In the basin, thematic maps showing distribution on stream network according to the class limit values of river pollution index were prepared. However, RPI scores were mapped as bar column in each sampling location in the river basin.

Results And Discussion

Results of applied River Pollution Index (RPI) scores of investigated basin components selected on the Ergene River Basin are given in Figure 2 and Figure 3.

According to the results of monomial RPI, the risk ranking of the parameters investigated in terms of index scores is as follows: BOD > NH₃ > SS > DO (Figure 2). According to the results of multinomial RPI, the riskiest habitats among the basin components investigated in terms of index scores were determined as Çorlu Stream and Ergene River (Figure 3).

As a result of applied RPI, 20% of the basin components were found as "Highly Polluted", 24% of the basin components were found as "Moderately Polluted", 28% of the basin components were found as "Less Polluted" and 28% of the basin components were found as "Unpolluted" in general.

Ammonium occurs as a result of the breakdown of organic substances containing nitrogen in general. It is an intermediate product and not significantly toxic for most organisms. Organic matter degradation, organic fertilizer or chemical fertilization from inorganic ammonium, discharge of domestic and industrial wastewaters are important factors that increase the amount of ammonium (NH₄) in water. Another significant indicator of biological activity and organic matter content in freshwater habitats is the biological oxygen demand (BOD) parameter and it is clearly known that BOD parameter can reach quite high levels especially in regions where organic wastes are high. (Wetzel, 2001; Manahan, 2011; Tokatlı et al., 2022).

According to results of RPI, NH₄ and BOD parameters were found as the most critical parameters for the Ergene River Basin. It is thought that the intensive agricultural and industrial activities carried out in the watershed may be the reason of the detected quite high RPI scores of these parameters especially in the water Çorlu Stream and Ergene River.

Conclusions

In the present investigation, River Pollution Index (RPI) a widely used surface potamic water quality assessment index was used to evaluate the quality of Ergene River Basin by determining some significant limnologic parameters including dissolved oxygen, biological oxygen demand, suspended solids and ammonium. As a result of applied RPI, 20% of the basin components were found as "Highly Polluted", 24% of the basin components were found as "Moderately Polluted", 28% of the basin components were found as "Less Polluted" and 28% of the basin components were found as "Unpolluted" in general. It was also determined that BOD and NH₄ parameters were found as the most critical parameters for the basin among the investigated parameters and Çorlu Stream and Ergene River were found as the most critical fluvial habitats for the system among the investigated basin components.

Women Empowerment in Agricultural Activities and Its Impact on Farming Household Food Security: The Case of Anna Sorra District, Guji Zone, Oromia Regional State, Ethiopia.

Guduro Beriso Ware

Department of Rural Development and Agricultural Extension, Jimma University, Ethiopia.

Abstract

Background: Food insecurity is widely recognized as a major concern throughout the world, notably in East Africa, including Ethiopia. Empowering women through agricultural activities is one key solution to improve food security, even though considerable gender inequities still exist. Hence, the objective of this study was to examine women's empowerment in agricultural activities and its impact on farming household food security among 336 randomly selected women households in Anna Sorra District, Guji zone, Oromia region of Ethiopia.

Methodology: Both quantitative and qualitative data were collected using a household survey, focus group discussion, and key informant interview data collection methods. Descriptive statistics (women empowerment in the agricultural index (WEAI), Household caloric acquisition), and econometric model (Binary logistic regression and Propensity Scores Matching) were used to analyze the data.

Result: The descriptive statistics result under women empowerment in the agricultural index showed that overall five domains of empowerment (5DE) of the study area were 73.7% and the 5DE result shows that 58.6% of the women in the sample were disempowered. The results of household caloric acquisition showed that out of 336 total respondents 53.9 % of the households were food in-secured, while the remaining 46.1% of the households are food secured. The regression result reveals that, except distant from the nearest market, other significant variables such as age, women being household head, educational level of women, Education of husband, annual household income, off/non-farm income, and ownership of the property had a positive effect on women empowerment. The result from Propensity Scores Matching revealed that empowered women households had higher food calorie intake per day per adult equivalent than those who did not. The average treatment effect on the treated (ATT) from empowered women's households was 560.89Kcal/AE/day.

Conclusion: The study concluded that empowering women in agricultural activities is one key valuable potential solution to ensure food security in the study area. As a result, it is suggested that the government's and all other stakeholders should focus on empowering women and further research should be conducted for a more holistic understanding of the significance of women's empowerment.

Keywords: Women empowerment, Impact, Anna Sorra, food security, Agricultural index

Background of the study

Food insecurity is widely recognized as a key issue around the world. According to the most recent data, nearly 9.2% of the world's population is at risk of the most extreme type of food insecurity. The individuals suffering food inadequacy are about 1.04 billion from Asia; 676 million and 188 million from Africa & Latin America, respectively (FAO, et al., 2019).

Food insecurity is an enduring and significant issue in East African countries, particularly Ethiopia (Mohamed, 2017). The number of food-insecure people in the country increases from time to time; which was an estimated 3.2 million people in 2012, 4.5 million in 2015, 5.6 million people in the year 2017, needed emergency food support (FAO et al., 2017), 8.13 million people need food assistance in 2019 (FSIN, 2020) and 2020 about 12.1 million peoples in the acute food insecurity (WFP and FAO, 2021).

Globally, debates on food security include gender equality as a mechanism to foster economic balance and food security (Aziz et al., 2020). Significantly, several researchers for instance, (Quisumbing and Pandolfelli, 2010), have demonstrated strong ties between gender inequality and food insecurity, especially in the case of underprivileged and oppressed women who sometimes have access to essential resources. The FAO (2009) gender equality congress reported that, women's access to resources and opportunities is typically limited, and their output remains low in comparison to their potential (Gender Equality, 2009).

Ethiopia has one of the lowest gender equality performance indicators in the world. The reports revealed that, Ethiopia is ranked 82nd out of 153 countries in 2019, while in 2020 ranked 97st out of 156 countries (Global Gender Gap Report, 2020 and Global Gender Gap Report, 2021). UN Women (2018) asserted, in certain cases, women are at a disadvantage as compared to men. They are strongly excluded in the social, economic, and political spheres and face restrictions in making decisions about issues that concern their lives. In line with this, Mengistie, (2013) confirmed that, women's socioeconomic deprivation is marked by a lack of resources, services, and work opportunities.

The account given by Care (2020) prevailed that food security will not be achieved without gender equality and rural women's economic, social, and political empowerment (. Gender based discrimination, or the denial of women's human rights, is widely acknowledged as one of the leading causes of hunger and food insecurity (Van,

2021). According to, Visser, and Wangu (2021) empowering women through agricultural activities is one key solution to improve food security. If women had equitable access to productive resources, they could increase farm yields by 20–30 percent, agricultural output in developing countries could be raised by 2.5–4 %, and the number of hungry people in the world could be reduced by 12–17%. Accordingly, an empowered woman can have a significant impact on how resources, especially food, are distributed in the household, benefiting the entire family's health and wellbeing.

Although there are numerous technical, political, financial, and other barriers to equality, the literature evidence, for instance (CFS, 2017) show that social norms and systemic barriers to gender equality and women's empowerment in the food security sphere are the most important. Discriminatory social norms, traditions, and roles form the gendered distribution of paid and unpaid work; restrict women's access to assets, economic capital, and markets; and erode women's self-confidence and leadership capacity. In addition to normative attributes of women discrimination, other studies, for instance, Didana, (2019), has identified socioeconomic factors such as age, family size, education level, household income, employment, ownership of property, and institutional factors including credit utilization, distance from the market, access of information, and participation of community affairs are among others determining women's level of empowerment in agricultural activities.

The impact of women's empowerment through agricultural activities has remain the focus of development research studies, (Lépine, and Strobl, 2013; Imai et al., 2014) arguing, is one of the most effective ways to increase food security. The fundamental reason has been well established by the study report, (Duflo, 2012), is the existence of variability in of resource, especially of income utilization preference among women and their counterparts asserted that, women invest significantly more resources in the well-being of their family members.

The above arguments (Lépine, and Strobl, 2013; Imai et al., 2014) that are not women empowerment as an effective solution in ensuring household food security are more of to the theoretical/ conceptual abstraction levels. Women empowerment, therefore, as it has been argued by Akter et al. (2017) would have been influenced by the contextual factors particularly, development policies and their implementation interventions. Thus, analyzing the relevance of empowerment for outcomes such as food security and nutrition requires addressing both the context-specificity as well as the multidimensionality of women empowerment in the development context. It is critical, asserted by Akter, et al. (2017), to recognize the specific settings in which certain policies are formed in order to construct relevant policies that address gender inequality.

To this end, several studies, for instance (Schutter, 2013; Sraboni et al. 2014), have shown a correlation between women's empowerment and household livelihood outcomes such as food security. Women choose to help and ensure household food security when they have leverage over assets and decision-making power (Schutter, 2013), and there is a positive relationship between women's empowerment and food security and calorie availability (Sraboni et al. 2014). Moreover, according to the findings of study conducted by (Aziz et al., 2020), women's rights in different domains, including leadership domain, agricultural production, resource ownership and time spent on farming lands have major positive effects on food security. However, since majority of these research studies has been focused on South Asia countries, there are few empirical evidences on the issue in Ethiopia.

Among recent studies, (Girma & Singh, 2019; Melese, 2019; Abera et al., 2020) in Ethiopia have focused on factors that affect women's empowerment. Even though, these studies, attempted to identify socio-demographic and institutional factors affecting women's empowerment, little attention has been given to economic factors such as assets ownership, off-farm and non-farm income, that are assumed pertinent to ensuring household food security. There are only few partial assessment studies among which, (Yimer & Tadesse, 2016 and Gebre et al. 2021) linking women empowerment in agriculture to household food security with in the agriculture-food security development pathways-framework. These studies are primarily concerned with the association between women's empowerment with children and women's nutritional status, thus, they have limited scope in integrating women's empowerment with overall household food security. In addition, it has been identified that, there is a methodological gap in the above reviewed studies. Have review, none of these studies; apply appropriate econometric models to evaluate the impact by using propensity score matching without considering unobserved factor covariates.

Therefore, this study believed, though empirically and systematic investigation that has established evidence based linkage of women's empowerment and farming household food security; has contributed new body of knowledge pertinent to planning and implementation of appropriate development interventions.

Methods and materials

Description of the study area

Geographical location: The research was conducted in Anna Sorra District, which is located in the Guji Zone of the Oromiya National Regional State. Anna Sora District Is situated in Oromia regional state at about 469km from Addis Ababa. It is bordered on the south by Arda Jila, on the west by Uraga, on the north Bore, and east by the Sidama people. The administration center of the District is Irba Muda. Astronomically, the district is situated at 60 15"N to 70 N and 380 to 390 15"E north of the equator.

Topography: The District has diverse topographic features that led it to experience a complex and diverse climatic condition. The District has a diverse agro-ecological zone which is the direct cause of experiencing the complex climatic condition. And altitudinally, district ranges from 1200-2800 meters above sea level.

The climate of the area: The district encompasses lowland, midland, and highland agro-ecological zones. It receives an estimated amount of 350-1830mm of rainfall annually and with an annual average temperature of 11.2-21.0 °C, Anna Sora District Agricultural office (ASDAO, 2021). The district has two main rainy seasons, spring and autumn that are locally known as Ganna and Hagayya rains, respectively. Most of the area receives its maximum rainfall in spring and small rainfall in autumn. Expected to be 78 % of the total annual rainfall is received during the spring season which comes at the end of February to the May and autumn is the minor rainy season of the area where rains begin in September and ends in November.

Economic activity: Cereal crops like Barley, Wheat, Corn (maize), Teff, Horse bean and Pea are important crops cultivated, Enset remain staple food, where coffee is grown in some parts of the district. Furthermore, livestock is the major economic activity in this District. Generally, their area was mostly agricultural-based (ASDAO, 2021).

Population and demographic characteristics: The 2006 national census reported CSA, (2006) total population for this District of 132,000 of whom 64,221 were men and 67,779 women, 13,601 or 8.15% of its population was urban dwellers, which is less than the Zone average of 11.6%. With an estimated area of 1,196.88 square kilometers, Anna Sora has an estimated population density of 110.3 people per square kilometer, which is greater than the Zone average of 21.1

The five largest ethnic groups reported in Anna Sora were the Oromo (86.92%), the Amhara (4%), the Gedeo (3.81%), the Sidama (3.42%), and the Silte (0.99%); all other ethnic groups made up 0.86% of the population. Oromiffa was spoken as a first language by 86.41%, 5.57% spoke Amharic and 3.63% spoke Gedeo the remaining 4.39% spoke all other primary languages reported. The majority of the inhabitants were protestant with 41.22% of the population having reported they practiced that belief, were 19% Muslims, while 17.62% of the population said they practiced traditional beliefs, 8.47% professed Ethiopian Orthodox Christianity 4.29% was catholic and 1.33% was Protestants (CSA, 2006).

Research design

A cross-sectional survey design involving quantitative and qualitative methods was used in this study to analyze women's empowerment in agricultural activities and its impact on household food security in the study area.

Study population, Sampling Design and Sample size determination

A multi-stage sampling procedure was followed in this study. In the first stage, Anna Sora District was selected purposively bearing in mind the fact that it is one of the most agricultural-based, the most populous. In the second stage, from the total of 20 kebeles², four kebeles were randomly selected. In the last stage, 336 samples of women households were selected by simple random sampling method. Since kebeles differ in terms of the total number of households they encompass, probability proportional to sample size-sampling technique was employed to determine the number of households from each kebele.

To determine the number of sample respondents, the Yemane formula was used. By considering 5% levels of error and determine sample size as follows:

² Kebele is the smallest administrative unit in the study area

$$n = N/1 + N (\alpha)^2 \dots\dots\dots (1)$$

Where;

n = Sample Size

N = Total number of targeted populations

α = level of precision (sampling error) at 5% significance level, the margin of error Level of confidence is 95 percent; this was chosen because the convenient method reduces the possibility of nonresponse drastically.

Accordingly, the sample size was determined from a total of four Kebele households out of 20 rural Kebeles of Anna Sorra District by the formula of Yamane as follows:

$n = 2,102/1 + (0.05^2) * 2,102 = 336$. To distribute the sample size to each Kebele, the sample size determination formula of Israel (1992) was used. That is $ns = (Nh/Ns) * n$, Where: ns = sample size from each kebele, Nh = total population in each kebele, Ns = Total population of the sum of kebeles for the study, and n = Total sample size population from the study. Table 1 presents sample distribution across the selected kebeles.

Table 1: Study sample size distribution proportion to respective kebeles

Kebeles	Sample of HH	ns= (Nh/Ns) *n	Proportion sample size from each kebeles
Robale Debaye	504	$504/2,102) * 336$	81
Kuku Seletto	634	$(634/2,102) * 336$	101
Kochore Barsisa	512	$(512/2,102) * 336$	82
Cicu Burasisa	452	$(452/2,102) * 336$	72
Total	2,102	(2,102/2,102) * 336	336

Data type and sources

Qualitative and quantitative data were solicited from both primary and secondary sources to answer the research questions of the study. Primary data was collected from women respondents, on different issues such as household characteristics, all other variables hypothesized to empowerment, and domains that determine women empowerment. In addition to this, about food security condition in study area was asked. Further, the secondary data was also used to increase the additional information necessary to substantiate the study. It was collected from reports, journals, articles, books, bulletins, statistical reports, and government documents, published and unpublished documents (thesis), and from websites and records of development agents, agricultural Office, and women and children affairs officers of the District.

Methods of data collection

The data was collected through various data collection methods such as household surveys, focus group discussions, and key informants.

Household survey

To generate quantitative and qualitative information at the household level, a household survey was undertaken by developing a structured interview schedule. The interview schedule was designed based on the objectives of the study- level of women empowerment, factors affecting women empowerment, the status of household food security, and the impact of women empowerment on household food security that aimed to address. The survey addressed data on five domains (production, resource, income, leadership, and time) and ten indicators (input in productive decisions, relative autonomy in productive decisions, ownership of land and assets, purchase, sale, and transfer of assets, access to credit control over the use of income, group membership, speaking in public, workload, and leisure) related to the level of women empowerment. Furthermore, to examine factors of women empowerment, data were collected on socio-demographic characteristics, age of respondents, women being household head, educational status of women, education of husband, distance from the market, Annually household farm income, off/non-farm income of the household, owning property, farm size credit utilization and extension contact, the number of participation in social groups and Access to information channels.

To capture the daily calorie consumption of food by each of the sampled households in the Anna Sorra, sort of questions were included to investigate data on the type and amount of food consumed by each household for seven days was considered. For each food item, different units of local measurement were translated into a common measure. Four enumerators were selected based on their ability to speak the local language. Before data collection, all the enumerators were trained about the methods of data collection, the content of the survey schedule, and how they approach the interviewee. Thus, the survey was conducted by selecting one enumerator for each study site and awareness was given for populations before actual data collection and finally the administration of actual

fieldwork. The questionnaire was prepared in English language and translated into the local language (Afan Oromo), and Amharic, because most of the women were Afan Oromo speakers, and the others, is come from different regional states and zones, especially from SNNP particularly Gedeo and Sidama peoples.

Focus Group Discussion (FGD)

Group discussions are intended to foster collective and creative enthusiasm, which leads to the sharing of new ideas and concepts with an outsider who becomes acquainted with them (Chambers, 1992). One particular powerful strategy to properly employ FGDs is to bring participants together with a common background with the issue under discussion. Getting groups' opinions, attitudes, and views is a requirement to elaborate, clarify and cross-check ideas, experiences, and arguments obtained through other methods. Based on this argument and to have detailed information that has been useful to draw the right conclusion from the survey work, qualitative information was gathered from purposively selected respondent women, development agents, and community leaders using checklists. Collection of primary qualitative information was managed through discussing with the focused group to generate information on the background on women's participation in their agricultural activities and the level of their decision, the factors influencing women to become empowered. Moreover, they were asked questions related to the situation of food security and the impact of those empowered women on household food security.

A total 28 people in four (4) focus group discussions were conducted in the study area (one focus group discussion per kebeles). Seven people made up the focus groups. In each kebeles, one focus group was made up of women, while the other focus groups were made up of males who were thought to have a lot of knowledge about women's lives, what influences them as a community, and food security. The enumerators, with the guidance of the researcher, guided the discussions.

Key informant interview:

In-depth interviews with purposively selected key informants were undertaken. Key informant interviews likewise, enabled the study to draw important information on women empowerment history, factors that influence them for a long period of and the issue regarding household food security and matter concerned what if women empowered to household food security in the study area. This method was conducted in two ways. One is guided by a general interview guide (checklist questions), and the second is an informal conversational interview conducted spontaneously. The key informant interviews were including two experts of women and children affairs office, three agricultural office experts, four religious leaders, two elder females and two elder males, one development agents (DA), and 4 Kebele leaders at each kebeles were interviewed.

Methods of data analysis

The quantitative data collected from the survey households were edited, coded, entered, cleaned, and analyzed by employing SPSS 23version and STATA 15 software. Descriptive, inferential statistics and econometric models were used for this study. Descriptive statistics such as frequency and percentage were used for dummy variables and minimum-maximum, mean, and standard deviations were used for continuous variables to summarize and present the quantitative data. An Independent t-test for the continuous and chi-square test for dummy variables were employed to test the significance.

Measuring of women empowerment status

Women Empowerment in Agricultural Index (WEAI) is the most recent index established by Oxford Poverty & Human Development Initiative (OPHI) in 2012 as a direct measure of household and individual economic empowerment and gender equity (Alkire *et al.*, 2012; 2013; and Yang & Stanley, 2012). Because empowerment is a dynamic and complex concept, a single indicator is insufficient to assess it. As a result, the WEAI was utilized to investigate women's empowerment; the five dimensions of empowerment like production, resource, income, leadership, and time with ten indicators (input in productive decisions, relative autonomy in productive decisions, ownership of land and assets, purchase, sale, and transfer of assets, access to credit, control over the use of income, group membership, speaking in public, workload, and leisure) were used and weighted according to their weight (Alkire *et al.*, 2012; Alkire *et al.*, 2013), with the 5 DE contributing for 90% of the measurement. WEAI aims to increase the understanding of the existent of the link between women's empowerment, food security, and agricultural growth (Malapit *et al.*, 2015). According to Alkire *et al.* (2012), and Alkire *et al.*, (2013), one has to achieve adequacy in more than 80% of the indicators to be empowered. A cut-off point for analysis is any combination of a number between 0 and 100% following the international standard set by Alkire *et al.* (2012); Alkire *et al.* (2013) cutoff point at 20% was used.

Coding the disempowerment indicators

Based on the idea of Alkire *et al.* (2012), the inadequacy score (Ci) of disempowerment indicators is the coded value of 1 for an individual who is inadequate in all 10 indicators and 0 for an individual who has no inadequacy on any indicator. The inadequacy score (Ci) is computed by:

$$(Ci) = W_1I_1 + W_2I_2 + \dots + W_dI_d \quad (2)$$

Where I_d = inadequacy achievement of a person in the indicator “i”; $I_d = 1$ for inadequacy and 0 otherwise.
 W_d = weight attached to indicator I

Identification of the disempowered

A cutoff of point 0.20 (20%) is used to identify the disempowered (Alkier *et al.*, 2013). This cutoff point is the share-weighted disempowerment an individual must have to be considered as disempowered, which is denoted by (k) . Hence, it is a way to compute the censored score. $C_i(k)$ denotes a censored score and C_i is a non-censored score. If $C_i > k$, the $C_i(k) = C_i$, and if $C_i < k$, then $C_i(k) = 0$ where $C_i(k)$ is the disempowerment score of the disempowered.

1st step: Disempowered headcount ratio (H_p): it is the incidence of the individuals (within a given population) whose share of weighted inadequacies is more than the cut-off k .

$H = \frac{q}{n}$ Where, H = Disempowered headcount ratio, q = number of disempowered individuals, and n is the total population.

2nd step: Intensity of disempowerment (A_e): it is the average inadequacy score of the disempowered individual.

$$A = \frac{\sum_{i=1}^n C_i(k)}{q} \quad (3)$$

Where, $C_i(k)$ = censored inadequacy score of individual i , and q is the number of disempowered individuals.

3rd step: Computing five domains of disempowerment

The disempowerment of an individual in five domains of empowerment is the product of disempowerment headcount and the average inadequacy score.

$$\text{Symbolically: } M_0 = H_p * A_e \quad (4)$$

Where, M_0 = Disempowerment Index, H_p = Disempowered Headcount, and A_e = Average Inadequacy Score.

$$\text{Finally, 5DE is easily obtained: } 5DE = 1 - M_0 = H_e + H_p \times A_e \dots\dots\dots (5)$$

Breaking of disempowerment index by domain and indicators

This is important to see the disempowerment of women in different context via decomposing M_0 into its component-censored indicators. The censored headcount in each of the indicators is calculated by adding up the number of disempowered people who are deprived of the indicator and dividing it by the total population. The censored headcount ratio for an indicator implies the proportion of deprived people in that indicator.

The overall M_0 can be computed as:

$$M_0 = w_1 C_{Hi1} + w_2 C_{Hi2} \dots + w_{10} C_{Hi10} \quad (6)$$

Where M_0 = Total disempowerment index, C_{Hi} is the censored headcount ratio of the indicator “i” and w_i is the weight attached to the indicator “i”, the sum of each weight is equal to one.

The percentage contribution of each indicator to overall disempowerment is computed as follows:

$$\% \text{ contribution of the indicator } I \text{ to } M_0 = \frac{w_i C_{Hi}}{M_0} \quad (7)$$

The contributions of all indicators were sum up to 100%. And the percentage contribution of each domain to the overall disempowerment of women is the sum of the percentage contribution of each indicator in their respective domain.

Measuring food security status

Household food security was calculated using the household calorie acquisition method, which is based on the daily calorie consumption variable measured in Kcal/AE/day at the household level. To assess household food security in the study area, data on the type and amount of food consumed by each household for seven days was considered. For each food item, different units of local measurement were translated into a common measure. Then, using the calorie conversion factor Adult Equivalent (AE), the calorie content of food products eaten by sample households was determined. Each household's total kilocalorie intake was calculated and then translated to regular quantities. Finally, each household's overall daily food kilocalorie intake was divided by household AE, yielding daily household kilocalorie intake per AE. The results then are compared to the Ethiopian government's

daily minimum subsistence requirement of 2,200 Kcal per AE (MoFED, 2012). As a result, the value of the minimum subsistence requirement was used as a cut-off point for determining if a household is food secure or food insecure, with a household being considered food secure if it meets this requirement and insecure if it does not.

Binary logit model

Logit and Probit models are commonly used to establish the relationship between household characteristics and a dichotomous response variable, according to popular belief. The probabilities are bound between 0 and 1, which gives these models an advantage over the Linear Probability model. They also fit the nonlinear relationships between the response and the explanatory variables the best. The models define a functional relationship between empowerment probabilities and various explanatory variables. Gujarati (1995) also pointed out that the probit model and the logistic model are nearly identical in terms of the formulation; the main difference is that the logistic model has slightly flatter tails than the cumulative normal distribution, i.e. the probit curve approaches the axes faster than the logistic curve. As a result, the choice between the two is purely mathematical.

In this case, the logit model is preferred over the probit model. A similarly, Hosmer *et al.*, (1989) claimed that the logistic distribution has an advantage over the others in the analysis of dichotomous outcome variables because it is a mathematically flexible and easy-to-use model that yields meaningful interpretations. As a result, the binary logit model was used in this study, even though both models may produce similar results. According to Gujarati (1995), the binary logit model is defined as follows,

$$P_i = \frac{1}{1 + e^{-(\beta_0 + \beta_1 X_i)}} \quad (8)$$

Equation (1) can be expressed by:

$$P_i = \frac{1}{1 + e^{-Z_i}} \quad (9)$$

Where; $Z_i = \beta_0 + \beta_1 X_i$

If P_i is the probability of being women empowered and the probability of disempowering $1 - P_i$, which is expressed, follows in equation 3.

$$1 - P_i = \frac{1}{1 + e^{Z_i}} \quad (10)$$

Equation 4 is obtained by dividing the empowered to disempower:

$$\frac{P_i}{1 - P_i} = \frac{1 + e^{Z_i}}{1 + e^{-Z_i}} = e^{Z_i} \quad (11)$$

Therefore;

The odds ratio (the ratio of the probability that an individual would choose an alternative). P_i is the probability of women empowered from 0 to 1.

Taking natural logarithms of $\frac{P_i}{(1 + P_i)} = e^{Z_i}$

$$L_i = \ln \frac{P_i}{(1 + P_i)} = \beta_0 + \beta_1 X_1 + \dots + \beta_k X_k + \mu_i \quad (12)$$

$$\text{Where; } Z_i = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_k X_k \quad (13)$$

Z_i is a function of k -independent variables β_0 = is the intercept or constant term

X_i = i th independent variable K = represents number of independent variables

X_k = Total number of independent variables.

Propensity score matching (PSM)

To generate statistically acceptable matched pairs between empowered and disempowered, the PSM probability model was used. The logic behind propensity score methods is that balance observed covariates through careful matching on a single score. This study was used propensity score matching techniques to build a matching pair for respondents that have similar observable characteristics between empowered and disempowered households based on p -score in absence of baseline data. The propensity score is defined as the probability of receiving treatment based on measured Covariates:

$$E(x) = P(D=1 | X) \quad (14)$$

Where $E(x)$ is the abbreviation for propensity score, P a probability, $D=1$ a treatment indicator with values 0 for control (disempowered), and 1 for treatment (empowered). This matching process creates a balance between treated and untreated women respondents. It is also expected to create a balance on covariates that are used to estimate the propensity score. This balance property is a key aspect of the propensity score method because; a

balanced pre-test covariate cannot be a confounder anymore, each that cannot bias the treatment effect estimate (Thoemmes, 2012). According to Caliendo and Kopeinig (2008), some steps apply in PSM. These steps are predicted propensity scores; choosing matching algorithm, restrict common support areas, testing matching quality or balancing tests, and sensitivity analysis.

Definition of variables and working hypothesis

Based on the review of empirical findings and observation concerning the existing conditions of the study area, the following variables were defined and hypothesized.

Outcome variable

In this study, the outcome variable is food security which is continuous and measured in the calorie acquisition method, the resulting average kcal consumed per adult equivalent per day was compared to the Ethiopian government's daily minimum subsistence requirement of 2,200 Kcal per AE (MoFED, 2012). As a result, the value of the minimum subsistence requirement was used as a cut-off point for determining if a household is food secure or food insecure, with a household being considered food secure if it meets this requirement and insecure if it does not.

Dependent variable

The dependent variable in this research was women's empowerment. The dependent variable is binary/dummy, 1 if the women are empowered, and 0, otherwise. According to Alkire *et al.* (2012) and Alkire *et al.* (2013), to be empowered, one has to achieve adequacy in more than 80% of the indicators. A cut-off point for analysis is any combination of the number between 0 and 100% following the international standard set by (Alkire *et al.* 2012: 13) cutoff point of 20% was being used.

Independent variables

The independent or explanatory variables are variables that tend to explain and influence the dependent variable. The explanatory variables that were hypothesized to affect women's empowerment are presented below.

Age of women respondent (AGE): Age is a continuous variable measured in years and one of the factors of multi-dimensional empowerment of women has long been explored by many researchers and the findings differ in different studies. It plays an important role in the process of agricultural production. For example, according to research conducted by Asmare *et al.* (2017), the result revealed that age is significantly associated with the empowerment of women, i.e. the age characteristics of women are considered to contribute favorably if she increases because she can be actively involved in agricultural activities. This study was expected this variable to influence women empowerment positively.

Women headed household (HEAD): Household in which an adult female is the sole or main decision-maker. Is about whether or not the women headed household are divorced, widowed, or have a husband who is ill, and whether or not their husband is far away from their household owing to employment, and so on. This variable is a dummy variable taking the value of 1, if women are head of and 0, otherwise. As previously stated, being women headed household affect their empowerment positively. For example, empirical result by Moepeng and Tisdell (2008), and Machio *et al.*, (2020) revealed that being women household head increase women empowerment. Hence, this study was expected this variable to influence women's empowerment positively.

Education status of women respondent (EDUCWOMEN): Education status is another continuous variable that is measured in years of schooling. The literature reveals that education is a very important factor in increasing women's empowerment in agricultural activities. The level of education was a fundamental factor that influences the empowerment of women significantly and positively (Taye, 2014; Vishal, 2015; Asmare *et al.*, 2017; Machio *et al.*, 2020 and Dadina, 2019). On an individual basis, the more the women farmers are educated, the more they tend to contact information and technology agents and become the user and participant of new agricultural practices to search for better agricultural income (Aazami, 2011). Hence, it is hypothesized that the educational status of women influences women's empowerment positively.

Educational status of husband (EDUCHUSBAND): Educational status of the husband is another continuous variable that is measured in years of schooling and that affects women's empowerment. This variable asks women whether their husbands are educated or not by considering their year of schooling. The most important aspect of husband education is his wife's empowerment. According to Thandar *et al.*, (2020), the result of binary logistic regression on women's empowerment among married women aged 15 to 49 shows that education level of husband is statistically significant affect women empowerment and he concluded that women with educated husbands have a higher level of empowerment than women with illiterate husbands. Therefore, it is hypothesized that the educational status of the husband influences women's empowerment positively.

Family size (AE). It is a Continuous variable that measured the number of members in adult equivalent. Literature shows that family size was another factor that affects the empowerment of rural women. According to Ali (2014), there is a strongly positive and significant influence of household size over women's empowerment. Households with large family sizes (in the productive age group) have been reported as one of the most important contributing variables for increased agricultural production (Adekunle, 2013). As a result, as the number of adults in a household grows, so women become empowered. Thus, in this study, the variable is expected to positively influence the empowerment of women.

Land holding (LSIZE): Size of Landholding is a continuous variable that is measured by total land owned by the household in hectares. Research conducted by Tefera *et al.*, (2014), demonstrates that the household farm size is a direct determinant of women's empowerment. It was assumed that the larger the farm size the farmer has the better seek to information and contact extension agent and situated to be empowered and economically strong. Hence, this study variable has expected to positively influence the empowerment of women.

Farm Income (AHFARMINC): Household income is a continuous variable that is measured in terms of Ethiopian Birr (ETB) and it's the most important factor that determines women empowerment. According to Asmare *et al.*, (2017); Taye, (2014); Haimanot, (2007) and Vishal, (2015) who applied descriptive studies to investigate the impact of microfinance services on the Empowerment of women household income has a statistically significant influence on the empowerment of women. Damisa and Yohana (2007) revealed that the annual farm income obtained from the sale of crops, livestock, and the sale of vegetables and other agricultural practices increases the farmers' financial capacity and increases the probability of investing and participating in new empowerment practices and technologies. Therefore, this variable has expected to positively influence the empowerment of women.

Income from non-farm activities (NON/OFF-FRMINC): This variable is a dummy variable taking the value of 1 if income earning from off-farm activities and 0 otherwise. (Kaba, 2009), indicated the significant influence of income towards women. Though these off/non-farm activities are diverse, income sources from handcrafts, selling labor, and petty trade are the most important for this variable. The incomes households seek from these sources are analyzed based on participation in these activities and earning cash income. Participating in different non/off-farm activities may increase the chance to be economically empowerment. As a result, Income from non-farm activities of women has been hypothesized to influence positively the empowerment of women.

Own property (OWNPROP): Having own property is a Dummy variable given value 1 if have owned, and 0 otherwise. Property ownership particularly land and Livestock are the most important asset and an index of wealth, prestige in rural communities. Gebrat (2013), consequently, he argues that accesses to the owned property for rural women have a strongly significant influence on the empowerment of women. Consequently, having the own property of women has been hypothesized to influence positively the empowerment of women.

Access to Credit (CREDIT): Access to Credit is a dummy variable taking a value of 1, if the woman has access to credit in the study period and 0, otherwise. According to Fletschner and Kenney (2011), rural farmers who have access to credit may overcome their financial constraints and therefore buy inputs and farm implements. That is the access to credit can relax the financial constraints of women farmers. As cited by Tefera, and Beyan (2014), the farmers without cash and no access to credit will find it very difficult to attain and adopt new technologies, access to inputs, and poor markets as top constraints to increasing productivity, a noteworthy gap (Ragasa *et al.*, 2012). A household's access to credit has a significant contribution to agricultural production (Anaeto *et al.*, 2012 and Adekunle, 2013). Thus, Access to Credit for women households has been hypothesized to influence the empowerment of women positively.

Extension Service (EXTSERVICE): Extension service is dummy variable takes value 1 if women household get access to extension service and 0 otherwise. The variable represents extension service as an important source of information, knowledge, and advice to smallholder farmers in Ethiopia. Empirical results revealed that extension service has a fundamental influence on farm households' adoption of new technology (Ali, 2014). He depicts that there is a strongly significant and positive influence on the empowerment of women. Hence, Contact with extension agents was hypothesized to positively affect women empowerment in this study.

Access to informational channels (ACSINFRMTNCH): Access to information channels is a dummy variable of whether households have access to information channels (=1, if yes; =0 otherwise). Access to informational channels, for instance, TV viewing, radio listening, printed materials, and public meeting were considered as the important factors to provide agricultural and relevant information, and informed farmers may play an important role in familiarizing women with basic information at their ease (Anila, 2009). At present, radio is a popular means of communication. Therefore, radio ownership is assumed to increase the probability of empowerment in rural activities. A study conducted by Almaz (2008) revealed that the effort to disseminate agricultural technologies is mainly successful if there is effective dissemination of information through mass media. If the information on technologies, programs, markets, etc. was more widely available and accessible; women would be better able to make their own choice out of a range of possible options. So, Access to informational channels was hypothesized to positively affect women's empowerment in this study.

Membership to social groups (SOCIALG): This is a continuous variable, measured in terms of the number of social groups in which the individual has a membership. It used to indicate the rural women's membership and involvement in a different social group. Abebe (2011) pointed that the more the woman farmer was participating in social groups, the more she will participate in the different activities of agriculture and be more empowered. Therefore, the number of social groups participating has been hypothesized to influence positively the empowerment of women.

Distance from the nearest market (DSFNRMKT): It is a continuous variable that measures in terms of Kms. If the market is far away from the households' residence, they may lack information regarding the market price and

quantity which makes them worse off. Hence women who are nearer to the nearest market towns are more likely to be empowered. The study conducted by Gebrat, (2013) reveals that the higher the demand for products and services, it is believed that the higher the empowerment of women. The households' residence was affected by their proximity to the market; they may lack information about the market price and quantity, making them worse off. As a result, women who live near a market are more likely to be empowered. Therefore, the distance from the nearest market of women's households has been hypothesized to influence negatively the empowerment of women.

Results And Discussion

Level of women empowerment

Because the comparison of empowered and disempowered women is the emphasis of the next explanation of continuous and categorical variables, this section begins with describing the level of women's empowerment. Tables 2 and 3, depict women's empowerment as determined by agricultural index measurement methodologies. The Women empowerment in agricultural index for the study area is presented in Table 2. The WEAI for the study area is 0.737, which is the outcome of weighted 5DE (the value of five dimensions of empowerment). This outcome is less favorable than the Bangladesh pilot study carried out by Malapit et al., (2017) in the country's southern and southwestern regions. But, the result is higher than the 0.702 results obtained in Guatemala. However, it is lower than the result obtained in Uganda's pilot studies (Alkire *et al*, 2012).

Overall, 58.6 percent of women are disempowered, while 41.4 percent of them are empowered according to the headcount ratio. The percentage of disempowered women in the study area is higher than in Uganda (58 percent), Guatemala (56.7 percent) (Alkire *et al*, 2012; Alkire *et al.*, 2013), and Nepal (58 percent) (Cunningham et al., 2015). On the contrary, it is found to be lower than in Bangladesh (61 percent), Guatemala (71.3 percent) (Alkire *et al.*, 2013), in Pakistan (83 percent) (Ahmad & Khan, 2016). Moreover, different studies in Ethiopia on women empowerment reported different results. For instance, Yimer & Tadesse, (2015), Didana (2019), and Belete and Melak (2020) reported 69 percent; 65.58 percent; 79 percent, respectively.

Overall, 26.3% of women are disempowered in five domains of empowerment, which is higher than the comparable measure of disempowerment in Bangladesh (25.4%) and Uganda (21.1%) but lower than women's disempowerment index of Guatemala (31%) by (Alkire, et al., 2013) and in Amhara national regional state of Ethiopia (30.81%) by (Belete and Melak, 2020). On average, women who are not yet empowered have inadequate achievement in 45% of the domains. This infers that the disempowered woman had achieved adequacy in 55% of the 5DE indicators.

Table 2: Level of women empowerment

Indexes	Index value
Disempowered Headcount (Hp)	0.586
Empowered Headcount (1-Hp)	0.414
Average Inadequacy Score (Ae)	0.450
Average Adequacy Score (1- Ae)	0.550
Disempowerment Index ($M0 = Hp \times Ae$ or $= 1-5DE$)	0.263
5DE Index ($1-M0$)	0.737

Source: Own survey (2021).

The decomposition of 5DE (Table 3) the censored headcount ratio shows that the domains that contribute most to women's disempowerment are about 27% of women lack in a decision in production and 25% percent of women lack sole or jointly decision-making power over autonomy in productive decisions and the ability to make decisions about it. The results show that women receive fewer empowerment effects due to their lack of command over productive resources and control over output. The findings also reveal that about 35, 65 and 36 percent of women lack the ability solely or jointly make decisions about ownership of land and assets, purchase, sale, and transfer of assets as well as access to credit, respectively. These factors contribute to the constraints they face in terms of extra limits that prohibit them from fully using their land, cattle, and other assets, possible market decision-making, such as purchasing and selling input and output, and credit utilization. They rely extensively on others, particularly their husbands and male relatives, for labor, skills, and contributions. Likewise, 14 percent of women lack control over the use of income. This might be due to the fact that men control more income in the studied area.

According to the findings, 22% of these women are not members of a group, and 25% of the women in the study do not have access to public speech or the ability to make a public speech. Group participation and public speech, on the other hand, were associated with barriers to women's ability or willingness to advance in leadership positions, such as gender biases in social service institutions. As a result, 30% of women do not have a manageable workload that exceeds 10.5 hours per day, and 15% of rural women do not have adequate leisure time. This finding indicates that there was a difference in workloads and share of input production decision-making and that there

was a risk that the production process would further marginalize women. The outcome is in line with a preliminary empirical finding in southern Guatemala (Alkire et al., 2013) and (Malapit and Quisumbing, 2015).

Two old males' ages 67 and 51, and one female, age 49, from Denbobi Robale Kebale participated in a focus group discussion and key informant interview. They pointed that, '*according to Robale Kebale, women face challenges in obtaining resources, and time poverty (high workloads and limited leisure time) is a major source of women's disempowerment*'. '*Again they argue that women in this area invest their time on work at least 13 hours in a one day*'. However, they frequently describe women's workload as disempowering. This is possible since men's initial bargaining position under patriarchy was that they were the primary decision-makers in their families and Men think that women are not as good in management as men in the resource.

Econometric model analysis results of on factors affecting women empowerment

Before moving to econometric estimation and results demonstrate, multicollinearity was checked using variance inflation factor (VIF) and contingency coefficients (CC). The variance inflation factor (VIF) was used to determine whether or not continuous independent variables were multicollinearity. The term multicollinearity is the existence of a "perfect," or exact, linear relationship among some or all explanatory variables of a regression model and also refers to the case in which two or more explanatory variables in the regression model are highly correlated and also an indication for a linear relationship between independent variable is called multicollinearity. So multicollinearity occurs when the independent variables are not independent of each other. The presence of multicollinearity affects the least-squares estimators and renders them inefficient. The problem of multicollinearity must therefore be regarded as a 'block mark' that reduces the confidence in the conventional tests of least squares estimators. The method that is commonly used to detect the existence or absence of multicollinearity is the variance inflation factor. Based on this the researcher used the variance inflation factor and contingency coefficients test to check the presence or absence of multicollinearity in the data. A decision rule for the multicollinearity test for the model stated is a variable whose VIF value is greater than 10 indicates the existence of a multicollinearity problem. As it is observed there is no multicollinearity. The researcher concluded that there is no problem of multicollinearity between the explanatory variables.

Age (AGE): Age of the respondents was hypothesized that it will have a positive relationship with the dependent variable. The result of the Binary logit regression model has shown that age has a positive influence on dependent variables and is statistically significant at the 1% level. The odds ratio in favor of women empowerment increases by a factor of 1.068 when the age of women increases by one year. Therefore, one can conclude that as the age of women increases, the probability of being empowered will also increase in the study area. This finding is in line with the results of studies done by Gebrat (2013); Ahamed (2013); Taye (2014); Asmare et al., (2017), and Didana (2019). But the result of this finding is contrary to the studies of Mengistie (2014); and Tefera, and Beyan (2014), which demonstrate that age is negatively and significantly, influenced the empowerment of women in agricultural activities.

From Focused Group Discussion Said "As our culture in this community, women are more respected and empowered when their age becomes older," (Jarsa Biyya-aged-56, of Kochore Barsisa Kebele).

Women head of household (HEAD): A woman being head of the household is statistically significant and positively affected women empowerment status at a 5% significance level. This variable has a 1.85 odds ratio in favor of women's empowerment. This means that if a woman is the head of the family, her chances of being empowered rise by 1.85. This may be due to the fact that as women become head of household, their overall responsibilities to making decisions about the household become increased and their empowerment increases. This result is in line with Moepeng & Tisdell (2008) and Machio *et al.*, (2020), being having a husband reduces the chance of women's empowerment but being widowed increases the chance of women's empowerment relative to being single. But contradicts with (Chant, 2004).

The educational level of women respondents (EDUCWOMEN): Education improves people's knowledge and abilities in a society, which is obvious. As a result, the more educated a society is, the more likely it is to become involved in various economic activities. As a result, Women's education is a recognized fundamental condition for women's empowerment because it allows them to have more access to and control over material and information resources, allowing them to improve their lives and resist discrimination and subordination ideas. Based on the result of the logit model, the education level of the women is found to be significantly and positively correlated with women empowerment at a 1% significance level. The result reveals that the odds ratio in favor of women empowerment increases by the factor of 1.144 when the number of years of schooling of women increases by an additional one year. This indicates that women's empowerment increased in parallel with their educational attainment. The result of this study is consistent with those of Alkire *et al.*, (2012); Asmare *et al.*, (2017); Achandi, (2019) and Dadina (2019), who found that empowerment and education were strongly associated. However, this study contradicts the findings of Ahmed, (2013) and Tefera *et al.*, (2014), demonstrating that no definitive conclusion can be taken about the association between education and women's empowerment.

Education of husband (EDUHUSBAND): Based on the result of the logit model, the education level of the husband is found to be significantly and positively correlated with women's empowerment at a 10% significance level. The result reveals that the odds ratio in favor of women empowerment increases by the factor of 1.1 when the number of years of schooling of men increases by an additional one year. This implying that women whose husbands have been educated have a high empowerment level compared with women whose husbands are uneducated, controlling for other factors. This finding is consistent with the results of studies done in Myanmar by (Thandar, *et al.* 2020).

From my focus group discussion Lucho Gelchu 42 years old from kuku seletto kebele, argued that “*because of my house band is educated I am more advantageous in my life and I enjoyed it well.*”

Distance from the nearest market (DSFNRMKT): Distance from the nearest market is found negatively related to women empowerment in the study area and statistically significant at a 1% probability level. The odds ratio in favor of women empowerment decreases by a factor of 0.854 when the distance to the nearest market increased by one kilometer. The findings show that women who live closer to the market are more likely to be empowered than those who live farther away. This could be because the women that are far away from the nearest market are less aware of their disempowerment (due to the availability of information through media, cross-cultural interactions, and general public awareness) while those nearest to market are aware of their disempowerment. This result is in line with the results of previous studies by (Achandi, 2019 and Didana, 2019). But the result of this finding is inconsistent with the results of Tefera, and Beyan (2014) which illustrates that there is no definite conclusion that can be drawn about the relationship between distance from the market center and empowerment of women. The findings of the focus groups and key informant interviews with two females aged 56 and 42 from the kochore Besrisa kebele further confirm the above assumption. From this, we can conclude that distance from the market affected the households' residence; they may lack information regarding the market price and quantity which makes them worse off. Hence women who are nearer to the market were more likely to be empowered.

Annual farm income (AHHFINCM): Different crops and livestock income sources, as well as other rural agricultural activities, are used by respondents to supplement their income. One of the most important aspects influencing people's empowerment in various development initiatives is their income. If respondents have a higher agricultural income, they are more likely to buy various farm inputs and implements, resulting in a higher profit/product from agriculture. As a result, it's been hypothesized that this variable has a positive and significant relationship with the dependent variable. The model output also supports the hypothesis and shows that farm income has affected the empowerment of women in agricultural activities positively and significantly at a 10% probability level. The odds ratio in favor of women empowerment increases by the factor of 1 when the household income rises by one birr. This could be because women from higher-income households have greater bargaining power in the home, the opportunity to participate more freely in the economic sector, and are more mobile in their communities. The finding of this study is consistent with the results of studies done by (Gebrat, 2013; Mengistie, 2013; Asmare *et al.*, 2017 and Achandi, 2019).

The income from non/off farm (NON/OFFFERMINC): The result of the binary logit regression model has shown that non/off-farm income has a positive influence over the dependent variable and is statistically significant at a 5% probability level. The odds ratio in favor of women empowerment reveals that the income from non/off-farm increases the probability of the women being empowered by a factor of 1.84. This can be explained by the fact

that women who have non/off-farm income are more adequate in the decision on their income than those who solely depend on on-farm activities. The outcome is in line with what was expected. This finding is consistent with the results of studies done in Ethiopia by (Asmare *et al.*, 2017 and Dadina, 2019), but not consistent with that of (Gebrat, 2013).

Ownership property (OWNPPTY): The result of the binary logit regression model has shown that having own property has positively related to women's empowerment and is statistically significant at a 5% level. The odds ratio for this variable in favor of women empowerment is 1.74. This indicates that the probability of women being empowered increases by 1.74 if a woman has their property. This is implying that in a rural society having their ownership especially land and livestock are the most valuable asset and an indicator of prosperity and reputation. As a result, one can conclude that rural women's access to owned property has a major influence on their empowerment. Other research, such as Dadina (2019) have found similar ownership property positively related to women empowerment. This is contradicting with (Thandar *et al.*, 2020) in the study; household ownership was not shown to be linked to overall levels of women's empowerment.

Food Security status of households

In this study, the household caloric acquisition method was used to measure household food security by physical consumption of food items. The amount of energy available for the household is compared with the minimum subsistence requirement per AE per day (i.e. 2,200 kcal) (MoFED, 2012). The survey indicates that the mean value of the energy available for food insecure and secure households were 2006.748 Kcal/AE/day and 2925.686 Kcal/AE/day, respectively. The minimum and maximum energy available for food insecure households was 843.4714 Kcal and 2199Kcal, respectively (Table 4). Whereas the minimum and maximum energy intakes of food secure households were 2202.1Kcal and 4867.775 Kcal, respectively. The mean energy intake of all sample households was 2430.663 kcal. The t value (19.2653) confirmed that there is a significant mean difference between food insecure and secure households.

Table 4: Food security status of household

Energy available/AE/day	Food security status			T-value
	Food secure (155)	Food insecure(181)	Total(336)	
Max	4867.775	2199	4867.775	19.2653***
Min	2202.1	843.4714	843.4714	
Mean	2925.686	2006.748	2430.663	
Std. Dev.	553.4525	300.7347	632.361	

Note: - *** is represented of statistical significance at a1% level

Source: Own survey, 2021

Classification and decomposition by empowerment and food status

Table 5 presents the food security status of households across women empowerment Status, which has been determined using descriptive analysis. Accordingly, the percentages of food insecure and secure households are found to be 53.9 % (42.3 from disempowered and 11.6 from empowered) and 46.1 % (16.40 from disempowered and 29.8 from empowered), respectively who fulfilled the minimum recommended daily calorie (2,200 Kcal/AE per day as mentioned in MoFED, 2012). The independent chi-square results reveal that empowering women is significantly different in terms of food security status, measured in terms of household food calorie intake/day per adult equivalent. To the extent that calorie intake is concerned, empowered women households tend to have higher calorie intake as compared to the disempowered ones.

Table 5: classification and decomposition by empowerment and food status

Empowerment status	Food security status						χ^2
	Food secured(155)		Food in secured(181)		Total (336)		
	No.	%	No.	%	No.	%

Impact of women empowerment on households' food security

Determining common support region

The common support region should be imposed on the propensity score distribution of the treated with untreated after propensity score estimation. As shown in Table 9, the predicted scores used to match empowered with disempowered ranges from 0.0292167 to 0.910523. The propensity scores for disempowered vary between 0.097270 and 0.839983 and for empowered it varies between 0.02921 and 0.910523. Thus, the common support

region, where the values of propensity scores of both treatment and comparison groups found is between 0.0923964 and 0.839983. As a result, 24 or 7.14% observations (7 from treated and 17 from untreated) were discarded from the study in the impact assessment procedure.

Table 9: Distribution of estimated propensity scores

Group	Obs	Mean	Std. Dev.	Min	Max
Total	336	0.413690	0.218553	0.029216	0.910523
Empowered	139	0.529082	0.206770	0.092396	0.910523
Disempowered	197	0.332271	0.188233	0.029216	0.839983

Source: Own survey, 2021

Table 10 below, describes the common support of the untreated and treated group for the outcome variables. From the total sampled household 312 observations (92.86%) are on support from both the treated and untreated groups. This result presents that 132 Empowered and 180 disempowered groups behave similar characteristics and matched. The decisions for the off and on support observations are based on the summarized p-scores in the treatment and untreated groups and count how many units are off support

Table 10: Common support region

Psmach2 treatment assignment	Off	On	Total
Untreated	17	180	197
Treated	7	132	139
Total	24	312	336

Source: Own survey, 2021

Using color codes, the diagram below distinguishes between the regions of common support. The upper green color shows the treated on support observations. The upper yellow color one indicates the treated off support, the lower blue color indicates the untreated off support and the lower red color represents untreated on support. As a result, the majority of the observations are concentrated in the region's common support region. This verified that there is enough overlap between the characteristics of treated and untreated components to find enough matches, according to Heckman (1997). As a result, the common support assumption is satisfied.

Figure 2: Common support for propensity score.

Source: Own survey, 2021

Testing the balance of propensity score and covariates

After choosing the best performing matching algorithm the next step is checking the balancing of propensity score and covariate using different procedures by applying the selected matching algorithm. To determine the estimations' balancing powers, different test methods, such as the reduction in mean standardized bias between matched and unmatched households, equality of means using t-test, and chi-square test for joint significance for the variables were used. The mean standardized bias before and after matching, as well as the total bias reduction achieved by the matching technique. The standardized difference in covariates before matching is in the range of -30.3% and 99.5% in absolute value. After matching, the remaining standardized differences of variables for all covariates are between -6.1% and 6.9%, which is lower than Rosenbaum and Rubin's (1985) indicated critical level of 20%. In every scenario, it is obvious that sample differences in the unmatched data significantly exceed those in the samples of matched cases. As a result of the matching process, the treatment and control samples have a high degree of covariate balance that is ready to utilize in the estimate phase. Similarly, the t-test demonstrated that after matching, all covariates became insignificant. As a result, the propensity score's matching quality or balance for all covariates has been recognized.

Propensity score matching: quality test

The standardized mean difference for overall variables utilized in the propensity score (30.4 % before matching) is decreased to about 4.1 % after matching, as shown in Table 11 below. Furthermore, the p-values of the likelihood ratio tests show that the joint significance of the covariates was always rejected after matching whereas it was never rejected before matching. The low pseudo R², low standardized bias, high total bias reduction, and the insignificant p-values of the likelihood ratio test after matching suggest that the specification of the propensity is successful in terms of balancing the distribution of covariates between the treated and control groups.

Table 11: Propensity score matching: quality test

Sample	Ps R2	LR chi2	p>chi2	MeanBias	MedBias	B	R	%Var
Unmatched	0.155	70.78	0.000	30.4	30.2	99.5*	1.16	33
Matched	0.005	1.67	1.000	4.1	4.2	15.9	0.99	44

Estimating treatment effect on treated

The impact of empowering women on household food security in daily calorie consumption in kcal consumption per adult equivalent per day is analyzed. The Kernel Matching (KM) result reveals that supportive evidence of statistically significant impact of the empowered women's on the household daily calorie consumption in kcal/AE/day. Empowered women got an average of 560.89Kcal/AE/day than disempowered households (Table 15). This implies that the empowered women household had higher food calorie intake per day per adult equivalent than those who did not. Sraboni et al., (2014) in Bangladesh; Yimer and Tadesse (2016) in Ethiopia; Gitungwa (2018) in Tanzania; Sinharoy et al., (2019) in Bangladesh and Aziz et al., (2020) in rural areas of Azad Jammu & Kashmir, Pakistan as well as a qualitative survey of Galiè et al. (2019) in Tanzania all support this conclusion. In contrast with a quantitative study conducted in Tanzania by Galiè et al. (2019) which concluded no significant relationship between women's empowerment and household food security.

One 64-year-old man from Anna Sorra woreda, Kuku Selato Kebele, stated that ‘*if they had greater control over their assets and could choose how much and what types of food to buy, they would be able to ensure that everyone in their family had enough and nutritious food to eat*’. ‘*They also indicated that when women are empowered, however, the male household head may decrease the household food budget as a result of the women's contribution to the household income*’.

Table 12: The result of average treatment effect on the treated

Variable	Sample	Treated	Controls	Difference	S.E.	T-stat
HKcal	Unmatched	2757.9312	2199.7476	558.1837	63.15486	8.84
	ATT	2770.6415	2209.7483	560.8932	77.596143	7.23

Conclusions and Policy implications

Women were still disempowered with a 5 domain empowerment level of 26.3%, and important disempowering domains include lack of asset purchase, sale, and transfer, workload, and restricted control over the use of income. As a result, more work is needed to empower women in various ways. Improvements in each indicator's contribution to women's disempowerment with their relevance will diminish disempowerment and facilitate adequate empowerment in all aspects. As a result, the study's findings may inform policymakers on women's empowerment through agriculture in the Woreda, and may help in the formulation of constructive policies that would boost women's empowerment while also promoting the country's economic development.

In this study, the age of respondents had a significant and positive effect on empowerment, and the study shows that older women are more empowered than younger women. It would be preferable if Anna Sorra Woreda Women Affairs focused on educating young females about empowerment and the relevance it has for them and society as a whole. Because the majority of economic activity was in their hands, educating and training them in a way that they can positively understand the empowerment of women may be the best option for improving the empowerment of future generations.

The study shows there was a positive relationship between empowerment and the education level of respondents; this is because education improves the attitudes and self-confidence of women. So that, society should give priority to the education of the girl child with the hope that this will form the basis of empowerment women in the future. Furthermore, the Ministry of Education and the Ministry of Women & Children's Affairs should implement education programs for rural women more effectively.

The findings also revealed that non/off-farm income had a favorable and significant impact on women's empowerment. As a result, Anna Sorra woreda should establish more continuous and regular non-farm/off-farm operations, as well as train and support local women in job creation and raise income from those activities.

Furthermore, owning property has a significant and favorable impact on rural women's empowerment. This research supports the idea that for women to be empowered, they must accumulate wealth that belongs to them. As a result, women should accumulate wealth by engaging in more productive activities, and it is preferable to have advice and awareness for society to inherit property from their parents to increase wealth accumulation in their own hands.

The study showed that the distance from the nearest market to women was a significant and negative effect on their empowerment. This could be the women that are far away from the nearest market are less aware of their disempowerment, due to the availability of information through media cross cultural interactions and general public awareness. Women's empowerment is further hampered by a long distance from markets. Women can be empowered by the construction of roads and markets that allow them to reach markets. Thus, the intervention of governmental and non-governmental organizations in improving rural infrastructure particularly roads and other access either in form of establishing new or strengthening those already started ones and social media services is very important to allocate women empowerment.

Monitoring and evaluation measures should be developed to ensure that benefit women. For example, the focus groups revealed that heavy workloads are a key determinant of women's empowerment. As a result, project investments and related interventions should avoid the workload of women.

Impact evaluation of this study revealed that empowering women in agricultural activities has had a considerable beneficial influence on household food security. The households that empowered women in their agricultural pursuits would enjoy the greatest benefits. As a result, investing in women's empowerment in agricultural activities is critical for gender equality and food security, even though considerable gender inequities still exist in the study area. To overcome these inequities, bold, broad-based, and transformative methods are required. It drew on a large body of evidence to identify crucial factors that support or hinder women's empowerment, as well as policy recommendations. Accordingly, other research should be promoted and increased for a more holistic understanding of the significance of women empowerment.

Abstract

Recently, the occurrence of resistant bacteria has led to the wide application of nano-technology whose structural components size ranges from 0.1 – 100nm. The biosynthesis of nanoparticles using plant extracts is of tremendous interest due to their numerous activities, accessibility, a wide spectrum of bioactive reducing agents and an excellent alternative for chemical and physical methods. Based on the important phytochemicals and biomedical applications of *Carica papaya*, this study aimed at the characterization and antimicrobial potential of biosynthesized silver nanoparticle using *Carica papaya* leaf extracts (CPL-AgNPs). The fresh leaves of *Carica papaya* extracted in aqueous, methanol and ethyl acetate and the phytochemical screening of the aqueous leaf extract was done. The CPL-AgNPs were characterized by UV-visible spectrophotometer, Fourier Transform Infrared spectroscopy (FTIR), Scanning electron microscope. The antimicrobial potential of the CPL-AgNPs was determined. The phytochemical analysis revealed that saponin, alkaloids and carbohydrates are strongly positive in the aqueous extract while glycosides and steroids were not detected in the aqueous extract. The methanol, ethyl acetate and aqueous extracts of the *Carica papaya* was able to bio-reduced the AgNO₃ to biosynthesized CPL-AgNPs by change in colour from colourless to dark brown. The UV-spectra of the aqueous, methanolic and acetyl ether leaf extract AgNPs has a sharp peak at 470 nm, 470 nm and 480 nm suggesting the formation of growing number of silver nanoparticles. These peak were conformed to the different functional groups and proven the presence of protein stabilizing agents. The scanning electron micrograph confirmed the shape of the biosynthesized CPL-AgNPs to be relatively spherical and the sizes ranging from 5-200 nm. The CPL-AgNPs had effective antimicrobial activity against the test bacterial pathogens with zones of inhibition ranging from 4 – 16 mm. All the test pathogens were susceptible to the nanoparticle except for the methanolic extract AgNO₃ that resisted *B. subtilis* and *K. pneumonia*. This findings revealed that CPL-AgNPs shape and size of nanoparticles and had effective bactericidal activity.

Investigation of Spatial Analysis of Small Houses Built in Konya

Hatice Çınar¹, Kerim Çınar²

¹Department of Interior Architecture, Faculty of Architecture and Design, Selcuk University, Konya, Turkey

² Department of Interior Architecture, Faculty of Fine Arts and Design, KTO Karatay University, Konya, Turkey

Abstract

Today, as a result of the changes in social, cultural and family life with globalization, the demands and needs of people have also changed. Due to reasons such as changes in lifestyle, shrinkage in the family, individualization and single-person living style, residences have been reduced spatially and the production of 'studio flat' residences, which are produced as 1+0, 1+1, 2+1, has increased today. Within the scope of this research, it is aimed to investigate the spatial harmony of small housing users with the houses they live in and their suitability for their lifestyles. For this purpose, 5 studio type residences with similar features in Selçuklu district of Konya, where the most studio flat stock is located, were examined. The close environment and spatial analyzes of these residences have been made, and they have been transferred within the framework of an analysis hierarchy from the general to the specific. These analyzes were handled in two stages, and in the first stage, the immediate environment analysis and architectural floor plan analyzes of the houses, and in the second stage, the residential plan types, spatial organization and interior analysis were transferred in tables and spatial determinations were made. As a result of the analyzes, the lifestyles of the small housing users were determined and the compatibility of this type of housing produced in Konya with the users was discussed.

Konya'da Üretilen Küçük Konutların Mekansal Analizlerinin İncelenmesi

Özet

Günümüzde küreselleşmeyle beraber yaşanan toplumsal, kültürel ve aile hayatında yaşanan değişimler sonucu insanların talep ve ihtiyaçları da değişmiştir. Yaşam tarzındaki değişiklikler, ailedeki küçülme, bireyselleşme ve tek kişilik yaşama biçimi gibi nedenlerden dolayı konutlarda mekânsal olarak küçülmeye gidilmiş ve günümüzde 1+0, 1+1, 2+1 olarak üretilen küçük konut tiplerinden 'stüdyo daire' konutların üretimi artmıştır. Bu araştırma kapsamında küçük konut kullanıcılarının yaşadığı konutlar ile olan mekânsal uyumu ve yaşam biçimlerine uygunluğunun araştırılması hedeflenmiştir. Bu amaçla, Konya'nın en çok stüdyo daire stokunun yer aldığı Selçuklu ilçesindeki 5 adet benzer özelliğe sahip stüdyo tipi konut üzerine inceleme yapılmıştır. Bu konutların yakın çevresi ve mekânsal analizleri yapılarak genelden özele doğru detaylanan bir analiz hiyerarşisi çerçevesinde aktarımı yapılmıştır. Bu analizler iki aşamada ele alınmış olup ilk aşamada konutların yakın çevre analizi ve mimari kat plan analizleri, ikinci aşamada ise konut plan tipleri, mekânsal organizasyonu ve iç mekân analizleri tablolar halinde aktararak mekânsal tespitleri yapılmıştır. Yapılan analizler sonucu küçük konut kullanıcılarının yaşam biçimleri belirlenip, Konya'da üretilen bu tip konutların kullanıcıları ile olan uyumu tartışılmıştır.

Metaphorical Approach in Interior Architecture Education

Hatice Çınar, Mine Sungur

Department of Interior Architecture, Faculty of Architecture and Design, Selcuk University, Konya, Turkey

Abstract

Education in architecture and interior design has been rapidly evolving in response to global economic, social, cultural, environmental, and technological advancements. Design studios, that are at the heart of design-based disciplines, are at the frontline of these developments. The goals of design studios are to inspire creativity, foster the ability to create forms, and allow learners to integrate the formal, spatial, and structural skills they have acquired in other classes to produce design solutions. For this reason, the changes in our age have caused design approaches in studios to be constructed with new/innovative methods. New methods and techniques applied in studio lessons have played an important role in the process of creative thinking and transforming one's thinking into an idea, and their contributions to education and students have been revealed by many studies and research in the literature. In this study, the project studio, which is the foundation of interior design education, has been designed using the metaphor method, one of the intellectual methods applied in education. The metaphor method is a technique used to make difficult-to-understand abstract concepts concrete and helps design students develop their critical thinking and creative skills. In this context, designing, that is, the verbalization of abstract thought is limited to an object and the responsibility that this object brings with it. From this point of view, an experimental study was carried out with the metaphor method that constructs the object-space relationship in a 14-week design studio with the sophomore students of Selçuk University, Faculty of Architecture and Design, Department of Interior Architecture. The studio work aims to draw the boundaries of the interior architecture students in the process of searching for a solution to the design problem and to enable the students to come up with creative designs in making their function and form decisions. At this point, the metaphor method was used in the context of the object-space relationship as a guide in the form decisions of the students in the function solutions for the problem revealed in the interior architectural design process. After working in the studio, the students have developed a working doctrine that will guide their interior design studio projects using the designed method, allow them to create unique forms and shapes, enable them to translate abstract ideas into concrete space and make it possible for them to design at various scales, from equipment to space design. The method is at a level that will set an example for students, designers and academicians working in the design discipline.

İç Mimarlık Eğitiminde Metaforik Yaklaşım

Özet

Mimarlık ve içmimarlık eğitimi güncel olaylardan ve dünyada yaşanan ekonomik, sosyal, kültürel, çevresel ve teknolojik gelişmelere bağlı olarak hızla değişmekte ve gelişmektedir. Bu gelişmelerin başında, tasarım temelli disiplinlerin merkezinde olan tasarım stüdyoları gelmektedir. Tasarım stüdyolarının amacı, yaratıcılığın ortaya çıkarılması, form üretme yeteneğinin geliştirilmesi ve diğer derslerden elde edilen biçimsel, mekânsal ve strüktürel bilgilerin özümserenerek, tasarım çözümlerini oluşturmaktadır. Bu nedenle çağımızda yaşanan değişimler, stüdyolarda tasarım yaklaşımlarının yeni/yenilikçi yöntemlerle kurgulanmasına neden olmuştur. Stüdyo derslerinde uygulanan yeni yöntem ve metotlar yaratıcı düşünme ve düşündüğünü fikre dönüştürme sürecinde önemli bir rol üstlenmiş ve bunların eğitime ve öğrencilere olan katkıları literatürde birçok çalışma ve araştırma ile ortaya konulmuştur. Eğitimde uygulanan düşünsel metotlardan biri olan metafor yöntemi bu çalışma özelinde iç mimari tasarım eğitiminin bel kemiğini oluşturan proje stüdyosunda kurgulanmıştır. Metafor yöntemi tasarım öğrencilerinin düşünme yetilerini ve yaratıcılıklarını geliştiren, anlaşılması zor olan soyut kavramların somut hale getirilmesi için kullanılan bir yöntemdir. Bu bağlamda tasarlamak yani soyut düşüncenin söze dökülmesinin, bir nesne ve bu nesnenin beraberinde getirdiği sorumluluk ile sınırlıdır. Bu noktadan hareketle Selçuk Üniversitesi, Mimarlık ve Tasarım Fakültesi, İç Mimarlık Bölümü 2.sınıf öğrencileri ile beraber 14 haftalık bir tasarım stüdyosunda nesne-mekân ilişkisini kurgulayan metafor yöntemi ile deneysel bir çalışma yürütülmüştür. Stüdyo çalışmasının amacı, iç mimarlık öğrencilerinin tasarım problemine yönelik çözüm arama sürecinde sınırlarının çizilerek öğrencilerin işlev ve biçim kararlarını vermede yaratıcı tasarımların ortaya çıkmasını sağlamaktır. Bu noktada öğrencilerin iç mimari tasarım sürecinde ortaya konan probleme yönelik fonksiyon çözümlerinde form kararlarında yol gösterici olarak metafor yöntemi nesne-mekân ilişkisi bağlamında kullanılmıştır. Stüdyo deneyimi sonucunda öğrenciler kurgulanan yöntem ile iç mimari stüdyo çalışmalarına yön verecek, özgün biçim ve şekillerin oluşmasını sağlayacak, soyut kavramdan somut mekân elde etmesine imkân verecek ve donatılan mekân tasarımına kadar farklı ölçeklerde tasarım yapabilecek bir çalışma öğretisi geliştirmişlerdir. Yöntem, öğrencilere, tasarımcılara ve tasarım disiplininde görev yapan akademisyenlere örnek teşkil edecek düzeydedir.

Abstract

The life history parameters of mealybug, *Drosicha* sp, fed on willow (*Salix wilhelmsiana*) and apricot (*Prunus armeniaca* L.) hosts were studied under laboratory conditions at 25 ± 2 °C temperature and 60-65 relative humidity in the Integrated Pest Management Laboratory of Agriculture Directorate Skardu during 2019-2020. Survival, developmental and fecundity, data were analyzed using the age-stage, two-sex life table. The intrinsic rate of increase (r), finite rate of increase (λ), net reproductive rate (R_0) and mean generation time (T) of *Drosicha* sp reared on willow and apricot hosts were (0.081 ± 0.001 , 0.076 ± 0.002) days, (1.085 ± 0.002 , 1.079 ± 0.002) days, (147.66 ± 15.97 , 120.9 ± 14.47) eggs/female and (60.96 ± 0.357 , 62.45 ± 0.422) days respectively. The results further revealed that significant differences were observed in the developmental times, adult longevity and fecundity of *Drosicha* sp when reared on willow and apricot hosts. Male longevity was recorded longer on willow (64.46 ± 0.924 days) as compared to apricot (63.5 ± 1.27 days). Similarly, female longevity observed shorter on willow (67.80 ± 0.42) as compared to apricot (69.78 ± 0.48 days). *Drosicha* sp reared on apricot resulted in significantly decreased oviposition days (5.060 ± 0.113) and fecundity (219.81 ± 5.487 eggs) as compared to *Drosicha* sp reared on willow. The age stage specific survival rate (s_{xj}), age specific life expectancy (e_{xj}), age specific reproductive value (v_{xj}) was recorded significantly higher when *Drosicha* sp reared on willow as compared to apricot. The results revealed that the invasive mealybug, *Drosicha* sp can be considered as serious threats to willow, apricot and other ornamental plants in forests and fruits orchards. Therefore, understanding of the demographic study *Drosicha* sp is important for the success of its management program.

Key Words: Apricot, Demographic, Mealybug, Willow, life table

Introduction

Willows are deciduous trees or shrubs which belong to the Genus *Salix* having about 400 species distributed worldwide. *Salix wilhelmsiana* is the native and most common naturally growing willow species of Skardu- Gilgit Baltistan, Pakistan. Willows trees provide fuel, fodder and green cover to the beautiful land of Gilgit Baltistan. But presently, the survival of this species in the area is endangered due to severe insect pests attack and other infectious diseases. Major pests include mealybug, aphids, scales and leaf curl virus. Among these pests, mealybug pose serious threats to the willow forestation in the region (Alford, 2012). Besides willow trees, *Drosicha* sp has also been observed on apricot, mulberry and other horticultural crops as a secondary pest (Rizvi *et al.*, 2016). Apricot (*Prunus armeniaca* L.) is an important and essential fruit of Gilgit Baltistan. Due to high nutritional value and pleasant aroma, apricots are cultivated and consumed all over the world (Solis-Solis *et al.*, 2007). Apricots contain dietary fibers which play important role in diabetes, malfunctioning of the digestive tract, cancer and prevention of other diseases (Enomoto *et al.*, 2010; Waterhouse, 2009). Unfortunately, due to lack of facilities and other techniques, a major portion of the apricots are lost at the farm level. Further severe losses in apricot fruit occur mostly due to the birds and insects (mealybug) infestation which leads to the dropping of immature fruits, insects and fungal invasion (Kader and Hussein, 2009).

The mealybug, *Drosicha* specie (Homoptera: Margarodidae) is an invasive and polyphagous pest in Gilgit Baltistan, Pakistan. This pest was first recorded in 2005, as primary pest of the willow tree (*Salix*). Since then, it has become more common in Gilgit-Baltistan and is now a serious pest of forest trees and vegetables in Skardu, Pakistan and adjacent areas (Tanwar *et al.*, 2007). The mealybugs are soft-bodied insects that feed on phloem tissue, suck plant sap and causing distortion and yellowing of leaves. The nymphs and adult bugs suck sap from young leaves, shoots, inflorescence and even fruits. As a result, the flowers become shrunk and get dried. In case of severe infestation, the plants may die. These mealybugs also produce honeydew resulting further in sooty mold growth on the infested plant parts and interfere with the plant photosynthesis process (Venkatesha and Dinesh, 2011).

A mealybug secretes a certain type of fluid or wax that covers their body, therefore the name mealy has been given (Tanwar *et al.*, 2007). Female mealybug lays eggs only once in a year. These eggs are laid two to six inches below the tree or within the bark of the trees. These eggs are enclosed inside a cotton sack which protects these eggs from adverse climatic conditions. A female lays on average 300 to 500 eggs. These eggs hatched in the first week of April or May. The adult mealybugs appear in the first week of July to the end of June. Male and females are distinguished by their wings. Females are wingless while males are winged. Females and males of mealybug

(*Drosicha sp*) have two and three nymphal instars, respectively. They need one to four-month to complete their life cycle. Male mealybug dies within a week or two weeks after mating with the female. In late August, *Drosicha* species lay eggs in the soil and die in September (Hodgson *et al.*, 2008). Growers use different methods for the management of the *Drosicha sp*. These include cultural or chemicals. Gunny bags wrapping technique was not proved to be useful to stop the crawlers (Karar *et al.*, 2010; Solangi *et al.*, 2012). *Drosicha sp* is polyphagous in nature, different researchers have studied their biology on a different host (Rizvi *et al.*, 2016). Due to this variation in methodologies, efforts in estimating the true-life table parameters become complicated (Kumar *et al.*, 2013).

Understanding the population variations of pests at different stages of their life cycle necessitates the study of life table factors. It's a type of bookkeeping system that entomologists use to keep track of different insect pests' developmental stages and fatality rates. (Kakde *et al.*, 2014). The most essential analytical tool in ecological studies is the life table, which provides extensive information on population dynamics and allows for the generation of basic but more meaningful statistics. It also goes into great depth about survival, development, and life expectancy. Collecting data on insect survival at different temperatures is an important task for pest control in different environmental condition (Arshad and Rizvi, 2009). Life tables studies are important tools for both theoretical and applied population ecology because they provide full information on insect survival, population development, and death (Chi and Yang, 2003). Keeping in view the importance of life table theory, this study was design to study the life-history parameters of *Drosicha sp* fed on willow and apricot hosts.

Materials and Methods

The research regarding the life history parameters of mealybug, *Drosicha sp*, fed on willow and apricot hosts were carried out at 25 ± 2 °C temperature and 60-65 relative humidity in the Integrated Pest Management Laboratory of Agriculture Directorate Skardu during 2019-2020.

2.1. Rearing of the Mealybug *Drosicha sp*.

For this purpose, the initial culture of mealybug was collected during the first week of May 2020 from infested areas of District Skardu, Baltistan region. Collection of mealybugs was done using soft hand brushes in Petri dishes along with host leaves and cuttings was brought into the laboratory. The mealybug culture was reared in rearing cages (35×33.7cm) on willow and apricot leaves and cuttings for one generation. The cultures were maintained at 25 ± 2 °C temperature and 60-65 (R.H) in the laboratory. Fresh leaves were provided daily. When a sufficient number of mealybugs were reared, various studies were initiated.

2.2. Life table study of Mealybug on willow host

Age-specific life-tables study of *Drosicha sp* on willow tree leaves was studied in the Integrated Pest Management Laboratory (IPM) Skardu. Ten mated pairs of *Drosicha sp* were released in rearing cages on excised willow leaves and shoots cuttings, with the base of the leaves and cuttings dipped in a bottle of water to keep them fresh. Every two days, the leaves and cuttings were replaced. Approximately sixty freshly oviposited eggs of *Drosicha sp* was used for studying the life table parameter, each egg was considered as a replicate. The eggs were separated using a camel hairbrush. Each egg was transferred into a petri dish containing fresh leaves and shoots cuttings of willow tree. These Petri dishes were observed daily for egg hatching. After egg hatching, various nymphal instars duration was recorded daily. Different instars were confirmed by the presence of exuviae. Full-grown nymph along with willow tree cuttings were transferred into new Petri dishes containing soil for pupation. Adults were seen in these Petri dishes on a daily basis. The presence of wings on newly emerging adults was used to sex them (male have wings, female wingless). After sexing mated pairs were then moved to new Petri dishes for egg laying. The leaves and cuttings were change every two days. Eggs laying data per day per female were counted and recorded daily until the death of all females. The data was recorded on percent egg hatching, survival rate, development period of various stages, pre-pupal and pupal period, pre oviposition period, oviposition period and adult's longevity were measured.

2.3. Life table study of Mealybug on Apricot host

Age-specific lifetables of *Drosicha sp* on apricot tree leaves and shoots cuttings were studied in Integrated Pest Management laboratory Skardu. Ten mated pairs of *Drosicha sp* were released on excised apricot leaves and shoots cuttings in rearing cages. The leaves and cutting were kept fresh by dipping their bases in a bottle containing water and were replaced with new leaves and fresh cuttings every two days.

Approximately sixty freshly oviposited eggs of *Drosicha sp* were used for studying the life table parameters. Each egg was deemed as a replicate. The eggs were separated using a camel hairbrush. Each egg was transferred into a petri dish containing fresh leaves of apricot tree. These Petri dishes were observed daily for egg hatching. After egg hatching, various nymphal instars durations were recorded daily. Different instars were confirmed by the presence of exuviae. Full-grown nymph along with apricot tree leaves and fresh cuttings were transferred into new Petri dishes containing soil for pupation. Every day, these Petri dishes were checked for the appearance of adults. After sexing one male and one female, newly emerged adults were sexed by the presence of wings (males have wings, females wingless). The mated pairs were then put onto new Petri dishes for egg-laying. Every two days, the leaves and cuttings were replaced. Eggs laying data peer day per female was counted and recorded daily until

all the females died. Data on eggs hatching, various developmental durations (nymphs and adults) male and female longevity and reproduction period, Oviposition period were calculated. The intrinsic rate of increase (r), finite rate of increase (λ) and the net reproductive rate (R_0) were also calculated.

2.4. Statistical analysis

The data regarding the life history parameters of mealybug, *Drosicha sp* were analyzed by the computer program TWO SEX-MSChart using age-stage, two-sex life table method (Chi, 2018).

Results

3.1. Life table parameters

The total developmental time of *Drosicha sp* individually reared individually on willow and apricot hosts under laboratory condition are shown in Table 1. The data showed that non-significant difference was observed for egg developmental duration ($P= 1.000$) when reared on willow and apricot hosts. Further non-significant differences were recorded for nymphal stages (N1 and N2) with P values of 0.387 and 0.086 respectively. However, the 3rd nymphal stage of the *Drosicha sp* fed on apricot had significantly longer developmental duration (13.12 ± 0.216 days, $P= 0.015$) as compared to *Drosicha sp* reared on willow host (12.45 ± 0.176 days). There was non-significance difference in the doubling time duration of *Drosicha sp* reared on willow and apricot hosts ($P= 0.065$). *Drosicha sp* reared on willow had significantly lower preadult survival rate ($54.88 \% \pm 0.354$ days, $P= 0.043$), significantly lower female total longevity (67.80 days ± 0.424 , $P= 0.002$) as compared to *Drosicha sp* reared on apricot host.

Table 1. Developmental time (means $\pm$ standard error) of different stages of *Drosicha sp* reared on willow and apricot hosts under laboratory condition.

Stage/Parameter	n *	Willow	n*	Apricot	P-value
Egg (days)	60	14.3 ± 0.089	60	14.3 ± 0.094	1.000
N1 (days)	60	13.26 ± 0.258	60	13.566 ± 0.222	0.387
N2 (days)	52	14.30 ± 0.270	47	14.87 ± 0.187	0.086
N3 (days)	51	12.45 ± 0.176	47	**13.12 $\pm$ 0.21	0.015
Doubling time (days)	60	8.459 ± 0.193	60	9.028 ± 0.244	0.065
Pre adult survival rate (%)	51	54.88 ± 0.354	47	**55.97 $\pm$ 0.41	0.043
Female total longevity (days)	36	67.80 ± 0.424	33	**69.78 $\pm$ 0.48	0.002
Male total Longevity (days)	15	64.46 ± 0.924	14	63.5 ± 1.278	0.535
Total longevity (days)	60	60.85 ± 1.893	60	59.36 ± 2.166	0.608

n* indicates number of replicates in each treatment, ** Specifies mean significance difference of different stages of *Drosicha sp* be reared individually on Willow and Apricot hosts using bootstrap technique with 100000 resampling.

The data presented in Table 2 showed that non significance difference was observed in the adult pre oviposition (APOP) of *Drosicha sp* when reared on either willow or apricot hosts ($P= 0.210$), while there was significance difference in the total pre oviposition days (TPOP) of *Drosicha sp* when reared on willow and apricot hosts ($P= 0.003$). The mean oviposition days of *Drosicha sp* when reared on willow and apricot hosts were 5.083 and 5.060 days respectively. The data further showed that *Drosicha sp* reared on willow host had resulted in significantly higher fecundity (246.11 ± 5.646 eggs) as compared to apricot with 219.81 ± 5.487 eggs ($P= 0.001$).

Table 2. Pre-oviposition period (APOP), total pre-oviposition period (TPOP), oviposition period and fecundity of *Drosicha sp* reared on willow and apricot hosts under laboratory conditions.

Stage/Parameter	n*	Willow	n*	Apricot	P-value
APOP (days)	33	4.277 ± 0.122	36	4.515 ± 0.144	0.210
TPOP (days)	36	58.83 ± 0.415	33	**60.60 $\pm$ 0.438	0.003
Oviposition day	36	5.083 ± 9.939	33	5.060 ± 0.113	0.887
Fecundity (egg)	36	**246.11 $\pm$ 5.64	33	219.81 ± 5.487	0.001

n* indicates number of replicates in each treatment, ** Specifies mean significance difference of different stages of *Drosicha sp* be reared individually on Willow and Apricot hosts using bootstrap technique with 100000 resampling.

3.2. Population Parameters

The population parameters of *Drosicha sp* reared on willow and apricot hosts under laboratory conditions are documented in Table 3. The data showed non-significant difference for the mean values of the intrinsic rate of increase (r) per day of *Drosicha sp* when reared on willow and apricot hosts (0.081 ± 0.001 and 0.076 ± 0.002) respectively. The results further demonstrated non significance difference for the mean values of finite rate of increase (λ) per day and net reproductive rate (R_0) of *Drosicha sp* as the values for these parameters in willow host were (1.085 ± 0.002 and 147.66 ± 15.97 offspring) per day and that of apricot host were (1.079 ± 0.002 and 120.9 ± 14.47) per day. The data further showed that significantly higher value of the mean generation time (T) in days

of *Drosicha sp* was recorded on apricot (62.45 ± 0.422) as compared to willow (60.96 ± 0.357 days) i.e. ($P=0.007$). The gross reproductive rate (*GRR*) of *Drosicha sp* showed non-significant difference ($P=0.325$) when reared on apricot (188.16 ± 13.56) and willow hosts (217.84 ± 24.81) respectively.

Table 3. Life table parameter of Mealybug (*Drosicha sp*) reared on willow and apricot hosts under laboratory conditions. Values are given as (mean $\pm$ standard error).

Parameter	n*	Willow	n*	Apricot	P-value
The intrinsic rate of increase (<i>r</i>) per day	60	0.081 ± 0.001	60	0.076 ± 0.002	0.060
The finite rate of increase (λ) per day	60	1.085 ± 0.002	60	1.079 ± 0.002	0.060
The net reproductive rate (<i>R</i> ₀)	60	147.66 ± 15.97	60	120.9 ± 14.47	0.215
The mean generation time (<i>T</i>) in days	60	60.96 ± 0.357	60	**62.45 $\pm$ 0.422	0.007
Gross reproductive rate(<i>GRR</i>)	60	217.84 ± 24.81	60	188.16 ± 13.56	0.325

n* indicates number of replicates in each treatment, ** Specifies mean significance difference of different stages of *Drosicha sp* be reared individually on Willow and Apricot hosts using bootstrap technique with 100000 resampling.

3.3. Age stage specific survival rates (*s*_{*xj*})

Age stage specific survival rates (*s*_{*xj*}) of *Drosicha sp* mealybug fed on willow and apricot hosts are shown in Fig. 1. The different curves showed that due to changed in the developmental time of the different stages, significant overlapping between the curves were observed. The age stage specific survival rate of *Drosicha sp* for egg reared on willow and apricot hosts were 14 and 15 days respectively. The curves regarding the different nymphal stages of *Drosicha sp* reared on willow were 19, 28, and 23 days for N1, N2 and N3 respectively while the age stage specific survival rate of nymphal stages (N1, N2, and N3) of *Drosicha sp* reared on apricot were 17, 23 and 23 days respectively. Similarly, the age stage specific survival rate curves for the male adult reared on willow and apricot were 25 and 23 days respectively while the age stage specific survival rate for the female adult reared on willow and apricot hosts were 21 and 23 days respectively.

Fig. 1. Age stage specific survival rate of *Drosicha sp* reared on willow and apricot hosts under laboratory conditions

The different lines curves of the age specific survival rate (*l_x*), age specific fecundity (*m_x*), age-stage specific fecundity (*f_x*) and age specific maternity (*l_xm_x*) of the *Drosicha sp* reared on willow and apricot hosts are shown in Fig. 2. The age specific survival rate (*l_x*) in *Drosicha sp* gradually dropped early when reared on apricot as compared to willow host. The age stage specific fecundity (*f_x*) value (41.029 offspring per day) was recorded on day 60 in willow which was higher than the peak value of *Drosicha sp* reared on apricot (35.909 offspring per day) on day 62. The curve for the age specific fecundity (*m_x*) showed greater value (5.361 offspring) reared on apricot at the time of emergence as compared to reared on willow (1.686 offspring). Similarly, the age specific maternity (*l_xm_x*) of *Drosicha sp* reared on willow host was (23.25 offspring) on day 60 which was greater than the age specific maternity (*l_xm_x*) (19.75 offspring) on day 62 of *Drosicha sp* reared on apricot host.

3.4. The age stage specific life expectancy (*e*_{*xj*})

The curves of the age stage specific life expectancy (*e*_{*xj*}) of *Drosicha sp* reared individually on willow and apricot hosts are shown in Fig. 3. The age stage specific life expectancy of newly hatched eggs of *Drosicha sp* reared on willow was 60.85 days while (*e*_{*xj*}) of newly hatched eggs of *Drosicha sp* reared on apricot was 59.36 days respectively. The curves regarding the male and female life expectancy showed that the life expectancy of male (12.17 days) and female was (16.80 days) recorded minimum on willow at the time of emergence. While the life expectancy of male (12.30 days) and female (17.78 days) were recorded maximum on apricot at the time of emergence.

Fig. 2. Age specific survival rate (l_x), female age specific fecundity (f_{xj}), age specific fecundity of the total population (m_x), and age-specific maternity ($l_x m_x$) of *Drosicha* sp reared on willow and apricot hosts under laboratory conditions

Fig. 3. Age stage specific life expectancy (e_{xj}) of *Drosicha* sp reared on willow and apricot hosts under laboratory conditions.

3.5. Age stage specific reproductive values (v_{xj})

Age stage specific reproductive values (v_{xj}) of *Drosicha* sp reared on willow and apricot hosts under laboratory conditions are shown in Fig. 4. The age stage specific reproductive rates (v_{xj}) of a new hatched eggs of *Drosicha* sp were recorded high (1.085 progeny) on willow as compared to the *Drosicha* sp reared on apricot host (1.079 progeny). Curve regarding the female reproductive value showed highest rates of (188.654 progeny) per day on day 58 when reared on willow which was higher than the reproductive rate of *Drosicha* sp when reared on apricot (160.64 progeny) on the day 56.

Fig. 4. Age stage specific reproductive values (v_{xj}) of *Drosicha* sp reared on willow and apricot hosts under laboratory conditions.

Discussion

Understanding the population parameter of insect pests is essential for the development of integrated pest management techniques. These parameters provide the population growth rate of the current and next generation of insect pests (Frel et al., 2003). The present research was conducted on the life-tables parameters of *Drosicha* sp reared on willow and apricot tree leaves and shoots cuttings in the Integrated Pest Management Laboratory (IPM) Skardu Gilgit Baltistan. Ten mated pairs of *Drosicha* sp were released on excised willow and apricot leaves

in rearing cages. After oviposition sixty eggs were separated using a camel hairbrush. Each egg was transferred into a petri dish containing fresh leaves of willow and apricot trees. These Petri dishes were observed daily for egg hatching. After egg hatching, various nymphal instars duration was recorded daily. Different instars were confirmed by the presence of exuviae. There was significant difference occurred in different stages of *Drosicha sp* due to the availability and different function of their hosts. The mealy bug *Drosicha sp* preferred willow host for feeding as compared to apricot. Host plant cues plays an important role in controlling and deterring different pests population (Golizadeh et al., 2009; Tazerouni et al., 2016; Salim et al., 2021). Plants with antibiotic properties affect the biology and adult performance of the pests (Goldasteh et al., 2012; Reddy and Chi, 2015). Bellows et al. (1992) and Shahout et al. (2011) also reported different developmental time and reproduction rate of mealy bug when reared on different host plants. Musa and Ren (2005) studied the life history parameters of *Bemisia tabaci* on three different bean species and reported that insect select host that meets specific nutritional requirement not offered by others host. Similarly, Syed and Abro (2003) obtained variable growth pattern of diamond back moth when reared on different hosts and concluded that the difference in growth and development of the diamond back moth may be due to differences in nutrition levels of the host plants.

The current study found that *Drosicha sp* has a shorter life cycle and higher fecundity on willow than on another host. Although a variety of factors influence insect populations, there is a useful relationship between the appropriateness of host plants and their intrinsic growth rate (Soufbaf et al., 2012). The intrinsic growth rate (r) is an important indicator of population dynamics. External and internal factors such as plant volatiles, wax, leaf shape, and host plant nutritional quality, or a combination of these elements, have been found to have a significant impact on intrinsic growth rate (Soufbaf et al., 2012; Ahmad et al., 2016).

Our results indicate that the host plant can affect the intrinsic growth rate, finite rate and net reproduction rate of *Drasicha sp*. Goundoudaki et al. (2003) also studied the life history parameters of *Myzus persicae* on Oriental and Virginia tobacco varieties and reported that The intrinsic rate of increase and net reproduction rate are both the best indicators of insect population growth. They further concluded that both of these parameters are significantly affected by nutrients and changing ecological conditions on the hosts. The life table parameters of the *Drosicha sp* proved the relationship between the net reproduction rate (R_0) and the average female fertility rate (F). Chi (1988) has tested the life tables of both sexes. Since the life table of two sex by age stages takes into account the variable development rate between individuals, the overlap between the stages can be observed in the curves of (s_{xj}). However, if the same data were analyzed using the traditional age-specific female life table, such as the Lewis-Leslie matrix (1993), the differentiation by stages would not be revealed.

The age-specific survival rate (l_x) is the simplified version of the survival rate by age stages. Although the differentiation and overlap of stages could not be observed in the (l_x) curve, it was however constructed using the life table of two sex by age stages and could accurately explain the change in survival rate with age. Chi and Huang (2012) demonstrated that incorrect (l_x) curve would be obtained if the usual age-specific female were used. According to our findings, the net reproduction rate and mean generation time of *Drosicha sp* were much higher on willow than apricot, owing to the fact that willow cuttings are fresh and do not dry as quickly as apricot, allowing the *Drosicha sp* to feed on different days. However, there is no difference in the intrinsic rate of increase (r) per day and the finite rate of increase (λ) per day between the willow and apricot. However, no difference was observed in the *Drosicha sp* Gross reproductive rate (GRR) when reared willow and apricot hosts.

Rearing of the *Drosicha sp* on willow resulted in significantly lower total pre oviposition period (58.83 days) as compared to *Drosicha sp* reared on apricot (60.60 days). Conversely no difference was observed in the oviposition days of *Drosicha sp* when reared on apricot (5.06 days) and willow (5.0833 days). The statistical data also revealed that significantly maximum number of fecundity (eggs/female) of *Drosicha sp* was observed when reared on willow (246.11) as compared to apricot (219.81). Our results are in close conformity with the findings of Çalışkan et al. (2016) who studied the demographic parameters and biological features of *Phenacoccus solenopsis* on *Hibiscus rosa-sinensis*, *H. syriacus*, *Brugmansia aurea* and *Cestrum nocturnum* under laboratory conditions and reported that total pre-oviposition, oviposition, post-oviposition time, fecundity and longevity are affected by host plant species. Similarly different researchers have documented different estimates of female fecundity of mealy bugs ranging from 90.4 nymphs/female to 424.3 nymphs/female (Abbas et al., 2010; Rashid et al., 2012).

The population growth factors of *Drosicha sp* were much higher on willow than apricot, according to the findings. As a result, willow was a superior host for *Drosicha sp* growth and development than apricot. The difference in some of the findings of the present study with the other researchers may be due to the variation of plant hosts. It is evidence that modification in the developmental time of insect on the base of nutritional needs that reproduce alterations in food intake and feeding behavior (Browne, 1995).

The main purpose of this research work was to examine the overall suitability of *Drosicha sp* life cycle fed on different host. The results revealed that the invasive mealybug, *Drosicha sp* can be considered as serious threats to willow and other ornamental plants in forests and fruits orchards. If the ecological conditions are suitable, the mealybug population will increase rapidly in a short time and will result in significant damage to the forests and fruit orchards. Further, this study provides a pathway to the farmers for selecting the most suitable biocontrol

agents of *Drosicha sp.*, to achieve efficient biological control. Therefore, understanding of the demographic study *Drosicha sp.* is important for the success of its management program.

Conclusion

The current study concluded that the mealy bug (*Drosicha sp.*) effectively feeds on both willow and apricot hosts and hence can be used for mass rearing of *Drosicha sp.* and its associated natural enemies under laboratory conditions.

Abstract

Fluoride is a naturally occurring mineral found in water in varying amounts and intake of inadequate or excessive fluoride may cause adverse effects in especially children. Süloğlu and Enez Districts are in the northern – southern parts of Edirne a major agricultural land in Thrace Region of Turkey. The aim of this study was to assess and compare the non-carcinogenic health risks of fluoride via daily human intake in drinking waters of the Enez and Süloğlu Districts. For this purpose, 22 drinking water samples (11 of them were in villages of Enez and 11 of them were in villages of Süloğlu) were collected during the winter season of 2019. Fluoride levels in drinking water were determined with spectrophotometric method and Estimated Daily Intake (EDI) and Hazard Quotient (HQ) of fluoride were calculated. The mean EDI data in infants, children, teenagers and adults were recorded as 0.00209, 0.01478, 0.01043 and 0.00836 ppm, respectively. All the calculated HQ values for all the investigated age groups were less than the critical limit of 1 with a mean of 0.03478 for infants, 0.24633 for children, 0.17388 for teenagers and 0.13933 for adults. The non-carcinogenic health risks of fluoride in drinking water of investigated settlements were found as follows: Süloğlu District > Enez District in general.

Keywords: *Enez District, Süloğlu District, Fluoride, Health Risk Assessment*

Introduction

Fluoride may enter to human body in various ways, but drinking water is known as the most significant source of fluoride. Intake of inadequate or excessive fluoride may cause several adverse effects on human. It is known that about 65% of dental fluorosis is caused by excessive fluoride exposure in drinking water, while inadequate intake cause to increase the risks of dental caries in especially children (Rasool et al., 2017; Aslani et al., 2019).

Health risk assessment indices are useful tools in estimating non-carcinogenic hazards, which may occur when people are exposed to various toxicants (Ustaoglu and Aydin, 2020; Tokatlı and Ustaoglu, 2020; Tokatlı and Varol, 2021a; 2021b; Varol and Tokatlı, 2022).

Enez District is located on the southwest corner of Edirne City. Enez District is in the Marmara Type area of the Mediterranean climate and semi-humid in terms of precipitation. The economy of the district is predominantly agricultural and animal husbandry. Fishing is also significant in the central and coastal villages. Süloğlu is located on the northern half of Edirne City. Süloğlu District is in the area of Thrace Passage Type climate (connected to Mediterranean climate) and semi-moist in terms of precipitation. The main livelihood of the district is agriculture (Anonymous, 2016; <http://www.edirnekulturturizm.gov.tr>).

The aim of the current study was to evaluate and compare the non-carcinogenic health risks of fluoride via daily human intake in 22 drinking water samples collected from villages of the Süloğlu and Enez Districts.

Material And Method

Sample Collection

Drinking water samples were collected from 22 stations (11 of them were in villages of Enez and 11 of them were in villages of Süloğlu) located in the Süloğlu and Enez Districts in winter season of 2019 in polyethylene bottles. Coordinate information of the villages investigated are given in Table 1 and map of settlements with the map of Edirne Province are given in Figure 1.

Chemical Analysis

Fluoride was determined by using spectrophotometric method (wavelength range 320 – 1100 nm) with a “Hach Lange DR 3900 Spectrophotometer” device. Hach Lange LCK 323 Cuvette Test was used in spectrophotometer (<https://tr.hach.com/>).

Non-Carcinogenic Health Risk Assessment of Fluoride

In this research, population was divided into four age groups based on their physiological and behavioural differences as follow: infants (< 2 years old), children (2 – 6 years old), teenagers (6 – 16 years old) and adults (> 16 years old). The daily exposure to fluoride was calculated in these four different groups by using the equation 1.

Hazard Quotient (HQ) describes the non-carcinogenic risk of fluoride and it was calculated by using the equation 2 (Yousefi et al., 2018). A lower value of HQ than one reflects a negligible risk of non-carcinogenic effects and a higher value of HQ than one reflects an important health risk and a significant risk of severe fluorosis may be present.

$$EDI = \frac{C_f \times C_d}{B_w} \quad (1)$$

$$HQ = \frac{EDI}{RfD} \quad (2)$$

EDI: Estimation of fluoride consumption – daily (mg/kg/day)

C_f: Fluoride level in the investigated drinking water samples (mg/L)

C_d: Mean daily water intake (L/day) (the mean water consumption rates in infants, children, teenagers and adults were 0.08, 0.85, 2 and 2.5 L/day, respectively)

B_w: Body weight (kg) (body weights of investigated groups were considered 10, 15, 50 and 78 kg, respectively)

RfD: Reference dose (mg/kg/day) (the reference dose for fluoride is 0.06 mg/kg/day (EPA, 1992).

Table 1. Location properties of villages

Enez District			Süloğlu District		
Location	Coordinate		Location	Coordinate	
	North	East		North	East
Yenice Village	40.700	26.149	Domurcalı Village	41.816	26.819
Çavuşköy Village	40.688	26.171	Sülecik Village	41.814	26.850
Büyükevren Village	40.651	26.228	Tatarlar Village	41.835	26.886
Abdürrahim Village	40.641	26.258	Taşhsekban Village	41.802	26.877
Hasköy Village	40.665	26.317	Yağcılı Village	41.784	26.829
Kocaali Village	40.666	26.345	Geçkinli Village	41.731	26.848
Şehitler Village	40.692	26.293	Küküler Village	41.715	26.896
Işıklı Village	40.719	26.309	Akardere Village	41.681	26.930
Çeribaşı Village	40.664	26.256	Büyükgerdelli Village	41.735	26.951
Karaincirli Village	40.627	26.297	Keramettin Village	41.787	26.977
Vakıf Village	40.616	26.258	Süloğlu District	41.767	26.911

Figure 1. Topographic map of Meriç River Basin and investigated settlements

Result And Discussion

EDI and HQ values for exposure to fluoride in drinking water for infant, child, teenager and adult groups can be seen in Figure 2. Also, the spatial distribution map showing the mean HQ values of different age groups is given in Figure 3.

Figure 3. EDI (left) and HQ (right) values of different age groups

Figure 3. Distribution map of mean HQ values

The EDI data for fluoride in infants, children, teenagers and adults were varied from 0.00054 – 0.00482, 0.00385 – 0.03417, 0.00272 – 0.02412 and 0.00218 – 0.01933 ppm, respectively. The HQ values for fluoride in infants, children, teenagers and adults were varied from 0.00907 – 0.08040, 0.06422 – 0.56950, 0.04533 – 0.40200 and 0.03632 – 0.32212, respectively. The EDI and HQ risk rankings among the investigated different age groups were found as follows: children > teenagers > adults > infants in general. It was also determined that the non-carcinogenic health risks of fluoride in drinking water of investigated villages were found as follows: Suloğlu District > Enes District in general.

The main source of fluoride exposure is known as drinking water. Fluoride may have quite adverse health effects on human health depending on the content and consumption (Ayoob and Gupta, 2006). Optimal levels of fluoride in drinking water have a significant preventive effect on especially dental caries. However, if high amounts of fluoride are ingested through drinking water, it may be adversely effective on the human health mainly on teeth (Güner et al., 2016; Tokatlı and Güner, 2018; 2020; Onur et al., 2019; Onur and Tokatlı, 2020).

In many researches conducted in many different countries on the assessment of health risks of fluoride confirmed that the children are at the chronic health risk due to the intake of fluoride in drinking water (Gao et al., 2013; Narsimha et al., 2018; Dehghani et al., 2019; Qasemi et al., 2020). In the current investigation, group of children were found as the riskiest age group for the health risk due to the intake of fluoride in drinking water in Enez and Suloğlu Districts.

Conclusions

In this research, the non-carcinogenic health risks of fluoride via daily human intake in drinking waters of the Enez and Suloğlu Districts by using the methods of Estimated Daily Intake (EDI) and Hazard Quotient (HQ) and by dividing the population into four age groups based on their physiological and behavioural differences were investigated. As a result of this research, the mean EDI values were recorded as 0.00209 ppm for infants, 0.01478 ppm for children, 0.01043 ppm for teenagers and 0.00836 ppm for adults. The HQ values of all age groups were found as less than the critical limit of 1 and the risk rankings among the investigated different age groups were found as follows: children > teenagers > adults > infants in general. The health risks of fluoride in water of investigated villages were also found as follows: Suloğlu District > Enes District in general.

Toxicity Of Various Insecticides Against *Trichogramma Chilonis* (Ishii) (Hymenoptera: Trichogrammatidae) Under Controlled Laboratory Conditions

Ahmad Ur Rahman Saljoqi^{1*} and Muhammad Saleem¹

¹Department of Plant Protection, Faculty of Crop Protection Sciences, The University of Agriculture, Peshawar, Pakistan.
Author for Correspondence: Prof. Dr. Ahmad Ur Rahman Saljoqi

Abstract

The research studies were conducted to investigate the toxicity of Neem oil and an insecticide (Spinetoram) on the fitness of *Trichogramma chilonis* (Ishii) under controlled laboratory conditions at Agriculture Research Institute (ARI) Tarnab, Peshawar, during March to August 2019. Completely Randomized Design (CRD) was used for all under observed parameters. The experiment consisted of four treatments and each treatment having 10 replications. Field recommended dose of chemical insecticide Spinetoram (8ml/100 litter water) and Neem oil (2% and 3%) concentrations were tested against the life parameters viz insecticide effects on adult emergence, parasitoid parasitism, persistence toxicity of tested toxicants, female fecundity, developmental time of parasitoid, sex ratio and adult longevity of *T. chilonis* under the recommended guidelines of International Organization For Biological Control (IOBC). Results regarding the harmful effects of tested insecticides on adult emergence confirmed that Neem oil 2% concentration was found “harmless” while Spinetoram and Neem oil 3% was showed “slightly harmful” impacts on parasitoid emergence. Throughout the parasitism experiment lowest parasitism was noticed in Spinetoram, therefore compound was classified in category of “Slightly harmful” whereas, Neem oil product (2%, 3%) concentrations were labeled as “Harmless” in term of *T. chilonis* parasitism. The persistence toxicity revealed that different concentrations (2% and 3%) of Neem oil were found “harmless” and showed “short lived” persistency while, Spinetoram showed persistency >30 days in term of parasitoid adult mortality. Reduction in fecundity per female parasitism rate test showed that Spinetoram was moderately toxic (RP >90%) on parasitoid fecundity. There was significant difference recorded among the treatments and control (water) in developmental time of *T. chilonis*, while in case of adult longevity Spinetoram showed severely effects on parasitoid when parasitoids were treated in pupal stage in side host eggs. Insecticide effects on sex ratio of *T. chilonis* revealed that Neem oil positively affect the female percentage which comparatively similar to Spinetoram while significantly difference from control treatment. Our studies results revealed that Neem oil concentrations are relatively nontoxic for biological control organisms and environmental friendly mean easily degradable. While Spinetoram proved highly toxic to life parameters except of developmental time of parasitoids.

Key words: Toxicity, *Trichogramma chilonis*, Neem oil, Spinetoram, Fitness

Introduction

Current agricultural systems include the use of million tons of fertilizers and chemicals. Due to rapid revolution in agricultural fields a large number of contaminations are eliminated and discharge especially chemical fertilizer and pesticides are causing environmental problems and making health hazardous (Trivedi *et al.*, 1986). Pesticides used are one of the major approaches for controlling agriculture and urban pests population all over the world (Musser *et al.*, 2006). Pesticides are considered to be the most efficacious means of protecting crops from pests in all stages; they provide immediate control of entire pest population (Carpenter *et al.*, 2001). In spite of its advantages, the agriculture chemicals cause environmental problems. These pesticides not only disturb terrestrial environment it's also spread the marine environment through leaching and some through overflow from land application. Environmental damage is a serious problem due to unnecessary and widespread use of pesticides. The complex chemistry of pesticides, persistence in the environment, and toxicity to animals, human beings and bioaccumulation-risks make chemical pollution a critical problem (Peterson *et al.*, 2001). The harmful effects of chemical insecticide on biological control agents have highlighted the need of research and creation of pest control strategies besides pesticides, including bio-control practices (Jervis, 2005). Now a day's crop protection policy has suggested reduction in the application of non-selective pesticides for protecting crop against insects. Therefore, it's extremely necessary to study their side effects and to exclude those insecticides which have the injurious effects on the natural enemies. Mostly crops are affected by various pests, some but not all of them may be controlled through bio-control organism that is predator, parasitoid and pathogen. Most of biological control organism that is predators, parasites, parasitoids, at works without human interference for excellent regulation of much agriculture and in urban pest population. But for successful and agreeable control of complexes of pests, selective pesticides are more essential. In fact, that is necessary for integrate pest management. The chemical and bio-control organism integration is often critical to the success of an integrated pest management program for pest complex (Shenhmar *et al.*, 2003).

Natural enemies have the potential for increasing the benefits of naturally occurring biological control agents by eliminating and reduction of pesticides. Biological control is almost safe, long last effecting, economic, ecological and sociable pest control approach. Most of bio-control agents are feeding on a few number of related species, in

short some bio-agents are host specific is unlikely to be infected the non-target species. Among the various natural enemies, egg parasitoids belong to Trichogrammatidae family are very effective against many lepidopteran pest (Takada *et al.*, 2001).

Trichogramma chilonis (Ishii) is an important and commonly available lepidopteran eggs parasitoid and economically viable enterprise (Hassan, 1993). *T. chilonis* species is widely use against lepidopteran pests in Pakistan (Sattar *et al.*, 2011). *Trichogramma* species are minute wasps that naturally occur anywhere (terrestrial habitat and some aquatic habitat). About 80 genera from the Trichogrammatidae family with 800 species of *Trichogramma* are used as a biological control around the world (Sumers, 2009). Approximately 200 species of Trichogrammatidae have been identified of which about 25 common species are used for pest management in 34 crops nearly in 30 countries (Parra and Zucchi, 2004). Moura *et al.* 2004 concluded that among the several parasitoids successfully used in the integrate pest management strategies the Trichogrammatidea is one of the most important groups of bio agent for the suppression of lepidopteran pests. Now a day's among the Trichogrammatidae nine species are rearing and commercially produce in the world. Common species of *Trichogramma* for management of pests on numerous crops, which is vegetable, cotton, sugar cane and orchard trees etc. (Hassan, 1993). *Trichogramma* as a feasible biological control organism against *Helicoverpa armigera*, brinjal shoot borer, *Plutella xylostelle*, *Chilo partellus* and *Sitotroga cerealella* etc.

All living things have 3 kinds of ability to uptake the insecticides from their environment i.e. 1) residual toxicity, 2) direct toxicity, 3) via food up taking and transfer (Croft, 1990). All Trichogrammatidae species are influenced by all three kinds of uptake of pesticides from their environment. Chemicals pesticides contamination can increase the lethal effects on *Trichogramma* that is toxic due to residual effect of pesticides (Hewa *et al.*, 2003). Lethal effects of pesticides on parasitic wasps may cause inside the host eggs in juvenile stage or in adult stage. In case of sub-lethal effects on parasitoid include reduction in parasitism, efficiency in developmental time and sex ratio (Brar *et al.*, 1991).

There is great describing value of the pesticide that has impacts on biological control agents as well as on *Trichogramma* specie. Due to the above mentioned facts, it is necessary to find out the toxicity of pesticides against parasitic wasps (*Trichogramma*), based on pesticides used with the parasitoid (*Trichogramma*) and as a result of a required concentration of insecticides that has been examined to be harmless for beneficial organisms (predator, parasite and parasitoid), especially *T. chilonis* (Tiwari and Khan, 2001) in order to effectively integrate chemical control with *Trichogramma* for successfully control measures of pests. The present research study was design to study the direct and indirect impacts of Neem oil and Radiant against *Trichogramma chilonis* under laboratory conditions.

Materials and Methods

To study the toxicity of Neem oil (2% and 3%) and Radiant (Spinetoram) against *Trichogramma chilonis* (Lepidopterous eggs parasitoid), the experiments were conducted under laboratory conditions (R.H 70-80% and Temperature 25-30°C) at Entomology section, Agriculture Research Institute (ARI) Tarnab, Peshawar from March to August, 2019. The Trichocards having *Trichogramma* pupal stage prepared in the laboratory of Agriculture Research Institute. The *Trichogramma* eggs cards (size: 4×4cm²) containing approximately 100 numbers of fresh eggs per card of *Sitotroga cerealella* parasitize eggs were used in laboratory experiment. Radiant 120 SC (Spinetoram, 80ml/100 liters of water) and Neem oil (2% and 3% concentration) was tested on the *Trichogramma* parasitized eggs card along with a control (distilled water).

Completely Randomized Design was used in all experimental work having four treatments with ten replications.

3.1 Rearing of host (*Sitotroga cerealella*) (Olivier) for egg parasitoids on wheat grains

S. cerealella eggs were released using trays size (30×25×4 cm) having two basic parts, its upper rectangular size (37×37×5 cm) part of mass rearing chamber made up of tin sheets, having about 5 kg sterilized wheat grains for *S. cerealella* (larval and adult) adults collecting box was attached with lower tapering downward with an opening size (3×3 cm). In upper part of mass rearing chamber hatching larvae were feed on wheat grains, then pupated and adults were emerged within 3-4 weeks and directly come into adult collecting box. The adults collecting box was changed on daily basis with new ones. Collected adults were place in plastic rearing jar having starch for feeding purpose. Adults laid eggs were collected by sieving starch with mesh size no. 70 and 50. The collected host eggs incubate for further experimental purpose in same conditions following the procedure of Saljoqi *et al.*, (2012).

3.2 Rearing of parasitoid (*Trichogramma chilonis*) on host eggs

For maintenance of *T. chilonis* culture, *S. cerealella* eggs were used in the laboratory experiments. Approximately 100 fresh 24<hrs host eggs were uniformly sprinkled on paper cards (size 4×4 cm²) by using a common 50 ml plastic bottle with lid of 30-45 mesh size. These Trichocards were placed at room temperature to dry for 1 to 2 hours. The dried Trichocards were put in glass jars (5×12 cm²) having approximately 40-50 (mixed gender adults) of *T. chilonis* at least for 24 hrs for parasitism. The glass jars were placed under tube light for good parasitism of parasitoid. The mass rearing jar was closely covered with nylon cloth to stop outflow of adult parasitoids. Subsequently, the parasitized Trichocards were transferred to another empty rearing jar of the same size and the jar were incubated at (Temperature 25-30°C and 60-70% R.H) conditions till parasitoids emergence

from host eggs. Numerous parasitized Trichocards were collected in the same method on daily basis and incubated at same environments for maintenance of *Trichogramma* culture and further use it for experimental purpose.

3.3 Toxicants

Two types of toxicant i.e. Neem oil with different concentration (2% and 3%) and chemical insecticides including Radiant 120SC (Spinetoram) was purchased from local market Peshawar. Similarly, Neem oil ready to use was arranged from the local market (Sheikh Pansari, Shaheen Town, Peshawar).

Bioassays

3.4.1 Effect on Pupal stage of *T. chilonis* (percent adult emergence)

The parasitized egg cards were cut into small size (1 cm²) having three days old; hundred parasitized eggs (appearing black in color) were treated with recommended rate of tested toxicants. For the control treatment, only distilled water was sprayed using hand atomizer. All the chemical substances were sprayed following procedure of Badshah *et al.* (2016), the use of a hand atomizer of 1ml of the tested toxicant in such a way that all pupae treated with equal amount of concentration of the solution. The treated Trichocards were dried at room temperature for 20 minutes and then were kept inside a test tube (5ml) covered with nylon fabric. Each treatment was replicated ten times. The emerged parasitoid from each treatment was counted on daily basis for percent emergence, for the determination of percent emergence of *T. chilonis*, the following formula was used;

$$\text{Percentage Emergence} = \frac{\text{No. of emerged adults in treatment}}{\text{Total No. of eggs offered}} \times 100$$

While reduction in adult's emergence E (%) was determined by:

$$E (\%) = \frac{1 - V_t}{V_c} \times 100$$

where E is effect of insecticide on adult emergence, V_c = emergence in control (water) and V_t adult emergence in treatment (Manzoni *et al.*, 2007)

3.4.3 Effect of above mentioned insecticides on Parasitism of *T. chilonis*

Approximately 100 Fresh eggs were used to spread uniformly on sticky cards (size 4×4 cm²) and the cards were placed at room temperature to completely dry for 1-2 hours. The dried Trichocards were put in small vials (15ml) and the fresh treated ten pairs of *Trichogramma* adults were released separately into each vial having Trichocards and covered with nylon cloth to prevent the outflow of adults. After 24 h parasitoid was removed following procedure of Saljoqi and Walayati, (2013) with some modification. On 3rd, 4th and 5th days parasitized eggs appeared black and plumpy were observed and the percent parasitism was determined by

$$\text{Percent parasitism} = \frac{\text{No. of parasitized eggs in treatment}}{\text{Total No. of eggs offered}} \times 100$$

The reduction in parasitism (RP) was calculated by the following formula:

$$RP\% = \frac{1-f}{t} \times 100$$

where RP = Parasitism reduction f = Parasitized eggs in treatment and t = Average parasitized eggs in control (water) (Hassan *et al.*, 2000).

3.5 Residual toxicity of neem oil and radiant on *T. chilonis*

To find out the residual effects of Neem oil (2% and 3%) and radiant on percent mortality of *T. chilonis*, a blank Trichocard (4×4 cm²) was separately treated with tested treatments Spinetoram and (Neem oil 2%, Neem oil 3%) and were kept under laboratory conditions for 24hrs, 48hrs, 72hrs and 5 days following procedure of Badshah *et al.*, (2017). The treated cards were kept in 15-ml flask separately, so that to make sure contact of these cards with parasitoids. Then one day old adults of *T. chilonis* (20/flask) were released in these flasks having sprayed cards. When the *T. chilonis* adults started moving inside the flasks, the adults were come in contact with the cards treated with tested toxicants. After 24 hours from the exposure of parasitoids to these cards the mortality rate of the parasitoids adults was recorded and then compared with the control (only water). Each treatment was replicated ten times.

To evaluate the effects of each toxicant on life parameters (fecundity and longevity) of *T. chilonis*, for surviving adult parasitoids the life-table method was conducted procedure followed by Bayram *et al.*, (2010) with a bit modification. Approximately 100 newly emerged adults (>4 hours after emergence) from already treated pupae with tested insecticides or distilled water for control of *T. chilonis* was introduced into a 15 ml flask, flask was covered with nylon cloth to stop adults flow and allow air circulation. The surviving female parasitoids after exposure to tested toxicants for 8 hours were transfer individually into a clean flask having honey products for food source, each treatment was replicated ten times. For each treatment, 30 numbers of treated adults were randomly collected from five replications to determine the fecundity and longevity of *T. chilonis* procedure followed by Bayram *et al.*, (2010). The egg card having 150-200 *S. cerealella* eggs were inserted into each vial. The egg cards were replaced with a new one after 24 hours and it was changed day-to-day till all individuals were died to assess the fecundity of treated *T. chilonis*. Survivals of female parasitoids were recorded daily for longevity of parasitoids. The egg cards were labeled and placed into glass tubes (5.5 cm and 1cm dia.) and incubated for 13 days under standard laboratory conditions to ensure a complete emergence of offspring from the initial parasitism and the number of parasitized eggs (black), percent of emergence was calculated for each treatment.

To determine sex ratio, the adults got from longevity was observed under stereomicroscope 10X by using identification key as well as morphological characters (Querino and Zucchi, 2011).

To find out the effects of tested insecticide on the developmental time of wasps, life table method was conducted procedure followed by Liu *et al.*, (2012) with slide modification. Approximately 100 fresh (old<3hrs) host (*S. Cerealella*) eggs were smoothly spread on sticky paper cards then placed at room temperature to completely dry for some hours. The dried Trichocards were separately sprayed by using hand automizer with tested insecticides at the above mentions rate for control treatment only water was used. These treated cards were kept into small vials size (5ml) and then, 5 pairs of *T. chilonis* (old<24 hours) adults were released into each vials and cover with nylon cloth to stop the outflow of parasitoids for 24 hours to insure parasitization. After 24 hours parasitoid was removed and observed the host eggs for parasitization. The host eggs that changed their color into black were considered as parasitized by parasitoids while the rest of other were counted as unparasitized. The unparasitized eggs were removed from each Trichocards before the larvae hatching. Each treatment was replicated ten times. The parasitized eggs were examined until the parasitoid adult emergence.

Statistical Analysis

The collected data for each parameter was separately subjected to ANOVA through a Completely Randomized Design (CRD). Means were separated using Least Significant Difference (LSD) at 5% level. Statistical tests were done by using Statistix 8.1 software (Steel and Torrie, 1980).

Results

The laboratory study was carried out in order to evaluate “The toxicity of Neem oil concentrations (2% and 3%) and an insecticide Radiant (Spinetoram 0.08%) against *Trichogramma chilonis* under controlled laboratory conditions at Entomology section, Agriculture Research Institute (ARI) Tarnab, Peshawar, during March 2019. The results of present investigation are discussed under the following headings.

4.1 Effect of Neem oil and Radiant on Adult emergence (%) of *T. Chilonis* under laboratory conditions

The data regarding the effects of different concentrations of Neem oil (2%, 3%) and field recommended dose of Radiant (Spinetoram) on the adults emergence of *T. chilonis* (Table-4.1) showed different effectivity.

The mean data (Table-4.1) revealed that the significant difference was recorded in percent adult emergence of *T. chilonis*. The mean data showed that treatments Radiant and Neem oil (2%, 3%) significantly affected in term of percent adult emergence of *T. chilonis* after 24hrs, 48hrs and 72hrs when compared with control. After 24hrs the maximum percent adult emergence (74.0%) was recorded in control (water) which was found significantly superior in term of adult emergence as compared to other treatments followed by Neem oil 2% concentration (54.6%). Minimum percent adult emergence (30.8%) was noticed in Radiant having Spinetoram which was followed by Neem oil 3% concentration. Mean data regarding after 48hrs showed that there was significantly difference observed in all tested treatments. Maximum adult emergence (79.7 %) was recorded in control which was statistically higher than other treatments while, lowest percent adult emergence (34.2%) was founded in Radiant which was followed by Neem oil 3% concentration (56.4%). After 72hrs, the highest percent adult emergence (89.5%) was showed in control (water) treatment followed by Neem oil 3% (63.0%) and lowest percent adult emergence (36.0%) was recorded in Radiant treatment which was followed by Neem oil 3% (59.7%). Overall lowest adult emergence at 24 hours, 48 hours and 72 hours was founded in Radiant (Spinetoram) as compared to other treatments and control therefore, categorized as “slightly harmful” (class 2). Similarly Neem oil 3% concentration was significantly difference in terms of reducing adult emergence rates and it was also ranked as “slightly harmful” (class 2). But Neem oil 2% concentration exerted the minimal negative effect on the immature stage of parasitoids therefore, it was ranked as ‘harmless’ on the basis of adult emergence.

Table-4.1. Effect of Neem oil (2%, 3%) and Radiant on Adult Emergence (%) of *T. chilonis* under laboratory conditions.

TREATMENTS	*AE(%)24 HRS	* E (%)	*AE(%) 48 HRS	*E (%)	*AE(%) 72 HRS	*E (%)
RADIANT	30.8 d	58	34.2 d	57	36.0 d	60
NEEM OIL 3%	50.8 c	31	56.4 c	30	59.7 c	34

CONTROL	74.0 a	-	79.7 a	-	89.5 a	-
LSD	1.92	-	1.22	-	1.7	-

Small letters after mean values indicate the significant differences ($P \leq 0.05$) within column among the treatments, *AE(%) = Percent Adult Emergence

$$E (\%) = \frac{1 - V_t}{V_c} \times 100$$

where E is the effect of the pesticide on parasitoid emergence compared to the control V_t parasitoid adult emergence in tested treatment and V_c adult emergence in control (water).

IOBC classification Class 1). Harmless ($E < 30\%$)

Class 2). Slightly Harmful ($E = 30-79\%$)

Class 3). Moderately harmful ($E = 80-99\%$)

Class 4). Harmful ($E > 99\%$).

4.2. Influence of Neem oil (2%, 3%) and Radiant on Percent Parasitism of *T. Chilonis* under laboratory conditions.

The mean data regarding percent parasitism presented in (Table-4.2) revealed that Radiant (Spinetoram) and two different concentration of Neem oil (2%, 3%) were significantly influenced the percent parasitism of *T. chilonis* as compared to control after 24hrs, 48hrs and 72hrs. The highest percent parasitism rate (90.60%) was recorded after 24hrs in control (water) which was followed by Neem oil 2% (80.90%). Minimum percent parasitism (41.10%) was showed in Radiant followed by Neem oil 3% (74.60%). With the passage of time the percent parasitism of *T. chilonis* was increased. After 48hrs, the lowest percent parasitism (42.10%) was noticed in Radiant treatment followed by Neem oil 3% with parasitism rate (76.30%) while, the maximum parasitism (93.60%) was recorded in control (water) which was followed by Neem oil 2% (83.0%). Similarly, the minimum percent parasitism (43.20%) after 72hrs was shown by applying Radiant treatment which was followed by Neem oil 3% with parasitism rate (78.20%). Maximum parasitism (93.60%) was observed in control (water) followed by Neem oil 2% (84.20%). Throughout the parasitism experiment the lowest percent parasitism was recorded in Radiant treatment that's why it was labeled as "Slightly harmful" (class 2). In case of percent parasitism all the tested treatment showed significant difference among the treatments

Table- 4.2. The toxic effect of chemical and botanical insecticides on percent parasitism of *T. Chilonis* under laboratory conditions.

E = Reduction in parasitism

$$E (\%) = \frac{1 - V_t}{V_c} \times 100$$

Class1)- harmless ($E < 30\%$)

Class 2)- slightly harmful ($30\% < E < 79\%$)

Class 3)- moderately harmful ($80\% < E < 99\%$)

Class 4)- harmful ($E < 99\%$).

4.3 Residual toxicity of Neem oil and Radiant on adult mortality of *T. chilonis*

Mean data regarding the residual effect of insecticides on *T. chilonis* adults (**Table-4.3**) showed that all the tested treatments were statistically noxious as compared to control (water). When adults were exposed to 24 hrs old treated cards. The highest toxicity in term of adult mortality (92.20%) was recorded in Radiant which was followed by Neem oil 3% with (43.00%) adult mortality. Minimum persistency (10.80%) was recorded in control (water) followed by neem oil 2% concentration (28.20%). When the parasitoid was exposed to 48hrs old insecticides residue maximum mortality (88.40%) was recorded in Radiant while, the lowest insecticide persistency (9.50%) was noticed in control (water) which was followed by Neem oil 2% with (24.70%) adult mortality. After 72hrs the insecticides persistency a little bit decreased, the minimum (6.20%) adult mortality was noticed in control (water). However maximum adult mortality (84.70%) was observed in Radiant treatment. Similarly, after 5 days the highest adult mortality (75.90%) was recorded in Radiant which was followed by Neem oil 3% with (27.60%) adult mortality. The lowest (5.20%) *T. chilonis* adult mortality was showed in control followed by Neem 2% (16.80%) when *T. chilonis* were exposed to 5 days old treated cards. In Radiant treatment about (92.00%) *T. chilonis* adult mortality was recorded dead when adults were exposed to 24hrs old treated cards therefore, compound was labeled as “harmful” while rest of treatment Neem oil (2%) was labeled as “harmless” in term of adult mortality.

Table- 4.3. Mortality (%) of *T. chilonis* adults after exposure to 24hrs, 48hrs, 72hrs and 5 days old insecticide residues for 24hrs under laboratory conditions.

TREATMENTS	Adult Mortality (%) of <i>T. Chilonis</i>			
	Age of pesticide residues (Hours)			
	24 Hrs	48 Hrs	72 Hrs	120 Hrs

CONTROL	10.80 d	9.50 d	6.60 d	5.20 d
LSD	2.34	1.99	1.58	1.75

Small letters after mean value indicate significant difference at ($P \leq 0.05$) within column among the treatments. International Organization for Biological Control (IOBC) residual toxicity:

Class A) short live (<5)

Class B) slightly persistent (5-15 days)

Class C) moderately persistent 16-30 days)

Class D) persistent (>30 days) (Sterk et al., 1999).

4.4 Toxic effect of tested insecticides on the fecundity of *T. chilonis*

The data regarding the fecundity of *T. chilonis* adults was presented in (**Table-4.4**). Results of the fecundity rate after 24hrs exposure to host eggs (*S. cerealella*), revealed that maximum rate of parasitization (9.90 eggs/female) was observed in control (water) followed by Neem oil 2% (6.60 eggs/female), whereas lowest (1.30 eggs/female) adults fecundity was recorded by applying Radiant treatment which was followed by Neem oil 3% (6.60 eggs/female). Data regarding the parasitization per female after 48hrs showed that minimum fecundity rate (0.70 eggs/female) was shown in chemical insecticide Radiant followed by Neem oil 3% with (4.60 eggs/female). The highest fecundity rate (9.0 eggs/female) was noticed in control followed by Neem oil 2% (5.60 eggs/female). With time interval the parasitization ability was decreased, After 72 hrs results was presented in Table-4.4 showed that uppermost parasitization (8.0 eggs/female) was noticed in control (water) which was followed by Neem oil 2% (4.0 eggs/female). Due to insecticide toxicity (0.60) egg lying by per female was recorded in Radiant treatment. According to the International Organization For Biological Control (IOBC) ranking of effectivity level for reduction the ovipositional capacity of biological control agents, Radiant was ranked as “Moderately harmful” while the rest of treatments were categorized as “Slightly harmful”(class 2).

Table -4.4 Influence of tested toxicant on fecundity rate of *T. chilonis* under laboratory conditions

TREATMENTS	Parasitization female ⁻¹ 24 HRS	%RP	Parasitization female ⁻¹ 48 HRS	%RP	Parasitization female ⁻¹ 72 HRS	%RP
RADIANT	1.30 d	87	0.70 d	92	0.60 d	93

$$RP\% = \frac{1 - f}{t} \times 100$$

Where RP is the reduction in parasitism, F average number of parasitized eggs in tested treatment and t average number of parasitized eggs in control (just water)

IOBC class wise ranking

Class 1, harmless (RP<30%)

Class 2, slightly harmful (30%<RP<79%)

Class 3, moderately harmful (80%<RP<90%)

Class 4, harmful (RP>90%).

4.5. Sub lethal impact of insecticides on Developmental time (days), Adult Longevity (days) and Sex Ratio (M:F) of *T. Chilonis*

After treatment with recommended concentration, the mean data (Table-4.5) longevity of treated *T. chilonis* were significantly at par from each other. Further mean data regarding the longevity of surviving parasitoid adult showed that among the tested toxicants, Radiant was the more toxic, it was statistically reduced (1.2 days) the longevity of *T. chilonis* followed by Neem oil 3% with mean value (3.8days), whereas longer (8.4 days) adult longevity was recorded in control (only water) which was followed by Neem oil 2% (5.6 days).

The data on the total development period of parasitoid emerged from the effected host eggs are presented in Table-4.5. However the developmental time of the survival parasitoids were not significantly different among the tested insecticides but in control (water) treatment parasitoid consumed more time (10.20 days) as compared to the other treatments. According to our experiment there were no toxic adverse was shown by insecticides.

Contrastive with these results, the sex ratio (female %) of F₁ offspring was not significantly different among treatments. Parasitoids exposed to Neem oil 3% concentration displayed higher female percentage (66.2%) of their F₁ offspring which was statistically difference from control (60.70%). However, parasitoids were exposed to Radiant showed (64.8%) it was significantly similar to the Neem oil 2% and 3% concentrations (66.10%, 66.20%) respectively. While in case of male ratio in control of F₁ offspring was significantly higher (39.30%) than rest of the insecticides treatments. When the parasitoids were exposed to radiant displayed (35.2%) male which was statistically similar to Neem oil 2% concentration (35.2%). Lowest (34.0%) male percentage was recoded in Neem oil 3% concentration.

Table-4.5. Adverse effect of insecticides on the life parameter of *T. chilonis* under laboratory conditions.

Treatments	Mean Longevity (Days)	of Developmental time (Days)	Mean of Sex ratio	
			Male (%)	Female (%)
Radiant	1.10 d	8.70 b	35.2 b	64.8 a
Neem oil 3%	3.80 c	8.80 b	34.0 c	66.2 a
Neem oil 2%	5.60 b	9.00 b	35.2 b	66.1 a
Control	8.40 a	10.20 a	39.3 a	60.7 b
LSD	0.40	0.78	1.16	1.98

Small letters after mean value indicate significant difference at (p<0.05) within column among the treatments.

Discussion

There is limited scientist publications are available on the effect of many novel chemical and biochemical insecticides against *Trichogramma* species Khan *et al.*, (2015). International Organization of Biological Control (IOBC) has recommended the strategies for research experiments of direct effect of insecticides on biological organism Hassan *et al.*, (1991). Similarly finite number of information are available regarding the effects of insecticides on the immature stages of *T. chilonis*, because IOBC arranged successive scheme for evaluating the adverse effect of insecticide against the adult stage of parasitoids Sattar *et al.*, (2011).

The present studies are helpful to growers for management of lepidopterous pest by using *T. chilonis* mass releases, since they can help in pesticides selection, selection of suitable time for pesticides application to control the pests and avoiding the adverse effects on beneficial organisms, as part of strategies to enhance both quality and productivity of natural organisms, specially *Trichogramma* species in Agri ecosystem and our environment.

The current studies were carried out to investigate the impact of Neem oil and an insecticide Radiant (Spinetoram) against *T. chilonis* under controlled laboratory conditions at Agriculture Research Institute (ARI) Tarnab, Peshawar. Four treatments i.e. Radiant with field recommended dose (0.08%), Neem oil (2%, 3%) concentration and control (only water) were tested for 1). Adult emergence from the host eggs (*S. cerealella*) which was treated in pupal, 2). Parasitism of treated F₁ offspring, 3). Residual toxicity of insecticides on adult parasitoid, 4) longevity and Fecundity of surviving Adult, 5). Sex ratio of F₁ treated generation.

The pesticide Radiant used in the present studies was comparatively novel chemistry and highly selective as compared to other pesticides while Neem was evaluated as have limited toxic impact on parasitoids survival,

emergence and parasitism. Overall results of our studies suggest that the Neem oil products may be effectively integrated with biological control in integrate pest management strategies, especially where *Trichogramma* and other same behavior parasitoids are important.

The results regarding the impact of Neem oil on adult emergence revealed that Neem oil @2% concentration proved not sub-lethal impact on the immature stage of *T. chilonis* in term of adult emergence from host parasitized treated eggs. Likewise Neem oil 3% concentration slightly reduced the adult emergence from the treated host eggs therefore labeled as 'slightly harmful'. Somewhat similar trend was observed by Sattar *et al.*, (2011) who investigated the influence of new insecticides on the *T. chilonis* under laboratory conditions they concluded that Neem oil was not significantly toxic to *T. chilonis* when parasitoid was treated in different developmental stages i.e. (Egg, larval and pupal) as compared to control. But on the basis of International Organization For Biological Control (IOBC) classification Neem oil cloud be labeled as 'slightly harmful' only for the larval stage of parasitoid. Our results about Neem oil completely in agreement with Lingathurai *et al.*, (2014) they conducted the experiment on Ecotoxicological performances and biochemical effect of selected pesticides on *T. chilonis* Ishii. Who reported that the highest *T. chilonis* adult emergence was recorded in Neem oil treatment and confirmed that Neem oil was harmless to *T. chilonis* in term of parasitoid adult emergence. We are strongly agreed with Mandi and Pramanik (2018) who tested the Bio-efficacy of botanical insecticides on the adult emergence of *T. chilonis* According to them, the highest adult emergence was recorded in Neem treatment. Further they determined that Neem oil was harmless to *T. chilonis* emergence when parasitoid was treated in immature stages. The results of current investigation are in line with earlier finding Rashid *et al.*, (2013) who studied the residual effect of Neem oil on cotton mealybug they reported that Neem oil was harmless to *Trichogramma* in integrate pest management programmed (IPM). They also reported that the Neem oil at minimum concentration against Trichogrammatidae family can be used to avoid the chemical insecticides to better and safer for the control of spotted bollworm. In current studied we observed that Neem oil (2% and 3%) significantly reduce the parasitism of host (*S. cerealella*) eggs by *T. chilonis* as compared to control. But according to the IOBC categorization it could be ranked as 'harmless'. These observations are partially in line with Rashid *et al.*, (2013) they investigated that the *T. chilonis* parasitism ability was statistically decrease by applying Neem oil at 2% concentration and Neem seed extract with 3% concentration. Our results show conformity with El-Wakeil *et al.*, (2006) they reported that Neem oil significantly decrease the parasitism of *T. pretiosum* and had some bit impact on *T. minutum*. Khattak and Rashid (2006) support the current finding, According to them Neem oil suppress the parasitization of spotted bollworm by *T. chilonis*.

A laboratory experiments were performed to examine the persistency impact of Neem oil on adult stage of parasitoid. According to our studies the residual toxicity of different concentration of Neem oil was significantly affected adults was exposed to treated blank cards. Badshah *et al.*, (2016) also reported that the persistency of Neem oil on adult parasitoid *Aenasius Bambawalei*. Somewhat similar trend was investigated by Thubru *et al.*, (2016) who reported that Neem formulation was comparatively more persistence due to oil-based formulation. Results of the current studies indicated that the parasitoids fecundity were slightly affected by applying the Neem oil (3%). Similarly when parasitoids were exposed to lower concentration of Neem oil then %RP > 30% was occurred in term of parasitoid fecundity consequently, Neem oil was labeled as 'slightly harmful'. Identical results were obtained by Irigary *et al.*, (2010) who noted that when European grape berry moth were exposed to Align having Azadirachtin the fecundity rate was decreased. Medina *et al.*, (2003) reported that the oviposition rate of *Chrysoperla carnea* was decreased when immature stage was treated with Neem products. Our results are strongly agree with Tang *et al.*, (2002) they explained that Neemix 4.5% (commercial name of neem product) significantly affect the oviposition preference of citrus aphids. Khaire *et al.*, (1992) also stated that Neem oil significantly reduced the fecundity of pulse beetle.

Results of our study revealed that Neem oil was comparatively impacted on *T. chilonis* on the basis of adult longevity. Similar observations were made by Fontes *et al.*, (2018) who tested 21 some chemicals and biochemical insecticides including Neem oil for their compatibility with *Trichogramma* specie and concluded that to some extends Neem oil reduced the adult longevity. Somewhat similar trend was observed by Thubru *et al.*, (2016) they investigated that the emerged adult longevity also affected when pupal was exposed to Neem oil. Concurring opinion was recorded by Singhamuni *et al.*, (2015) that concluded Neem products relatively reduced the longevity of survived beneficial arthropods as compared to control. Badshah *et al.*, (2017) reported that the highest concentration neem oil (3%) was relatively reduced the adult longevity and percent emergence. We recorded the Neem oil have no negative effects on *T. chilonis* in term of developmental time because there was no significant difference among treatments and control. Similar results were recorded by Raguraman and Singh (1999) who indicated that inside the host eggs parasitoid remained unaffected by using Neem oil. Nevertheless earlier worker like Hamd *et al.*, (2005); Nathan *et al.*, (2007) contrary to our finding they investigated when higher concentration of Neem oil were used on mealy bug then it needed maximum developmental time to reach adult stage. Somewhat similar conclusion was observed by Fontes *et al.*, (2018) they described the Neem products have no adverse effect on the developmental time of parasitoids.

The current data concerning the sex ratio of *T. chilonis* significantly affected with increase the female number out of total collected adults as compared to control when parasitoids were treated with Neem oil 3% concentration. The finding of present study are in agreement with the earlier worker Fontes *et al.*, (2018) who study the lethal and sub lethal effect of pesticides on *T. achaeae* they reported that Neem oil are slightly effect the sex ratio of parasitoid with an increase of in the female number in progeny. Somewhat similar trend was recorded by Narendra *et al.*, (2013) the percentage female in the population of Neem product was found to be on par with control. Similar finding have been stated by Flavia *et al.*, (2004) in research study the parasitoids adult emerged host eggs which was treated with neem seed oil solution had no effect on the sex ratio of parasitoid. The finding of current study are in line with earlier research work carried out by Thubru *et al.*, (2016) who proposed that the percentage of female in population were highest in neem oil treatment as compared to control.

An experimental study was performed to study the negative impact of Spinetoram (spinosyn) against the *T. chilonis*. The finding proved that when parasitoid exposed to Spinetoram which was significantly impact the parasitoid adult emergence and parasitism capacity. The compound was categorized as “slightly harmful” (class 2). Similar results were obtained by Khan *et al.*, (2015) they study the toxicity of new commonly used pesticides to parasitism by *T. chilonis* who concluded that spinosyn act as slightly harmful to parasitoid in term of adult emergence. As somewhat similar observation was recorded by Sattar *et al.*, (2011) they stated that Spinosad belong to same group of Spinosyn as Spinetoram was slightly effected the adult emergence of *T. chilonis*. The present study was strongly agreed with Hernandez *et al.*, (2011) they stated that Spinetoram had no more toxic effect to parasitoid compared to other treatment and control. In contrast of our results Hossain and Poehling (2006) found that Spinetoram strongly affects two leaf minor parasitoids immature stages. Somewhat similar observation was recorded by earlier worker Elzen (1990) they reported that Spinosad at 75 g a.i/ha had no adverse impact on *T. chilonis* as compared to insecticides. Also Ruberson (2003) found that Spinosad had no negative effect on the *T. pretosum*. Further report that Spinosad was completely compatible with *T. pretosum* for integrates pest management. Our results are in line with Liu and Zhang (2012) who study the side effect of Spinosad and indoxacarb they reported that the high concentration of Spinosad when applied to larval and pupal stages significantly reduced adult emergence and parasitization rate of parasitoids. Similar observation was made by Visnupriya and Muthukrishnan (2015) who stated that Spinetoram 12SC at 36, 45 and 54g a.i/ha had bit adverse effect on the basis of parasitism rate and adult emergence of *T. chilonis* when treated at developmental stages. Similarly Gandhi *et al.*, (2005) who proposed that only 60% parasitism of host egg treated Neem oil 2% concentration.

Data concerning the persistency impacts of Spinetoram on the mature stage of parasitoid showed that when the *T. chilonis* adult were exposed to 24 old residue of insecticide so more than (90%) of the adult were founded dead, therefore the Spinetoram was categorized as “Harmful” (Class 4). Our finding was strongly in line with Sattar *et al.*, (2011) who proposed that the all the insecticides were poisonous to *T. chilonis* in term of adult mortality. Further they reported that 100% percent of *T. chilonis* were recorded killed when adult was exposed to 24hrs old residue of Spinosad. The current results are in line with finding of Liu and Zhang (2012) they reported that the highest rate 60-70% of adult mortality was recorded in three days old residue of Spinosad. Similar observation was noted by Williams *et al.*, (2003). Who study the Spinosad residual effect in field conditions they have been stated that Spinosad persistency was quickly degraded in field with bit residue toxicity to some species of predator and some parasitoids.

The study was conducted to tested the effects of Spinetoram on the life parameter of *T. chilonis*. The results showed that there was no significant difference in term of developmental time was recorded in all treatments including control (only water) the possible reason was that parasitoids mostly complete their life cycle inside the host eggs they were worked as well-protected layer from the direct contact of pesticides, that’s why tested insecticides showed not influenced on the developmental duration of *T. chilonis*. Similar observation was concluded by Liu and Zhang (2012) who study the Side effects of two reduced-risk insecticides, Indoxacarb and Spinosad, on life parameter of *Trichogramma*. They revealed that the developmental period of *T. brassicae* and *T. pretiosum* were not significantly different from control, developmental duration range 9.3 to 10.9 days. The present study was in agreement with Ruberson (2003) reported that spinosyn product having no adverse impacted on developmental time of *Trichogramma* species. Our present data regarding the influence of tested toxicant on adult longevity of parasitoid were significantly different among the treatments, the results showed that shortest longevity of emerged adults from the treated pupae was recorded in Spinetoram. Somewhat similar data was observed by Thubru *et al.*, (2016) who evaluated the risks of pesticides targeting lepidopteran pests in cruciferous ecosystems to eggs parasitoid, *T. brassicae*. They stated that lowest adult longevity was recorded in Spinosad followed by Neem oil, when the parasitoids were treated in pupal stage. The current study showed conformity with (Schneider *et al.*, 2003; Xu *et al.*, 2004) who described some parasitoid could emerged from Spinosad treated pupae but directly died within hour. Shoeb, (2010) support current findings who confirmed that after emergence of *T. chilonis* was died within 6 to 12 hours when parasitoids were treated with Spinosad in pupal stage.

Our present finding revealed that all the experimental process Spinetoram was founded harmful on the fitness of *T. chilonis* except of the developmental time, while the Neem oil 3% concentration was also showed slightly

harmful impact on beneficial wasp. The Neem oil was found harmless on the life parameters of *T. chilonis*. Further we confirmed that *T. chilonis* was comparatively compatible with less concentration of Neem oil for integrated pest management program and environmentally friendly in terms of being easily degradable in the environment.

Protein Requirements of Buffalo

Taşkın Değirmencioğlu¹

Milk and Fattening Program, Bursa Uludag University, Karacabey Vocational School, Bursa, Republic of Türkiye

Abstract

Proteins have an important place in terms of their physiological functions in the animal body. For example, 75% of body dry matter consists of proteins. They take part in the structure of enzymes and hormones in the cell, in antibodies from the body's defense mechanism, and in nucleoproteins, which are the main features of heredity. Protein demand of buffaloes is met with medium quality pasture and vegetable protein supplementary feeds. Early form of pastures, being rich in amide substances, adding excessive urea to the feed and not undergoing heat treatment of the feed, etc., facilitate the breakdown of protein in the rumen. Accordingly, increased ammonia concentration causes irritability, uterine inflammation, early embryonic death, hypomagnesamic tetany, and increased urea level in milk in buffaloes. Diets containing high levels of protein and low energy levels similarly lead to lubrication in the mammary glands, infertility, laminitis and ketone formation. In case of protein deficiency, it reduces the feed consumption of animals. It reduces the digestibility of cellulose and reduces its ability to be injured from feed. In various studies, there is information that protein supplementation in buffalo ration positively affects the performance of animals. In this review, the protein requirements of buffaloes and information on the importance of protein are discussed.

Key words: Protein Requirements of Buffalo and importance of protein

Mandaların Protein Gereksinimleri

Özet

Proteinler, hayvan vücudundaki fizyolojik fonksiyonları bakımından önemli bir yere sahiptir. Örneğin vücut kuru maddesinin %75'i proteinlerden oluşmuştur. Hücre içinde enzim ve hormonların yapısında, vücudun savunma mekanizmasından antikorların içerisinde ve kalıtımın temel özelliği olan nükleoproteinler içerisinde görev alırlar. Mandaların protein talebi, orta kalite de mera ve bitkisel kaynaklı protein ek yemleri ile gerçekleştirilir. Meraların erken biçimi, amid maddelerince zengin olması, yeme aşırı üre katılması ve yemin ısıl işlem görmemesi vb işlemler proteinin rumende parçalanmasını kolaylaştırır. Buna bağlı olarak artan amonyak yoğunluğu mandalarda hırçınlaşma, uterus yangısı, erken embriyonik ölüm, hipomagnesamik tetani ve sütteki üre düzeyinin yükselmesine neden olur. Yüksek düzeyde protein ve düşük düzeyde enerji içeren rasyonlar, benzer şekilde meme bezlerinde yağlanma, kısırılık, laminitis' ve keton oluşumuna yol açmaktadır. Protein yetersizliği durumunda hayvanların yem tüketimini azaltır. Selülozun sindirilme derecesini düşürerek yemden yararlanma yeteneğini düşürmektedir. Çeşitli çalışmalarda manda rasyonunda protein ilavesinin hayvanların performansını olumlu yönde etkilediğine dair bilgiler bulunmaktadır. Bu derlemede, mandaların protein gereksinimleri ve proteinin önemi üzerine bilgiler ele alınmıştır.

Anahtar Kelimeler: Mandaların protein gereksinimi ve proteinin önemi.

Giriş

Mandaların besin madde ihtiyaçları sığırlarla benzerlik gösterir (Paul, 2003). Bu nedenle süt sığırları için önerilen besin madde gereksinimleri mandalar için de önerilebilir. Çalışan mandaların canlı ağırlık kaybı olmadan hem büyüme hem de çeki gücü kapasitesi ihtiyaçlarını karşılayabilecek düzeyde yoğun yemle beslenmeleri gerekir. Bu nedenle, mandaların yaşadıkları bölgelerde beslenme ve yönetim koşullarının iyileştirilerek hayvanların çeki gücü ve et potansiyeli önemli ölçüde artırabilmesi mümkündür. Asya'da, hayvanlar henüz gelişmelerini tamamlamadan çeki gücü için kullanılır. Çalışan hayvanların hareketli olmaları, terlemenin artması ve ısı artışı nedeniyle yaşama payı ihtiyaçları çalışmayan hayvanlara oranla %40' fazladır. Mandaların toplam besin madde gereksinimleri; yaşama payı, gelişme dönemi, gebelik dönemi ve süt ile salgıladıkları besin maddeleri göz önüne alınarak hesaplanmaktadır (Değirmencioğlu, 2020). Hayvanların ihtiyaçlarını çeşitli faktörler etkilemektedir. Bu faktörlerden bir kısmını, kısaca aşağıda belirtildiği biçimde özetlemek mümkündür.

Hayvan temelli faktörler; yaş, canlı ağırlık, fizyolojik durum (büyüme, gebelik, laktasyon vb.), sindirim sistemi özellikleri ve sağlık durumu.

Rasyon ile ilişkili faktörler; rasyonda kullanılan yemlerin oranları, yemin besin madde içerikleri, yemlere uygulanan işlemler ve yemin saklanma biçimi.

Çevresel faktörler; iklim, stres, yemleme sistemi ve barınak koşulları (Paul 2007). Türkiye de manda işletmelerinin küçük ölçekli olması ve manda yetiştiricilerinin eğitimlerinin yetersiz ve sermayelerinin kısıtlı olması nedeniyle, mandalar tek yönlü, beslenmekte, laktasyonun ilk aylarında beslenme bozuklukları meydana gelmekte ve süt verimi istenen düzeye ulaşamamaktadır (Degirmencioğlu, 2016). Bu derlemede, mandaların protein gereksinimleri ve proteinin önemi üzerine bilgiler ele alınmıştır.

Materyal ve Yöntem

Bu derlemenin kaynak materyalini toplam (yurt içi ve yurt dışı) 22.kaynak oluşturmuştur. Derleme de proteinin genel metabolizması, mandaların dönemlere göre protein gereksinimi olmak üzere iki bölüme ayrılmış ve ilgili bölümlerde kaynaklara yer verilerek konuya açıklık getirilmeye çalışılmıştır. Sonuç kısmında ise mandalların protein gereksinimlerinin karşılanması için izlenmesi gereken yol haritası hakkında bilgi verilmiştir.

Proteinin Genel Metabolizması

Proteinlerin temel yapısal birimi amino asittir. Bütün amino asitler (a.a), aynı karbon atomuna bağlı bir karboksil (-COOH), bir amino (-NH₂) grubu ile bir H atomu ve bir kök (R) içerirler. Proteinler, yağ ve karbonhidrata olduğu gibi temel elementler olarak C, H ve O₂'den oluşurlar Ancak diğerlerinden farklı olarak C, H ve O₂'in yanısıra N içerirler. Proteinler ayrıca P, Fe, Cu, Zn ve manganez içerebilir. Proteinler amino grubunun N ile diğerinin karboksil grubunun yapılarından su açığa çıkarak oluşturdukları peptit bağları ile yüksek moleküllü organik bileşiklerdir. Organizmada bulunan bağışıklık maddelerinin tümü, hücre içinde yer alan enzim ve hormonlar, kalıtımın temel özelliği olan genler protein yapısındadır (Okuyan,1997).

Rasyon Proteinini

Şekil 1. Protein Metabolizması

Mandaların protein talebi, orta kalite mera ve bitkisel kaynaklı protein ek yemleri ile gerçekleştirilir. Yararlanılan başlıca protein kaynakları soya, pamuk, keten tohumu küspeleri, üre ve yavaş çözünen diğer protein olmayan nitrojen kaynakları ile karşılanabilmektedir. Rasyonun ham protein düzeyi yükseldiğinde, rumende parçalanarak mikrobiyal protein sentezinde kullanılır, geride kalan amonyak ise kana geçer, daha sonra karaciğerde üreye dönüşür. Ürenin bir kısmı idrarla dışarıya atılır. İdrardaki üre hızla amonyağa hidrolize edilir ve çevre kirliliğine neden olur (Muck, 1982). Üre oluşumu sırasında 3 molekül ATP kullanılır. Dolayısıyla gerek rumendeki amonyağın mikrobiyal proteine gerekse karaciğerdeki amonyağın üreye dönüşümü esnasında gereken enerji rasyonla desteklenmelidir. Rumen ortamında, mikrobiyal protein sentezi için belirli oranda hızla parçalanabilen amino asit kaynaklarına (a fraksiyonlarına) ihtiyaç vardır. Diğer yandan meraların erken biçimi, Mera yemlerinin amid maddelerince zengin olması ve bu yemleri tüketen mandalarda işkembede amonyak seviyesi hızla artmaktadır. Yeme ayrıca üre katılması ve yemin ısı işlem görmemesi vb işlemler proteinin rumende parçalanmasını kolaylaştırır (Şekil 1). Buna bağlı olarak artan amonyak yoğunluğu mandalarda hırçınlaşma, uterus yangısı, erken embriyonik ölüm, hipomagnesamik tetaniye neden olur. Esas itibarıyla rumende NH₃ ve karbonhidratların parçalanması sonucu açığa çıkan keto asitler rumendeki mikroorganizmalar tarafından amino asitlerin sentezlenmesinde kullanılır. Rumende parçalanmaya dayanıklı karbonhidrat ile kolay parçalanabilen protein kaynaklarının birlikte kullanılmasında rumende amonyak yoğunluğunu yükseltebilir (Di lella t, 1995). Örneğin rasyonda NPN kaynaklı bileşiklere ağırlık verilmesi durumunda sütün gerçek protein içeriği düşer. Mikrobiyal proteinleri ise parçalanmış yem partikülleri ile birlikte abomasuma ve ince bağırsağa gelerek emilimi ince barsakta aktif- transport sistemiyle gerçekleşmektedir. Emilen amino asitler deaminasyona (keto asitler ve amonyak), transanimasyona (amino asitin amin kökü bir keto asite aktarılır) ve dekarboksilasyona (karboksil kökünü kaybeder ve primer amin ve karbondioksit) uğrarlar. İnce barsakta emilen amino asitler; vücut dokusu, süt, enzim ve hormon sentezinde kullanılır. Dokularda protein depolanmasının bir üst sınırı vardır. Bu sınır aşılmıca, amino asitleri α - keto asitleri ve amonyağa parçalanır. α - keto asitleri (piruvik asit) kreps siklusunda oksidasyona uğrayarak enerji kaynağı olarak kullanılır (glikoz, glikojenik amino asitler) ya da (yağ asitleri –ketojenik amino asitler) yağa dönüştürülerek depo edilir. Yüksek düzeyde protein ve düşük düzeyde enerji içeren rasyonlar, meme bezlerinde yağlanma, kısırlık ve laminitis' ve keton oluşumuna yol açmaktadır (Görgülü, 2019). Yüksek protein içerikli rasyonlar ve amino asitler

asetil CoA' ya dönüşerek vücutta keton oluşumunu hızlandırır. Keton parçalarından β -OH Butirik asit orta derecede kuvvetli asitler olduklarından, bu bileşiklerin idrarla atılma sırasında önemli miktarda katyon (Na) kaybına neden oldukları için bazende asidosis ortaya çıkar.

Protein yetersizliği durumunda hayvanların yem tüketimini azaltır. Selülozun sindirilme derecesini düşürerek yemden yararlanma yeteneğini düşürmektedir. Buffaloların protein yetersizliğine karşı gösterdiği reaksiyon şiddetlidir. Mandaların yetersiz proteinle beslenme durumunda hemen süt verimi düşmemektedir. Hayvan kendi vücut dokularından proteini mobilize ederek süt veriminin azalmasını engellemeye çalışmaktadır. Ancak protein yetersizliği devam etmesi durumunda hayvanda canlı ağırlık kayıpları artmakta ve hayvanın yaşamı tehlikeye girecektir.

Mandaların protein gereksinimi canlı ağırlık, canlı ağırlık artışı, gebelik ve laktasyon dönemi ve sütün içerdiği protein seviyesine göre büyük bir değişim göstermektedir.

Protein gereksinimi, ham protein (HP) ve/veya sindirilebilir ham protein (SHP)'e göre hesaplanabilir. Süt mandaların beslenmesinde genelde toplam protein ihtiyaçları üzerinde durulmaktadır (Bülbül, 2010). Zira rumen bakterileri sayesinde mikrobiyal proteinin biyolojik %80'e çıkabilmektedir.

Mandaların Yaşama Payı İhtiyacı

Hayvanın solunum, sindirim organlarının çalışması, dolaşım ve vücut sıcaklığı gibi kısaca yaşamsal olayların devamı için gerekli besin maddesi miktarıdır. Yaşama payı hesaplanırken vücutta herhangi bir canlı ağırlık kazancı ya da kaybı veya verim payı gereksinimi dikkate alınmaz. Araştırmacılar tarafından manda ineklerinin yaşama payı protein ihtiyacını şöyle belirtilmiştir.

Yaşama payı protein ihtiyacı = 5.43 HP ve 3.14 SHP g/kg CA^{0.75} Paul ve ark., (2002).

Yaşama payı protein gereksinimleri = 2.54-2.84 g sindirilebilir protein (SP) /kg Canlı ağırlık (CA)^{0.75} Ranjhan (1992)

YP protein gereksinimleri = 0.6 g SP/Kg CA Proto (1993)

Zicarelli (2001), 650 kg ağırlığında manda inekleri için

YP protein gereksinimi = 700 g Ham protein (HP)-400 g SP (gerçek protein) önermektedir.

Yaşama payı enerji ihtiyacı Toplam Sindirilebilir Besin Maddeleri (TSBM) = 35.3 g/kg CA^{0.75} Paul., (2002,2003)

Canlı ağırlık artışı (1kg) = 330 g HP ve 230 g SHP Paul ve ark., (2002).

Mandalarda yaşama payı olarak 100 kg canlı ağırlık için 0.51 kg nişasta birimi (NB) ve 50 gr sindirilebilir protein (SP) hesaplanması öngörülmektedir.

Mandaların Üremesinde Proteinin Önemi

Manda yetiştiriciliğinde işletmenin karlılığını sürdürülebilmesi için üremenin belirli düzeyde gerçekleşmesi gerekmektedir. Döl veriminin üç temel amacı vardır. Bunlar;

Sürü büyüklüğün korunması

Verimli bir üretimim gerçekleştirilme

Seleksiyon ve ayıklamanın etkin yapılabilmesidir.

Nehir mandası, damızlıkta yavaş hareket etmesi nedeniyle kötü bir üne sahiptir. Hayvan ayrıca barınak şartları oldukça kötü ve tek yönlü beslenmektedir. Ortam şartlarının bozuk olması üreme performanslarının düşmesine neden olmaktadır. Esas itibarıyla hayvan yetiştiriciliğinin ana unsuru üretilir. Dişi mandaların besin madde ihtiyaçlarının karşılanmaması durumunda, gebelik süresinin uzamasına ya da malakların canlı ağırlıklarının kısılmasına neden olmaktadır. Döl tutma üzerinde protein, enerji, vitamin ve mineral maddelerin önemi bir payı vardır. Proteinler, hormonların yapısına girerek üreme olaylarının düzenlenmesini sağlamaktadır. Örneğin FSH ve LH hipofiz ön lobunun bazofil hücreleri tarafından sentezlenen glikoprotein yapısında bir gonadotropindir. Mandalarda uzun süreli protein eksikliği FSH eksikliğine yol açmaktadır. Bu hormonun az salgılanması yumurta gelişimini ve döl tutma oranını azaltmaktadır (Sevgican, 2001).

Gebelik Döneminde Mandaların Protein Gereksinimi

Gebelik süresince uterus, plasenta ve süt bezlerinin büyümesi (yükselen anabolizma) yüzünden mandalarda fizyolojik değişimler ortaya çıkmaktadır. Gebelik süresince ihtiyaç duyulan besin maddelerin önemli bir kısmı bu ihtiyaçların karşılanması için kullanılmaktadır. Gebeliğin ilk 2/3 lük döneminde fötüsün besin madde ihtiyacı düşüktür. Kurudaki mandalara ihtiyaç duyduğunda biraz üzerinde besin maddesi verip dışının vücut rezervlerini geliştirmesi şansı sağlanmalıdır. Yaşama payı ve bunun biraz üzerinde yapılan besleme yeterli olmaktadır. Gebeliğin son haftalarında fötüs hızla büyümekte, süt bezleri gelişmektedir. Fötüste meydana gelen canlı ağırlık artışın büyük kısmını gebeliğin son 1/3 ünde sağlanan artış oluşturmakta ve toplam ağırlığının % 65'ini bu dönemde kazanmaktadır. (Sevgican, 2001). Bu dönemde protein ve enerji ihtiyaçları önemli ölçüde artmaktadır (Çizelge 1 ve 2). Gebelik süresince fötüste en fazla biriken besin maddesi proteindir. Özellikle gebeliğin son haftalarında protein ihtiyacı giderek yükselmektedir. Fötüs büyümede tüketilen proteinin % 60'ından yararlanabilmektedir. Gebeliğin son aylarında enerji birikiminin % 85' i protein formunda olmaktadır.

Çizelge 1. Kurudaki Mandaların Protein ve Enerji İhtiyaçları

Malakların Beslenmesinde Proteinin Önemi

Özellikle genç malakların günlük canlı ağırlık artışının yüksek oluşu nedeniyle protein gereksinimi ve dolayısıyla et artışı fazla olmaktadır (Çizelge 3). Ancak, Kazein içermeyen protein ikameleri, abomasumda aşırı şişkinliğe yol açmakta ve protein yarıyışlılığını azaltmaktadır. Nitekim, soya veya by pass kaynaklı süt ikame yemleri sindirim sistemindeki sekrotorik HCl, rennin, pepsin, tripsin ve kimotripsin salgılarını azalttığı düşünülmektedir. Ayrıca, soyanın antijenik potansiyeli bağırsak vilusları kısaltarak abomasum ve bağırsak hareketliliğini hızlandırmakta ve böylece ishal ile sonuçlanan etkilere neden olmaktadır (Gay, 1991, Bartocci, 2002).

Yeni doğan malaklara öncelik papilla gelişimi üzerine ağırlık verilmelidir. Malak başlangıç yemi besin madde içerikleri bakımından zengin olmalıdır (ham protein % 18 ham kül, % 8 ham sellüloz, % 12 metabolik enerji 2800 (Kcal/kg) vitamin ve mineral madde) ve tam yağlı sütle birlikte verilmelidir. Malak başlangıç yemi buzağı başlangıç yemiyle benzerlik gösterir. Karma yemin yapısında buğday, arpa, mısır kırmaları, buğday kepeği, yağlı tohum küspeleri, vitamin ve mineral katkıları, tuz ve mermer tozu yer almaktadır. KM tüketiminin artması ve rumen gelişmesi nedeniyle daha ekonomik olan buzağı büyütme yemi 3-6 aylık dönemde malaklara verilebilir. Buzagı büyütme yeminin protein ve enerji içeriği açısından (% 17 HP 2600 ME A Vitamini, 5.000 IU/kg, D3 Vitamini, 600 IU/kg, E Vitamini, 25 mg/kg) başlangıç yemine göre daha düşüktür.

Çizelge 3. Genç Malakların Protein ve Enerji İhtiyacı (gün)

Kaynak. Naydenova L. ve ark., (1993), KE; Enerji Birimi; Yem Enerji Ünitesi 1 KE=1410 kcal

Araştırmacılar, besiye alınan malakların rasyondaki protein düzeyi artışından olumlu yönde etkilenmediğini bildirdiler. Araştırmacı Malaklar %12,6, 16 ve 19,4 ham protein içeren rasyonlarla beslenmişlerdir. Her gruba %26 saman ve %74 kesif yem verilmiştir Rasyonlarda canlı ağırlığın %2,2 si kadar kesif yem kuru maddesi, canlı ağırlığın %0,8'i kadar kaba yem kuru maddesi kullanılmıştır. Rasyonlardaki farklı protein düzeylerinin günlük canlı ağırlık artışı ve yemden yararlanmaya önemli derecede etkisinin olmadığı anlaşılmıştır.

Araştırmacı, 8 aylık yaştaki toplam 18 erkek malağı % 10.1, 12.8 ve 15.1 ham protein içerikli rasyonlarla 197 gün beslenmişlerdir. Araştırma sonucunda, farklı protein düzeyleri ile beslenen manda grupları arasında günlük canlı ağırlık artışı ve yemden yararlanma oranlarının benzerlik gösterdiği belirtilmektedir (Aksoy, 1989).

Manda Düvelerin Protein Gereksinimi

Düveler geleceğin süt veren hayvanı olduğundan bakımına özen göstermek gerekir (Çizelge 4). Cinsi olgunluk öncesi (pupertas) yüksek besleme düzeyi serum somatotropin düzeyini düşürerek memedeki parankim doku miktarını azaltmaktadır (Görgülü, 2019).

Laktasyon Döneminde Manda İneklerin Protein Gereksinimi

7 kg/gün süt veren Anadolu mandası günlük olarak 490 g yağ, 245 g protein, 350 g laktoz, 14 g Ca, 8.4 g P ve 10.5 g Na mineralleri her gün vücudundan dışarı atılmaktadır (Değirmencioğlu, 2020). Nitekim yaşama payı gereksinimlerine ek olarak süt ile dışarı atılan besin maddelerin mandalarda karşılanması zorunludur. Mandaların gereksinimleri laktasyon dönemine ve fizyolojik özelliklerine göre farklılık gösterir. Manda sütleri inek sütlerine kıyasla daha fazla yağ ve yağsız kuru madde içerdiğinden, manda sütlerinin kalorisi inek sütünden daha yüksek bulunmaktadır. Manda ineklerinin protein gereksinimi genotipe, yaşa, sütün yağ düzeyi ve süt verimine oranına, ve rasyonun yapısına göre değişiklikler göstermektedir. Sütteki protein oranı, manda yaşlandıkça ve laktasyon

dönemine doğru azalır. Sütün yağ miktarı düştükçe protein seviyesi de düşmektedir. Süt veriminde proteinden faydalanma oranının % 65 -70 arasındadır. Pratik olarak manda ineklerinin sindirilebilir protein ihtiyaçları için, sütte bulunan protein miktarının 1.5 katı kadar bir proteinin verim payı için verilmesi gerekmektedir. Farklı oranlarda yağ ve protein içeren sütlerin yapımı için gerekli sindirilebilir protein ihtiyacını aşağıdaki gibi bildirmektedir (Çizelge 5).

Çizelge 4. İtalyan Manda Düvelerinin Besin Madde Gereksinimleri

Kaynak. Proto,(1993)

Farklı protein içerikli rasyonların mandaların verim ölçütleri üzerine etkilerini araştırdıkları bir çalışma da manda rasyonlarına ham protein içeriğinin % 17.8 den % 19.18 çıkarılması süt verimi (0.70 kg/gün) üzerine önemli düzeyde etki yaptığı saptanmıştır. Ayrıca süt bileşimi üzerinde olumsuz bir etkisinin olmadığı belirlenmiştir (Değirmencioğlu,2022). Süt inekleriyle yapılan benzer bir çalışma da ise rasyonun ham protein içeriğini (HP) % 15'ten % 16'ya yükseltmenin, süt üretimini 0.75 kg / gün artırdığı, rasyonun HP düzeyini % 19'dan % 20'ye çıkarılması ise süt verimini olumlu yönde etkilediğini tespit etmişlerdir (0,35 kg / gün). Anonymous (2001)

Sonuç

Mandaların protein ihtiyaçları sığırlarla benzerlik gösterir. Bu nedenle süt sığırları için önerilen protein gereksinimleri mandalar için de önerilebilir. Mandaların yetersiz beslenme koşullarına dayanıklı olduğu düşüncesinden vazgeçilmelidir. Bu kapsamda mandaların yaşama payı protein gereksinimleri baklagil kaba yemleri ile, verim payı protein ihtiyaçları ise küspe ile karşılanabilir. Manda yetiştiricilerin bulunduğu alanlarda mera ıslahına önem verilmelidir. Manda yetiştiricileri aynı zamanda tarla tarımıyla uğraşmaktadır. Bu yerlerin yem bitkileri üretiminde kullanılması yönünde teşvikler sağlanması ile sorun büyük ölçüde çözümlenebilir.

Determination of Phytochemicals and Antioxidant Capacities of Fresh Scots Pine (*Pinus Sylvestris* L.) Sprouts Consumed as Herbal Tea

Fatma Ergün

Faculty of Health Sciences, Kırşehir Ahi Evran University, Kırşehir, Türkiye

Abstract

In this study, the phytochemicals and antioxidant capacity of fresh Scotch Pine (*Pinus sylvestris* L) sprouts consumed as herbal tea in the regions where it grows were investigated. The total amounts of phenolic and flavonoid substances in fresh yellow pine shoots were determined as 19.92 ± 1.65 mg GAE/g and 6.20 ± 0.74 mg QE/g, respectively. The free radical scavenging activity of the pine shoots used in the study was determined to be 18.80 ± 0.35 µg TE/mL using 1,1-diphenyl-2-picrylhydrazil (DPPH) radical. In addition, the reducing antioxidant capacity was determined as 2.13 ± 0.01 µg TE/mL with the FRAP method and 16.20 ± 3.20 µg TE/mL with the CUPRAC method. As a result, it was seen that fresh Scotch pine sprouts have the potential to be a natural antioxidant source. However, there have been doubts about the widespread use of its consumption may cause various problems in terms of the development of the plant. New studies are needed to eliminate the hesitations caused by regional consumption.

Keywords: *Pinus sylvestris* L, Phenolic substance, Flavonoid substance, Antioxidant

Bitkisel Çay Olarak Tüketilen Taze Sarıçam (*Pinus Sylvestris* L.) Filizinin Fitokimyasallarının ve Antioksidan Kapasitelerinin Belirlenmesi

Özet

Bu çalışmada yetiştiği bölgelerde bitkisel çay olarak tüketilen taze Sarıçam (*Pinus sylvestris* L) filizlerinin fitokimyasalları ve antioksidan kapasitesi araştırılmıştır. Taze sarıçam filizlerinin toplam fenolik ve flavonoid madde miktarlarının sırasıyla $19,92 \pm 1,65$ mg GAE/g ve $6,20 \pm 0,74$ mg QE/g olduğu tespit edilmiştir. Çalışmada kullanılan çam filizlerinin serbest radikal giderme aktivitesinin 1,1-difenil-2-pikrilhidrazil (DPPH) radikali kullanılarak $18,80 \pm 0,35$ µg TE/mL olduğu belirlenmiştir. Ayrıca indirgeyici antioksidan kapasitesi FRAP yöntemiyle $2,13 \pm 0,01$ µg TE/mL ve CUPRAC yöntemiyle $16,20 \pm 3,20$ µg TE/mL olarak tespit edilmiştir. Sonuç olarak taze Sarıçam filizlerinin doğal antioksidan kaynağı olma potansiyeline sahip olduğu görülmüştür. Ancak tüketiminin yaygınlaşmasının bitkinin gelişimi açısından çeşitli problemlere neden olabileceği ile ilgili tereddütler oluşmuştur. Bölgesel tüketiminden kaynaklı tereddütlerin ortadan kaldırılması için yeni çalışmalara ihtiyaç vardır.

Anahtar Kelimeler: *Pinus sylvestris* L, Fenolik madde, Flavonoid madde, Antioksidan

Giriş

Bitkisel çayların besleyici özelliklerinin yanında rahatlatıcı, iyileştirici ve koruyucu etkilerinin de olduğu bilinmektedir. Bu amaçla daha çok bitkilerin yaprak, çiçek, tohum, kök ve gövde gibi kısımları kullanılmaktadır. Bitkinin özelliğine bağlı olarak infüzyon (demleme), dekoksasyon (kaynatma) ve maserasyon (bekletme) gibi teknikler kullanılarak tüketime hazır hale getirilirler. Tatları buruktur. Bu burukluğun giderilmesi için tüketimlerinde çeşitli tatlandırıcılar kullanılmaktadır (Özdatlı ve ark., 2014)

Dünyada sıcak ve soğuk olarak en çok tüketilen bitkisel çay *Camellia sinensis* bitkisi yapraklarından yapılan çaydır (Balentine ve Paetau-Robinson, 2000; Wang ve ark., 2000). Tüm dünya toplumları tarafından tüketilen, *C. sinensis* çayının geçmişi 5000 yıl öncesine dayanmaktadır. Bu çayından başka adaçayı, ıhlamur, kuşburnu, papatya ve nane gibi bitkisel çaylar da yaygın olarak tüketilmektedir (Atoui ve ark., 2005). Tüketimi yıllar öncesine dayanan ve bölgeye özgü doğal bitkiler kullanılarak hazırlanan pek çok çay çeşidinin var olduğu da bilinmektedir.

Beslenme kaynaklı bozuklukların artışı doğal ürün kullanımını da artırmıştır. Bu durumdan çay olarak tüketilen bitkilerde etkilenmiş ve artan talebin karşılanması için alternatif kaynak arayışı artmıştır. Bu kapsamda sarıçam (*Pinus sylvestris* L) taze sürgünlerinden yapılan çay önemli potansiyele sahip bir üründür. Bu çayın hazırlanışı taze olarak çam ağaçlarından toplanmış filizlerinin (genç sürgünler) hiçbir işleme tabi tutulmadan kaynatılmaları (dekoksasyon) yöntemi şeklinde olur. Sarıçam genç sürgünleri geniş, yastık şeklinde olup tomurcuk kısımları kırmızı-kahverenginde ve pullu yapıdadır (Yaltırık ve Akkemik, 2011). Ayrıca bu sürgünler güzel kokulu ve uçucu yağ bileşenleri yönünden de zengindir (Hannus, 1976). Bu çayın ülkemizin kuzey doğusunda Erzurum, Artvin ve Ardahan bölgesinde yaşayan insanlar tarafından tüketimi yaygındır. Tüketimi yıllar öncesine dayanmaktadır. Bu çayın başta solunum yolları olmak üzere, karaciğer, saç, cilt ve diş sağlığı üzerine olumlu etkisinin olduğuna inanılmaktadır.

Bu çalışmada, bölgesel olarak bitkisel çay olarak tüketilen sarıçam filizlerinin biyoaktif bileşenlerinin toplam madde miktarı ve antioksidan kapasitesinin belirlenmesi amaçlanmıştır

Materyal ve Yöntem

Bitki Örneklerinin Toplanması

Çalışmada kullanılacak numuneler Nisan ayında Erzurum Olur ilçesinde özel mülk içerisinde bulunan ağaçlardan toplanmıştır (40°49'50"N 42°07'4"E 1317 m). İşlem sırasında numunelerin taze ve temiz olmalarına dikkat edilmiştir. Toplanan örnekler oda şartlarında sabit tartıma gelinceye kadar kurutulmuş ve kullanımına kadar +4 °C'de saklanmıştır.

Ekstraktların Hazırlanışı

Öğütücüyle parçalanmış örneklerden 5 gr alınarak ağız kapalı erlene yerleştirilmiş ve üzerine 100 mL metanol ilave edilip manyetik karıştırıcıda karıştırılmıştır. Daha sonra karışım süzülülüp çözücüsü 45 °C'de evaporatör yardımıyla uzaklaştırılmıştır. Elde edilen ekstraktan 1000 ppm stok çözelti hazırlanmıştır (Ergün, 2021).

Toplam Fenolik Madde Miktarı

Folin-Ciocalteu metodu ile yapılmıştır (Slinkard ve Singleton., 1977). 1000 ppm olarak hazırlanmış stok çözeltiden 50 µL alınarak üzerine destile su ilavesinden sonra üzerine reaktif olarak 40 µL Folin- Ciocalteu ilave edilmiştir. 3 dk bekletildikten sonra karışım %2'lik Na₂CO₃ çözeltisinden 120 µL eklenmiştir. Oda sıcaklığında 2 saat inkübe edilen karışım 760 nm'de absorbansı ölçülmüş ve fenolik madde miktarı standart grafik yardımıyla mg GAE/g olarak belirlenmiştir.

Toplam Flavonoid Madde Miktarı

Bitki numunesinin alüminyum nitrat metodu kullanılarak toplam flavonoid madde miktarı tayini yapılmıştır. Toplam flavonoid madde miktarı mg KE/g olarak belirlenmiştir (Nieva Moreno ve ark., 2000).

DPPH• Serbest Radikal Giderme Aktivitesi

Serbest radikal giderim aktivitesi Blois (1958) metodu kullanılarak belirlenmiştir. Troloks kullanılarak standart grafik oluşturulmuş ve bitki ekstraktının DPPH radikal giderici aktivitesi troloks eşdeğeri olarak hesaplanmıştır.

Fe³⁺ -Fe²⁺ İndirgeme Gücü

Fe³⁺ indirgeme gücü tayini Oyaizu (1986) metodu kullanılarak yapılmıştır. Bu metod da Fe³⁺'ün Fe²⁺'ye indirgenmesi bağlı olarak meydana gelen renk değişiminin 700 nm'de tespitine dayanmaktadır. Çalışmada trolox kullanılarak standart grafik çizildi ve sonuçlar troloks eşdeğeri olarak hesaplanmıştır.

Cu²⁺ indirgeme antioksidan kapasitesi (CUPRAC)

Cu²⁺ indirgeme kapasitesi Apak ve ark., (2004)'e göre yapıldı. Bunun için 1'er ml CuCl₂, Neokuprin ve NH₄CH₃COO ilave edildi. Üzerlerine ekstrak çözeltisi ilave edildikten sonra toplam hacim 4 ml'ye saf su ile tamamlandı. 30 dk inkübasyondan sonra 450 nm'de absorbansı okunmuştur. Sonuçlar troloks eşdeğeri olarak hesaplanmıştır.

İstatistiksel Analiz

Çalışma sonuçlarının incelenmesinde SPSS istatistik programı kullanılmıştır Bütün analizler üç tekrar olarak planlanmış ve sonuçlar 3 tekrarlı ölçümlerin ortalaması ± standart sapma olarak ifade edilmiştir.

Bulgular ve Tartışma

Bu çalışmada, yetiştiği bölgelerde çay olarak da tüketilen sarıçam taze filizlerinin toplam fenolik ve flavonoid madde miktarı tespit edilmiştir (Tablo 1).

Tablo 1. Toplam fenolik ve flavonoid madde miktarları

Fenolik Madde Miktarı (mg GAE/g)	Flavonoid Madde Miktarı (mg KE/g)
19,92±1,65	6,20±0,74

Bitkisel gıdaların yapısında bulunan fenolik bileşiklerin varlığı bize bitkinin antioksidan kapasite hakkında bilgi verir. Çalışmada toplam fenolik madde miktarının 19,92±1,65 mg GAE/g olduğu tespit edilmiştir. Yapılan literatür taramasında benzer şekilde çeşitli bitkisel çaylar üzerinde yapılmış bilimsel çalışmaların olmasına rağmen taze sarı çam filiz çayına ait bilgiye ve araştırmaya rastlanmamıştır. Dünyada ve ülkemizde en çok tüketilen siyah ve yeşil çayın kökeni *Camellia sinensis* L bitkisinin yapraklarıdır. Türkiye de yetiştirilen *Camellia sinensis* L. bitkisi üzerinde yapılmış bir çalışmada toplam fenolik madde miktarının 1. hasatta 59.44 µg GAE/mg, 2. hasatta 80.69 µg GAE/mg ve 3. hasatta 62.88 µg GAE/mg olduğunu bildirmişlerdir (Ercişli et al., 2009). Başka bir çalışmada yapraklı bitki çaylarının etanol ekstraktlarındaki fenolik madde miktarının Biberiye çayında (Rosemary tea) 39,44 ± 0,92 mg GAE/g olduğu, Dut yaprağı çayında (Mulberry leaf tea) 10,98 ± 0,38 mg GAE/g olduğu, Limon çayında (Lemongrass tea) 17,32 ± 0,32 mg GAE/g ve Trabzon hurması yaprağı çayında ise (Persimmon leaf tea) 46,42 ± 0,95 mg GAE/g olduğu bildirilmiştir (Oh ve ark., 2013). Bulduğumuz değer *Camellia sinensis* L. bitkisi, Biberiye (Rosemary tea) ve Trabzon hurması yaprağı (Persimmon leaf tea) çaylarına ait değerden düşük, Dut yaprağı (Mulberry leaf tea) çayına ait değerden ise yüksektir. Ayrıca Limon çayının (Lemongrass tea) toplam fenolik madde miktarına benzemektedir. Bu farklılıkların tür arası farklılıklardan kaynaklanmış olabileceği ve ayrıca bitkilerin toplam fenolik madde miktarına mevsim ve vejetasyon dönemi gibi faktörlerin etkisinin olabileceği düşünülmektedir.

Çalışmada ayrıca toplam flavonoid madde miktarı 6,20±0,74 mg QE/g olarak tespit edilmiştir. Karık ve Sağlam (2018) yılında Marmara bölgesinden topladıkları ada çayı (*Salvia fruticosa* Mill.) üzerinde yaptıkları çalışmada

toplam flavonoid madde miktarını 5,52-7,93 mg QE/g olarak bulmuşlardır. Benzer şekilde Papatya çayı (*Marş arvensis*) üzerinde yapılmış bir çalışmada ise toplam flavonoid madde miktarının 13.12 ± 0.1 mg QE/g olduğu bildirilmiştir (Djeridane et al., 2006). Bulduğumuz değer, Karık ve Sağlam (2018)'in bildirdiklerine benzer, Djeridane et al., (2006)'inden küçüktür. Beklenen bir durum olarak karşımıza çıkan sonucun tür farklılıklarından kaynaklanmış olabileceği sonucuna varılmıştır.

Çalışmada bitki ekstraktının IC₅₀ değeri, DPPH• serbest radikal giderme aktivitesi (DPPH), Fe³⁺-Fe²⁺ indirgeme gücü tayini (FRAP), Cu²⁺-Cu⁺ indirgeme antioksidan kapasitesi (CUPRAC) değerleri hesaplanmıştır (Tablo 2).

Tablo 2. Bitki ekstraktına ait toplam IC₅₀, DPPH, FRAP ve CUPRAC değerleri

	IC ₅₀ (µg /ml)	DPPH (µg TE/g)	FRAP (µg TE/mL)	CUPRAC (µg TE/gr)
BHT	38,84±0,46	120,24±1,43	7,42±0,95	324,64±2,89
Bitki Ekstraktı	470,95±4,62	18,80±0,35	2,13±0,01	16,20±3,20

Çalışmada DPPH• serbest radikal giderme aktivitesinin belirlenmesinde standart olarak BHT kullanılmıştır ve taze çam filizlerinin radikal giderme aktiviteleri 18,80±0,35 µg TE/g olarak belirlenmiştir. Ada çayı olarak tüketilen *Salvia fruticosa* bitkisi üzerinde yapılmış benzer çalışmada bitkisel ekstraktın toplam radikal giderme aktivitesi 820,00-876,79 µmol TE/100g kuru madde olduğu bildirilmiştir (Karık ve Sağlam, 2018). Farklı bir çalışmada ise Hibiskus çayının (*Hibiscus sabdariffa* L.) radikal temizleme aktivitesinin 323,1-505,0 mg TE/L olduğu tespit edilmiştir (Naji ve ark., 2021). Türlerin farklı olması radikal giderme aktivitelerinin de farklı olması sonucunu doğurmuştur. Burada önemli olan çay olarak tüketilen diğer bitkilerde olduğu gibi sarıçam filizi çayının da radikal giderme aktivitesine sahip olmasıdır.

Çalışmada taze çam filizlerinden elde edilen bitki ekstraktının Fe³⁺-Fe²⁺ indirgeme gücü (FRAP) değerinin 2,13±0,01 µg TE/mL olduğu tespit edilmiştir. İhlamur (*Tilia platyphyllos* Scop) ve reyhan üzerinde yapılmış benzer bir çalışmada Fe³⁺-Fe²⁺ indirgeme gücünün (FRAP) ihlamurda 4.82±0.38 mg Troloks/g olduğu ve reyhanda ise 2.95±0.31 mg Troloks/g olduğu bildirilmiştir (Karadağ, 2019). Ayrıca Eser (2018) yılında Türkiye'deki bitkisel çaylar üzerinde yaptığı çalışmada, bitkilere ait etanol ekstraktlarında bu değerlerin; Adaçayı çayında (*Salvia officinalis*) 0.27 ± 0.74 mM Trolox, böğürtlen çayında (*Rubus procerus*) 0.15 ± 0.05 mM Trolox, elma çayında (*Malus domestica*) 0.15 ± 0.04 mM Trolox, ekinezya çayında (*Echinacea angustifolia*) 0.15 ± 0.04 mM Trolox, limon çayında (*Tilia platyphyllo*) 0.15 ± 0.03 mM Trolox, kuşburnu çayında (*Rosa canina*) 0.15 ± 0.01 mM Trolox ve yeşil çayda ise (*Camellia sinensis*) 0.15 ± 0.01 mM Trolox olduğunu bildirmiştir (Eser 2018). Taze çam filizlerinin Cu²⁺-Cu⁺ indirgeme antioksidan kapasitesi (CUPRAC) 16,20±3,20 µg TE/gr olarak belirlendi. Bu değer çay olarak tüketilen ihlamurda 192.18±3.20 mg Troloks/g olduğu, karanfilde ise 2.73±0.17 mg Troloks/g olduğu bildirilmiştir (Karadağ, 2019). Ayrıca adaçayı üzerinde yapılmış farklı bir çalışmada ise Cu²⁺-Cu⁺ indirgeme antioksidan kapasitesi 0,438±0,029 0,2 mg/mL olarak bildirilmiştir (Işık, 2020).

Sonuç

Çalışmada Erzurum Olur bölgesindeki özel mülkiyet içerisinde bulunan çam ağaçlarından toplanan ve çay olarak tüketilen taze çam filizlerinin toplam fenolik ve flavonoid miktarı ile antioksidan aktiviteleri araştırılmıştır. Taze çam filizlerinin toplam fenolik ve flavonoid bileşik miktarının yüksek ve antioksidan özelliğinin ise yüksek olduğu belirlenmiştir. Çay olarak tüketilmesi durumunda günlük antioksidan ihtiyacının karşılanmasına yardımcı olabileceği düşünülmektedir. Fakat bitkinin gelişmesi için çok önemli olan genç sürgünlerin bu şekilde toplanıp değerlendirilmesinin bitkinin gelişmesini olumsuz yönde etkileyebileceği yönünde tereddütler oluşmuştur. Bu konuda yeni çalışmalara ihtiyaç vardır.

Determination of Phytochemicals and Antioxidant Capacity of *Satureja hortensis* L.

Fatma Ergün

Faculty of Health Sciences, Kırşehir Ahi Evran University, Kırşehir, Türkiye

Abstract

Thyme is one of the spices that is widely consumed in the regions where it grows and is used in many dishes, especially soups, and gives a regional identity to the dish where it is used. In this study, the amount of phytochemicals and antioxidant capacity of the plant *Satureja hortensis* L. (süpürge kekiği, çibriska) which grows spontaneously and is used as a spice in meals in the Karakoçlar settlement area of Olur district of Erzurum province was investigated. The total amounts of phenolic and flavonoid substances were determined to be 40.85 ± 0.85 mg GAE/g and 26.52 ± 0.46 mg QE/g, respectively. In addition, the DPPH radical scavenging activity of the plant extract was calculated as 45.24 ± 3.47 µg TE/mL and the IC₅₀ value was calculated as 177.11 ± 0.99 µg/mL. It was determined that the Cu²⁺ reducing antioxidant capacity of the *S. hortensis* plant extract was 2162.09 ± 113.61 µg TE/mL and the Fe³⁺ reducing antioxidant capacity was 24.36 ± 4.59 µg TE/mL. As a result, it was concluded that the *S. hortensis* plant, which is known with different names in different regions, has antioxidant potential and can be used as a natural antioxidant source in addition to its common use.

Key Words: *Satureja. hortensis* L., Phenolic and Flavonoid substance, CUPRAC, FRAP, DPPH.

***Satureja hortensis* L.'nin Fitokimyasallarının ve Antioksidan Kapasitesinin Belirlenmesi**

Özet

Kekik yetiştiği bölgelerde yaygın olarak tüketilen ve başta çorbalar olmak üzere birçok yemekte kullanılan ve kullanıldığı yemeğe bölgesel kimlik kazandıran baharatların başında gelmektedir. Bu çalışmada, Erzurum ilinin Olur ilçesi Karakoçlar yerleşim yeri bölgesinde kendiliğinden yetişen ve bölgede yemeklerde baharat olarak kullanılan *Satureja hortensis* L. (süpürge kekiği, çibriska) bitkisinin fitokimyasal madde miktarları ve antioksidan kapasitesi araştırılmıştır. Toplam fenolik ve flavonoid madde miktarlarının sırasıyla $40,85 \pm 0,85$ mg GAE/g ve $26,52 \pm 0,46$ mg KE/g olduğu tespit edilmiştir. Ayrıca bitki ekstraktının DPPH radikal giderme aktivitesi $45,24 \pm 3,47$ µg TE/mL ve IC₅₀ değeri ise $177,11 \pm 0,99$ µg/mL olarak hesaplanmıştır. *S. hortensis* bitki ekstraktının Cu²⁺ indirgeyici antioksidan kapasitesinin $2162,09 \pm 113,61$ µg TE/mL olduğu ve Fe³⁺ indirgeme antioksidan kapasitesinin ise $24,36 \pm 4,59$ µg TE/mL olduğu belirlenmiştir. Sonuç olarak farklı bölgede değişik isimlerle anılan *S. hortensis* bitkisinin antioksidan potansiyele sahip olduğu ve yaygın olarak kullanım şekline ilave olarak doğal antioksidan kaynağı olarak kullanılabileceği kanaatine varılmıştır.

Anahtar Kelimeler: *Satureja. hortensis* L., Fenolik ve Flavonoid madde, CUPRAC, FRAP, DPPH.

Synthesis Of N₁,N₃-Di(N₁',N₁'-Didesoxymethylazon-N'-Monodesoxymethylazon)diphenylquanidine And Research As A Corrosion Inhibitor

Bayramov Qiyas

Baku State University, Ecological chemistry, Baku, Azerbaijan Republic

Based on the information provided in the technical literature and the results of our many years of research, it has been proved that organic compounds containing nitrogen atom, ROCH₂-functional group, -CH₂-group, C₆H₅-group and many double bonds have high effective corrosion inhibitor properties. Therefore, the synthesis of this type of organic compounds and its study as a corrosion inhibitor is considered one of the most relevant topics. For this purpose, diphenylquanidine derivative N₁,N₃-di(N₁',N₁'-didesoxymethylazon-N'-monodesoxymethylazon)diphenylquanidine (conventionally denoted DQ-2 compound), which forms coordination bonds in aggressive environments on the metal surface, was developed by the methods previously developed by us [1-3] synthesized accordingly and studied as a corrosion inhibitor. This compound was synthesized in several stages by the reaction of diphenylquanidine with N₁, N₁-didesoxymethylazon-N'-monodesoxymethylazon ether.

DQ-2

The composition and structure of the synthesized DQ-2 compound were determined by methods known in analytical chemistry. Research to determine the corrosion inhibitory properties of this compound was carried out in accordance with the methods described in the literature [1-3].

Based on the results of the study, it was determined that the effectiveness of the synthesized DQ-2 compound of diphenylquanidine in the presence of highly aggressive [3% NaCl + oil (10: 1) + H₂S 500 mg / l; 0.3 N HCl + gasoline (1: 7) + H₂S 1000 mg / l] environments in the laboratory, even at concentrations of 0.5-1.5 mg / l, is 99.92-100%.

The non-corrosion of the Cm.3 steel (metal) used in the sample during the study was determined by the gravimetric method. The reasons for the effectiveness of the corrosion inhibitor of the DQ-2 compound have been clarified by us on the basis of the data given in the literature [1-3] as follows.

As noted in other studies, the inhibitory effect of each nitrogen-containing organic compound is likely to be passive and non-corrosive due to the large number of nitrogen atoms, functional groups, double bonds and their coordination with the metal surface. Therefore, the presence of 15 nitrogen atoms, 6 C₁₀H₁₂OCH₂-functional group

and 25 double bonds in the DQ-2 compound is likely due to the simultaneous increase in electron density “group-metal” coordination bonds are formed, forming a very thin layer on the surface of the metal. As a result, the surface of the metal plate in the study becomes passive and does not corrode.

According to the results of the research, the use of DQ-2 compound as an economically and environmentally effective inhibitor of 100% corrosion protection of steel technological equipment used in the oil and gas and petrochemical industries in high temperatures and aggressive environments can be considered scientifically based.

Synthesis Of N₄, N₅-Di(N₁', N₁'-Didesoxymethylazon-N'-Monodesoxymethylazon) Diphenylcarbazone Compound And Research As A Corrosion Inhibitor

Bayramov Qiyas

Baku State University, Ecological chemistry, Baku, Azerbaijan Republic

One of the main environmental problems of the oil and gas and petrochemical industries is the corrosion of steel technological equipment in the production areas of these industries. That is why the synthesis of highly inhibitory substances and their study as a corrosion inhibitor is one of the most pressing issues.

For this purpose, on the basis of cheap raw materials, a new derivative of diphenylcarbazone (conventionally marked KB-4 compound) containing a carbon atom, a nitrogen atom, the ROCH₂-functional group, and many double bonds was synthesized. The synthesis of diphenylcarbazone compound N₄, N₅-di (N₁' , N₁'-didesoxymethylazon-N'-monodesoxymethylazon) was carried out in the final stage by the following reaction in accordance with previously known methods[1-3] by us.

KB-4

N₄, N₅-di (N₁' , N₁'-didesoxymethylazon-N'-monodesoxymethylazon) diphenylcarbazone (KB-4) compound synthesized 6 Corrosion inhibitor efficacy is established in highly aggressive [3% NaCl + oil (10: 1) + H₂S 500 mg/l: 0.3N HCl + gasoline (1: 7) + H₂S + 1000mg/l] environments organized in the laboratory by us. Mass loss of steel plates of "cm.3" brand in these environments on the basis of "gravimetric" method for determination of corrosion rate of KB-4 compound at concentrations of 0.25: 0.5: 1.0 mg/l, temperature 70°C, for 4 hours, 600 period/min. research work was carried out with rapid mixing.

Based on the results of the study, it was determined that the effectiveness of the corrosion inhibitor of the KB-4 compound is 99.96-100%, even at the low concentrations mentioned above. The scientific results obtained in our previous researches and explanations in the technical literature have been proved in the mentioned research work. Thus, the scientific data and explanations show that organic compounds containing ROCH₂ functional group, nitrogen atom, -CH₂-group double bonds have a highly effective corrosion inhibitor effect. New synthesized derivatives of diphenylcarbazone N₄, N₅ (N₁' , N₁'-didesoxymethylazon-N'-monodesoxymethylazon) diphenylcarbazone (KB-4)

The following explanations can be given for the corrosion inhibitor effectiveness of the compound, which is noted in the literature[1-3].

Due to the presence of 6 $C_{10}H_{21}OCH_2$ -functional groups, 6 C_6H_5 -groups, 4 azonyl groups, 54- CH_2 -groups in the KB-4 compound, as well as an increase in electron density and Vander-Waltz forces due to the presence of 32 double bonds, it is likely that the steel plate "Azonyl group-metal" coordination bonds are formed on the surface and passivate the metal surface by adsorbing on the metal surface. As a result, the metal surface does not corrode. According to our research, the inhibitory effect of KB-4 compounds is many times more economical than the inhibitors currently used in the oil and gas and petrochemical industries to protect technological steel equipment from corrosion, as well as the results of research (even awarded an invention patent). and has a huge environmental advantage.

Thus, the use of synthesized and inhibitory KB-4 compounds in the oil and gas and petrochemical industries in the corrosion protection of steel process equipment operating in high temperature and aggressive environments can be considered scientifically based.

Study Of Antibacterial Properties Of Salicylic Acid Derivatives

Niyazi Sh. Rasulzade, Namiq Sh. Rasulov, Kamala K.Badalova

Azerbaijan Medical University, General and toxicological chemistry

Abstract

One of the important methods for obtaining antimicrobial polymer materials is the incorporation of biologically active monomers into the polymer chain at the stage of macromolecule synthesis. In this regard, the synthesis of monomers with new biological activity attracts the attention of many researchers. Thus, the synthesis of monomers, polymers, co-polymers based on potential antibacterial salicylic acid and the use of obtained high-molecular compounds as antibacterial additives is considered a very promising direction].

The presented work is dedicated to the study of the antibacterial properties of salicylic acid, acetylsalicylic acid, allyl and vinyl esters of salicylic acid. Both allyl and vinyl esters of salicylic acid and acetylsalicylic acid were synthesized by known methods.

The study of the antibacterial properties of the synthesized substances was studied by the serial dilution method. For this, 1:100, 1:200, 1:400, 1:800 dilutions of the 1% solution of substances prepared in ethyl alcohol in sterile distilled water were performed. The antimicrobial effect of these substances was studied at a rate comparable to alcohol, 1% phenol and nitrofungin used in medical practice. Golden staphylococci (*St. aureus*), Gram-negative intestinal bacilli (*E. coli*), blue-green pus bacilli (*Ps. Aeruginosa*) from pigment-forming ones, and *C. albicans* from the genus *Candida* were taken as test cultures. EPA (meat-peptone agar) was used to cultivate bacteria, and Saburo nutrient medium was used to cultivate fungi.

On the basis of experiments, it was determined that the synthesized substances have different effects on different types of organisms, and when these substances are diluted at a ratio of 1:100, they show strong antimicrobial activity against all tested test cultures. Based on these, vinylacetate is more active antimicrobial. Thus, in 1:400 dilution, it destroyed candida fungus in 20 minutes, intestinal and blue-green pus bacilli in 10 minutes, and staphylococci had a negative effect in 20 minutes when diluted in 1:700 ratio, but the other dilutions did not affect one hour.

Based on their antibacterial activity, the studied salicylic group is classified primarily as salicylic acid, vinylsalicylic acid, allylsalicylic acid, vinylsalicylate and allylsalicylate.

Developed antibacterial monomers can be used in the composition of polymers in household, medicine, and in the preparation of coatings for corrosion protection.

Key words: *antibacterial, polymer, salicylic acid, fungi*

A Review: Covid-19 Impacts On Soil

Asuman Büyükkılıç Yanardağ* and İbrahim Halil Yanardağ

Malatya Turgut Özal University, Agriculture Faculty, Soil Science and Plant Nutrition Department. Alacakapı Mah. Kırkgöz Cad. No:70 P.K. 44210 Battalgazi / Malatya/Turkey

Abstract

The Covid-19, the biggest challenge facing humanity since World War II, spread rapidly all over the world. It created health, economic, social and environmental problems. The increasing need and supply of food with Covid-19 has once again shown us how important the soil and nature are. The effects of Covid-19 on the soil and its solutions have become a very important issue and have also become a concern with the increasing amount of waste. During Covid-19, people produced solid waste during their stay at home, and soil was used for the disposal of this waste. Contamination of the soil was also very important in that it served as a sink. It is necessary to understanding the relationship between COVID-19 and human activities related to soil pollution and its functionality. There is a strong need to address the role of soil science in understanding and mitigating the problems caused by COVID-19 in the short and long terms. The purpose here is to find national and international solutions that can be done for the protection, improvement, repair and maintenance of the soil during and after Covid-19.

Keywords: Covid-19, Soil, Soil Pollution, Impacts

Introduction

In December 2019, a new infectious respiratory disease named COVID-19 (coronavirus disease 2019) emerged by the World Health Organization (WHO) in Wuhan, Hubei province, China. The COVID-19 pandemic has been hailed as the greatest challenge facing humanity since World War II, the most significant global health disaster of the century. It quickly spread around the world and created enormous health, economic, environmental and social challenges for all of humanity.

The virus, which was not taken very seriously at the beginning, spread all over the world in an incredible short time, as if we were living in sci-fi movies, causing the death of hundreds of thousands of people. Against the "common enemy", which still continues with all its violence and remains uncertain, countries are trying to reduce their economic losses while trying to protect their citizens.

The coronavirus (Covid-19), which forces us to stay at home, upsets our social and kinship relations, questions our habits, and turns economies upside down, is also the result of environmental intervention and nature intervention. After the epidemic spread in the world, the first decisions taken by countries were to impose restrictions on the trade of agricultural products. In other words, agricultural policies and rural policies began to come to the fore. The main purpose here was primarily to ensure the food safety and security of its own citizens. The coronavirus epidemic has seriously affected the global economy and still does. At this point, the effects of covid 19 on the soil has also been an important issue that causes concern.

Soil And Soil Polution During Covid-19

Soil is the most important part of the ecosystem that both regulates the environment and regulates food production, climate and water (Mishra et al., 2020). Pollution of soil will decrease crop yield and quality if it is caused by anthropogenic activity, especially urbanization, which will also vary soil organic matter, biodiversity and groundwater quality (Singh and Singh, 2020). During the Covid-19, a significant reduction in solid waste has been reported. Soil pollution may reduce cop quality and yield and, as well as change SOC (soil organic matter), biodiversity, and groundwater quality (Singh et al. 2020). Air pollution may originate from different anthropogenic and natural sources, which are able to bio-accumulate and bio-magnify in the trophic levels, and thus increase their toxicity in the food chain (Lee et al. 2020).

Soil plays a central role in production on individual farms with global developments,. It is also a fundamental condition for the resilience and productivity of agriculture in crises. Managing the soil both for recovery from COVID-19 and for long-term sustainable soil control is important not only to preserve yields but also to keep the soil healthy for many functions and new generations.

Figure 1. Some relevant sources of soil pollution (reused from Gavrilesu, 2021)

Soil pollution sources can be listed as follows; application of pesticides, herbicides or fertilizers in excess, solid waste leaching, breaking of underground storage tanks, discharge of industrial waste onto soil, leakage from landfills, percolation of contaminated water into the soil (Fig.1) During Covid-19, Solid waste leaching is to be a very important research topic in the World.

As known, soil pollution of natural or anthropogenic origin poses a serious threat to global food security, especially in the context of COVID-19 (Lal et al. 2020). During COVID-19, huge amounts of medical waste (e.g. tissue paper, gloves, face masks, plastic bags, empty liquid soap cans and disinfectant bottles) were produced that could contaminate the soil and require close monitoring (Lal et al. 2020). Therefore, it is necessary to understand the interrelationship between COVID-19 and human activities related to soil pollution (e.g., HMs, antibiotics, polycyclic aromatic hydrocarbons and petroleum products) and its functionality (Lal 2020; Lal et al. 2020). Thus, there is a strong need to address the role of soil science in understanding and mitigating the problems caused by COVID-19 in the short and long terms (Lal et al. 2020; Steffan et al. 2020).

Covid-19 Impacts On Soil

There are several environmental impacts of Covid-19 pandemic on soil, these are sometimes negative and sometimes positive effects. For instance, as air pollution increases, so does Covid-19, so it is positively correlated. Along with the decrease in greenhouse gas emissions, the decrease in industrial refineries and activities, the decrease in the use of vehicles and transportation systems due to social distance, quarantine and quarantine, also led to an increase in air quality and a decrease in the risk to human health (Heet al. 2020; Juan-Reyes et al. 2021). Many studies have been published and are still awaiting publication to illustrate the complex interactions of the environment and human system with COVID-19. (Sarkar et al. 2021), increasing plastic waste due to COVID-19 as very common materials (gloves and masks) used during this pandemic (Patrício Silva et al. 2021), the pollution of wastewater by COVID-19 virus (Lahrich et al. 2021), impact of COVID-19 on forest fires (Paudel 2021), environmental surfaces during the COVID-19 (Hu et al. 2021) incubation period.

Conversely, COVID-19 may negatively impact human society through, global food crisis or insecurity, the global economic recession, public health risks, and lowering psychological resilience (Sarkar et al. 2021). Land management needs to be addressed and adjusted the food supply chain disruption, labor shortages, difficulties in performing farm operations, negative impacts on essential and high-value crops, and food and medical waste disposal issues during the COVID-19 (Lal et al. (2020)).

Figure 2. How soil has been affected by COVID-19? (reused from Lal et al, 2020)

The most immediate soil impacts and responses of COVID-19 are human activities resulting from the decrease in human consumption leading to excess food being thrown away and added to the soil (Figure 2). It led to reduced food waste, meat consumption and the use of U.S. Department of Agriculture (USDA) soil maps to find areas suitable for mass burial of pigs and poultry in the United States (Anonymous., 2020). This is what is done; It has long-term results on groundwater quality, land use, human health, biodiversity, and land value (Bernton., 2020, Lal et., al., 2020).

To combat the ongoing COVID-19 effects, it is necessary to policy guidelines for the appropriate management of waste and treatment, and to apply them at the international and national levels, and to understand the environmental and ecological COVID-19 effects in the future so that it can be effectively addressed (Ankit et al., 2021).

Conclusion

Environmental pollution is still one of the most important problems today especially during Covid-19 period, which is also linked to human activities and health. Pollution of soil and air, which are the most important elements of agricultural ecosystems, is still a global problem. COVID-19 has affected all aspects of our lives and has had many impacts reaching all sectors of public health, socio-economic issues and the wider environment. How soil management can help us address the COVID-19 pandemic and how it can be transmitted through soil are important questions that need to be addressed. There is a positive correlation between air pollution and COVID-19. Some open questions regarding soil and air pollution during the COVID-19 era still need to be explored as human activity patterns have changed in a way that has resulted in a number of relevant impacts around the world. The COVID-19 has shown once again that the injured skin of the planet, the fragile soil, must be protected, healed, repaired and sustained. Some lands need to be acidified and returned to nature in order to improve and restore planetary processes through prudent management, reducing food waste and resource (soil, water, nutrient) losses.

Soil science should also be relevant to the general public, both as a consumer of food and as a beneficiary of the soil and other ecosystem services that provide for its management. Farmers and landowners are concerned about carbon sequestration, water quality and renewability, soil biodiversity, etc., which should be rewarded and encouraged through payments for ecosystem services such as current and emerging global challenges.

Modeling Surface water resources for effective Water Allocation Using Water Evaluation and Planning (WEAP) Model, the case of Dabana Watershed, Dhidesa Sub basin of Ethiopia

Abraham Dirbaba Guyysasa

Abstract

Water demand evaluation to varied competitive uses is more and more necessary in watershed that has different users. Within the study watershed, there are a variety of surface water users, however, no effective surface water potential and demand assessment exists for either the watercourse of Dabana or the complete watershed under study hence which is making area for competition between among these users including the environment. The study watershed is important because it forms a site in the Dhidesa sub basin that supports the ecosystem of the Blue Nile Basin in western Ethiopia. The main purpose of this study was to simulate surface water resources in the study watershed using the WEAP (Water Evaluation and Planning) model for effective surface water allocation. The outputs of the model were analyzed using tables, figures, percentages and arc gis 10.4 under reference and three future demand scenarios (climate change, increase irrigation area and population increase). The simulated monthly flow has shown a good agreement with the observed flows for a period (2000 –2020). The NSE was 0.92, RSR was 0.89 and R^2 was 0.85 for the calibration period and 0.85, 0.78 and 0.76 for the validation period respectively. The annual average surface water potential of the study watershed was estimated at 1329.6 Mm^3 , 1119.0 Mm^3 1308.2 Mm^3 and 1313.6 Mm^3 under the reference(2020), Climate change, Increase irrigation area and population increase scenarios, respectively at 2030 G.C. The demand for domestic users, livestock population, irrigation agriculture and Bedele Beer factory during the reference period was estimated to be 4.1 Mm^3 , 6.1 Mm^3 , and 11.1 Mm^3 and 0.3 Mm^3 , respectively. This surface water demand will raise to 5 Mm^3 , 9.2 Mm^3 , 16.6 Mm^3 and 0.316 Mm^3 respectively by 2030. On the other side, the environmental flow requirement for the health of ecosystem within the watershed and in the downstream of the study watershed was estimated to be 332.2 Mm^3 and 279.75 Mm^3 respectively during the reference (2020) and Climate change scenario (2030) respectively. The study has revealed that WEAP model is good decision support tool to assess the water demand, water resource availability and resource reliability of demand sites of study watershed. Based on the result of this research it has been recommended that both surface water supply and demand side management measures should be well implemented through integrated watershed management manner.

Abstract

Here we report efficient direct *in vitro* regeneration in *Spinacia oleracea* which results in healthy plants with fleshy leaves. Five different types of explant tissues were tested on different plant growth regulators at varying concentrations. Only petioles exhibited response for direct regeneration, hence it was used in further experiments. More than 35% of petioles regenerated directly into shoots which were later separated and cultured onto rooting medium. All other explants showed variable responses however, none of them could regenerate *in vitro*. As far as the role of plant growth regulators is concerned, Gibberellic acid (GA₃) appeared to be the most imperative one for direct *in vitro* regeneration and bringing about maximum regeneration in Murashige and Skoog's (MS) medium augmented with 2 mg/L GA₃, 0.4 mg/L NAA and 1 mg/L BAP. The resultant plants were acclimatized in the green house and resulted in healthy fleshy leaves. The protocol reported here describes efficient direct *in vitro* regeneration from green tissues. Hence, it may be a step forward to engineer/edit genome of this green vegetable for valuable traits including agronomic traits improvement, biofortification and biopharmaceutical production in future.

Upregulation of gene expression Profiles of BAK1 and BAK1/BCL2 cause Age Related Hearing Impairment (ARHI) by Triggering Apoptosis

***Muhammad Qasim, Bilal Ahmad**

Department of Bioinformatics & Biotechnology , Government College University Faisalabad

Abstract

Presbycusis or Age Related Hearing Impairment (ARHI) is a progressive, very common and most ignored neuro-sensory disorder in the older people that usually results in social isolation of the affected individuals. Programmed cell death of cochlear cells is the key reason in animal models of presbycusis. Since cochlear cells cannot regenerate, their apoptosis causes permanent hearing impairment. Discovery and characterization of molecular components can aid in developing prophylactic and therapeutic measures. The study involved comparison of expression profiles *BAK1* and *BCL2* genes between normal and age related hearing impairment subjects. These genes have been reported to be the integral part of intrinsic apoptosis pathway. Both normal and affected subjects were enrolled after detailed ENT examination, audiometry and otoscopic investigation and blood samples were taken after written informed consent. Samples were subjected to RNA extraction and degree of gene expression was determined through real time PCR. *BAK1* and the *BAK1/BCL2* ratio were found statistically significantly high in presbycusis subjects. The ratio was positively correlated with audiometric results. Our results show that *BAK*-mediated cell death may be the chief mechanism in the development of presbycusis in humans. The study reveals that the changes in gene expression profile of these genes can be used as a simple and quick marker for diagnosis of presbycusis.

Abstract

Vegetables grown in mining areas can accumulate significant amounts of heavy metals (HMs), which can cause serious developmental disorders and have long-term negative effects on public health. In the present study, HMs contamination levels in vegetables grown around the Riruwai mining area in Kano State, Nigeria were investigated. Fifteen (15) vegetable samples, including lettuce (*Lactuca sativa*), tomato (*Solanum lycopersicum*), and bean (*Phaseolus vulgaris* L), and their corresponding soils were collected. The concentrations of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc were determined using Microwave Plasma Atomic Emission Spectrometry, and the measured concentrations were used to compute the bioaccumulation factor (BAF). Heavy metal concentrations in the investigated vegetables and soils were found to be significantly high, with the majority of levels exceeding the WHO/FAO (2007) recommended limit. Pollution levels for heavy metals and vegetable types differed significantly ($p \leq 0.05$). Cadmium had the highest BAF value, with a value significantly greater than one, and *L. sativa* had the highest accumulation of all vegetables studied. The higher concentration of these metals in vegetables necessitates immediate scientific attention and further research to determine the optimum concentration required for human health. Planting of vegetables for human and animal consumption should be stopped until this is accomplished.

Key Words: BAF, Heavy metals, Microwave Plasma Atomic Emission Spectrometry, Riruwai, Vegetables

Introduction

Heavy metal (HMs) contamination of soils and vegetables has remained a threat to public health around the world, particularly in developing countries (Bayissa and Gebeyehu, 2021). Vegetables grown in mining areas can accumulate significant amounts of HMs, which can cause serious developmental disorders and have long-term negative effects on public health (Cao et al., 2010; Gebeyehu and Bayissa, 2020; Guo et al., 2020). Mining operations have historically played a significant role in national and regional economies. However, mining operations are usually carried out uncontrollably, resulting in profound ecological problems, particularly HMs pollution (Zhuang et al. 2014). Vegetables cultivated in mining areas can accumulate significant amounts of HMs, resulting in negative health effects on humans and other animals (Halim et al., 2015). Short and long-term exposure to HMs could result in numerous human health issues, including dermal, cardiovascular, gastrointestinal, hematological, renal, and hepatic effects (Lin et al., 2013; Zhuang et al. 2014). HMs contamination of soils is a major pathway for HMs exposure to humans, as they can enter the human body through ingesting contaminated vegetables (Makanjuola et al., 2019). Vegetables are important edible crops that are a necessary segment of the human nutrition regimen. They are high in nutrients that are essential for good health and provide carbohydrates, vitamins, minerals, and fiber (Khan et al., 2015). HMs are easily absorbed by vegetable root systems and can accumulate at high levels in the edible portions of vegetables even at low levels in the soil (Hu et al., 2013; Liu et al., 2013). It is clearly evident that more than 70% of the dietary intake of HMs is contributed to the food chain (Liu et al., 2013).

Riruwai, located in the southern part of Kano State, Northwestern Nigeria, is principally a mining community. A large-scale mining operation began in 1979 and was expanding rapidly with close to nine hundred (900) tons of zinc and tin ore production every day. The mine was stopped after five years of continued mining. However, small-scale mining has continued regularly in the area. There is growing evidence across the globe that HMs pollution in mining areas is causing health problems for the local residents (Li et al., 2014; Irzon et al., 2018). The residents of the mining communities are constantly at risk of being exposed to these metals through the consumption of vegetables. There is, therefore, a need to investigate the HMs contamination levels in the soils and vegetables grown in the mining area in order to protect the environment and public health. To the best of our knowledge, this is the first scientific study that investigated the HMs contamination levels in the soils and vegetables of farmland around the Riruwai mining area, Kano state, north-western Nigeria.

Materials and Methods

Description of the Study Area

Riruwai covers an area of 129 km² and is located between latitude 10°43'97"N - 10°45'01"N and longitude 8°43'3"E - 8°47'39" E (Fig. 1). The climate was classified as tropical savanna by Köppen, with mean annual rainfall ranging from 400 to 1,200 mm/year (Alhaji et al., 2017). Riruwai is one of Nigeria's younger granite complexes. The complex is an example of decayed roots of an alkaline volcano that formed as component of an early Jurassic chain of anorogenic centers. It is surrounded by a collection of metamorphic and calc-alkaline meta-igneous rocks that transitioned from Precambrian to Cambrian ages (Olasehinde et al., 2012). According to the 2006 census, the population of Riruwai is estimated to be 150,645 people. The projected population is 257,479 people as at 2015 at 3.2 % growth rate (NPC, 2006). The occupation of majority of people of the community is farming. Riruwai is one of the promising historical sites in Kano State that is well-known for its beautiful natural and man-made sites (Yakubu et al., 2019).

Figure 1. Map showing the study Area

Vegetables Sampling and Pre-treatment

A total of fifteen (15) vegetables that represent the species commonly grown in the area were collected directly from the farms in the study area. The vegetables include lettuce (*Lacuta sativa*), tomato (*Solanum lycopersicum*) and beans (*Phaseolus vulgaris* L). The specific sampling quantities were 4 *L. sativa*, 6 *S. lycopersicum*, and 5 *P. vulgaris*. The collected vegetable samples were washed three times with tap water to remove dust particles, blotted with tissue paper to dryness, and separated into edible and non-edible parts. The edible parts were oven-dried at 30 °C until they reached a consistent weight, then ground into powder with a blender (Jamali et al., 2009).

Determination of Heavy Metals in Vegetables

A 0.50 g sample of each treated vegetable was digested in a 5:1:1 tri-acid mixture of HNO₃, H₂SO₄, and HClO₄. The mixture was heated to 80 °C until clear, then filtered into a 50 cm³ volumetric flask using Whatman filter paper number 42. The filtrate was diluted with deionized water to mark. A blank sample was also prepared using similar acid mixtures into empty digestion vessels. Microwave Plasma Atomic Emission Spectrometer (MP-AES, Model: 4200) was used for the determination of HMs concentrations at their respective wavelengths in the soils and vegetable samples.

Determination of Heavy Metals in the Soils

The sample was air-dried at room temperature and visible materials such as stones, and plants residues were removed. The sample was pulverized, passed through a 0.15 mm nylon screen, sieved and homogenized. The soil sample was digested with a mixture of three concentrated acids (HNO₃, HF and HClO₄). Soil sample (0.50 g) was placed in a 200 cm³ Teflon beaker. 10.00 cm³ of HNO₃, 10.00 cm³ of HF and 10.00 cm³ of HClO₄ were added and the mixture was heated on an electric hot plate at 180 °C until the solution was almost dried. The beaker was

removed and cooled to room temperature. 5.00 cm³ of concentrated HNO₃, 5.00 cm³ of HF and 5.00 cm³ of HClO₄ were added and the mixture was boiled until dense white fumes appeared. The beaker was removed, cooled and 15.00 cm³ of deionized water was added and boiled for 5 minutes. The digest was filtered using Whatman filter paper no. 42 into a 50 cm³ volumetric flask. The wall of the beaker was washed three times with 10.00 % dilute HNO₃. The solution was made up to the mark with the HNO₃ for HMs analysis. Blank solution was treated and prepared in a similar way. The concentrations of As, Cd, Cr, Hg, Mn, Ni, Pb and Zn were analysed at their respective wavelengths using Microwave Plasma Atomic Emission Spectrometer (MP-AES, 4200). The concentrations of heavy metals were reported in mg/kg.

Determination of Bioaccumulation Factor (BAF)

The bioaccumulation factor (BAF) is a ratio of HMs present in vegetables to those found in the soil (Hossen et al., 2021):

$$BAF = \frac{C_{vegetable}}{C_{soil}} = \quad (1)$$

Where: $C_{vegetable}$ and C_{soil} are the HMs concentrations in vegetables edible portions and soils on a weight basis, respectively.

Quality Control

Analytical grade reagents were used with no further purification. All glassware and plastic containers were soaked in 10% (v/v) nitric acid overnight before being washed three times with distilled water and three times with distilled deionized water. They were oven dried overnight at 50–60 °C. After oven drying, the containers were desiccated for about 20 minutes before being analyzed. All samples were analyzed three times, the standard solution for each metal was prepared by sequential dilution of certified standards (1000 mg/L) obtained from Sigma Aldrich, and a calibration curve for each metal was created. Blanks were determined using similar procedure.

Statistical Analysis

All data was transformed into the mean standard deviation of three replicates. One-way Analysis of Variance (ANOVA) was used to compare heavy metal concentration levels in different vegetable samples. A statistically significant difference was established using the Tukey HSD post-hoc test ($p \leq 0.05$). Statistical analyses were carried out using SPSS 23.0 (Chicago, USA), while Microsoft Excel[®] 2010 was used in plotting the graph.

Results and Discussion

Concentrations of Heavy Metals (HMs) in Vegetables

The concentrations of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in vegetables cultivated around the Riruwai mining area are presented in Table 1. The levels of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in lettuce (*Lactuca sativa*) samples are 0.20, 1.21, 3.66, 0.50, 1.46, 0.57, 6.43, and 64.25 mg/kg, respectively. Zinc accumulated the highest in *L. sativa*, while arsenic was found to be the lowest accumulated metal. The HMs in *L. sativa* accumulated in decreasing order of Zn > Pb > Cr > Mn > Cd > Ni > Hg > As. The values of all the HMs in *L. sativa* are above the threshold values established by WHO/FAO (2007), except for zinc. This indicates that *L. sativa* cultivated in the study area is contaminated with HMs due to mining activities. High concentrations of HMs in lettuce, especially zinc, lead, and chromium, might be due to their corresponding high concentrations in the soils. This was consistent with the findings of Monterroso et al. (2014), who investigated the HMs distribution in plants grown in a Pb and Zn mining area in northwestern Spain. The concentrations of HMs (mg/kg) in tomato (*Solanum lycopersicum*) samples were: arsenic (0.19), cadmium (0.27), chromium (2.80), mercury (0.04), manganese (0.25), nickel (0.21), lead (0.40), and zinc (106.23). Zinc accumulated the most, while mercury had the lowest uptake. The uptake of HMs in *S. lycopersicum* follows a decreasing order of Zn > Cr > Pb > Cd > Mn > Ni > As > Hg. The concentrations are above the WHO/FAO (2007) maximum reference standards, indicating contamination of *S. lycopersicum* by heavy metals. The levels of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in bean (*Phaseolus vulgaris* L) samples are 1.05, 1.15, 2.56, 0.09, 0.33, 0.28, 5.94, and 77.06 mg/kg, respectively. A high level of zinc accumulation was found in *P. vulgaris*, followed by lead, chromium, cadmium, arsenic, manganese, and nickel, with mercury having the lowest accumulation. Except for zinc, the levels of all HMs in beans exceed the WHO/FAO (2007) threshold values. Generally, the findings of this study revealed that the investigated vegetables are polluted with HMs and might pose a significant health risk to consumers. Similar reports of heavy metal overload in edible plants grown on contaminated sites are well documented (Gebeyehu and Bayissa, 2020). *L. sativa* accumulated the most heavy metals. This is because *L. sativa* is a leafy vegetable, and leafy vegetables grow faster and have higher transpiration rates than non-leaf vegetables. Consequently, leafy vegetables can increase the uptake of HMs by plant roots, causing metal to move from roots to other vegetable tissues (Luo et al., 2011; Chang et al., 2014). Moreover, due to their broad leaf area, leafy vegetables are more prone to HMs contamination by the dust from soil (Chang et al.,

2014). The high level of HMs accumulated by vegetables is clearly consistent with the fact that plants in contaminated areas develop mechanisms to absorb greater amounts of the contaminants (Liang et al., 2017). HMs concentrations varied significantly ($p \leq 0.05$) between vegetables. This could be due to differences in their accumulation abilities caused by physiological and genetic differences as well as differences in soil properties (Khan et al., 2015; Liu et al., 2013). Consumption of HMs-contaminated foods for an extended period may result in an unending accumulation of toxins in the liver and kidneys of humans, thereby causing disruptions in biochemical processes such as liver, kidney, cardiovascular, nervous, and bone disorders (WHO (2006). Lin et al. (2013) recommended that leafy vegetables should be cultivated in soil with low HMs content and non-leaf vegetables in soil with comparatively high HMs content in order to reduce HMs pollution in the vegetables.

Heavy Metals	Vegetables			WHO/FAO (2007)
	<i>L. sativa</i>	<i>S. lycopersicum</i>	<i>P. vulgaris</i>	
As	0.20 ^a ± 0.03	0.19 ^a ± 0.01	1.05 ^a ± 0.04	0.15
Cd	1.21 ^a ± 0.01	0.27 ^a ± 0.03	1.15 ^a ± 0.09	0.2
Cr	3.66 ^b ± 0.04	2.80 ^b ± 0.11	2.56 ^b ± 0.05	2.3
Hg	0.50 ^c ± 0.03	0.04 ^a ± 0.03	0.09 ^c ± 0.03	----
Mn	1.46 ^a ± 0.01	0.25 ^a ± 0.04	0.33 ^c ± 0.01	0.2
Ni	0.57 ^c ± 0.03	0.21 ^a ± 0.02	0.28 ^c ± 0.00	0.1
Pb	6.43 ^d ± 0.06	0.40 ^a ± 0.01	5.94 ^d ± 0.09	0.3
Zn	64.25 ^e ± 0.09	106.23 ^c ± 0.55	77.06 ^e ± 0.04	100

Values are mean ± standard deviation (n = 3). The values on the same column with same superscript letters are statistically the same ($p < 0.05$), whereas values on the same column with different superscript letters are statistically different ($p < 0.05$), as revealed by one-way ANOVA and the Tukey HSD post-hoc test

Concentrations of Heavy Metals in the Soils

The concentrations of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in the farmland of the Riruwai mining area are 21.54 8.81, 1.51 0.06, 96.44 30.75, 0.50 0.09, 148.11 47.56, 18.31 5.32, 87.21 20.15, and 426.51 35.69 mg/kg (Fig. 2.). The concentration of HMs decreases in the following order: Zn > Mn > Cr > Pb > As > Ni > Cd > Hg, with As, Pb, and Zn exceeding the recommended limit set by WHO/FAO (2001). High concentrations of Pb, Zn, and As observed in the farm area beyond their respective safe limits indicate the spread of heavy metal pollution from the mining sites. Acidic drainage and dust transport by wind may be the primary mechanisms causing pollution dispersion (Rodr guez et al., 2009).

Figure 2. Heavy metals concentration in Riruwai mining area

Bioaccumulation Factor (BAF)

The results of BAF values in vegetables grown around the Riruwai mining area are presented in Figure 3. The BAF values of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in *L. sativa* are 0.02, 13.43, 0.05, 1.40, 0.02, 0.05, 0.10, and 0.18, respectively. Cadmium had the highest BAF, whereas manganese had the

lowest. According to Monterroso et al. (2014) and Bhatti et al. (2016), metal excluders have a *BAF* value of less than one, while accumulators have a *BAF* value of greater than one. The *BAF* values of arsenic, chromium, manganese, nickel, lead, and zinc were less than one, indicating that *L. sativa* is not an accumulator of these metals. Cadmium and mercury, on the other hand, had a *BAF* greater than one, which signifies that cadmium and mercury are accumulators of *L. sativa*. The *BAF* values of HMs in *S. lycopersicum* are arsenic (0.01), cadmium (3.00), chromium (0.04), mercury (0.11), manganese (0.003), nickel (0.02), lead (0.01), and zinc (0.29). Cadmium had the highest *BAF*, while manganese had the lowest value. With the exception of cadmium, the *BAF* values of all the studied HMs in *S. lycopersicum* were less than one. This shows that only cadmium is the accumulator of the plant, while the rest of the metals are excluders. The *BAF* values of arsenic, cadmium, chromium, mercury, manganese, nickel, lead, and zinc in *P. vulgaris* are 0.08, 12.76, 0.04, 0.25, 0.003, 0.02, 0.09, and 0.21, respectively. The *BAF* value of cadmium was the highest among the HMs, whereas that of manganese was the lowest. The *BAF* of cadmium was significantly greater than one, demonstrating that cadmium had a considerably high accumulation capacity in *P. vulgaris*. The *BAF* values of arsenic, chromium, mercury, manganese, nickel, lead, and zinc were, however, less than one, which signifies their low accumulation capacities. Generally, the *BAF* of cadmium is the highest and greater than one in all the vegetable samples. High *BAF* values in cadmium could be attributed to competition between Cd^{2+} and Ca^{2+} . Because of the similarities in their ionic radius and valence state, Ca^{2+} is more easily replaced by Cd^{2+} than other metals (Chang et al., 2014).

Figure 3: Bioaccumulation Factor (*BAF*) Vegetables Grown around Riruwai Mining Area

Conclusion

In this study, the HMs contamination level in vegetables grown around the Riruwai mining area in Kano State, Nigeria, and their corresponding soils were investigated. The findings of the study showed that HMs concentrations in the investigated vegetables were found to be significantly high, with the majority of levels exceeding the WHO/FAO (2007) recommended limit and the concentration of HMs in the soil decreased in the order of $\text{Zn} > \text{Mn} > \text{Cr} > \text{Pb} > \text{As} > \text{Ni} > \text{Cd} > \text{Hg}$, with As, Pb, and Zn exceeding the WHO/FAO (2001) recommended limit. Pollution levels were found to significantly differ ($p \leq 0.05$) between HMs and vegetable types. The *BAF* of all the HMs is less than one in all the vegetable samples except for mercury in *L. sativa*, which signifies that *L. sativa* is the accumulator of Hg. It is recommended, therefore, that planting of vegetables for human consumption should be stopped in the area until immediate scientific attention is given to the vegetables grown in the area and further research is conducted to determine the optimum concentration of HMs suitable for human consumption.

Abstract

The study was carried out to develop biscuits with the incorporation of carrot and cowpea powder at the Institute of Food Sciences and Technology, Sindh Agriculture University, Tandojam, Pakistan. The sample were prepared with various percentages of carrot and cowpea powder. That includes: T₀: 100% wheat flour (control), T₁: 90% wheat flour (WF), 5% cowpea Powder (CF), 5% Carrot Powder (CP), T₂: 80% WF, 10% CF, 10% CP and T₃: 70% WF, 15% CF, 15% CP. The results revealed that the variation in the physico-chemical characteristics and sensory quality of biscuits was significantly ($P < 0.05$) associated with the flour, carrot and cowpea powder ratio. The incorporation of carrot-cowpea powder supplementation resulted in a significant increase in protein, fat and ash contents of the biscuits. The biscuit width, thickness and weight also increased significantly. The sensory analysis also revealed significant differences ($P < 0.05$) amongst all treatments. It is concluded from the research that, biscuits prepared with 70% wheat flour, 15% cowpea flour, and 15% carrot powder had a significant impact on biscuit quality.

Evaluation Of Elite Sugarcane Genotypes In Nepal

A Shrestha[@], B Thapa

National Sugarcane Research Program, Jitpur, Bar

[@]Corresponding author

Abstract

Sugarcane is the sole crop for supplying raw materials for industries and contributes more than 60 % of sugar demand in Nepal. As compared to neighboring countries, there is still low production and productivity due to a lack of high-yielding and abiotic and biotic resistant varieties. So, the experiment was conducted in NSRP, Jitpur, Bara for evaluating the early maturity genotypes for assessing high yielding and abiotic and biotic resistance in both plant cane and ratoon. The experiment was laid in IET, CVT, CFFT, and AVT under abiotic and biotic stress conditions with RCBD design replicated thrice in 2018-2022 year. Yield and yield attributes and juice quality (Brix %, Purity %, SR %) were recorded at the harvesting stage. Among the tested genotypes under IET plant cane and ratoon, CoS 08272 gave the highest yield 107 t/ha, followed by CoP 2061 (97.2 t/ha), CoS 08276 (90.3 t/ha), and CoS 13231 (80.2 t/ha) while CoP 2061 and CoS 08272 has the higher ratooning ability. Overall performance of genotypes under different experiments, season, location, and year, CoS 08272, CoS 98014, Co 0118, and CoS 13231 were found high yielding and ratooning capacity as well as good sugar recovery. Under waterlogged condition, Co 98014 and CoS 08272 produced higher yields, while in rain-fed conditions CoS 08272 and Co 0118 provided higher plant cane and ratoon yields. Considering the farmers and sugar mills preference, CoS 08272, Co 0118, CoS 13231, and Co 98014 was superior over yield, abiotic and biotic resistant, and, good ratooning ability. So these genotypes should proceed for the release and registration process in Nepal.

Key words: Sugarcane, NSRP, Plant-Cane, Ratoon, Yield, Juice Quality

Introduction

Sugarcane (*Saccharum officinarum* L.) is one of the major cash and industrial crops and plays a pivotal role in the Nepalese economy. It is being grown in all agro-ecological zones but intensive commercial productions are the highest in the Terai region. The high demand for sugarcane-derived products has stimulated the expansion of sugarcane cultivation and sugar factories establishment in recent year (MoALD, 2020). The sugarcane area has been increased by fourfold (17,480 to 68,565 hectares) and total production increased by almost eight folds (408,260 to 3,400,175 tons) from 1985 to 2019 (MoALD, 2020). The productivity of Sugarcane during FY 2019 was 49.59 mt/ha (MoALD, 2020) which is very low as compared to neighboring and other developed countries. Sugarcane is the sole crop in Nepal, providing raw materials for the production of sugar to fourteen sugar mills and about a dozen of the jaggery mills in the country. Sugarcane is grown in an area of 68.5 thousand hectares producing 3.4 million tons of cane with a national average yield of 49.5 mt/ha (MoALD, 2020) which is very low as compared to neighboring and other developed countries. Primarily, this is due to a lack of highly productive genotypes and poor adoption of improved technologies. There is an urgent need to replace the old low-productive sugarcane varieties with high-yielding sugarcane clones (NSRP, 2021). To meet the requirement of both the farmers and industries, it is always better to have more diverse cultivars with different sucrose content, maturities and stress resistance so that proper and effective varietal scheduling can be practiced to have a higher yield of quality cane that are resistant/tolerant to biotic and abiotic stress. Lack of different maturity group genotypes shorten the cane supply period to the industry.

Sugarcane requires land for up to 12-18 months for its maturity and is ready to harvest as raw materials to industries. It is a long duration and time-consuming crop compared to other traditional field crops grown in Nepal. On the other hand, there is a lack of suitable varieties for production for different growing areas with different maturation period and high sucrose content and recovery (Shrestha & Thapa, 2020). Therefore, the sustainability of sugarcane cultivation in this country is threatened. For the sustainable development of sugarcane production of Nepal, focusing on biotic and abiotic stress management, nutrient balance, and its efficiency, enhancing sugar recovery and sustainable running of industries has become a major concern. The development of varieties is an important consideration for enhancing production and productivity and tolerance to biotic and abiotic stress (Ekelekepeze et al 2016).

Materials And Methodology

Varietal Improvement Trials Of Sugarcane Clones

The sequence of testing and evaluation are listed in Table 1.

Table 1: Varietal testing methods for registration of sugarcane followed by National Sugarcane Research Program, Nepal, as per guidelines described .

Varietal Evaluation Methods	Description
Coordinated varietal trials (CVT)	The third steps of varietal improvement where, selected varieties were evaluated in different location for their genotypic and environment interaction and their stability. This trial was also conducted in RCBD design with 3 replication in different location (NSRP, Bara, Indu-shankar Sugar Mills Sarlahi, Himalayan Sugar Mills Siraha, Eastern Sugar Mills Sunsari).High yielding and stable genotypes were selected for CFFT trials. Plot size were maintained 5 row line with 5 m long and 0.9 m row to row spacing
Coordinated farmer field trials (CFFT)	4 genotypes with check was selected for evaluating their performance in farmer field as design by scientist and management by farmer of Bara, Parsa and Sarlahi. Plot size were maintained 10 row line with 10m long and 0.9 m row to row spacing. DUS test was conducted in farmer field in participation of farmers, sugar industries, and extension officer for selecting their varieties as per their requirement. Then selected varieties was proposed for release and register process.

Study Sites And Planting Materials

Three different field experiments were conducted during 2018 to 2022 in National Sugarcane Research Program (NSRP). The soil of the experimental fields was sandy loam, slightly acidic, low in total nitrogen and organic carbon and medium in available phosphorus and potassium. Three budded sett of healthy canes were planted in furrow methods. Seed treatment was done with solution of Carbendazim 45% WP at rate of 1.5 gm. per liter water and with Chloro-pyrifos 25% EC at 1.5 ml per liter water each dipped for five minutes. The fertilizer was applied at the rate of 150:60:40 and 200: 60: 40 kg NPK per hectare for plant cane and ratoon crop respectively. Before planting, half dose of N and full dose of phosphorus and potassium were applied and mixed with soil as basal. Remaining half dose was applied as two split top dressed each at 60 and 90 days after planting. The genotypes used in this experiment were listed in Table 2 with detailed parentage and source of donors.

Table 2: List of genotypes used in the experiment and their respective parentage and donors

The preliminary characterization form was based on the description of morphological traits and growth characters like stool habit, tops, trashing, leaf blade and sheath, dewlap, ligule, node, internode and bud. Following (Chidambaram et al., 2017), all the data were collected at 180 days after planting

Table 3: List of plant morphological traits and observation

Qualitative data	Type of variable	Evaluation Level
Data were taken at 6 months after planting	Stem external color	Yellow (1), Green (2), Black (3), Red (4), Yellow reddish (5), Brown green (6), Violet (7)
	Shoot habit	Erect (1), curved (2)
	Leaf sheath color	Green (1), Yellow (2), Red (3), Brown (4), Other (5)
	Color of dewlap	Brown (1), Brown green (2), Green (3), Other (4)
	Shape of the buds	Oval (1), other (2)
	Bud cover	Present (1). Absent (0)
	Pubescence	Present (1). Absent (0)
	Internode alignment	Heterogeneous (1), other (2)
	Leaf appearance	Erect and stiff (1), Just bend at tips (2), other (3)
Data taken at 12 months after planting	Flowering	Present (1). Absent (0)
	Split of the stem	Present (1). Absent (0)
	Shape of inter-node	Cylindrical (1), Other (2)
Data collecting period	Quantitative traits	Measurement techniques
Six months after planting	Leaf width	Width of the broadest portion of the third fully opened leaf from tip measured
	Length of leaf (cm)	Distance between the leaf tip and base measured on the third fully opened leaf from the tip
	Length of leaf sheath (cm)	Measured in cm

Data Collection For Both CVT And CFFT

Five canes were randomly selected for measuring single cane weight and stalk length from 2nd row from both sides while central three row of the plot were harvested (area 13.5 m² for CVT and 27 m² for CFFT) for counting number of millable cane and finally yield of plot. Then, yield per hectare was converted. Three canes were randomly selected for measuring cane diameter and sugarcane juice analysis. Horne's Dry Lead method was used for sugar recovery (sugar content) quantification.

$$\text{Average Pol \%} = \frac{\text{Pol reading}}{\{0.00576 \times \text{brix}(\text{brix} + 0.014752) + 3.83545\}}$$

$$\text{Sugar recovery (\%)} = [\text{Pol \%} - 0.4 \times (\text{brix} - \text{Pol\%}) \times 0.74]$$

Where, Pol % mean sucrose content in sugarcane juice. Pol reading was optical rotation of juice extract solution, measured by manual Polarimeter ($\pm 130^\circ$). Brix (total soluble solute) was measured by digital brix refractometer and data calibrated in 20°C ambient temperature.

Data Analysis

All recorded data were processed and accomplished statistics in R studio (R Core Team 2013). Arithmetic mean of the respective data file per plot was taken for statistical analysis. Analysis of variance (ANOVA) of sugarcane yield, and yield attributing parameter were calculated with generalized least square model with replications (nlme package (Pinheiro et al 2014) to access the treatments effect. Individual effect analysis was only conducted and means comparison was done by DMRT. In case of CFFT, individual farmers were allocated as replication and analysis was done as simple RCB Design. The differences were considered significant at 0.05 probability level. Model residuals were checked for normality and homoscedasticity prior to ANOVA analysis.

Result And Discussion

IET On Sugarcane Plant Cane And Ratoon In 2018-19

The Initial Evaluation Trials was conducted in National Sugarcane Research program for testing the genotypes for disease and insect-pest resistance, high yielding and sucrose recovery. The tested genotypes showed the significant variant among them in terms of millable cane, Cane yield (t/ha), diameter, stalk length and single cane weight (g) in both plant cane and ratoon. At 5% level of significance, Table 1 depict plant cane and ratoon yield which was significantly varied with different genotypes. Based on plantcane, CoS 08272 showed higher yield (107.3 t/ha) which was followed by CoP 2061 (97.2 t/ha), CoS 08276 (90.3 t/ha) and least yield was obtained from check varieties Jitpur 4. Similarly, in the respect of ratoon, CoP 2061 produced the higher cane yield (84.1 t/ha), followed by CoS 08272 (81.1 t/ha), CoS 08279 (65.1 t/ha) and least by CoS 08452 (41.9 t/ha).

Table 2 showed that stalk diameter, single cane weight of both plant cane and ratoon crops was not found significant at level of 5% of significance. But plant height and millable cane was varied in both plant cane and ratoon. The average height of stalk ranges from 1.8 to 2.5, while tallest plant height was of CoP 2061 (2.5 m) and least by CoS 08278 (1.8m). Another important traits that enhances the yield of sugarcane is millable cane that is directly linked to yield. At 5% level of significance, higher millable cane was produced by CoP 2061, followed by CoPk 05191, Co 98014 and least by Co 0118.

Performance Of Sugarcane In Coordinated Varietal Trials At Different Location Of Madhesh Province And Province 1

Comparing the yield of sugarcane under different location, Table 6 and 7 showed that there were significant variations in yield among the genotypes. Among the tested region, Sarlahi showed overall good production of sugarcane yield which as followed by Bara, Sunsari, and Siraha. Overall mean yield, at the 5% level of significance, CoS 08272 produced higher cane yield (95.6 t/ha) followed by Co 0238 (92.8 t/ha), CoPk 05191 (87.3 t/ha) and least by Jitpur-1 (61.4 t/ha).

The yield attributes of sugarcane under CVT trials illustrated in Table 8 explained that single cane weight, cane diameter and stalk length was found non-significant to genotypes but Millable cane number was significantly varied among the genotypes. Higher millable cane was noted in CoPk 05191, followed by Jitpur-1, CoS 13231 and least in CoS 91259.

Ratoon Performance In Co-Ordinated Varietal Trial Of Early Maturing Genotypes During 2021-2022

Table 9: Performance of ratoon of different varieties of sugarcane in Jitpur condition in 2022

Genotypes	Stalk length (m)	Single cane weight (g)	Stalk diameter (mm)	Millable cane (No/ha)	Yield (t/ha)	Rank
Jitpur-1	1.8	366	17.4	114074	37.5 d	V
Co 0238	2.3	964	21.8	65926	70 b	II

P-value	0.002	<0.01	0.001	<0.001	<0.001	

Table 9 depicts the performance of sugarcane ratoon under CVT during 2021-2022. The stalk length, single cane weight, millable cane number, Yield was significantly influenced due to genotypes effect. At 5% level of significance, all yield and yield character were highly significant. The average length of stalk of ratoon crops was 2 m while its ranges from 1.8 to 2.3 m. The average single cane weight and stalk diameter was 653 g and 19.9 mm which laid in medium thick criteria but some genotype consists thin diameter and low single cane weight i.e Jitpur-1 which falls in thin criteria. Ratoon yield varied among genotypes where CoS 08272 contributed to higher yield (96.1 t/ha), followed by CoS 13231 (71.8 t/ha), CoS 0238 (70 t/ha) and least by Jitpur-1 (37.5 t/ha).

Table 10: Juice quality of different sugarcane genotypes

Genotypes	Sucrose (%)	Purity (%)	Sugar Recovery (%)
CoS 08272	19.6	93.2	13.9
Co 98014	19.0	92.7	13.4
Jitpur-1	16.9	89.9	11.8
Co 0238	18.0	89.5	12.5
CoSe 91259	13.9	84.5	9.4
Co 0118	19.1	87.1	12.1
CoS 13231	18.2	92.0	12.8
CoPk 05191	16.1	88.3	11.1

Overall evaluation of juice quality of individual genotypes presented in Table 10 showed that CoS 08272 consists of higher sucrose, purity and sugar recovery percentage followed by Co 98014, Co 0118, CoS 13231 and least by Jitpur-1.

Table 11: Preference testing of both farmers and Mills

Genotypes	Farmer marking	Farmer Ranking	Mills score	Mills Rank
CoS 08272	6.8	II	8	II
Co 98014	4.3	VII	9	I
Bo 120	3.4	VIII	6	III
Co 0238	7.0	I	8	II
CoSe 91259	6.1	III	5	IV
Co 0118	5.3	IV	9	I
CoS 13231	4.9	V	8	II
CoPk 05191	4.8	VI	5	IV

Based on preference and ranking of farmer based on yield performance and by mills based on sugar recovery, higher preference was given to Co 0238 and CoS 08272 and higher rank was provided to Co 98014 and CoS 08272 by Mills.

Discussion

Morphological Traits Of Registered Varieties

The morphological traits were found distinct among the varieties that help for easy identification of respective varieties in farmers field for further evaluation and breeding process. These three genotypes showed distinct character in different morphological traits like prominent bud shape, leaf color, auricle and ligule shapes, clasping and appearance of leaves and stem orientation. These characters could be used as descriptors for identification, distinctiveness, uniformity, and stability performance of varieties and maintaining purity in sugarcane seed and commercial production (Ahmed & Obeid, 2012). (Hunsigi, 1993) stated that the width of the medium leaf blade, dewlap shape, ligule, and sheath auricles are the characters of value for the identification of different sugarcane cultivars. (Chang & Milligan, 1991) reported that the most important geomorphological characteristics of sugarcane varieties are the shape, color, and wax of aerial organs. (Srivastava & Gupta, 2008) reported that the most outstanding, organographic characters of the sugarcane stalk were the bud shape.

Yield and yield attributes

There is prominent variation in yield and yield attributes among the tested genotypes. Variation in character is the characteristic of individual genotypes, while it may varies with climatic condition, soil parameters and other agronomical practices. Besides on same management and other practices, significant role in variation plays role by varietal characterization. Among the tested genotypes, the average yield was 64 t per ha which is 20t more than the ratoon yield. But in case of varieties CoS 08272, Co 0118, Co 98014 and CoS 13231, the cane yield is similar to ratoon yield which is very beneficial to farmers in terms of yield and enhancing productivity and profitability. Farmers in Nepal prefer the varieties that have higher ratoon capacity because ratoon cultivation saves 30% cost of cultivation due to land management and sett costs (Shrestha et al 2021). Also, other yield attributing characters i.e. number of millable cane, weight of single cane, stalk length and diameter showed similar results. Sprouts of left stubbles in the field allows growth of ratooning, thus saving total production costs by saving on seed bed preparation, seed materials, and planting operations. And, naturally the productivity of ratoon is 10 to 30% less than the plant crop of sugarcane despite of its 20-25% higher requirement of nitrogenous fertilizers over normal recommended dose (Arshad et al 2020). Such reduced yield of ratoon crop is mainly due to low and differential ratooning potential of cultivars and sub-optimal crop management and cause 35% losses in productivity (Arshad et al 2020)

Juice and Juice quality

Canes Pol %, cane Brix %, commercial cane sugar (CCS), and ton cane per hectare (TCH) are the sugar yield parameters which is usually used to determine cane maturity, however (Ahmed & Obeid, 2012; Hunsigi, 1993) reported Pol % of cane as the mostly used parameter by the researchers, whose value ranges from 10.49 to 17.86. Also, (Acland, 1971) reported the cane with 16% or more and purity of more than 80 were considered equal to maturity and are commercially acceptable. (Nisha et al 2019) reported there is a great importance of study of agronomic and commercial traits of interest in the progenies of hybrids of sugarcane to pick better performing progenies for further utilization in the breeding programs.

Conclusion

Under the supervision of varietal improvement trails like IET, AVT, CVT & CFFT, during interval of 4 years, and other agronomical and biotic and abiotic stress trails, observation showed that Co 0238, CoS 08272, CoS 13231, Co 98014 & Co 0118 found most promising in yield and sugar recovery. This variety comes under the choice of both the farmer and industries, due to its good yield in plant cane and ratoon crops as well as good sugar recovery.

Ecological Assessment of Transboundary Rivers of Azerbaijan

Sevinj Hajiyeve, Shamilov Nazim, Tarana Aliyeva, Madina Nabiyeve

Department of Ecological Chemistry, Faculty of Ecology and Soil Sciences
Corresponding Author

Abstract

There are 21 transboundary rivers in the country, and most of them belong to the basins of the Kura and Araz rivers. The Kura and Araz basins are located in four and five countries, respectively. According to various estimates, the water resources of the Kura River basin (including Araz) vary from 25.9 to 26.9 km³. The water reserve of the Araz River basin is 9.10-9.30 km³, the inflow from neighboring countries is 7.70-8.10 km³ or 85-87%, and the local flow is 1.04-1.40 km³. The water resources of the rivers flowing into the Caspian Sea as a whole are 2.17-3.41 km³, the inflow from neighboring countries is 0.14 km³, and the local flow is 2.17-3.27 km³. According to various calculations, the total water resources of the rivers of the Republic of Azerbaijan are 28.1-30.3 km³. The inflow from neighboring countries to the territory of the Republic is 19.7-20.3 km³ or 67-70%. The volume of flow formed in the country is 7.81-10.6 km³. Thus, the inflow from neighboring countries is 2.0-2.5 times higher than the local inflow.

There is a shortage of water in Azerbaijan, which can be reflected in the water supply per 1 km³ of the area. Provision of the Republic's territory with local flow is 90-122 thousand m³/year. Taking into account the inflow from foreign countries, the total water supply of the Republic is 324-350 thousand m³/year.

Water quality in Azerbaijan is monitored on 25 indicators. Water samples are usually taken once a month. The frequency of monitoring at the confluence of transboundary rivers is once every 10 days. Water quality is assessed by the decision of the Cabinet of Ministers of the Republic of Azerbaijan in accordance with the Standards adopted in the former USSR. Unfortunately, according to research, more than 90% of industrial and domestic wastewater in transboundary river basins is discharged directly into these rivers. With the inflow of wastewater into the aquatic environment pollution problems are increasing and are spreading throughout the basin.

Pollution of rivers in the area occurs mainly in two ways. First, physical pollution occurs due to increased turbidity of river water during periods of turbulence and floods under the influence of natural factors. Second, chemical and biological pollution includes anthropogenic pollution of water with substances harmful to the human body. The studied areas show that anthropogenic pollutants enter the rivers from many sources. The most harmful sources are the untreated discharge of wastewater from various industries, especially the oil and petrochemical complex, metallurgy and mining industry, urban wastewater. In addition, a number of chemical and mineral fertilizers, pesticides, defoliantes used for agricultural purposes in the area flow into the rivers and streams by irrigation water and groundwater.

In general, the following factors have a greater impact on the ecological status of rivers flowing directly into the Caspian Sea, forming both transboundary and in the territory of Azerbaijan:

- Discharge of industrial and municipal wastewater into rivers;
- Deforestation in the basins of local rivers;
- Illegal misappropriation of river protection zones;
- Increased amount of water taken from rivers;
- Non-compliance with international conventions and local legislative acts on the use of territorial rivers.

Thus, the main pollutants of transboundary rivers are minerals, inorganic salts and acids, heavy metals from mining enterprises, hydrocarbons, nutrients from the agricultural sector and chlorine organic pesticides, surface erosion products in the basin as a result of intensive deforestation, etc.

Modern Ecological Situation and Pollution of the Araz River

Sevinj Hajiyeva, Nazim Shamilov, Tarana Aliyeva, Madina Nabiyeva

Department of Ecological Chemistry, Faculty of Ecology and Soil Sciences
Corresponding Author

Abstract

The Araz River is the largest tributary of the Kur, and the second largest river in the South Caucasus in terms of flow. Its length is 1072 km, the basin area is equal to 102 thousand km². The Araz River originates from numerous lakes in the northern foothills of the Bingöl mountain range of Turkey (at an altitude of about 3000 m). The part up to the confluence with Akhuryan river is in the territory of Turkey. From that place to the vicinity of Bahramtepe water junction in Imishli district, approximately 600 km away, it forms the state border with Turkey, Azerbaijan, Armenia and Iran.

The total catchment area of Araz is 102,000 km², 18,740 km² or 18% of this area is in Azerbaijan. Many factors affect the formation of the natural features of the Araz River basin. Among them, the relief formed as a result of the interaction of endogenous and exogenous processes, severe continental climate, geographical position, orographic conditions, changes in hypsometry over a wide range, higher average altitude, location in the transition climate zone, anthropogenic influence, etc. is quite important.

Due to the strengthening of the influence of anthropogenic factors, significant changes have occurred in the chemical composition of the water of the transit rivers and their tributaries. After the well-known events between Armenia and Azerbaijan, the process of pollution of these rivers has become even more cruel by the Armenians. Before these waters enter the territory of the country, they are exposed to contamination with various chemical elements and compounds, organic substances, and bacteria exceeding the sanitary-hygiene norms have been found. Starting from Gyumru, the Araz River receives domestic and industrial wastewater from more than 10 industrial cities of Armenia along its flow to the border area with Nakhchivan MR. Especially the rivers Gederchay, Vorotan, Akhuryan, which join the Araz from the territory of Armenia, have been polluted with extremely toxic substances. Waste water from industrial enterprises of Razdan, Charensavan, Abovyan, Yerevan cities and domestic waste from other residential areas located on the banks of the river are thrown into this river, which Razdan ranks first in Armenia in terms of its water pollution. There is almost no oxygen in the waters of these rivers, acidity has decreased to pH 2.4, microflora has decreased by 200 times, vegetation along the river banks has also been destroyed. Between Armenia and Nakhchivan MR (Sadarak and Surenavan villages), in the water of Araz, phenols are 220-1160 times, salts of heavy metals 36-44 times (copper, molybdenum, etc.), nitrogen-phosphorus salts 26-34 times, chlorides 28 times, hydrocarbons of petroleum origin are 73-113 times higher than the permissible concentration.

Keywords: *Araz river, industrial wastewater, pollution, heavy metals, phenols*

Abstract

The problem of selecting the correct land for the cultivation of a certain crop is a long-standing and mainly empirical issue and nowadays, sustainability is one of the important issues in land use system. A Typic Plinthustalfs soil developed on Pre-Cambrian basement complex rocks was evaluated for its suitability for cucumber (*Cucumis sativus* L.) in the southern guinea savanna zone of Nigeria. Three mapping units that were established along the topo-sequence and three profile pits that were dug in 2017 were used for the experiment. Linear parametric and square root models were used for assessing the suitability of the soils for sustainable cucumber production. Land qualities considered in the study were climate, topography, wetness, soil fertility and soil physical properties. Except for the fertility status of the land, other qualities were not a constraint to the production of cucumber at study site. None of the pedon is highly suitable for production of cucumber by both linear and square root models with index of current productivity (IPc) that ranged between 18.7 and 70. Linear model indicated pedon 2 as currently not suitable with IPc of 18.7. Potentially, the index of potential productivity (IPp) ranged between 25 and 70 which rated pedon 1 and 3 as moderately suitable and pedon 2 as marginally suitable for cucumber production by both linear and the square root model. The limiting factors were mainly low levels of available macro-nutrients (N, P, K, Mg), low organic carbon (<0.54%), and low cation exchange capacity (<5.61cmol/Kg) in all three pedons studied. Field trial also confirms the claim as application of both organic and NPK fertilizers significantly affect the yield of cucumber in all the pedons. In conclusion, it is therefore recommended that Insecticides, organic and Inorganic fertilizer should be applied for sustainable cucumber production on soils of the studied site.

Introduction

The need for increase food production to feed the ever increasing human population cannot be over emphasized. Hence it is of great importance to carry out land evaluation assessment in relative to crops that are planted in different regions of the Nation.

Land sustainability assessment is a method of land evaluation, which identifies the major limiting factor for planting a particular crop. Land suitability assessment includes qualitative and quantitative evaluation, it is important to step in the process of land use planning where resources are limited. The assessment is carried out separately for each categories of land use (Reshmideri *et al.*, 2009).

Land suitability assessment provides information on constraints and opportunities for land use and hence serves as guide for decisions on optimal utilizations of the land resources; whole knowledge is an essential prerequisite for land use planning and development. (Kappo *et al.*, 2004).

These kinds of assessment identify the main limiting factors for the agricultural production and enable decision makers such as land users and agricultural support services to develop crop management that can overcome such constraints thereby increasing yield (Rabia, 2012).

Soil assessment can tell farmers how suitable their land is in terms of soil limitations to specific land use and management practices.

Soil suitability classifications are therefore based on the knowledge of crop requirements, prevailing soil conditions and defined soil management. From the basic soil requirements of crop, a number of soil characteristics directly related to crop yield performance. (Jimoh, *et al.* 2018)

Nutrients deficiencies and imbalance are the main constraints of crop production in Nigeria, and thus assessing the suitability of soil for agricultural production is very important in the production of crops to meet the ever increase in population.

The food sub-sector of Nigerian agriculture parades a large array of crops, amongst this crop is cucumber (*Cucumis sativus*). It belongs to the cucurbitaceae family which comprised of 118 general and 825 species.

Compared with other Vegetables, cucumber occupies fourth place in importance in the world, following tomatoes, Cole crops and onion. In 1987 world acreage of cucumber was estimated at about 850,000ha with a total production of 12.5 million tons. About half of this production was from Asia, with China leading at 240,000ha and 3.7 million tons.

Fertile soils are used for the cultivation of cucumber, infertile soil result in bitter and mish happen fruits which are rejected by consumers, fresh cucumber supply thiamine, Vitamin C, Niacin, Phosphorus, Iron and Calcium.

Soil suitability assessment for agriculture is a means to evaluate the ability of soil to provide optimal ecological requirements of a certain crop variety. This is a strategy for achieving food security as well as sustainable environment.

Information on soil-site suitability evaluation for cucumber production is not available for the study area. The present study was therefore undertaken to unfold this information. Therefore, the main objective of this study is to evaluate the soils of teaching and research farm, Malete, Kwara State, for sustainable production of Cucumber (*Cucumis sativus*).

Materials And Methods

The study area was Kwara State University Teaching and Research farm, Malete. It is located in Southern Guinea Savanna ecological region of Nigeria. It lies between Latitude 08°71'N; longitude 04°44'E in Moro Local Government Areas of Kwara State at 360 m above sea-level and the relief is very gentle.

Climate

The climate of the teaching and research farm is characterized by distinctive wet and dry seasons with a mean annual rainfall of about 1150mm, with a double maximal pattern between April and October. The wet season begins in April and ends around October while the dry season begins in November and ends in March. In addition, the annual mean temperature ranges from 25 to 28.9°C.

Geology of the area

According to Alabi *et al.* (2017), the soil at the Teaching and Research farm of Kwara State University, Malete is Sandy loam and slightly acidic. The Kwara State University land area forms part of the South-Western sector of Nigerian basement complex, a zone of basement reactivation.

Vegetation and Land Use

The natural vegetation of the Kwara State University Teaching and Research has been destroyed due to farming activities and procedures such as ploughing, harrowing and ridging by man making it anthropogenic. Presently, the type of vegetation in the area is savannah woodland. The area is predominantly used for the cultivation of arable crops such as maize, groundnut and cowpea, perennial trees such as cashew and mango. The site also contains woody species such as baobab (*Adansonia digitata*), Neem tree (*Azadirachta indica*) and acacia (*Acacia species*), grasses such as spear grass (*Cylindrica imperata*), Elephant grass (*Pennisetum purpureum*) and guinea gamba grass (*Andropogon gayanus*).

Field Survey and Sampling

Detailed soil survey was conducted in the area using rigid-grid method. Three mapping units and soil profiles that was already dug in the study area for its classification in 2017 was used and Surface samples were collected at 0-20 cm for laboratory analysis.

Laboratory analysis and procedure

Samples were collected from eight different locations and air-dried. The samples were passed through a 2mm sieve to separate the large particles, stones and debris. The soil was analyzed to detect the macro and micro nutrients present in the soil. Particle size analysis was determined using the hydrometer method modified by Gee and Or, 2002. Soil pH was determined electrometrically in 1:1 soil water suspension.

Organic carbon is determined by Walkey-Black method while Total Nitrogen was determined by the Micro-Kjeldahl method (Bremner and Mulvaney, 1982) and extractable P was determined by Bray and Kurtz, 1945). Exchangeable Ca, Mg, Na and K were extracted with 1M ammonium acetate (1M NH₄OAc) solution buffered at pH 7.0, as described by Anderson and Ingram (1998). The exchangeable sodium (Na⁺) and potassium (K⁺) content of the filtrates were determined by Flame photometer while the exchangeable calcium (Ca⁺) magnesium (Mg⁺) were determined by EDTA titration method and were read with atomic absorption spectrophotometer (AAS). Micronutrients (Fe, Cu, Mn, Zn and B) of the soils was extracted by Mehlich-III multi-nutrient extraction method.

Land Evaluation Procedure

The pedons were first placed in suitability classes by matching their characteristics with the requirements in Table 2 below. The suitability class of a pedon is that which is indicated by its most limiting characteristics. This affirms the well famous "Law of Minimum" in agriculture, which states that crop yield will be determined by the plant nutrient in lowest supply (FAO,1984). Secondly each limiting characteristic would be rated for the parametric method. The index of productivity (IPp) for each pedon was calculated using the equation below:

$$IP_c = A \times \frac{B}{100} \times \frac{S}{100} \times \frac{C}{100} \times \frac{F}{100} \dots \dots (i)$$

$$IP = A \cdot \sqrt{\frac{B}{100} \cdot \frac{C}{100} \dots \frac{F}{100} \dots \dots (ii)}$$

Where A is the overall lowest characteristic rating, B, C...F are the lowest characteristics rating for each land quality group.

The five land quality groups to be used in this study are climate, topography, soil physical properties, wetness and chemical fertility. Only one member in each group would be used because (IPP) and current (actual) index of productivity (IPC) would be calculated without putting the calcium (Ca) mole fraction and available phosphorous (Bray's P1) into the 'f' group, while the IPC would be calculated with the calcium mole fraction (exchangeable Ca²⁺ as a fraction of cation exchange capacity) and available phosphorous (Bray's P1) forming part of the 'f' group.

Table 1: Rating of the limiting characteristics

Symbol	Suitability classes	Land index
S1	Highly suitable	1.00 – 0.90
S2	Moderately suitable	0.89 – 0.75
S3	Marginally suitable	0.74 – 0.50
N	Currently not suitable	0.49 – 0.25

Agronomic Evaluation

The performance of cucumber was evaluated experimentally using a 3 × 3 factorial experiment. The factors were topo-sequence and types of fertilizer or soil amendments. There are three levels of each factor; namely, upper slope, middle slope and lower slope, application of farmyard manure, N P K and control

Experimental Design and Land Management

The experiment was carried out using a randomized complete block design (RCBD) with 3 replications. Experimental plots consisted of 17m by 11m in each mapping unit. Pre planting herbicide was applied at 2 weeks before planting at 100 ml of Paraquat and Pendimethalin 250 ml rate, farmyard manure was applied at two weeks before planting. Plant spacing of 0.60 m × 0.30 m was used. Marketmore variety of cucumber was planted and 2 seeds were planted per stand.

Data collection

Growth and Yield parameters collected include: Number of leaves at 4,6 and 8 weeks after planting , Vine length at 4,6 and 8 weeks after planting (m), Leaf area at 4,6 and 8 weeks after planting (cm), Days to 50% flowering , Days to 50% fruit setting, Fruit length (cm), Fruit yield per plant, Fruit weight (g), Yield per ha (ton).

Statistical Analyses

Data collected was subjected to analysis of variance (ANOVA). Using DSAASAT and treatment means where significant, were separated using Duncan Multiple Range Test, at 5% level of probability

Results And Discussion

Soil Physical and Morphological Properties

The present study was based on the physical and morphological properties of soils of Teaching and Research farm, Kwara State University, Malete that was carried out in 2017 as shown in the Table 4 below. The first profile was located in the upper slope of the topo-sequence on a gentle slope (<3 %) slope. Pedon UPP had colour variations between reddish brown (5 YR 4/3) in the surface soil to a range of red (10 YR 4/6) and Yellowish red (5 YR 5/8) in the subsurface soils. This profile had a loamy sand epipedon overlying a sandy loam to sandy clay loam subsoil. This pedon had high sand content, moderate silt content and clay content increases with depth which shows the evidence of argilluviation in the second, third and fourth horizons of this pedon. The iron- manganese concretions were identified in the subsurface horizon between depth 35- 86cm and 86- 147 cm. The soil was well drained at the time of sampling, but few, distinct dark reddish grey mottles (10 R ¾) were observed at a depth 35 -86 cm.

With increase in depth, the mottles became many, coarse and prominent with a colour change from dark reddish grey to black (5 YR 2/1) at a depth 86 -147 cm.

The pedon had medium sub angular blocky structure in both surface and sub-surface soils. The profile had a consistency that range from friable, loose, slightly- sticky, and slightly- plastic (wet). The boundaries between the horizons were gradual and smooth throughout the pedon.

The second pedon was located on the middle slope of the topo sequence. The colour of the pedon also varies ranging from Dark brown (7.5 YR 4/2) on the surface to dark brown (7.5 YR4/4) and Yellowish red (5YR 4/6 and 5 YR 5/8) in the sub soils. The Pedon had loamy sand texture on the surface horizon and loamy sand, sandy loam in the sub surface soils. The epipedon were fairly stony and free of concretion while iron- manganese concretions were encountered at depth 41-61 cm and 61-156 cm. The soil was deep and well drained at the time of sampling. However, dark gray (5 YR 4/1), fine, medium and distinct to dark reddish brown (5 YR 3/2), many, common, coarse and prominent mottles were encountered between 41 cm and 156 cm depth.

The structure of the pedon ranged from fine sub angular blocky to single grained on the surface and coarse sub angular blocky to sub angular blocky in the subsurface soils. Profile consistency ranged from friable, loose, non-sticky, non-plastic (wet) on the surface to firm, hard, very sticky, very plastic in the subsoil. The boundaries between horizons were gradual and smooth.

Source: Alabi et al., 2017 Soil Chemical Characteristic

The third pedon (LS) was located on the lower slope of the topo sequence. The surface and second horizon of this pedon were dark brown (7.5 YR 4/2) and reddish brown (5YR 5/4) respectively, while the subsurface horizons were red (2.5 YR 5/6) and yellowish red (5 YR 5/8). The pedon had loamy sand in the first and second horizons and sandy clay loam to sandy loam in the third and fourth horizons. There was evidence of argilluviation in the subsoils due to increase in clay content. The profile was well drained. However, black (5 YR 2/1) fine, coarse distinct, prominent mottles were noticed between 61 cm to 156 cm depth. The profile had medium sub angular blocky structure in the surface soils to single grained in the subsurface soils. The consistency of the horizons ranged from firm, slightly- sticky, slightly- plastic in the surface to friable, loose, non-sticky, non- plastic in the subsurface soils. The horizon boundaries were gradual smooth in the surface horizon but gradual wavy in the sub surface horizon.

Table 5 showed the chemical properties of the pedons dug in 2017. The soils had reactions ranging from moderately acidic to slightly acidic (5.47 -6.31) in distilled water. However, the upper slope had the range between 5.80 -6.01, the lower slope had the highest pH value in the second horizon (6.31) and the first horizon (6.16) while other horizons exhibited moderately acid condition. A similar pattern of pH variation was noticed in the middle pedon with the highest value in the first horizon and second horizons.

The Total exchangeable acidity was moderate for all the pedon ranging from 0.15 -0.35 cmol/Kg. The total Nitrogen of all the pedons were generally low (0.09-0.24 %), but the middle pedon fell into medium class, having a range between 0.14 -0.24 %. The first horizon of the middle pedon and third pedon had a very high organic carbon, while other horizons of the pedons had moderate to high content of organic carbon with the expectation of third horizon of the upper slope pedon, which was low (0.82 %). The high content of organic carbon exhibited by middle slope pedon is probably due to the presence of Baobab tree around the place; which shed leaves that form litters on the ground. The available Phosphorus were generally low for all pedons (ranging between 0.77 -2.96 ppm).

The percentage Base saturation of the soils was consistently higher than 90 %. The ranged from 92.0 -97.5 %.

Soil Classification

Pedon 1(upper slope) has argillic B horizon (Bt1, Bt2). Pedon 2 and pedon 3(middle and lower slopes) have no either an argillic or kandic horizon;

All the Pedons (Upper, middle, lower slopes) have CEC of clay < 16 cmol kg⁻¹ clay; base saturation > 50% by NH₄OAc at pH 7.0 and ustic moisture regime, Plinthic subsurface horizons and mottling which occupied more than half volume of the soils.

Based on the above properties, all the pedons were classified as Typic Plinthustalf (According to USDA) and according to FAO/ UNESCO, they were classified as (Plinthosol; Cutanic, Hypereutric), At the Soil Series level, all pedons belong to Gambari series.

Land Evaluation for Cucumber production

Suitability ratings of the land characteristics (Table-7) was constructed using the rating of limiting characteristics (Table-1) and land requirements for suitability classification for cucumber cultivation (Table-3) suitability ratings of the various land characteristics as well as their aggregate rating (potential and actual) were computed using the linear and square root parametric models presented in the write up

None of the pedons is highly suitable for Cucumber production by both linear parametric and square root model. Using linear model, the actual productivity (IP_c) indicated pedon 2 as currently not suitable (18.7 (N) and pedon 1 and 3 as marginally suitable (37.5 -S3). The limiting factors were mainly low level of CEC, organic carbon and low micro nutrients. The evaluation of the potential suitability without considering fertility factors which are regarded as temporary limitation, using the linear model indicated that pedon 1 and 3 are classified as moderately suitable and pedon 2 as marginally suitable for production of cucumber with the productivity index of IP_p 70 and 50 respectively.

However, evaluation of the suitability using the square root model, both the actual productivity (IP_c) and potential productivity (IP_p) ranged from 50 to 70 which indicated pedon 1 and 3 as moderately suitable and pedon 2 as marginally suitable for cucumber production.

Agronomic Evaluation of suitability Mapping Units

The analysis of variance of the data collected on physiological growth and yield parameters for cucumber grown on different mapping units during 2021 planting seasons are presented in Table 8

The result showed that the performance of cucumber differed significantly (P<0.01) in all measured parameters across the pedons.

NPK Fertilizer application had significant effect in terms of vine length and leaf area. However, in terms of fruit yield, application of manure, NPK and control are significantly different with manure ranking the highest followed by NPK. In terms of number of leaves both at 4 and 6 weeks, the control performing best followed by manure and NPK. The significant effect of NPK fertilizer over Organic manure in terms of Vine length and leaf area may be attributed to delay response in Organic manure in the release of nutrients for plant use. The higher effect of organic manure on the fruit weight and fruit yield over NPK may have resulted from the presence of micronutrients in the organic manure and this may have rectified the micro-nutrient deficiencies observed in the soils. Also, the slower rate of release of nutrients from the mineralization of the organic manure may have synchronized nutrient requirement by the cucumber with nutrient release, thereby minimizing nutrient loss by leaching. There is no significant difference at 50% days to flowering and 50% fruit setting with the application of organic manure, NPK and control.

With the application of NPK at 4weeks, leaf area is significantly different from control and manure while the upper, middle and lower elevations have significant difference. This is also similar to that of 6weeks where NPK is significantly different. Upper elevation is significantly different from middle and lower elevation. At 8weeks, application of organic manure and NPK, performed better than control with the upper elevation performing better than the lower and middle respectively.

The cucumber variety used for this experiment differed significantly ($P<0.05$) in its performances across the three delineated mapping units. In terms of fruit weight and fruit yield, the cucumbers in the upper slope pedon were significantly higher than plants in the middle and lower slope. Also, the upper slope pedon maintained a significantly higher average number of leaves per plant and in the average leaf area per plant. The yield at upper slope pedon was slightly higher than that of lower slope and middle slope had the lowest fruit yield.

Although there was no significant difference ($P<0.05$) in the 50% days to flowering and 50% fruit setting, with the application of either organic manure or NPK. But the middle slope pedon performed better than the upper and lower slope pedons. There was interaction between soil amendment and slope positions.

Discussion

Land suitability evaluation enables more accurate and useful predictions to be made for specific purposes. Soil characterization helps us understand soils better and provides useful information for the assessment and monitoring of the behavior of soils. The analysis of research work showed the constraint of these soils to sustainable cucumber production. The constraints include low level of macro nutrients (N, P, K) which are needed in large quantities by the plants especially for cucumber production, low organic carbon and low exchange capacity.

Constraints of soils identified can be managed through some of these management systems; The low levels of micro-nutrients, organic carbon and CEC could be managed through the application of both organic and inorganic manure. Among the different sources of organic manure which have been used in crop production poultry manure was found to be the most concentrated in terms of nutrients content (Yagock and Awoniyi; 1974, Lombin et al., 1992).

Lia and Mathur (1998) stated that inclusion of organic manure improves soil fertility and crop yield. Sarkar et al. (2003) reported that the combination of farmyard manure along the recommended inorganic fertilizer dose increased yield significantly. Incorporation of crop residues could also be suggested as this would control soil erosion, crusting and improve physical conditions of crop root zones (Tarawali et al., 2001, Odunze, 2006). Minimum tillage is also suggested as heavy mechanized land preparation will increase structural destruction.

Conclusion and Recommendation

Three Pedons (upper, middle and lower slope) were established and classified as USDA soil order Alfisol and was classified further as sub-group Typic Plinthustalfs (Plinthosol, cutanic, Hypereutic) still remain. None of the pedon is highly suitable for the production of cucumber by both linear and square root models. Pedon 2 was classified as currently not suitable but potentially marginally suitable for cucumber production by both models. The limiting factors were mainly low levels of available macro and micro-nutrients (low total Nitrogen, Available Phosphorus, CEC, Organic Carbon and organic Matter). Potentially (without considering soil fertility which is regarded as temporal limitation) by both Models, Pedons 1 and 3 are moderately suitable (S2) for the Production of cucumber.

Field trial confirms the claim that low level of fertility is the major factor limiting the Productive Potentials of the soils for cucumber production in the area. Application of manure and NPK as well as herbicides and insecticides had significant improvement on the growth and yield of cucumber. However, application of manure had the higher effect in terms of Fruit weight, fruit yield per ha and the other parameter taken in the upper slope segment than the middle and lower slope. In conclusion, the productive capacity of the soils for cucumber production can be achieved through the use of insecticides, both organic and inorganic fertilizer.

Farmer Perception of Trees in a Semiarid Agroecological Zone

Eniola Ajibola Olowu*, Ian Timothy Riley

Niğde Ömer Halisdemir University, Faculty of Agricultural Science and Technologies Merkez Yerleşke, Bor Yolu Üzeri, 51240 Merkez/Niğde, Türkiye.

*Corresponding author

Abstract

Trees in upland, semiarid agroecological zones typically require water efficiency due to low rainfall, cold and dry temperatures as in Niğde Province, Central Anatolia, Turkey. This study quantitatively assessed farmer perception of ecosystem services and production advantage of trees in a semiarid zone. Forty-nine farmers in Niğde Province were surveyed. The survey evaluated two major factors: ecosystem services and production advantage using eleven indicators. The responses were grouped by age, gender, education, district class (rural and urban) and farm settlement (rural and urban) and were analysed by test of association (χ^2) at $p \leq 0.05$. Most farmers had knowledge of trees in their environment and mainly supported the perspective that trees were important mainly for cultural and provisioning ecosystem services. However, they held the opinion that having trees on their farmers was a production disadvantage in a semiarid agroecological zone. Although there were no gender differences in their perspectives, there were significant difference by age, education, district class and farm settlement. Farmers in this semiarid agroecological zone seemed more interested in trees with clear ecosystem services and production advantage such as improved crop yield, water efficiency, weed and pest management, ease of harvesting as well as reduced overall production cost. By implication, trees with multiple benefits are required if further planting by farmers is to be encouraged for agroecosystem improvement. In addition, tree choice will be based on farmer perception of the benefits of trees for ecosystem services and production advantage and further research to identify and promote trees that benefits the widest range of agroecosystems.

Key Words: *Agroecosystem, Farmers, Semiarid zone, Trees*

Introduction

Low precipitation, extreme temperatures and likelihood of drought characterises semiarid agroecological zones (Çalışkan and Boydak, 2017) and the Central Anatolia Region of Turkey fits this description with less than 400 mm/year rainfall, subzero cold winter, dry summer, the vegetation dominated by drought tolerant plants, such as those in the genera *Astragalus*, *Acantholimon*, *Alnus*, *Artemisia*, *Elaeagnus*, *Pinus*, *Populus* and *Quercus* (Çalışkan and Boydak, 2017, Kenar et al. 2020).

Based on the Millennium Ecosystem Assessment (MEA) (Dorji et al. 2015), the four categories of ecosystem services are cultural, provisioning, supporting/habitat, regulatory which are linked to community values, such as environmental conservation, wellbeing, socioeconomic, and spiritual sustenance provided by trees. In a study of tree and ecosystem services provided by trees in coffee plantations, Wagner et al., (2019) observed that farmer perception is hinged on the prioritised ecosystem services and Yang et al (2020) underpinned the critical management of agroecosystems to the attitude of farmers to ecosystem services. However, the studies that led to these assertions were done with farmers having either a target crop (coffee agroecosystem) or temperate climate such 800 mm annual rainfall in China. Reviewing the farmland productivity of Zimbabwean semiarid zones, Parwada et al (2022) opined that trees may improve water supply and water use efficiency as well as nitrogen fixing trees having soil health potentials. However, this opinion had not been tested with farmers in semiarid zones of Zimbabwe

Farmer perception of trees in Niğde, Central Anatolia, a semiarid zone was quantitatively assessed to understand their knowledge of the trees, their connection of trees to the ecosystem services and to understand perhaps the production advantages or otherwise the trees served.

Materials and Methods

A questionnaire-based survey was conducted with forty-nine farmers in Niğde Province as guided by the methods of Haines-Young and Potschin (2013). and Dorji et al. (2019). Niğde Province, Central Anatolia, Türkiye has six districts, Altunhisar, Bor, Çamardı, Çiflik, Merkez and Ulukışla, and a population of about 400,000 (TÜİK, 2020). Altunhisar, Çamardı, Çiflik, Ulukışla were categorised as rural while Bor and Merkez were considered urban in this survey based on their level of urbanisation and industry. Sociodemographics of the farmers included their age, education, gender, district class (residence of the farmers) and farm settlement (location of the farm).

The farmers' knowledge of trees was ascertained by pictorial matching of 12 common trees in Niğde with their names. The trees were alder, apple, black pine, black willow, chinaberry, hawthorn, oak, poplar, Russian olive, sea buckthorn, Turkish fir and weeping willow. Farmer perception was tested through 10 indicators and these were

subsequently grouped into two major factors, ecosystem services and production advantage (Table 1) and presented in Likert scale of strongly agree to strongly disagree with corresponding scores of 5 to 1. Cultural and provisioning categories had scores 1-5 having one indicator per category while supporting and regulatory had two indicators each and scores 1-10. The survey questionnaire was written in the Turkish language, data collection was done randomly and responses were grouped based on their sociodemographics for analysis. The jplot package (Patil, 2018; Brunson, 2019; Koneswarakantha, 2019) on jamovi statistical software (The jamovi project, 2021; R Core Team, 2021) was used for test of association (χ^2) at $p \leq 0.05$.

Results and Discussion

Knowledge of Trees

Most farmers that participated in this study were between 20-50 years old. Two-thirds of the farmers in the study were male, the proportion of male farmers resident in the urban to districts was 48% while 52% resided in the rural districts. Only 7% of the female farmers in this study resided in the rural districts. The high school qualification of the farmers was 40%, vocational qualification (4%) and more than 50% had bachelors and higher degrees. Thirty-six farmers could recognise at least six of the 12 trees ($p < 0.05$). Age, gender and district class had no influence on their knowledge of trees (Table 1). All farmers had recognised apple trees (100%) followed by poplar (91%), black pine (86%), hawthorn (84%), oak (82%), chinaberry (81%) and weeping willow (79%).

Niğde Province is known for apple production in Turkey (Bozbuğa and Pırlak, 2012) while poplar, oak, black pine, hawthorn and weeping willow are well adapted trees growing commonly in Central Anatolia (Çalışkan and Boydak, 2017; Ertug, 2000) and these are common trees in Niğde Province. Tree knowledge is important to guiding the farmer choice and preference of tree to either be retained or removed (Wagner et al., 2019) and perhaps their ecosystem services (Yang et al. 2020).

Table 2: Ecosystem services and production advantage by response groups ($p \leq 0.05^*$)

Factor	Indicator	Response groups

Ecosystem Services

There was a strong farmer perception of trees as important for environmental conservation and improved crop yield (Figure 1). Socioeconomic values such as food, fodder and fuel may lead farmers to gravitate towards

provisioning ecosystem services (Wagner et al. 2019) in addition to environmental conservation, a community value linked cultural ecosystem services (Dorji et al. 2019). There was a strong agreement towards trees providing cultural (83%) and provisioning ecosystem services (72%) (Figure 2) while farmers were clearly divided in opinions regarding supporting and regulatory ecosystem services. As suggested by Riley (2021), there is perhaps a need to access a wider range of exotic trees with potential to provide ecosystem services in Central Anatolia, Turkey

The farmers had varying opinions on the possibility of limited use of fertiliser use and water with trees and this significantly differed with those having farms in rural farm settlements. Although it is suggested that water efficiency is increased in an agroforestry system as tree may theoretically influence water cycling, the empirical proofs are limited (Parwada et al. 2022) and the farmers in a semiarid agroecological zone may be unconvinced of this possibility. Also, not many farmers agreed that pest and weed controls could be better achieved with trees on their farms. Tree belts can be used to create buffer zones on and around farms to mitigate pesticide drift (Zaady et al. 2018) and risk of negative impact on pollinators (Vaughan et al. 2017) but not necessarily for reduced use of chemical pest and weed control agent.

Production Advantage

Although many farmers agreed to trees having benefits (Figure 3), they objected to the assertion that trees may provide them some advantage through production cost and ease of harvesting. This agrees with Lehman et al. (2020) which opined that choice of farmers for integrated food and nonfood systems may be influenced by the crop species, production system and agroclimatic zone. Optimum resource utilisation such as water and land with reduced risk of losses due to drought (Golla, 2021) perhaps had shaped the farmer perception of trees as a production disadvantage.

Figure 1: Farmer perception by ecosystem service indicators. ES1, environmental conservation; ES2, crop yield; ES3, reduced fertilizer use; ES4, reduced water use; ES5, pest control; and ES6, weed control (codes defined in Table 1).

Figure 2: Farmer perception of ecosystem services of trees. Cultural and Provisioning were scored 1-5 each while Supporting and Regulatory were scored 1- 10.

Figure 3: Farmer perception of production advantage. PA1, farms need the support of trees; PA2, not all trees are beneficial to farms; PA3, reduced production cost; and PA4, ease of harvesting (codes defined in Table 1).

Conclusion

The knowledge of trees and cropping system is pivotal to the farmer perception of their ecosystem services and possible derivations of production advantage in a semiarid agroecological zone as management options are limited by factors such as water efficiency requirement and unfavourable climatic factors.

Cultural and provisioning ecosystem services were identified in this study as paramount to the farmers compared to supporting and regulatory ecosystem services for socioeconomic and environmental conservation considerations. Since cost reduction and ease of harvesting were not perceived as production advantage where trees are planted on the farmlands, there is a need to further understand other factors such as crop types and production systems that may lead to agronomic productivity in a semiarid zone.

By implication, indigenous trees with multiple benefits and drought tolerant exotic actinorrhizal tree species (Riley, 2021) are required if further planting by farmers is to be encouraged for agroecosystem improvement. Tree choice will be based on farmer perception of the benefits for ecosystem services, production advantage and further research to identify and promote trees that benefits the widest range of agroecosystems.

Acknowledgements

This study was part of the broader PhD research of EAO and grateful to Ayhan Şahenk Foundation for scholarships provided. Also, Adbulhamid Garba and Nida Ünlü are appreciated for helping with Turkish translation of the survey instrument. Mustapha Akkamis, Ayşe Hayriye Saygı, Baqer Hussein Abass Al Abass, Oyinkansola Olowu and Sinem Tulukoğlu Kunt are all appreciated for technical assistance in form of survey production and distribution.

Abstract

Peripheral nerve injuries are one of those problematic medical disorders for which there is still no effective first-line treatment. Since ancient times, natural substances produced from plants have been used medicinally to treat specific ailments. In this situation, the current work was designed to investigate potential protection against sciatic nerve injury in a mouse model provided by n-hexane and ethyl acetate extracts of *C. sativa* (leaves). For this purpose, a total of 18 albino mice were divided into 3 groups (1 control and 2 treated groups; n=6 /group). The control group was fed on a plain diet, while the treatment groups were offered a diet containing a dose of 10 mg/kg *C. sativa* (n-Hexane and Ethyl acetate extracts). The sensorimotor function restoration was assessed by various behavioral tests: hot-plate test, muscle grip strength, and SFI. We noted a significantly ameliorated functional restoration in the *C. sativa* n-Hexane group when compared with other groups such as the control and *C. sativa* Ethyl acetate extract groups. Additionally, the *C. sativa* n-Hexane extract-treated group showed an improvement in muscle fiber diameter as well as a notable increase in TAC and a significant decrease in the TOS when the muscle fiber cross-sectional area was analyzed morphometrically. These findings, taken together, support the hypothesis that *C. sativa* n-Hexane extract has the ability to accelerate functional recovery after peripheral nerve damage. However, a more in-depth research is needed to identify the true culprits behind these extract-related effects and the mechanism that enhances functional restoration.

A Critical Review on The Accumulation of Microplastics In Agroecosystem and Its Effects on Terrestrial Plants

Md. Shafiul Islam, Shitosri Mondal, Prodipto Bishnu Angon* and Md. Abdul Jalil

Faculty of Agriculture, Bangladesh Agricultural University, Mymensingh 2202, Bangladesh

Abstract

Microplastics are currently a major global threat, as they enter the ecosystem in large quantities daily and are able to persist in the environment for a long period of time. Current research focuses mainly on aquatic ecosystems where little information is available on the sources, possible accumulation and pathways of microplastics in the agroecosystem. Previously it was thought that plastic particles cannot uptake or accumulate into the plant body but modern technology has found that plastic particles are able to penetrate the plants at the micro and nanoscale through transpiration pulling force and, in some cases, foliar application of leaves. The purpose of the study is to find out potential sources, the way of entry into the agroecosystem as well as into the plant system, and the effects on the plant in its physiological process. We highlight the harmful effects of these pollutants on the agricultural ecosystem. It causes pore space blockage of the root surface, oxidative damage, inhibits nutrient and water uptake, decreases germination capability, product quality and so on.

Small-Scale Farmers' Perception Of The Adoption Of Agroforestry Practices In Tolon District, Ghana

Sordji Larweh¹, Ammal Abukari^{1*}

¹Department of Forestry and Forest Resources Management, Faculty of Natural Resources and Environment, University for Development Studies, Tamale, Ghana

*Corresponding Authors

Abstract

This study was conducted in the Tolon district of Ghana to determine small-scale farmers' perceptions, motivation and problems faced by them in the adoption of agroforestry practices. Primary data were collected through a pre-structured questionnaire from a sample of 200 respondents who were selected using a multi-stage random sampling technique.

Data analysis was done by using the percentage and total weighted score (TWS) method. Most of the farmers in the study area have a positive perception of the adoption of agroforestry practices.

Crop diversification, high returns and risk minimisation were the major motivational factor, whereas small landholding size, lack of awareness and poor knowledge, poor market accessibility, lack of subsidy, credit facility, lack of good quality planting material and longer period for tree growth were the major problems faced by the farmers in the study area.

Thus, the study suggested that farmers can be encouraged to practice agroforestry through improved agroforestry extension services, cooperative groups and distribution of quality planting material to farmers.

Keywords: Perception, adoption, agroforestry, practices, small-scale farmers

Introduction

The development of environmentally friendly farming techniques is receiving a great deal of attention nowadays days. Following the goal of achieving sustainable agricultural systems, agroforestry is becoming more important for reducing pressure on natural forests and addressing climate change. Concurrently, it increases returns to small-scale farmers and enhances livelihood security. Agroforestry is viewed as an alternative theory for rural growth around the world, focused on species-rich, low-input farming practices that include a vast variety of new indigenous tree crops, rather than high-input monocultures with just a few main food crops (Krebs & Bach, 2018). As a result, the implementation of agroforestry systems has the potential to solve contemporary issues such as an increase in population, environmental degradation and deforestation (Appiah et al., 2016; Foli et al., 2018). Agroforestry systems have been practiced in Ghana for millennia and handed down from generation to generation (Kiptot & Franzel, 2012). These approaches have allowed indigenous peoples to become self-sufficient and generate economic advantages. Furthermore, although most agroforestry study has been undertaken from a biophysical standpoint, assessing farmers' views and attitudes about agroforestry is critical for raising its adoption rate among farmers. Therefore, this study was conducted in the Tolon district of Ghana to analyse farmers' perception of agroforestry practices, and the motivating variables affecting the adoption of agroforestry practices and to highlight the problems farmers experience while adopting agroforestry practices in the Tolon district of Ghana.

Materials and Methods

The research was carried out in the Tolon District of the Northern Region of Ghana. The district covers a total area of land 1353.65550 km² and shares borders with Kumbungu to the North, Central Gonja to the South, Sagnarigu Districts to the East and North Gonja to the West, lies between latitudes 9° 15' and 10° 02' North and Longitudes 0° 53' and 1° 25' West. The district is characterized by grasslands and scattered guinea savannah woodlands and includes drought-resistant species such as *Vitellaria paradoxa*, *Pakia biglobosa*, *Adansonia digitata*, *Acacia longifolia*, *Azadirachta indica*, and *Mangifera indica*. The district experiences unimodal annual rainfall. The rainfall begins late in April when low rainfall rises to its peak by July-August and declines suddenly and stops entirely by October-November. The mean yearly rainfall of the district extends from 950 mm to 1200 mm. A continuous dry season occurs between November to March when temperatures rise between 33°C to 39°C during the day, and at night the mean temperature ranges between 20°C to 26°C (GSS, 2019).

The multi-stage random sampling design was used for the study. The first stage involved the purposive sampling of the district due to its significance to food production in the country and most institutes concerning agriculture come from the district. The second stage involved the random selection of four communities namely Kpalsogu, Dimabi, Kpendua, and Tunayili where agroforestry practices were more predominant. The third stage involved randomly selecting 50 respondents from each of the selected communities who were actively involved in agroforestry practice. In total, the sample size for the study was 200 respondents. The researcher trained four

enumerators who were natives of the area for two days. The questionnaire pre-testing was performed by applying it to twenty chosen respondents. The finding of the pretest allowed the researcher to adjust some questions in the questionnaire. During the entire study process, field observation was carried out to guarantee the quality of information gathered from the respondents through the interview schedules.

The secondary data required for the study were obtained from policy documents, journals and books, etc. Simple mathematical and statistical tools such as the percentage method were used to analyse the collected data. Thus, to reduce the variability among the respondents, the total weightage score method was used to provide different weights to the problems. Each respondent was asked to indicate his/her extent of agreement or disagreement against each problem along a 5-point Likert scale: Strongly agree, agree, disagree, strongly disagree and neutral. Weights assigned to these responses were 5, 4, 3, 2 and 1, respectively (Chaudhary et al., 2019). Weight according to their importance was given, and multiplied the values of problems (X) by the weights (W). Then, all the values were added to obtain the total score and the problem with the highest score was given the first rank and the one with the lowest score was given the lowest.

Results and Discussion

Demographic characteristics of Respondents

Table 1. shows the majority (82%) of the respondents were males, while 18% were females. The age respondents illustrate that 12.5% were less than 25 years of age, 28% were between 25-35, 20% were between 35-45, and 39.5% were above 45 years.

Table 1. Demographic characteristics of Respondents

Variables	Description	Number of respondents	Percent (%)
Sex	Male	164	82
	Female	36	18
Total		200	100
Age	<25	25	12.5
	25-35	56	28
	35-45	40	20
	Above 45	79	39.5
Total		200	100
Educational level	No formal	34	17
	Primary	92	46
	Secondary	53	26.5
	Tertiary	21	10.5
Total		200	100
Marital status	Single	56	28
	Married	144	72
Total		200	100
Farm size	<1 acre	98	49
	2-5 acres	77	38.5
	Above 5 acres	25	12.5
Total		200	100
Farming type	Mixed cropping	102	51
	Mono cropping	98	49
Total		200	100

The educational status of respondents showed that 17% had no formal education, 46% had primary education, 26.5% had secondary education, and 21% had tertiary education. Most respondents (72%) were married, while 28% were single. On the farm size respondents, 49% farm on <1 acre of land, 38.5% farm on 2-5 acres of land, and 12.5 of the respondent's farm on above 5 acres of land. The respondents' type of farming revealed that 51% of the respondents practiced the mixed cropping system while the remaining 49% practiced the mono-cropping system.

Farmers' perception of the adoption of agroforestry practices

Table 2 shows the analytical view in terms of farmers' perception of the adoption of agroforestry practices in the study area. Total weightage score analysis was done, followed by the ranking.

Table 2. Small-scale farmers' perception of agroforestry adoption

Statement	SA	A	D	SD	N	TWS*	Rank
Increase farm income via diversification	115(57.5)	35(17.5)	25(12.5)	15(7.5)	10(5)	830	3 rd
Protect the crops against wind and wild animals	76 (38)	58(29)	28 (14)	26 (13)	12(6)	760	5 th
Risk minimization	102 (51)	68(34)	15(7.5)	10(5)	5 (2.5)	852	2 nd
Increase self-sufficiency	85(42.5)	40(20)	35(17.5)	28(14)	12(6)	758	7 th
Competition between trees and crops	90(45)	85(42.5)	10(5)	10(5)	5(2.5)	737	8 th
Improvement in soil fertility	98(49) **	78(39)	10(5)	8(4)	6(3)	854	1 st
Easily accessible markets for tree crops	74(37)	65(32.5)	34(17)	23(11.5)	4(2)	782	6 th
The problem of fuel wood fodder and timber availability will be solved through agroforestry	80(40)	40(20)	33(16.5)	29(14.5)	18(9)	735	9 th
Input cost for the adoption of agroforestry is less	76(38)	64(32)	48(24)	8(4)	4(2)	800	4 th

TWS-Total weighted score, Figure in parentheses represents percentages of the total responses
SA (Strongly agree), A (Agree), D (Disagree), SD (Strongly disagree), N (Neutral)

The study revealed that 49% of respondents placed at 1st rank with the highest (854) total weighted score which shows the strong agreement among the respondents regarding improvement in soil fertility through agroforestry adoption in the study area, "risk minimization" by the adoption of agroforestry scored 2nd rank and increase farm income via diversification scored 3rd rank. It was observed that the lowest TWS (735) was given the 9th rank. These findings corroborate with the findings of Abukari (2019) who indicated that most farmers adopt agroforestry practices to increase soil fertility levels.

Factors of motivation influencing the adoption of agroforestry practices among farmers

Crop diversification, high returns and accessibility to the market for produce were the major motivational factors among the respondents to adopt the agroforestry practices in the study area (Table 3).

Table 3. Motivational factors influencing small-scale farmers' adoption of agroforestry

Statement	SA	A	D	SD	N	TWS*	Rank
Availability of incentives	98(49)	42(21)	22(11)	36(18)	2(1)	798	5 th
Availability of fuelwood, fodder and timber	70 (35)	62(31)	30(15)	28 (14)	10(5)	754	7 th
Risk minimization	86 (43)	72(36)	28(14)	12(6)	2 (1)	828	4 th
Proper land-use	79(39.5)	63(31.5)	36(18)	19(9.5)	3(1.5)	796	6 th
High returns	109(45)	55(42.5)	22(5)	11(5)	3(2.5)	856	2 nd
Accessibility to the market for produce	95(47.5)	80(40)	8(4)	15(7.5)	2(1)	851	3 rd
Crop diversification	120(60) **	63(31.5)	10(5)	5(2.5)	2(1)	900	1 st

TWS-Total weighted score, Figure in parentheses represents percentages of the total responses SA(Strongly agree), A(Agree), D(Disagree), SD(Strongly disagree), N(Neutral)

Further, it was observed from the study that proper availability of market and incentives for the agroforestry produce will lead to the higher adoption of agroforestry practices and will enhance their farm income. These findings are consistent with the findings of Pathania et al. (2020), who indicated that crop diversity and high financial returns are the primary motivators affecting agroforestry practice adoption.

Problems faced by small-scale farmers in the adoption of agroforestry practices

The most important problem perceived by the farmers was small landholding size with the highest TWS score (934), followed by lack of planting materials (TWS; 879), lack of awareness and poor knowledge (TWS; 871), the high initial cost of input for agroforestry practices (TWS; 851), lack of credit facilities (TWS; 858), the Longer gestation period of tree crop (857), lack of subsidy (TWS; 847), poor market accessibility(TWS; 835) and lack of incentives with the TWS score of 801 were ranked 1to 9, respectively by respondents in the study area (Table 4). Gara et al. (2020) made a similar discovery, stating that farmers are willing to adopt an agroforestry system suitable for their locations but are unable to do so because of landholder size.

Table 4. Problems faced by small-scale farmers in the adoption of agroforestry practices

Statement	SA	A	D	SD	N	TWS*	Rank
Lack of awareness and poor knowledge	120(60)	40(20)	33(16.5)	5(2.5)	2(1)	871	3 rd
Lack of incentives	79 (39.5)	66(33)	33 (16.5)	21 (10.5)	1(0.5)	801	9 th
Poor market accessibility	99 (49.5)	60(30)	23(11.5)	13(6.5)	5(2.5)	835	8 th
Lack of subsidy	89(44.5)	78(39)	26(13)	5(2.5)	2(1)	847	7 th
Lack of credit facilities	90(45)	86(43)	17(8.5)	6(3)	1(0.5)	858	4 th
Lack of planting material	97(48.5)	90(45)	9(4.5)	3(1.5)	1(0.5)	879	2 nd
High initial cost of inputs for agroforestry practices	89(44.5)	83(41.5)	20(10)	6(3)	2(1)	851	6 th
Longer period for tree growth	95(47.5)	80(40)	15(7.5)	7(3.5)	3(1.5)	857	5 th
Small land size	150(75)	35(17.5)	8(4)	5(2.5)	2(1)	934	1 st

TWS-Total weighted score, Figure in parentheses represents percentages to the total responses
SA (Strongly agree), A (Agree), D (Disagree), SD (Strongly disagree), 5(Neutral)

Conclusion

The results from the study showed that most small-scale farmers had a positive perception of the adopted agroforestry practices. They perceived that the adoption of agroforestry can improve their farm productivity, minimise the risk and enhance their overall income in comparison to practicing monoculture. The study also revealed that crop diversification and high financial returns are the key motivational factors influencing the adoption of agroforestry practices in the area. The main problems faced by the farmers related to the agroforestry adoption were small landholding size, lack of awareness and people's knowledge about agroforestry, lack of incentives, poor market accessibility and lack of planting material. Therefore, it is concluded that the adoption level of agroforestry may be increased in the study area by considering these determinant factors at the time of designing a good agroforestry system for better productivity, sustainability and adoptability. Lack of capital with the farmers restricts the adoption of agroforestry practices thus, the credit agencies must provide necessary incentives in the form of lowering the cost of credit to the farmers to encourage the adoption of agroforestry practices. Moreover, proper marketing strategies can be formulated for better disposal of tree products by developing the producers-industry linkages.

Abstract

Mimusops elengi L. is an evergreen, ornamental plant that is famous for its medicinal values. It is planted along the road side of Lahore city to provide the shade, due to its vast canopy. Automobile exhaust releases different types of pollutants such as carbon-monoxide, sulfur oxide, nitrogen oxides, hydrocarbons, and particulate matters that effect the physiochemical nature and genomorphic characteristics of this plant.

In the present study, we compared the physiochemical and genomorphic characteristics of *Mimusops elengi* L. that is planted along the road side of Lahore with control, where the vehicular exhaust are less.

The physiochemical analysis of both sites were performed to determine the air pollution tolerance index. For molecular analysis, CTAB method is used for DNA extraction. PCR product was analyzed by using the primers of GRF5 genes.

The result showed that higher values of APTI were seen in Canal Road samples then in Mall Road. Normal values of APTI were seen in experimental site. The molecular analysis showed that the expression of GRF5 genes in experimental sites are recessive as compared to control site which can negatively affect the development and normal growth of plants.

Automobile exhaust, constructional projects, planned or unplanned industrialization and urbanization causes combine effect in production of air pollution. The activity of man, careless technology, lack of awareness and casual attitude may lead to air pollution. The plants in city of gardens are facing tremendous stress of environmental pollution.

The plantation of higher tolerant plant on road side has great importance to execute the reduction in air pollutions.

Abstract

Eichhornia crassipes (Mart.) Solms is a freely floating and ubiquitous invasive aquatic weed. There is tremendous trouble of water pollution worldwide due to anthropogenic activities in which increment of industrialism is a major contributor. For treating industrial effluent that contain potentially toxic elements, before disposal, several physical and chemical protocols have been applied that are highly expensive and cannot be practiced regularly. Cost-effective and eco-friendly techniques are bioremediation and phytoremediation. Solms is a menace but a promising phytoremediator. It is renowned for its potential of rectifying wastewater and eloquent tolerance against heavy metals. Despite of its competence, pollutants impart deleterious impacts on it. While recycling polluted water, heavy metals culminate phytotoxicity. The present study aims to determine genotoxicity and physiochemical deterioration in water hyacinth that grows in paper mill effluents. Water analysis of polluted site showed acidic pH, high electrical conductivity ($1.857 \pm 0.73456\text{S/m}$), turbidity ($339 \pm 43.4319\text{NTU}$), salinity > 0.5 ($1.03 \pm 0.35119\text{ppt}$), TDS ($1.343 \pm 0.40869\text{g/L}$) to dangerous level. Soil analysis revealed metals Cu, Ni, Pb in order $\text{Cu} > \text{Ni} > \text{Pb}$ $3.577 > 1.336 > 0.786\text{mg/L}$ respectively. Reduction in leaves' number, leaf area, roots length and relative water content were observed. Biochemical profile of water hyacinth growing in adulterated aqueous ecosystem manifested inauspicious ramifications on total chlorophyll content up to $0.03836 \pm 0.05\text{ mg/g}$. Toxins curtailed optimum cellular pH. Ascorbic acid elevated ($0.014 \pm 0.05\text{mg/g}$, $0.032 \pm 0.05\text{mg/g}$, $0.0127 \pm 0.05\text{mg/g}$). Lead, Cadmium and Nickel were detected in wastewater plants in order $\text{Cd} > \text{Ni} > \text{Pb}$. Mean of Cd and Ni was ($-0.0057 \pm 0.00153\text{ppm}$), (0.005ppm) respectively and Pb was absent. Molecular analysis was done to determine genotoxicity, DNA was extracted by a modified CTAB. Industrial effluents effect the physiochemical nature and genomorphic characteristics of *Eichhornia crassipes* (Mart.) Solms.

Antiviral Effects of a Natural Disinfectant Formulation on Enteric FCV, MNV Viruses

Dilvin İpek¹

¹Food Processing Department, Ezine Vocational School, Çanakkale Onsekiz Mart University, Ezine, Çanakkale, Türkiye

Abstract

Disinfectants have wide usage area from food to wastewater treatments. So, they have become ecological and health problems with possible by-products and resistant-microorganisms. Today, natural products are becoming popular to use while increasing human awareness on nature. During Coronavirus disease (COVID-19) pandemic, disinfectant usage increased significantly and ecological problems became visible with especially Mucilage crises in Marmara Sea, Turkey. Natural disinfectant solutions can be a good and eco-friendly alternative to chemical disinfectant for food industry which is an important polluter. This study aimed to investigate antiviral activity of a natural disinfectant formula, Naturdisinfect which includes Epigallocatechin gallate-EGCG and borax, on enteric viruses Feline Calicivirus-FCV and Murine norovirus-MNV viruses which can be isolated from food, food-related surfaces and food-related wastewaters. They are important foodborne enteric Ribonucleic acid-RNA viruses, like also a RNA virus Severe Acute Respiratory Syndrome-Coronavirus 2-SARS-CoV-2. Enteric FCV and MNV viruses which can transmit by foods are important factors for gastroenteritis and meningitis. In this study, an important antiviral activity, 99 % inhibition ratio, was determined by 1h Naturdisinfect application against both FCV and MNV. It was determined that substance EGCG increased the antiviral effect of the formula.

Key Words: *Natural Disinfectant, FCV, MNV, Antiviral, EGCG, SARS-CoV-2*

Infiltration Characteristics of Soils of Some Selected Sites in Federal University Gashua, Yobe State, Nigeria

***Ibraheem Alhassan¹ And Abdullahi Bala Shukurana¹**

Department of Agronomy, Federal University Gashua, Yobe State, Nigeria.

*Corresponding Author

Abstract

Infiltration studies is very important in efficient soil and water management as well as in managing problems like erosion and flooding. Therefore a research was conducted in three experimental site of Federal University Gashua, Yobe State to evaluate the infiltration characteristics of soils of the selected sites. The sites are Biological Garden (BG), Teaching and Research farm (T&R Farm) and a reserved forested area behind Centre for Irrigation and Desertification Studies (CIDS). Infiltration studies were carried out using double rings infiltrometer at randomly chosen three points within each site. Composite soil samples were collected from the sites and analyzed for some physical and chemical properties using standard procedures. The results indicated that the soils of T&R farm and CIDS are sandy loam while that of BG is loamy sand in texture with very low organic matter content 0.52, 0.43 and 0.38% and moderately high bulk densities of 1.58, 1.62 and 1.56gcm⁻³ respectively. The result indicated low quasi-steady infiltration rates for T&R farm and CIDS (13.0 and 3.50 mm/hr respectively), while that of the BG has a little rapid steady infiltration rate of 50.00 mm/hr. The results further showed highly significant difference in steady infiltration rates among the land uses with very low coefficient of variation 1.37%. It is recommended therefore that management practices like incorporation of organic manure, minimum tillage and other soil conservation methods be adopted to check potential flooding problem in BG soils.

Key Words: *Infiltration, land use, Gashua, flooding*

Introduction

The needs of growing populations and developing national economies, demand intensification of land and water use for the purpose of increasing and stabilizing agricultural production. These needs are most acute in the arid and semi-arid regions, where, the water requirements of crops are greatest even while the supplies by rainfall are the least (Engida *et al.*, 2000). The information regarding moisture intake and retention characteristics of the soil is required for planning an efficient soil and water management system. This will contribute in the promotion of moisture water retention characteristics techniques being followed in arid and semi-arid zones (Sallan *et al.*, 2004). Based on soil intake and retention characteristics a suitable management practice could be adopted to minimize the risk the crop failure (Rao and Prasadni, 2001). Another advantage of determining soil moisture characteristics and hydrological properties will be to compute the water balance for planning cropping patterns, supplementary irrigation requirement and special precautionary measure needed to manage surplus water (Lal, 2006). The infiltration rate is not constant over time, but generally decreases during an irrigation or rainfall episode. If the soil is quite dry, when infiltration begins, all the macro pores open to the surface will be available to conduct water into the soil. Consequently, the infiltration rate declines sharply at first then tends to level off, and remains fairly constant thereafter (Brady and Weil, 2002).

Water intake and infiltration problem most especially during rainy season is a known phenomenon in Federal University Gashua and the surrounding community. Infiltration depends upon the physicochemical condition of the soils and the hydraulic characteristics of the water in those soils both of which may change with time. The infiltration rate is affected by the soil texture and structure, the condition of the soil surface, the distribution of soil moisture or soil-moisture tension, the chemical and physical nature of the water, the head of the applied water, the depth to ground water, the length of time of application of water, biological activity, the temperature of the water and the soil, the percentage of entrapped air in the sediments, the atmospheric pressure, and the type of equipment or method used (Mohamadi, 2015).

Within the University places are mostly flooded and water logged during rainy season which makes human and vehicular movement very difficult or even impossible in most part of the university. This research will try to find information on the water intake characteristics of the soils of the study area with a view of finding solution to the problem. The study was carried with the objectives to determine the physico-chemical properties and the steady infiltration rates of the soils of selected sites in Federal University Gashua.

Materials and Methods

The Study Area

The University is located approximately on latitudes 12° 52' 5" N north of Greenwich and Longitudes 11° 2' 47" E east of the equator, in one of the principal towns in Yobe State, Nigeria called Gashua. The climate of Gashua is usually hot and dry for the greater part of the year reaching its peak between March and April with temperature ranges of between 38 to 42 degree Celsius and the rainy season is between June to September with temperature falling to 23 to 28 degree Celsius and an average annual rainfall of 400 to 500mm (NEAZDP, 2015).

Gashua is located in the Sahel Savannah Agro ecological zone, in the northern part of Yobe State of North Eastern Nigeria. Gashua is a predominantly farming and fishing community. Despite the unfavorable climatic condition of the place, and even though average annual rainfall is low, it is important to know that most of the soil in Gashua are very fertile and suitable for cultivation of many variety of crops such as; cereal, legumes, fruits, and vegetable which include both leafy and fruity vegetables (Alhassan *et al.*, 2018). The topography and relief of Gashua can be described as generally flat, and the most important geographical feature of the Gashua is its famous River Yobe which usually flood the area and empty into the main river which itself empty into the great Lake Chad (Harrod, 1975).

Field Studies

The research work was conducted in three sites; these are: Teaching and Research Farm (T&R) generally cultivated annually for crop production; Biological Garden (BG) which is mostly grassland and behind the Centre for Irrigation and Desertification studies (CIDS) which is a reserved area dominated by Desert date trees (*Balanites aegyptiaca*) all within the premises of Federal University Gashua, Nigeria.

Soil samples were collected from five randomly chosen point within each site from the top 0-20cm depth and composite. The samples were then thoroughly mixed separately and passed through 2 mm sieve for laboratory analysis for laboratory analysis. Five core samples were also collected with core samplers for soil bulk density and porosity determination.

Infiltrometer tests were carried out on each site in three replicate using double ring infiltrometer with inner ring diameter of 30cm and outer ring diameter of 55cm and a height of 30cm to determine steady infiltration rate of the site as described in Bertrand (1965). The infiltration rings were gently driven into the soil and soil around the inside ring were gently firm to avoid any gaps. The inner ring was lined with plastic sheet and water was gently poured into plastic-lined rings which was gently pulled away to allow the water infiltrate into the soil. Time taken for water to infiltrate was recorded with stop watch, repeated several times at time interval until it reaches steady state infiltration in a cumulative time of two hours.

Soil Analysis

Particle size was determined by the hydrometer method and textural classes determined from textural triangle, organic carbon (OC) content was determined according to the Walkley-Black wet oxidation method and converted to organic matter by multiplying it with a factor of 1.72 while, bulk density (Db) was determined using undisturbed core sampler method using volumetric cylinder and calculated by dividing the oven dry mass at 105°C (Estefan *et al.*, 2013).

$$\text{Bulk density (Db)} = \frac{M_s}{V_t} \quad (\text{Eq.1})$$

Where: M_s = is the oven-dried soil mass, V_t = volume of the soil core sampler

The total porosity (TP) was estimated as described in Estefan *et al.* (2013) as:

$$TP (\%) = \left[1 - \left(\frac{D_b}{p_s} \right) \right] \times 100 \quad (\text{Eq.2})$$

In equation Eq.2; TP = total porosity, p_b = bulk density, p_s = particle density (average value of 2.65 g cm⁻³ is used as particle density).

Data Analysis

Infiltration data were analyzed using STAR software (2013) and MS excel Spreadsheet was used for graphical presentations

Results and Discussion

The results of the soil analysis in table 1 showed that was 56, 58 and 79%; silt was 28, 15 and 24% which day was 16, 06 and 18% at Teaching and Research Farm, CIDS and Biological Garden respectively. The soil textural class at T & R and CIDS was sandy loam while at BG was loamy sand. The organic matter content were 0.52, 0.43 and 0.38%, bulk density was 1.58, 1.62 and 1.52g/cm³ while porosity was 40.38, 38.87 and 42.64% at T & R, CIDS and BG respectively. Sandy loam and loamy sand textural class with high percentage of sand particles, low organic matter content and slightly high bulk density were in conformity with findings of Alhassan et al. (2018) for soils of Gashua and for soils in the Sahel Savanna zone of Nigeria.

Table 1. Physicochemical Properties of the Soils of the Study Sites

Soil Properties	T & R	CIDS	BG
Sand (%)	56	58	79
Silt (%)	28	24	15
Clay (%)	16	18	06
Textural Class	Sandy Loam	Sandy Loam	Loamy Sand
Organic Matter (%)	0.52	0.43	0.38
Bulk Density (g cm ⁻³)	1.58	1.62	1.52
Porosity (%)	40.38	38.87	42.64

T& R (Teaching and research farm), BG (Biological Garden) and CIDS (Centre of irrigation and desertification)

Average Infiltration Rates at Teaching and Research Farm

Table 2 presents results of infiltration studies from Teaching and Research Farm. The average infiltration rate was rapid at the initial stage which could be attributed to the low soil moisture content considering the period the test was conducted which is the dry season and it decreases as the time increases which indicates increases in moisture content that is approaching saturation level. The quasi-steady infiltration rate of 13 mm/hr recorded was in agreement with Uloma et al. (2013) who reported not much different rates for some soils in Abia State.

Generally low infiltration rate was recorded at the T & R Farm could be due to high presence of fine grain silt and sand that can cause blockage of pore spaces thus, impeding early water infiltration and presence of hard layers beneath the soil surface and soil sealing commonly noticed in the area could be other reason for low infiltration rate.

Table 2. Average Infiltration Rates at Teaching and Research Farm

Time (min)	Cumulative Time (min)	Infiltration Rate (mm/min)	Infiltration Rate (mm/hr)
1	1	1.67	100.00
5	6	0.67	40.00
10	16	0.46	28.00
15	31	0.31	18.60
20	51	0.25	15.00
25	76	0.21	12.80
30	106	0.23	13.80
30	136	0.22	13.00

Average Infiltration Rate of the Soils of CIDS

A very low quasi-steady infiltration rate was recorded at CIDS (Table 3) which could be due the clay and low organic matter content of the soils of the sites. These could lead to low aggregate stability and the soils can be easily disperse causing internal slumping and capping at the surface. Crust and surface sealing noticed in this study site could be another factor in reducing infiltration rates in the soil. This agree with the report that surface sealing and crust reduced infiltration rates of soils (Morin, 1993)

Table 3. Average Infiltration Rates at CIDS

Time (min)	Cumulative Time (min)	Infiltration Rate (mm/min)	Infiltration Rate (mm/hr)
1	1	1.66	100.00
5	6	0.53	32.00
10	16	0.30	18.00
15	31	0.17	10.60
20	51	0.20	12.00
25	76	0.16	9.60
30	106	0.11	6.54
30	136	0.07	3.50

Average Infiltration Rates at Biological Garden

There was a sharp and rapid drop in infiltration rate at 1 minutes to 6 minutes at Biological Garden (Table 4), this could be attributed to the high level of porosity in the site which is also related to sandy nature of the soils of the site. It was reported that sandy soils have high infiltration rates ranging from 40-250 mm/hr (Mohammed and Ali, 2013). High infiltration rates recorded at this site could be a cause of concern because there could be water losses and high irrigation cost.

Table 4. Average Infiltration Rates at Biological Garden

Time (min)	Cumulative Time (min)	Infiltration Rate (mm/min)	Infiltration Rate (mm/hr)
1	1	11.60	700.00
5	6	9.13	182.60
10	16	6.10	122.00
15	31	1.58	96.20
20	51	1.39	83.60
25	76	1.19	71.60
30	106	0.97	58.60
30	136	0.83	50.00

The infiltration rates as plotted against time for the study sites as shown on Figure 1 showed that infiltration rate at BG was very high at the beginning of the experiment and decreased rapidly within a short time than those at CIDS and T & R sites which decrease slowly until they reached a steady state.

Figure 1. Infiltration rates (mm/hr.) at the land uses and the time (min)

Table 5 indicated highly significant difference ($p = 0.0001$) in the mean steady infiltration rates within the land uses, but with a very low coefficient of variation (1.37%). The highly significant difference could be attributed to the differences in soil texture and bulk densities within the land use types (Table 1).

Table 5. Mean Steady Infiltration Rates within the Land Uses

Land use	Steady Infiltration rates (mm/hr.)
BG	49.99a
CIDS	3.50c
T & R	13.00b
Pr (> F)	0.0001
CV (%)	1.37

BG (Biological Garden), CIDS (Centre of irrigation and desertification), and T& R (Teaching and research farm)

Conclusion

The maximum infiltration at start was higher at Biological Garden followed by Teaching and Research Farm and was low at CIDS and similarly final quasi-steady infiltration was also higher at Biological Garden then T & R and lower at CIDS. This study has provided an estimate and basic knowledge of the local soil infiltration rates and its variability within the university environment and has revealed that soil texture and bulk density play greater roles in infiltration rates.

Abstract

In this study, we aimed to determine antiviral activities on human noroviruses (NoVs) and antibacterial activities on resistant bacteria of *Sideritis Trojana Ehrend* (S) and *Hypericum perforatum* (HP) extracts which are known as Anatolian medicinal folk medicines. Extractions were done by ethanolic (EE) (40 %) and ultrasound assisted extraction (UAE). Cytotoxicity of extracts were determined by MTT studies. Phenolic amount, total phenolic and antioxidant activity of extracts were investigated HPLC and UV-Vis spectrophotometer. Both UAE and EE extracts of 5 mg/L HP showed 1-2 log reduction on MNV; however only UAE extract of S observed 1-2 log reduction at overnight. On FCV viruses, both UAE and EE extracts of 5 mg/L plants showed >2 log reduction at overnight. 0,5 mg/L EE extracts reduced FCV infectivity at >2 log level at overnight incubation. Antibacterial activities of both plants UAE extracts were higher than EE extracts. None of extracts were defined as cytotoxic. UAE application increased total phenolic amounts nearly 3-4 times. Trolox equivalent antioxidant capacity (TEAC) amounts of plants' extracts increased nearly 2 times by ultrasound application. Same phenolic compounds were defined by EE and UAE extracts of both plants, but phenolic compounds amounts were determined higher by ultrasound application. UAE application increased antimicrobial, antioxidant and phenolic amounts of both medicinal plants; also cytotoxicity of extracts decrease by this application.

Sanitizing Stainless Steel Process surfaces by New Natural Disinfectant Formula

Dilvin İpek¹, Nükhet N. Demirel Zorba²

¹ Food Processing Department, Ezine Vocational School, Çanakkale Onsekiz Mart University, Ezine, Çanakkale, Türkiye

² Food Engineering Department, Engineering Faculty, Çanakkale Onsekiz Mart University, Çanakkale, Türkiye

Abstract

The aim of this study is to provide a natural disinfectant solution which is natural, environmentally friendly, enabling fast cleaning and reducing purification costs. Natural disinfectant solution which comprises epigallocatechin gallate extract, borax extract and ethylenediaminetetraacetic acid were applied on biofilm formed food process line stainless steel surfaces. Effects of formulation were searched on real process line isolated *Enterobacter cloacae* and *Bacillus coagulans* by using SS 316 L coupons and UHT milk. Corrosion effects of these formula was determined by SEM-EDX analysis and also, compared to CIP, peracetic acid and other formula which comprises borax extract and ethylenediaminetetraacetic acid applications. The formula can reduce the microbial load (sessile and biofilm formable cell numbers) on SS 316 L surfaces that are used frequently in particularly food production by 6 logarithmic values following 5 minutes of application. This activity value was equal to 15 min peracetic acid application. Peracetic acid was determined as corrosive on SS 316 L, when formulas were not corrosive by SEM-EDX analyses. As a natural solution, it can be effective on biofilms that are already present on surfaces; and due to its quorum quenching feature it can inhibit the medium perception systems of microorganisms and prevent them from biofilm formation.

Key Words: *Natural Disinfectant formula, Sanitize, Biofilm, Quorum Quenching*

Removal of Methyl Red Dye From Aqueous Solution by Bacterial Consortium

Osman Fetoshi¹ Ayten Öztürk²

¹Niğde Ömer Halisdemir University, Faculty of Arts and Sciences, Department of Biology, osmafetoshi@hotmail.com

²Niğde Ömer Halisdemir University, Faculty of Arts and Sciences, Department of Biotechnology, aozturk@ohu.edu.tr

Abstract

Coloured industrial effluents are the most important problem of water pollution and its discharge into the environment in decades. Scientists have reported that many microorganisms belonging to different taxonomic groups of bacteria, fungi, and algae have the ability to remove and decolourize dyes. Some research has shown that mixed microorganisms were better to remove dyes from water. The aim of this research is to investigate the ability of two bacterial consortia from Akkaya lake (Niğde-Turkey) to decolourise methyl red dye under light conditions with or without acetate as a co-substrate. One of two consortia is gMR which grows under the presence of Methyl Red (100 mg/L) and the absence of acetate and, another one is gMRa which grows under the presence of Methyl Red (100 mg/L) and acetate (1.0 g/L). Determination of decolourization and growth of the consortia were performed spectrophotometrically. However, FT-IR analysis and metagenomic analysis were conducted at the end of the experimental period. We have found some differences between the two consortia in terms of bacterial diversity and decolourization. We have shown that consortium gMR consists of 73 species of bacteria while gMRa of 79 species. Both types of consortia have been used for the removal of Methyl Red dye. The microbial consortium gMR has shown a high decolorizing percentage for Methyl Red, 97.7% within 30 days, meanwhile, gMRa also shows a high percentage of decolorizing 94.27 within 5 days. According to FTIR analysis, the dye not only decolourization but also has been degraded by the two consortia. On the other hand from metagenomic analyzes, it was confirmed that in both bacterial consortia gMR and gMRa the species with the highest abundance were: *Proteiniphilum acetatigenes*, *Prevotella copri*, *Bellilinea caldifistulae* *Phenylobacterium lituiforme*, *Blastochloris sulfovirdis*, *Rhodoplanes oryzae*, *Lactobacillus delbrueckii*, *Phenylobacterium lituiforme*, *Phyllobacterium brassicacearum*, *Roseomonas soli*, *Thauera linaloolentis*, *Thiocapsa bogorovii*, *Aminiphilus circumscriptus*, *Aminivibrio pyruvatiphilus*. Results have demonstrated that the microbial consortia have better than the pure culture in the treatment of the dye and, the role of co-substrate acetate has been the favorable factor in terms of microbial diversity. Photosynthetic nonsulphur bacteria have been dominated by using acetate in the media. According to the FT-IR analysis at the end of the experimental period, it was determined that the dye was degraded and used as substrates by the consortia.

Expression Level Of Mydgm (Myeloid-derived growth factor) In Liver Fibrosis

Muhammad Abbas, Laaraib Nawaz and Haseeb Anwar*

Department of Physiology, Government College University Faisalabad, Pakistan.
Corresponding author

Abstract

Liver fibrosis is a wound-healing response generated against an insult to the liver. Following the injury there is accumulation of ECM protein that alters the liver architecture by forming fibrous scarring. Consequently, regenerating hepatocytes nodules lead to hepatic cirrhosis; causing destruction of hepatocytes, portal hypertension and ultimately liver failure.

The objective of this study is to evaluate the expression level of Myeloid-derived growth factor (*MYDGF*) gene and the hepatoprotective role of *Bellis perennis* after inducing liver fibrosis by carbon tetrachloride (CCl_4) in the rat model.

In the current study, liver fibrosis was induced in rats by use of CCl_4 intra-peritoneal (1ml/kg BW) and the rats were allocated in 3 groups; Negative control fed on standard diet; Positive control received 1ml/kg/body weight carbon tetrachloride injection mixed with olive oil intraperitoneally. Treatment group received CCl_4 injection along with oral administration of 200mg/kg/body weight of *Bellis perennis* (BP) for three weeks. After each week decapitation was done; blood samples and liver tissues were procured for further analyses. Parameters like hematology, biochemical assays, Oxidative stress markers, were analyzed. In addition, RNA extraction for purpose of gene expression analysis of selected gene using qRT-PCR was done on each preserved tissue sample. For statistical analysis, data was then be subjected to Two-way ANOVA by using Statistical Software.

Serum total oxidative status (TOS), malondialdehyde (MDA), total cholesterol, triglycerides, low-density lipoprotein, total protein, bilirubin, ALT, AST, ALP, CRP, TSH, WBCs, platelet count were significantly increased in positive control. However, BP significantly ($p \leq 0.05$) lowered the raised levels of these parameters as compared to the untreated group. The level of *MYDGF* was up regulated in positive control as compared to treatment group. Liver histology showed improvement in architectural integrity in treatment group.

Based on these findings it is concluded that BP may possesses hepatoprotective activity by upregulating levels of *MYDGF*.

Microplastics as a Threat to Meat Consumption, Review

Aliu Olamide Oyedun¹ and Lukman Omoniyi Lawal²

¹Institute of wastewater Management and Water Protection, Hamburg University of Technology, Germany

²Department of Geography, Kwara State College of Education, Ilorin, Kwara State, Nigeria

Abstract

The world population increasingly consumes about 300million tonnes of meat up to 2018. As this trend continues due to the increasing world population, plastic becomes necessary to preserve meat, required to meet its corresponding demands. Plastics in the meat industry were of immense benefits that have turned into an environmental burden. This is because they protect meat and other products from spoilage but contain many contaminants in the form of microplastics (MPs) additives and trapped carbons. These contaminants significantly contribute to the health risks meat pose and other global environmental concerns. A further concern is that consumers may likely not be aware of the safety risks of these MPs and their additives. Educating the meat consumers through proper labeling of the plastic packaging with straightforward and understandable terms for MPs migratory possibilities rather than industrial terminologies may likely guide the consumer against MPs consumption.

Key Words: Microplastics, Safety, Health risks, Concerns, Meat, Packaging

1.0 Introduction

Large polymer plastics degrade due to weathering and other environmental impacts such as shearing, attrition, UV-radiation, erosion, chemicals, and burning after their end-use into smaller plastics (Gewert, 2015). These plastics with sizes less than 5mm are microplastics (MPs) according to Kim et al. (2020). Other authors such as Andrady (2017), GESAMP (2015), and Hartmann et al. (2019) also reported MPs as plastics with particle sizes up to 5mm. These MPs are found in waterbodies and farmlands (Horton et al., 2017; Xu, 2020). Microplastics cause several environmental burdens by leaching into the groundwater, affecting plants and humans, and animals ingest them during feeding. Animals such as buffalo, camels, pigs, cows, rabbits, cavia, etc., are processed globally into meat to meet human nutritional demand. These are wild and domesticated animals that produce meat when processed and produce milk, and eggs when alive (Suman and McMillint, 2014; Garnett, 2014). Meat plays a key role in global food security as livestock contributes 13% to the global energy required from nutrients (Smith et al., 2013). However, the products from these animals are not very safe from MPs contamination as they get into farms through sludge application, plastic soil cover (plastic mulching), compost and bio-waste, tyres from busy roads, and stormwater (Cole et al., 2011; Khan and Strand, 2018; Knight et al., 2020). Many other authors have also tried to evaluate the quantity and abundance of these MPs on land, air, and water bodies. They also tried to develop and estimate these MPs' abundance from different global regions as well as MPs' sampling methods, identification, and characterization (Yu et al., 2018; Fuller and Gautam, 2016; Cole et al., 2011; Herath et al., 2022; Abaroa-Pérez et al., 2021; Pagter et al., 2018). Furthermore, humans, plants, and or animals through adsorption, inhalation, absorption, ingestion, migration, and leaching consume these MPs before they find their ways back into the environment in an endless cycle (Domenech and Marcos, 2021; Ivar do Sul and Costa, 2014). Figure 1 is a summary figure, which describes microplastics' path into the meat. This also shows a partial 'microplastic-meat-environment' relationship (MME). This relationship highlights how MPs get into the meat consumed via animals, crops, and human activities before going into MP forms.

Figure 1: Microplastic paths to meat consumption

1.2 Plastic packages in the meat industry

Meat consumption as of 2018 has increased globally by above 300 million tonnes on average. Meat is a source of essential nutrients and a nutritional alternative for non-vegetarians (Parlasa and Qaim, 2022). As the demand for meat consumption increases, so also the need for reduction in meat spoilage and better packaging materials like plastics.

Plastics are cheap, easily used to transport meat, extend its shelf life and protect it from environmental impacts (Andrady and Neal, 2009). Plastics are forms of controlled atmosphere for meat by providing protection against moisture, microbial communities, and atmospheric oxygen (Alessandroni et al., 2022). They protect meat and meat products from becoming waste and consequently prevent greenhouse gases that would arise from this waste (Billiet and Trenor, 2020). However, most meat packaging is from petrochemical, containing additives that are toxic and can leach out of the plastics (Barrick et al., 2021). These plastic packages can take the desired shape under thermal treatment. They also contain high carbon content. Such include polyvinyl chloride (PVC), polyamide (PA), polyvinylidene chloride polypropylene, and polyethylene (PE) considered for their strength and durability (Guerreiro et al., 2018; Marsh and Bugusu, 2007). Katsara et al. (2022) discussed other properties of why these plastics are in use in the meat industry. However, these plastics are not very environmentally friendly and contain high carbon. Already, around 57% of the total global GHG emissions are from meat products as of 2010 (Xu et al., 2021). Moreover, it is possible that GHG from plastics to transcend 56000MT by 2050 (Shen et al., 2020). Although, concerns are some of the carbons temporarily held by meat plastic packages will escape into the environment if not properly processed at the end of their lifecycle. Already study shows that the more plastics are produced the more the significant possibility of an increase in CO₂ emission in the environment (Oktavilia et al., 2020). These are mostly high-volume single-used plastics discarded due to bloodstains and concern about microbial contamination during reuse (Taufik et al., 2020; Nemat et al., 2022). Plastics used for extending bacon shelf life for example have more carbon trapped in them than regular plastic packaging. They are multilayer plastic packaging that prevents bacon thawing and reliably provides oxygen and puncture-free requirements during handling and sales. Table 1 shows some meat packaging used in extending its shelf life. It is troubling that most meat producers sacrifice plastic packaging circularity for meat shelf life (Pauer et al., 2020; Dong et al., 2014).

Most plastics used in the meat industry are of petrochemical origins and are mostly non-degradable, and have a lasting effect on the environment. So, most consumers and concerned stakeholders in a bid to mitigate these effects are delving more into bio-based plastics and edible-films-derived plastics for meat packaging (Bishop et al., 2021). Bioplastics are environmentally friendly alternatives to petrochemical plastic packaging. However, they have challenges of lesser duration and strength compared the petrochemical plastics. Ruban (2009) reported some of these bioplastics' classifications, their derivation, and their applications. Song et al. (2021) explained the chemistry and the production processes of these edible films and their different applications in processing meat. An important note in this review is that plastic films get into the layers of packaged meat in smaller plastic forms or MPs. Although, they have no nutritional purpose and are alien to meat's nutritional composition. Some might not necessarily be toxic but pose a nutritional conflict of interest between consumers and meat producers. Reports and studies show that they are edible, but the concern remains that consumers eat MPs and their derivatives due to standard meat industry practices (Ruban, 2009). The contention is if it will pose a health risk to the consumer or if the consumer would wish to eat such meat if they knew bio-based polymers means they have to eat 'edible-plastic or films. Regardless of the importance claimed by meat processors. More so, Puscaselu et al. (2020) believe that edible films are not food and have no nutritional or physicochemical properties that describe them as food even if some industrial standards regard them as food. Cenci-Goga et al. (2020) categorized the extent of use of these plastic packaging for meat according to their uses. None of these classifications shows edible films as nutrients rather they serve protection purposes even if they were from organic sources that their way into the human diet. Research show that petrochemical plastics pose a health risk. While edible films such as sodium alginate may pose no health risk, consumers of protein polymers may experience allergies (Anderson et al., 1991; Tolouie et al., 2017). Plasticizers are another group of additives that make plastic to be easy to shape. They can migrate into the meat through plastic packaging. Hahladakis et al. (2018) in their review extensively reported more than eight (8) other plasticizers, additives, heavy metals, volatile organic compounds, and other organic compounds from other authors and their migration rate into meat and other food items. All these compounds pose a serious threat to meat consumers via packaging. Plasticizers can be cancerous and disrupt the regular function of the body system. Additives or plasticizers, like phthalates, diphthalates, and benzene alcohol from plastics have been found to affect animals' immune systems and cause hormonal imbalance and the possibility of asthma in humans. In addition, the prolonged PVC-MPs exposure during its use to package meat caused respiratory issues such as breathing difficulty, cough, and asthma (Jaakkola and Knight, 2008).

Table1: The effects of plastic packaging on meat

Packaging	Meat	Effects	References
PVC	Cured meat	Extend shelf life	Marsh and Bugusu (2017)
Low-density polyethylene (LDPE) coated with bacteriocin	Oyster, Beef	Shelf-life extension up to approximately two weeks. Reduce microbial loads	Kim et al. (2002)
Polylactic acid	Pork	Reduced <i>L. monocytogenes</i> by almost 29% for about 12 days	Yang and Song (2016)
Polybutylene succinate	Chicken	Microbial reduction, Colour stability	Yusof et al. (2021)
Etin-vinyl-acetate, PE bags	Goat	Tenderness, pH and redness preservation, microbial preservation	Fernandes et al. (2013), Sabow et al. (2016)
PE, LDPE	Bacon, Salami, Mortadella	Extend shelf life	Katsara et al. (2022)

1.3 Microplastic in meats, seafood, and health concerns

Microplastics can get into living animals from the environment and their derived products during their processing into consumable meat products via plastic packages. Katsara et al. (2022) found LDPE MPs in bacon, salami, and mortadella in a study. LDPE in these samples via migration appeared after 9 days and continued until their 28days study. These LDPE MPs migrated into the meat samples even at 4°C. Polystyrene from 6.4µm-104µm has been found to leach out of meat trays and other food containers made with PS (Ajaj et al., 2021). Polystyrene poses a health risk. Extruded polystyrene MPs fiber of a range of 300–450 µm were found in chicken (Cverenkárová et al., 2021). Similarly, according to Siddique et al. (2021), bisphenol A (BPA) MPs were found to leach into beef and chicken (between 9µg/kg to 10µg/kg and, 4 µg/kg respectively). They reported BPA to have migrated from the inner layer of plastic packaging into the meat. Dioctylphthalate and dioctyladipate (from PVC) in the range 0.12 mg/dm²-4.8 mg/dm² after a week were detected ground meat (Kondyli et al., 1992). Stojanović et al. (2019) also reported beef goulash and meatballs to have contained BPA in the range 3.2-64.8 µgkg⁻¹ and 21.3-31.2 µgkg⁻¹ respectively. Microplastics also have the tendency of adsorbing other pollutants like polybrominated diphenyl ether (PBDE) thereby increasing their bioaccumulation and toxicity in meat (Brennecke et al., 2016). Sometimes, an extra agent such as pediocin and nisin is added to regular plastic bags for packaging meat. These extra additives added to plastic that industrially contains plasticizers already, pose more health risks. The question of whether such meat should reach consumers is a regulatory issue in different countries (Quintavalla and Vicini, 2002; Ming et al., 1997). As it is of concern, it may have adverse effects like the release of antibiotics and food poisoning in humans. Already these MPs have been found in human feces (50-500 µm) and placenta (5-10 µm) (Ragusa et al., 2021; Cverenkárová et al., 2021). De-la-Torre's (2020) study review also reported that MPs (<150 µm) can get into the human circulatory system. While MPs of size less than 20µm might get into some other organs causing cytotoxicity or inflammation. Polyester, polyurethane, and chlorinated PE (in the range 44.67-210.64µm) were found in the human sputum. While PS, PE, PVC, and PE terephthalate according to Tan et al. (2020) affects the human gastrointestinal system by inhibiting nutrient assimilation. It is worth noting that meat itself carries some potential health risks for humans like obesity and heavy metal accumulation (Grosso et al., 2017; Shaheen et al., 2016). Therefore, MPs' migration into meat may further increase the potential health damage likely caused by meat. These MPs have the possibility of introducing microorganisms into the body and damaging human organs such as the kidney, spleen, intestinal tract, and liver (Wright and Kelly, 2017; Katsara, 2022). They can cause oxidative stress in human cells after exposure (e.g., PE, PS, and other MPs) in the range 10ng/ml-10µg/ml (Schirinzi et al., 2017). Authors like Wright and Kelly (2017) reported their migratory mechanisms, effects, and environmental supporting factors into the human organs, blood, and body tissues and their role in harboring microbes and their consequential immune system damages. Some of the other food processing factors aiding this easy migration of MPs into the meat during processing and handling are the meat fat, temperature, and exposure duration (Katsara et al., 2022; Petersen et al., 2004; Ajaj et al., 2021).

Aside from meats, almost all seafood consumed by every family around the world contains MPs. Mostly these MPs resulted from human activities, which are currently a burden on all life forms. Of these MPs consumed by marine organisms, humans consume about 53,864 of these particles yearly (Nicole, 2021). Microplastic additives contaminate and greatly accumulate in animal body tissues when ingested. Triclosan, nonylphenol in PVC, and phenanthrene affect the feeding pattern, and oxygen intake, and more than 55% death rate in lugworms (Browne et al., 2013). Franceschini et al. (2021), suggest results that MPs ingestion affects the mortality rate, biodiversity, and feeding pattern of *N. norvegicus*. Microplastic threatens humans via marine bodies. This is because larger fishes ingest more microplastics up to 2.79mm and some of which end up in humans. Other marine life like *M. edulis*, mussels, *Calonectris leucomelas*, *Puffinus tenuirostris*, *carcinus maenas*, *Dosidicus gigas*, barnacles, and Holothuria, etc. at certain period ingested MPs as reported in various studies. Microplastics ingested were from

high-density polyethylene (HDPE), PVC, polychlorinated biphenyls (PCBs), and polybrominated diphenyl ethers among others. These MPs caused challenges such as feeding and breathing difficulties and eventual death (Ivar do Sul and Costa, 2014). Smith et al. (2018) also elaborated more on these MPs found in the marine environment. Table 2 shows these MPs and their environmental effects. In addition, seafood reared in monitored and controlled farms is not safe from MPs contamination (Lu et al., 2019; Feng et al., 2019). Lv et al. (2020) reported MPs ingestion by Asian swamp eels raised in a controlled environment from fertilizer and animal feed. The death of these organisms means the deposition of their carcasses. Either humans or animals continuing the chain of microplastic environmental threats eat these carcasses.

Table 2: The effect of plastic packages on the environment

Plastics packages	Microplastic contaminants	Environmental Impact	References
Conventional/Petroleum-based (Meat packaging)	Phthalic Anhydride, Stearamide, Diisooctyl phthalate, Polyethylene glycol, PVC, etc.	Persistent, GHG emission, toxic, aquatic biodiversity depletion and death, etc.	Guerreiro et al. (2018); Bishop et al. (2021)
Biobase/Edible films (Meat packaging)	Sodium alginate, cellulose, agars, starch, carrageenan, chitosan, pectin gum, plasticizers, and collagen, etc.	Biodegradable, low toxicity or non-toxic, GHG emission, etc.	Ruban (2009); Puscaselu et al. (2020); Song et al. (2021)
Meat and Non-meat packages (Others)	PS, PP, PE, PET, etc.	Chemical toxicity, carbon emission, gut clogging, digestive stress in the animal, organism weight loss and aquatic, death, etc.	Weis (2020); Ivar do Sul and Costa et al. (2018)

1.4 Consumer Awareness

Consumers' understanding of meat packaging goes a long way in how consumers view meat safety (Liana et al., 2010). Therefore, educating consumers on meat handling and consumption can also help in controlling MPs' intake during meat consumption. Regulations such as the EC 852/2004 in the EU are also in place around the world to mitigate challenges posed by additives and external factors to meat quality. Autio et al. (2018) explained some of these directives in detail. Some of these regulations do not compel meat processors to reveal every packaging material involved in meat production as they are voluntary labeling. This is a moral conflict of interest between producers and consumers. In a study by Mehlenbacher et al. (2011), commercially package raw meat for pets had *Salmonella* contamination without packaging warnings of this possibility. So that consumer can be well informed of processing options to eliminate such food threats. In addition, these labeling packages have bioplastic or recyclable logos on them (Kadellis et al., 2021). Data on the extent of consumer warning about labels on commercial meat packaging about MPs' migration are not available. However, most consumers are concerned more about moral obligations regarding animal welfare and information about the animals such as the meat source and rearing system. Others are concerned about expiration dates, freshness, nutritional attributes, price, and other attributes associated with meat quality (Barone and Aschemann-Witzel, 2022; Lagerkvist, 2013; Bernués et al., 2003). While some consumers of packaged meat do not totally consider the information on meat, packages and some consider them too much information (Stranieri and Banterle, 2015). According to Stranieri and Banterle (2015), of 999 consumers researched, 41%, 18%, and 6% do not check for traceable labels, origins, and feeding systems of cattle processed into meat respectively. As regards consumers' awareness of edible packaging films, most consumers are not aware of these edible films, their safety risks, benefits, or if they are edible or not (Wan et al., 2006).

1.5 Conclusion

There is a moral need to report plastic composition on meat packages in easily understandable language by consumers and not through industry terminologies. If there is a need to process or handle meat with plastics, it is advisable to process lean meat or low-fat meat with plastic packaging to reduce the migratory effects of MPs into such products. Stakeholders should carry out more research on the extent of public awareness available about meat MPs migration. Stakeholders should also research how much of the allowable additives or edible films recommended by regulation, consumers are willing to allow in their diets.

Abstract

Natural products, which have evolved over millions of years, have a unique chemical diversity, which results in diversity in their biological activities and drug-like properties. Natural products have a wide range of diversity of multi-dimensional chemical structures; in the meantime, the utility of natural products as biological function modifiers has also won considerable attention. As the global use of natural medicinal products continues to grow and many more new products are introduced into the market, public health issues, and concerns surrounding their safety are also increasingly recognized. Those products have become one of the most important resources for developing new lead compounds and scaffolds. Natural products will undergo continual use toward meeting the urgent need to develop effective and beneficial drugs, and they will play a leading role in the discovery of drugs for treating human diseases, especially critical diseases. The application of natural products in preclinical researches and clinical trials across the world. Besides what is stated, there are natural products applications for other chronic inflammation associated diseases such as atherosclerosis and ischemia. Hopefully, this work will provide an important knowledge for therapeutic or preventative utilities of natural products in chronic inflammatory diseases.

Keywords: *Natural products, Health, Preventive medicine.*

1. Introduction

Traditional medicines make use of natural products and are of great importance. Natural products, which have evolved over millions of years, have a unique chemical diversity, which results in diversity in their biological activities and drug-like properties. Natural products have a wide range of diversity of multi-dimensional chemical structures; in the meantime, the utility of natural products as biological function modifiers has also won considerable attention.

The use of natural medicines and phytonutrients continues to expand rapidly across the world with many people nowadays resorting to these products for treatment of some health challenges in various national healthcare settings. As the global use of natural medicinal products continues to grow and many more new products are introduced into the market, public health issues, and concerns surrounding their safety are also increasingly recognized.

Natural products from the herbal remedy, medicinal plants, functional foods, and their constituent have been used for the treatment of various diseases including cancer from ancient time to recent days; increasing emphasis has been focused on the research on traditional medicine. Those products have become one of the most important resources for developing new lead compounds and scaffolds. Natural products will undergo continual use toward meeting the urgent need to develop effective and beneficial drugs, and they will play a leading role in the discovery of drugs for treating human diseases, especially critical diseases.

The application of natural products in preclinical researches and clinical trials across the world. Besides what is stated, there are natural products applications for other chronic inflammation associated diseases such as atherosclerosis and ischemia.

This work presents an important information about therapeutic or preventative utilities of natural products in chronic inflammatory diseases.

1.1. Natural Products

The natural products, which have evolved over millions of years, have a unique chemical diversity, which results in diversity in their biological activities and drug-like properties. Those products have become one of the most important resources for developing new lead compounds. Natural products will undergo continual use toward meeting the investigation need to develop effective medical drugs, and they will play a leading role in the discovery of medicines for treating human diseases, especially chronic diseases.

1.2. Natural Products in The Medicine

The development of new drugs relying purely on modern technology appears to be reaching something of a limit. In developing new drugs, the pharmaceutical industry has tended to adopt many throughput synthesis. But the effective efforts made in this direction have not resulted in the expected drug productivity. Various pharmaceutical companies are facing great challenges to develop new products. In the past times, increasing attention has

accordingly been paid to the natural products in the search for modern drugs in combination with novel technology, such as great throughput selection. Therefore, to promote the development of modern medical research on natural products, humans have to many efforts. Providers of medicines, such as physicians, nurses, and pharmacists, often have little training in and understanding of how herbal medicines affect the health of their patients. Most of them are also poorly informed about these products and how they are being used. Adequate training is now very essential since most patients are almost often on other types of prescription or non-prescription medicines. For this to be effective, it would be essential to create a medium of trust to facilitate adequate sharing of knowledge about the use and safety of herbal medicines. In fact, the education of healthcare professionals, providers of herbal medicines, and patients and consumers is vital for the prevention of potentially serious risks from misuse of herbal medicines.

The natural products from the herbal remedy, medicinal plants, functional foods, and their constituent have been used to cure of different diseases including cancer from ancient time to recent times, increasing emphasis has been focused on the study on the traditional medicine such as many herbs and medicinal plants. This developing on this field requires new approaches to overcome inflammation mediated diseases and these natural products could be effective sources for prevention and treatment of some diseases.

2. Conclusion

In conclusion, this great topic provides an important knowledge of the application of the natural products in preclinical researches and clinical trials in the world. In addition to, there are natural products applications for other chronic inflammation associated diseases such as atherosclerosis and ischemia in the issue. Finally, this paper presented an important information for therapeutic or preventative utilities of the natural products in chronic inflammatory diseases and many human diseases.

Abstract

Cumilla Sadar Dakshin region is highly diverse in respect to land types, topography, agro-ecology, land-use pattern, cropping systems and crop variability & variety. systems and crop variability & variety. Agricultural development of the region largely depends on the reliable and comprehensive statistics of the existing cropping cultivation and its related system adopted by the farmers. To investigate the homestead vegetable production and its impact on family nutrition, food security, income generation as well as involvement of female members a survey study was conducted at Cumilla members a survey study was conducted at Cumilla Sadar Dakshin during 2019. A total of 150 selected homesteads were surveyed for this purpose through developed questionnaire and focus group discussion. Both primary and secondary data has been collected from different sources to fulfill the objectives of the study. The results of this study indicated that the farmer's age, marital status, education level, farm size, source of income, women participation etc. Farmer's knowledge and farming experiences, perception and attitude differs on different demographic conditions like: age, sex, education, farm size, training which significantly influence the adoption of modern technologies provided by different organizations. The results also showed that women contribution in homestead vegetable production is high in medium farmer's category 41.67% and low in small farmers 36.36% respectively. The highest number of total vegetables was produced by the medium farmer (63,732 kg/year) followed by small (39,445 kg/year) and marginal farmer (25,514 kg/year). This study provides some recommendation which might impacts on betterment of farmers' occupational and socio-economic condition by establishing proper policy and legislation both in local and national level administration as well as agricultural extension.

Key Words: Food security, rural development, women empowerment, nutrition, homestead vegetable production.

Abstract

Spinal cord injury (SCI) is a process that damages many organs due to the occurrence of related events such as oxidative stress. Studies on finding suitable treatment drugs for this type of damage are quite scarce. Therefore, in our study, we planned to investigate the effect of secondary damage caused by spinal cord injury on spleen tissue and whether valproic acid (VPA) could have a protective role in this damage. Sixteen Wistar albino rats were divided into two equal groups. The rats in group 1 were created with SCI after laminectomy and were not treated. In the rats in group 2, SCI was created, as in group 1 and treatment of VPA (single dose 300 mg / kg intraperitoneally) was started. After decapitation of rats, the tissues taken were malondialdehyd (MDA) and glutathione (GSH) levels and catalase (CAT) activities were examined as markers of oxidative stress. In order to determine the role of VPA in SCI-induced spleen tissue damage, oxidative stress and enzyme levels were examined biochemically and histologically. VPA treatment, increased GSH levels, and CAT, activities but decreased MDA levels, indicating that it improved increased oxidative damage and impaired enzymatic antioxidant levels in SCI-damaged spleen tissue homogenate. We have observed that VPA, one of the neuroprotective agents, has a significant healing effect on damaged spleen tissue induced by SCI, and this effect is associated with an improvement in the oxidant / antioxidant balance.

Valproik Asit Sıçanlarda Antioksidan Enzimleri Düzenleyerek Omurilik Yaralanmasına Bağlı Oksidatif Dalak Hasarını Önler

Özet

Omurilik yaralanması (SCI), oksidatif stres gibi ilgili olayların ortaya çıkması nedeniyle birçok organa zarar veren bir süreçtir. Bu tür hasarlar için uygun tedavi ilaçları bulma çalışmaları oldukça azdır. Bu nedenle çalışmamızda omurilik yaralanmasının neden olduğu sekonder hasarın dalak dokusu üzerindeki etkisini ve bu hasarda valproik asidin (VPA) koruyucu bir rolü olup olamayacağını araştırmayı planladık. On altı Wistar albino sıçanı iki eşit gruba ayrıldı. Grup 1'deki sıçanlar laminektomi sonrası SCI ile oluşturuldu ve tedavi edilmedi. Grup 2'deki sıçanlarda grup 1'deki gibi SCI oluşturuldu ve VPA (intraperitoneal olarak tek doz 300 mg / kg) tedavisine başlandı. Sıçanların başını kestikten sonra alınan dokuların, oksidatif belirteç olarak malondiadehid (MDA) ve glutatyon (GSH) düzeyleri ile katalaz (CAT) aktiviteleri incelendi. VPA'nın SCI kaynaklı dalak doku hasarındaki rolünü belirlemek amacıyla lipid peroksidasyonu ve enzim düzeyleri biyokimyasal ve histolojik olarak incelendi. VPA tedavisi, GSH düzeylerini, ve CAT aktivitelerini artırdı, ancak MDA seviyelerini düşürdü, bu da SCI hasar görmüş dalak dokusu homojenatında artmış oksidatif hasarı ve bozulmuş enzimatik antioksidan seviyelerini iyileştirdiğini gösterdi. Nöroprotektif ajanlardan biri olan VPA'nın, SCI tarafından indüklenen hasarlı dalak dokusu üzerinde önemli bir iyileştirici etkiye sahip olduğunu ve bu etkinin oksidan/antioksidan dengesinde bir iyileşme ile ilişkili olduğunu gözlemledik.

Abstract

High morbidity and mortality rate associated with pneumococcal infection globally is of major concern most especially among infant. This burden is equally worsened by multidrug resistance strains due to indiscriminate consumption of antibiotic. Hence, need for constant search for cheap and effective bioactive compounds as alternative antimicrobials for the treatment of pneumococcal infection. Bioactive compound profiling and *in-vitro* antibacterial activity of ginger crude methanol extract against two predominant pneumococcal agents; *Streptococcus pneumonia* and *Haemophilus influenza* were investigated. Gas Chromatography Mass Spectroscopy (GC-MS) was used for the identification and quantification of bioactive compounds in the ginger crude methanol extract. The antibacterial activity and Minimum Inhibitory Concentration (MIC) of the extract was determined using Agar well diffusion. Twenty-seven (27) matched bioactive compounds were detected in the sample. Zingerone (17.70%), α -zingiberene (13.30%), (6)-shogaol (10.84%), α -Farnesene (6.26%), β -Funebrene (5.61%), 6-gingerol (5.18%), α -curcumene (4.15%) were the major compounds present. All other identified compounds had less than 4% composition by peak area each. The antibacterial activity of the ginger crude methanol extract against *S. pneumonia* and *H. influenza* were 2.33 mm and 9.33 mm. MIC of the extract against the isolates was 10%. In conclusion ginger crude methanol extract contain an array of bioactive compounds and the extract exhibited antibacterial activity against predominant pneumococcal agents. Ginger extract can be harnessed for the production of new antimicrobials to combat pneumococcal infection.

Abstract

Ocimum gratissimum is a perennial herbaceous plant used in the treatment of fungal and bacterial infections. Green synthesis has provided cost effective, environment friendly procedure and raising safe strategies for the synthesis of nanoparticles. This study was aimed at investigating the potential of *O. gratissimum* for the synthesis of selenium nanoparticles (SeNPs) and their antimicrobial activities. Phytochemical screening on aqueous extract was carried out using standard procedures. Selenium nanoparticles was biosynthesized by *O. gratissimum* and characterized using Visual detection, UV-Visible spectroscopy, Scanning Electron Microscope, Transmission Electron Microscope, Energy dispersive X-ray, Fourier Transform Infra-red spectroscopy and X-ray diffraction spectroscopy. Antimicrobial activity of the biosynthesized selenium nanoparticles by *O. gratissimum* was done using agar well diffusion method. Saponins, tannins, cardiac glycosides, terpenoids and phenols were present. The biosynthesized SeNPs had a strong plasmon resonance band at 300 nm, changes in colour from dark brown to ruby red. The SeNPs were spherical and aggregated with varying shapes and size ranged from 20 – 50 nm. Strong signal of selenium element was observed. Hydroxyl, esters, aldehyde, alkane and amine are present and responsible for the efficient stabilization and bioreduction of Selenium nanoparticle. Furthermore, biosynthesized SeNPs by *O. gratissimum* (OGSeNPs) exhibited higher antimicrobial activity against both Gram positive and Gram negative bacteria. Green synthesis of nanoparticles is a promising method in the biomedical field, due to its high bioactive components.

Ultrasound Assisted Extraction and Optimization of Pectin From Pumpkin Peels

Seda Işık¹, Özlem Akpınar²

¹Department of Food Engineering, Faculty of Engineering and Architecture, Tokat Gaziosmanpaşa University, Tokat, Turkey

²Department of Food Engineering, Faculty of Engineering and Architecture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

In this study, pectin was produced from pumpkin peels by ultrasound assisted extraction method and the physicochemical properties of the produced pectin were compared with the pectin produced by the classical extraction (KE) method. Ultrasound assisted extraction (UAE) was optimized by the response surface method for the pectin yield. The optimum extraction conditions for ultrasound assisted extraction (UAE) were determined as 10.6 ml/g liquid/solid ratio, 33.42 minutes and pH 1.04 and the pectin yield obtained at these optimum conditions was determined as 9.02%. It was determined that the structure of the pectin was similar to pectin obtained by KE method as results of the FTIR analysis. In addition, pectins obtained by both methods were determined to be high methoxyl pectin (DE>50). The solubility, emulsion activity and stability of pectin produced by the UAE method were found to be higher than the pectin produced by the KE method. The foam capacity and stability of pectin produced with KE were found to be higher than pectin produced by UAE method. This study showed that pumpkin peels can be used as a raw material for pectin and UAE method can be used effectively in the isolation of pectin from pumpkin peels.

Bal Kabağı Kabuklarından Ultrason Destekli Yöntem ile Pektin Ekstraksiyonu ve Optimizasyonu

Özet

Bu çalışmada, bal kabağı kabuklarından ultrason destekli ekstraksiyon yöntemi ile pektin üretilmiş ve üretilen pektinin fizikokimyasal özellikleri klasik ekstraksiyon yöntemi ile üretilen pektinle karşılaştırılmıştır. Ultrason destekli ekstraksiyon (UDE) pektin verimi için yanıt yüzey yöntemi ile optimize edilmiştir ve optimum ekstraksiyon koşulları, 10.6 ml/g sıvı/katı oranı, 33.42 dakika, 1.04 pH olarak belirlenmiştir. Bu koşullarda elde edilen pektin verimi, %9.02 olarak tespit edilmiştir. FTIR analizi sonucunda pektinin yapısının KE yöntemi ile elde edilen pektine benzer olduğu belirlendi. Ayrıca iki yöntemle de elde edilen pektinlerin yüksek metoksilli pektin (DE>50) olduğu belirlenmiştir. UDE yöntemi ile üretilen pektinin çözünürlüğü, emülsiyon aktivitesi ve stabilitesi KE yöntemi ile üretilen pektine göre daha yüksek bulunmuştur. KE ile üretilen pektinin köpük kapasitesi ve stabilitesi, UDE yöntemi ile üretilen pektine göre daha yüksek olduğu tespit edilmiştir. Bu çalışma bal kabağı kabuklarının pektin için hammadde olarak ve UDE yönteminin de balkabağı kabuklarından pektin izolasyonunda etkili bir şekilde kullanılabileceğini göstermiştir.

Abstract

Fusarium graminearum is one of the most important phytopathogens worldwide. It causes head blight disease in cereals. Plant derived essential oils have been used in fight against phytopathogenic fungi in recent years. In this study, antifungal effect of cumin seed oil was tested on *F. graminearum*. For this purpose; (i) minimum inhibitory concentration (MIC) and half maximum inhibitory (IC₅₀) values were detected by agar dilution technique, (ii) genomic/epigenomic alterations were evaluated by coupled restriction enzyme digestion-random amplification (CRED-RA) method, (iii) oxidative stress and deoxynivalenol synthesis were investigated by *cat* and *tri6* gene expression assays. Firstly, MIC and IC₅₀ values were detected as 0.5 and 0.25 mg mL⁻¹ cumin seed oil treatment, respectively. In CRED-RA assays, genomic template stability (GTS) and % polymorphism for *HapII/MspI* values were 96.49% and 24.3/35.8%, respectively. In gene expression analysis, fold changes in *cat* and *tri6* genes expression were recorded as 5.29±0.74 and 0.66±0.06. According to our findings, cumin seed oil has strong antifungal effect by causing growth inhibition, decreased GTS, epigenomic alterations, oxidative stress increase and deoxynivalenol decrease on *F. graminearum*. Further studies could include apoptotic and autophagy effects of cumin seed oil on *F. graminearum* and related fungi.

Key Words: Cumin seed oil, *Fusarium graminearum*, Gene Expression, Oxidative stress, Polymorphism

Kimyon Tohum Yağının *Fusarium graminearum* Üzerindeki Potansiyel Antifungal Etkileri

Özet

Fusarium graminearum dünyadaki en önemli bitki patojenlerinden birisidir. Tahıllarda başak yanıklığı hastalığına yol açmaktadır. Bitki türevli esansiyel yağlar son yıllarda fitopatogenik funguslarla mücadelede kullanılmaktadır. Mevcut çalışmada kimyon tohum yağının *F. graminearum* üzerindeki antifungal etkisi test edilmiştir. Bu amaçla; (i) minimum inhibitör konsantrasyonu (MİK) ve yarı inhibitör konsantrasyon (IC₅₀) değerleri agar dilüsyon tekniği ile saptandı, (ii) genomik/epigenomik değişimler çift restriksiyon enzimi kesimi ve rastgele çoğaltım (CRED-RA) metodu ile değerlendirildi, (iii) oksidatif stres ve deoksinivalenol sentezi *cat* ve *tri6* gen anlatımı analizleri ile irdelendi. İlk olarak, MİK ve IC₅₀ değerleri, sırasıyla, 0.5 ve 0.25 mg mL⁻¹ kimyon tohum yağı uygulaması olarak belirlendi. CRED-RA analizlerinde, genomik kalıp stabilitesi (GKS) ve *HapII/MspI* % polimorfizm değerleri, sırasıyla, %96.49 ve %24.3/35.8 olarak belirlendi. Gen anlatım analizlerinde *cat* ve *tri6* gen anlatımlarının oransal değişimleri 5.29±0.74 ve 0.66±0.06 olarak belirlendi. Bulgularımıza göre, kimyon tohum yağı *F. graminearum* üzerinde kuvvetli bir antifungal etki göstermiştir ki bu da üremenin baskılanması, düşmüş GKS, epigenomik değişimler, oksidatif stres artışı ve deoksinivalenol azalması ile olmuştur. İlerde yapılması hedeflenen çalışmalar *F. graminearum* ve ilişkili mantarlarda kimyon tohum yağının apoptoz ve otofaji etkilerini içerebilir.

Anahtar Kelimeler: Kimyon tohum yağı, *Fusarium graminearum*, Gen anlatımı, Oksidatif stres, Polimorfizm

Abstract

Fusarium culmorum is the predominant causal agent of fusarium head blight (FHB) in many Mediterranean regions. In this study, a detailed genetic characterisation of *F. culmorum* isolates obtained from wheat samples collected from the Çanakkale province (Turkey) in the year 2021, was carried out. A total of 45 monosporic cultures were obtained and identified at species level by morphological characteristics. *Tef1-α* sequencing was also carried out to confirm the identification at species level. For this purpose, gDNA was extracted from 7-d-old potato dextrose agar (PDA) cultures. A portion of the *Tef1-α* gene was amplified and sequenced from all isolates. The sequences were subjected to BlastN analysis. In linear growth rate (LGR) analysis, 4th and 7th day of PDA cultures were used in calculation the radial growth. LGR results showed that isolates were clustered in single groups as $10 < x < 20$ mm/day. Minimum and maximum mean LGR values were recorded as 11.51 and 16.32 mm/day, respectively. All 45 monosporic isolates, obtained from Sutlucekoy and Bayirkoy regions (Çanakkale Province), were identified as *F. culmorum*. Class B chemotype assays were also carried out in *F. culmorum* isolates by PCR assay. The *TRI12* gene was amplified to distinguish isolates as 3-acetyldeoxinivalenol (3-ADON) or nivalenol (NIV) producers. All isolates belonged to 3-ADON chemotype and to *MAT1-2* idiomorph. Further studies will be extended to a larger number of isolates from different regions in order to provide a comprehensive set of data on the *Fusarium* populations causing FHB in this area.

Key Words: Çanakkale, *Fusarium culmorum*, *Fusarium head blight*, PCR, *TRI12*

Çanakkale kökenli *Fusarium culmorum* izolatlarının genetik karakterizasyonu

Özet

Fusarium culmorum, birçok Akdeniz bölgesinde fusarium baş yanıklığının (FHB) baskın hastalık etmenidir. Bu çalışmada, 2021 yılında Çanakkale ilinden (Türkiye) toplanan buğday örneklerinden elde edilen *F. culmorum* izolatlarının detaylı genetik karakterizasyonu yapılmıştır. Toplam 45 monosporik kültür elde edilmiş ve tür düzeyinde morfolojik özelliklere göre tanımlanmıştır. Ayrıca *Tef1-α* sekans analizi ile tür düzeyinde tanımlama doğrulandı. Bu amaçla, 7 günlük patates dekstroza agar (PDA) kültürlerinden gDNA ekstrakte edildi. Tüm izolatlardan *Tef1-α* geninin bir kısmı çoğaltıldı ve sekanslandı. Diziler BlastN analizine tabi tutuldu. Lineer büyüme oranı (LGR) analizinde radyal büyümenin hesaplanmasında 4. ve 7. gün PDA kültürleri kullanıldı. LGR sonuçları, izolatların $10 < x < 20$ mm/gün olarak tek grup halinde kümelendiğini göstermiştir. Minimum ve maksimum ortalama LGR değerleri sırasıyla 11.51 ve 16.32 mm/gün olarak kaydedildi. Sütluceköy ve Bayırköy bölgelerinden (Çanakkale İli) elde edilen 45 monosporik izolatın tamamı *F. culmorum* olarak tanımlandı. *F. culmorum* izolatlarında PCR aracılığı ile B sınıfı kemotip analizleri de gerçekleştirilmiştir. *TRI12* geni, izolatları 3-asetildeoksinivalenol (3-ADON) veya nivalenol (NIV) üreticileri olarak ayırt etmek için çoğaltıldı. Tüm izolatların 3-ADON kemotipi ve *MAT1-2* idiomorfuna ait oldukları belirlendi. Bu alanda FHB'ye neden olan *Fusarium* popülasyonları hakkında kapsamlı bir veri seti sağlamak için farklı bölgelerden daha fazla sayıda izolata yönelik ileri çalışmalar genişletilecektir.

Anahtar Kelimeler: Çanakkale, *Fusarium culmorum*, *Fusarium başak yanıklığı*, PCR, *TRI12*

Environmental effects of food production systems and dietary models

Neslihan Öner¹, Yağmur Yaşar Fırat¹

¹Department of Nutrition and Dietetics, Faculty of Health Sciences, Erciyes University, Kayseri, Türkiye

Abstract

Environmental health is one of the factors affecting human health. In addition to the increase in fuel oil, water and agricultural land use due to common dietary habits, some critical environmental problems such as the decrease in biodiversity caused by climate change are on the global agenda. There is a risk that all these problems will lead to depletion of water and food resources, food insecurity and inequalities in access to food sources. The dietary models widely consumed by communities and changing dietary habits lead to negative developments in terms of both human and environmental health. It is emphasized that these widely consumed nutrition models and food production systems are not sustainable for future generations. With the global population growth, environmental problems caused by climate change and the increase in the consumption of animal-derived foods reveal the importance of the need for sustainable nutrition models. For this reason, the contribution of the transition to sustainable nutrition models that protect environmental health on a global scale is very important for the protection of environmental health and the prevention of climate change. Sustainable nutrition models contribute to food safety and security as they have lower negative environmental impacts and support a healthier life for individuals. In order to lead to a positive transformation in nutrition models, it is important to raise awareness of consumers as well as politicians and food producers about sustainable nutrition.

Key Words: Dietary models, climate change, greenhouse gas emissions, sustainable nutrition

Besin üretim sistemleri ve beslenme modellerinin çevresel etkileri

Özet

Çevre sağlığı insan sağlığını etkileyen faktörlerden birisidir. Yaygın beslenme alışkanlıkları nedeniyle petrol, su ve tarım arazisi kullanımının artmasının yanı sıra, iklim değişikliğinin neden olduğu biyolojik çeşitliliğin azalması gibi bazı kritik çevre sorunları dünya gündemindedir. Tüm bu sorunların su ve besin kaynaklarının tükenmesine, besin güvencesizliğine ve besin kaynaklarına ulaşmada eşitsizliklerin yaşanmasına neden olması riski söz konusudur. Toplumların yaygın olarak tükettiği beslenme modelleri ve değişen beslenme alışkanlıkları hem insan hem de çevre sağlığı açısından olumsuz gelişmelere yol açmaktadır. Yaygın olarak tüketilen bu beslenme modellerinin ve besin üretim sistemlerinin gelecek nesiller için sürdürülebilir olmadığı vurgulanmaktadır. Küresel nüfus artışı ile birlikte iklim değişikliğinin ortaya çıkardığı çevre sorunları ve hayvansal kaynaklı besinlerin tüketiminin artması, toplumların sürdürülebilir beslenme modellerine duyduğu ihtiyacın önemini ortaya çıkarmaktadır. Bu nedenle, küresel boyutta çevre sağlığını koruyan sürdürülebilir beslenme modellerine geçişin çevre sağlığının korunması ve iklim değişikliğinin önlenmesine katkısı oldukça önemlidir. Sürdürülebilir beslenme modelleri, olumsuz çevresel etkilerinin daha düşük olması ve bireyler için daha sağlıklı bir yaşamı desteklemesi nedeniyle, besin güvenliği ve güvencesine katkıda bulunmaktadır. Beslenme modellerinde olumlu bir dönüşüme yol açabilmek için tüketicilerin yanı sıra, politikacılar ve besin üreticilerinin de sürdürülebilir beslenme ile ilgili farkındalıklarını sağlamak önemlidir.

Anahtar Kelimeler: Beslenme modelleri, iklim değişikliği, sera gazı salınımı, sürdürülebilir beslenme

Giriş

Mevcut küresel besin üretim sistemleri, dünyanın doğal kaynaklarının tüketimine ve önemli miktarda sera gazı salınımına neden olmaktadır. Toplumların yaygın olarak tükettiği beslenme modelleri ve değişen beslenme alışkanlıkları hem insan hem de çevre sağlığı açısından olumsuz gelişmelere yol açmaktadır (Garnett, 2011; Harris et al., 2020; Johnston et al., 2014; Vermeulen et al., 2012). Besin üretim sistemleri sera gazı salınımı, tatlı su kaynaklarının tüketimi, petrol ve tarım arazilerinin kullanımının artmasına yol açtığı için çevre sağlığı üzerinde olumsuz etkileri olduğu bilinmektedir (Marlow et al., 2009; Tobler et al., 2011; Tukker & Jansen, 2006).

Toplumların tükettiği beslenme modelleri, sürdürülebilir beslenmeyi etkileyen önemli bir bileşen olup; toplumlar besin seçimleriyle çevre sağlığını önemli düzeyde etkilemektedir (Tobler et al., 2011; Willett et al., 2019). Günümüzde toplumların yaygın olarak tükettiği, çevre üzerinde olumsuz etkileri olan beslenme modelleri ve değişen beslenme alışkanlıkları çevre sağlığını ciddi boyutta tehdit etmektedir (Garnett, 2011; Harris et al., 2020; Johnston et al., 2014; Vermeulen et al., 2012). Yaygın olarak tüketilen bu beslenme modellerinin ve besin üretim sistemlerinin gelecek nesiller için sürdürülebilir olmadığı öngörülmektedir (van Dooren et al., 2014).

Beslenme modellerinin insan sağlığı üzerindeki etkileri daha kolay açıklanabilirken, çevre sağlığı üzerindeki etkilerini analiz etmek daha karmaşıktır. Bu nedenle, çeşitli beslenme modellerinin sürdürülebilir beslenmenin sağlanmasına katkısının ölçülmesi oldukça önemlidir (Garnett, 2011; Harris et al., 2020; Vermeulen et al., 2012).

Daha sağlıklı beslenme modellerine geçişin, sera gazı salınımı ve su ayak izinin azaltılması da dâhil olmak üzere birçok çevresel fayda sağlayabileceği vurgulanmaktadır (Vanham et al., 2018). Bunun için atılması gereken en önemli adım özellikle tüketiciler başta olmak üzere, politikacılar ve besin üreticilerinin de sürdürülebilir beslenme ile ilgili farkındalıklarını sağlamaktır.

Besin Üretim Sistemlerinin Çevresel Etkileri

Endüstriyel faaliyetlerin yanı sıra, toplumun beslenme alışkanlıkları tarımsal ürünlerin üretimi ve yetiştirilmesine ilişkin tüm süreçler ile pişirme ve atık yönetimi önemli düzeyde çevresel etkilere sahiptir (González-García et al., 2018). Bir ürünün ya da faaliyetin üretiminden başlayarak taşıma, kullanım ve yok edilmesi de dâhil yaşam döngüsünün tüm aşamalarında ortaya çıkan ve biriken CO₂ emisyonunun ölçümüne “karbon ayak izi” adı verilmektedir (Mancini et al., 2016). Karbon ayak izi, tipik olarak karbondioksit eşdeğeri (CO₂e) olarak ifade edilen ve CO₂, CH₄ ile N₂O emisyonları dâhil olmak üzere sera gazı emisyonlarının miktarını açıklamaktadır (Wiedmann & Minx, 2007) “Su ayak izi” üretilen veya tüketilen her ürün ya da alınan hizmet için gerekli olan su miktarı olarak tanımlanmaktadır. Başka bir ifade ile üretimde tedarik zinciri boyunca kullanılan ve kirlenilen suyu ifade etmektedir (Egan, 2011; Lovarelli et al., 2016). Su ayak izi genellikle “mavi”, “yeşil” ve “gri su ayak izi” olmak üzere üç bileşene ayrılmaktadır (Egan, 2011; Lovarelli et al., 2016). “Mavi su ayak izi”, bir ürünün üretimi için yüzey ve yer altı su kaynaklarından kullanılan tatlı su miktarını ifade etmektedir. “Yeşil su ayak izi”, bir ürün üretmek için topraktan buharlaşan, köklerden emilen ve ürün tarafından kullanılan yağmur suyu miktarını ifade etmektedir. “Gri su ayak izi” ise, yerel su kalitesi standartlarını sağlamak için belirli bir faaliyetle ilişkili kirlenimlerin azaltılması veya bertaraf edilmesinde kullanılan tatlı su miktarını ifade etmektedir (Egan, 2011; Lovarelli et al., 2016).

Tarımsal üretim, iklim değişikliğini ele alan ve artan küresel nüfus için gıda güvenliğini sağlama girişimlerini hedefleyen önemli bir sektör haline gelmiştir (Loboguerrero et al., 2019) Besin zincirinde yer alan bir ürünün üretimi, dağıtımı, depolanması, hazırlanması, pişirilmesi ve atıkların bertaraf edilmesine kadar her süreçte sera gazı salınımı oluşmaktadır (Elferink et al., 2008). Sera gazı, dünyanın yüzeyindeki, atmosfer ve bulutlar tarafından yayılan kızılötesi radyasyon spektrumu dâhilinde belirli dalga boylarındaki radyasyonu emen ve yayan, atmosferin hem doğal hem de antropojenik gaz halindeki bileşenleridir (Batlle-Bayer et al., 2019). Su buharı, karbondioksit, nitroz oksit, metan ve ozon başlıca sera gazlarıdır. Sera gazlarının atmosferdeki miktarı sera gazı salınımını ifade etmektedir. Küresel sera gazı salınımını azaltmak için daha fazla önlem alınmazsa, küresel ısınmanın sanayileşme öncesi seviyelerin yaklaşık 2oC üzerinde olacağı hesaplanmıştır. Böyle bir gelişmenin dünyanın kara ve deniz seviyeleri üzerinde büyük bir etkiye sahip olacağı ve dünyadaki her ülkenin ekonomik ve sosyal gelişimini etkileyeceği ön görülmektedir (Zheng et al., 2019).

Gıda ve Tarım Örgütü (Food and Agriculture Organization, FAO) raporuna göre dünya nüfusunun 2050 yılında kadar yaklaşık 9.7 milyar civarında olması beklenmektedir. Bu senaryoda, gelecekteki küresel nüfusun beslenme ihtiyaçlarını karşılamak için mevcut tarımsal üretim kapasitesinin yaklaşık olarak %60 oranında artırılması gerektiği bildirilmiştir (Food and Agriculture Organization, 2012). Ancak, mevcut tarımsal üretim dünya genelinde sera gazı salınımının yaklaşık %20'sinden ve tatlı su kaynaklarının tüketiminin yaklaşık %70'inden sorumludur (Food and Agriculture Organization, 2017a). Bu durumda, tarımsal üretimin artması dünyanın tatlı su kaynaklarını azaltarak, atmosfere sera gazı salınımını arttıracaktır (Food and Agriculture Organization, 2017b). Bu nedenle, küresel nüfus artışı ile birlikte iklim değişikliğinin ortaya çıkardığı çevre sorunları ve hayvansal kaynaklı besinlerin tüketiminin artması, toplumların sürdürülebilir beslenme modellerine duyduğu ihtiyacın önemini ortaya çıkarmaktadır (Food and Agriculture Organization, 2019; Harris et al., 2020; Willett et al., 2019).

Birleşmiş Milletler Çevre Programı (United Nations Environment Programme, UNEP) tarafından yayınlanan bir raporda, “yeşil ekonomi; birtakım çevresel riskleri ve ekolojik kısıtları azaltırken, aynı zamanda toplum refahını da sağlayan ekonomik bir model” olarak tanımlanmaktadır. Bu bağlamda, yeşil ve döngüsel bir ekonomi gerek yatırımlar gerekse büyüme stratejileri belirlenirken sera gazı emisyonlarının azaltılması ile enerji ve kaynak verimliliğinin artırılmasının gözetilmesini gerektirmektedir. Yeşil ve döngüsel ekonomi hedeflerinin bir arada ele alınması ve bu kapsamda geliştirilecek faaliyetlerin hem üretici hem de tüketicileri kapsayan bütüncül bir yaklaşımla hayata geçirilmesi önem arz etmektedir. Bu alanda Avrupa Birliği (AB) tarafından açıklanan hedefler, Yeşil Mutabakat hedefleri ve Yeni Sanayi Stratejisi doğrultusunda 11 Mart 2020 tarihinde “Döngüsel Ekonomi Eylem Planı” ile raporlanmıştır. Yeşil Mutabakat hedefleri doğrultusunda, sürdürülebilir tüketim ve üretimin geliştirilmesini desteklemede, çevrenin bir bütün olarak korunması amacıyla sürdürülebilir tüketim ve üretim eylem planının hazırlanması önem teşkil etmektedir (Ticaret Bakanlığı, 2021).

Beslenme Modellerinin Çevresel Etkileri

Çevre ve insan sağlığı birbirilerini doğrudan etkilemektedir (Marlow et al., 2009; Tobler et al., 2011; Tukker & Jansen, 2006). Mevcut doğal kaynaklardaki sınırlılık ile birlikte küresel nüfus artışının görülmesi, sürdürülebilir diyet modellerine geçişin önemini artırmaktadır (Garnett et al., 2013). Ekosistemdeki bozulmanın en önemli sorumlusunun günümüzdeki besin üretim sistemleri ve beslenme modelleri olduğu bilinmektedir. Batı ülkelerindeki besin tüketiminin dünyadaki toplam çevresel etkinin yaklaşık olarak %20-30'undan sorumlu olduğu

bildirilmiştir (Garnett, 2011; Tukker & Jansen, 2006). Bu nedenle, özellikle Batı ülkelerde et tüketiminin azaltılması ve bitki bazlı diyetlere geçişin; iklim hedeflerine ulaşmak, halk sağlığı sorunlarını ele almak ve hayvan refahını korumak için çok önemli olduğu vurgulanmaktadır (Kwasny et al., 2022).

Besin gruplarının küresel ısınmaya katkıları değerlendirildiğinde; et ve et ürünlerinin en yüksek küresel ısınma katkısına, tahıl, meyve ve sebze gruplarının ise en düşük küresel ısınma katkısına sahip olduğu gösterilmiştir (Meier et al., 2022). Günümüzde tüketicilerden gelen taleplerin artması nedeniyle, besin üretim sistemlerinde et ve et ürünlerinin üretiminde giderek artış olduğu bilinmektedir (Kwasny et al., 2022). Gelişmiş bir ülkedeki bir tüketicinin et ve et ürünleri temelli bir diyetten bitkisel ürün temelli bir diyetle geçtiğinde, su ayak izinin ortalama %36 oranında azalabileceği belirlenmiştir (Colombo et al., 2021). Ayrıca, besin üretim sektöründe zamanla biyolojik çeşitlilik kaybına neden olan sera gazı emisyonları ve su tüketimi açısından da et ve et ürünlerinin üretiminin ön planda olduğu bilinmektedir (Marlow ve ark., 2009). Pimentel ve ark. (2003) nüfus artışına ve temelde hayvansal kaynaklı besinlere dayalı diyetlerin dünyanın doğal kaynaklarının sürdürülebilir kullanımını açıkça tehdit ettiğini bildirmiştir. Bu çalışmalar et tüketim miktarındaki azalmayla hem halk sağlığı hem de çevresel etki açısından fayda sağlanabileceğine işaret etmektedir (Laestadius et al., 2013).

Tarım ve hayvancılık faaliyetleri sırasında oluşan sera gazı emisyonlarının nedeni, doğal gübreleme ve azotlu suni gübreleme uygulamalarından kaynaklanan nitröz oksit (N₂O) ile geviş getiren hayvanların bağırsaklarında gerçekleşen fermentasyon ve anaerobik gübreleme sırasında salınan metan gazıdır (CH₄) (Kumar et al., 2022). Nitröz oksit ve metan gazının küresel ısınma potansiyeli karbondioksitten daha fazladır (Elin Röö, 2013). Hayvansal ürünlere yönelik artan tüketici taleplerinden dolayı, ormanlık arazilerin tarımsal ve hayvansal ürün üretimi için kullanımı, besin üretim sisteminden kaynaklanan sera gazı emisyonlarının artışının en temel nedenidir (Clark & Tilman, 2017).

Diyet modellerinin değişimi ile daha sağlıklı bir gezegen

Sürdürülebilir besin sistemleri ile sürdürülebilir beslenmenin yaygınlaştırılmasını sağlamak, küresel besin sistemini dönüştürmek için büyük ölçekli ve koordineli çabaları içeren bilimsel kanıtlara ihtiyacın olduğu vurgulanmaktadır (Willett et al., 2019). Bu nedenle, 2019 yılında, 16 ülkeden 19 komisyon üyesi ve 18 bilim insanı; sağlıklı beslenme ve sürdürülebilir besin üretimini sağlamak ve yaygınlaştırmak için, bilimsel kanıtlara dayalı olan küresel hedefler geliştirmek adına bir araya gelerek, “EAT-Lancet” adı altında bir komisyon oluşturmuşlardır (Willett et al., 2019). Birleşmiş Milletler (BM) Sürdürülebilir Kalkınma ve Paris İklim Anlaşması Hedeflerine ulaşmak için toplumda sağlıklı ve sürdürülebilir besin üretim sistemleri ile beslenme modellerine dönüşüm gereklidir. Bu nedenle, “Büyük Besin Dönüşümü (Great Food Transformation)” olarak vurgulanan sağlıklı ve sürdürülebilir beslenme modelleri ve besin üretim sistemleri için bilimsel kanıtlara ihtiyaç vardır (Willett et al., 2019).

EAT-Lancet Komisyonunun önerdiği bilimsel hedeflerden birisi; “Sürdürülebilir besin üretim sistemleri ile sağlıklı ve sürdürülebilir beslenme modellerine yönelik bilimsel hedeflere ulaşmak, aile planlaması ve sağlıklı beslenme eğitimi bütünleştiren yüksek kaliteli birinci basamak sağlık hizmetlerini sağlamaya bağlı olacaktır.” şeklinde beyan edilmiştir (Willett et al., 2019). Bu nedenle, toplumda beslenme sorunlarının saptanması ve bunlara çözüm önerileri geliştirebilme konusunda özellikle öncül meslek mensuplarının mezuniyet öncesinde eğitim müfredatına sürdürülebilir beslenme eğitiminin eklenmesi önemlidir. Ayrıca, besin üretim endüstrisi besinleri işleme sürecindeki kayıplar, besin israfı ve besin paketlemenin oluşturduğu olumsuz çevresel etkiler ile ilgili olarak düzenlemeler yapmalıdır (Aylin Alsaffar, 2015)

Abstract

The complex nature of the relationship and interaction between land use land cover (LULC) and slope gradients resulted in a decrease in soil fertility parameters, exacerbating the reduction in sustainable productivity in Ethiopia in general and the study area in particular. The purpose of this research was to assess the effects of land use, land cover, and slope classes on the physicochemical properties of soil. With three replications, a total of 27 composite soil samples were collected from 0-20 cm depth under three dominant adjacent land use types across three slopes. Soil samples were collected and analyzed for selected soil properties. The mean differences were tested using two-way ANOVA.

SOC, TN, AvP, CEC, exchangeable bases (Ca^{2+} , Mg^{2+} , K^{+} , and Na^{+}), PBS, and clay contents percentage of cultivated soil and steep slope gradient (15-30%) were lower and significantly different ($P \leq 0.05$) from forest and grazing soils on the same slope gradient. In comparison to the others, the gentle slope (3-8 percent) classes of the forest lands had the lowest BD and the highest TP.

The steep slope gradient (15-30%) of cultivated soil has a worse overall soil fertility condition than the other, and cultivating the steep slope is the cause of productivity loss in the research sub-watershed. As a result, efficient land-use planning and the implementation of an integrated soil management strategy result in increased production and improved soil productiveness status.

Productivity, forage quality and capacity of Trifolieta-Thymusetum-Festucosum formation in the territory of Lerik district

Sanubar Aslanova

Azerbaijan State Pedagogical University, Baku, Azerbaijan

Abstract

The change of the multi-year average productivity of the *Trifolieta-Thymusetum-Festucosum* formation (On the territory of Lerik region, the summer pasture No. 12, which is not grazed, the area "Chaparlanan" spreads on grassy mountain-meadow lands) during the years 2019-2020-2021 (in the summer season) was determined to be 9.4-12.4 s/ha (table 1).

It can be seen from the table that the drying coefficient of the phytomass in determining the productivity of the formation is equal to 2.3-2.8.

In the first year (2019) of the study, the wet mass was 28.6 s/ha - *Poaceae* 11.4 s/ha (39.9%), *Fabaceae* 9.2 s/ha (32.2%), *Herboseta* 8.0 s/ha (27.9%); dry mass was 5.4 s/ha (43.5%), *Poaceae* 3.7 s/ha (29.9%) *Fabaceae* , and 3.3 s/ha (26.6%) *Herboseta*.

Thus, in July of that year (according to the multi-year data of the meteorological station of the region), the average monthly air temperature rose to 30-37°C and the average annual amount of precipitation was 640 mm.

In 2020, the average annual productivity of the formation in terms of dry edible mass is set at 9.4 s/ha; 5.2 s/ha (55.3%) of *Poaceae*, 2.8 s/ha (29.8%) of *Fabaceae* and 1.4 s/ha (14.9%) of *Herboseta* were recorded.

Table 1

The average annual productivity of the *Trifolieta-Thymusetum-Festucosum* formation spread in the "Gizyurdu" summer pasture area No. 12 in the territory of Lerik region.

Years and months	Botanical herb groups	Dry mass		Dry edible mass	
		With s/ha	With %	With s/ha	With %
2019 (July 10-15)	Poaceae	11,4	39,9	5,4	43,5
	Fabaceae	9,2	32,2	3,7	29,9
	Herboseta	8,0	27,9	3,3	26,6
	Average annual productivity	28,6	100,0	12,4	100,0
2020 (July 15-20)	Poaceae	12,5	55,4	5,2	55,3
	Fabaceae	6,7	29,6	2,8	29,8
	Herboseta	3,4	15,0	1,4	14,9
	Average annual productivity	22,6	100,0	9,4	100,0
2021 (July 20-25)	Poaceae	12,7	42,1	4,9	45,4
	Fabaceae	7,7	25,5	2,4	22,2
	Herboseta	9,8	32,4	3,5	32,4
	Average annual productivity	30,2	100,0	10,8	100,0

In the third (2021) year of the study (July 20-25), it has a higher yield (in dry edible mass) (10.8 s/ha) in the same phytocenosis (table 1). Among them, 4.9 s/ha (45.4%) of *Poaceae*, 2.4 s/ha (22.2%) of *Fabaceae* and 3.5 s/ha (32.4%) of *Herboseta* were also designated.

It is possible to determine the capacity (1154 heads of small horned cattle) of the pasture area (on 296 ha) in the summer pasture "Gizyurdu" (No. 12) with the calculation of 3.9 heads, on the condition that the three-year average productivity of the *Trifolieta-Thymusetum-Festucosum* formation are accepted as (10.9 s/ha), feed unit accepted as (55.3 kg), as well as the period of use of phytocenosis (120 days) and the daily feed rate of cattle accepted as 1.3 fodder units.

In general, taking into account the average annual productivity of the corresponding formation, the capacity per hectare of fodder quality, this phytocenosis can be attributed to the good quality pasture group. First of all, effective use of vegetation and implementation of surface improvement measures is appropriate.

Comparative study on the prevalence of parthenocarpic embryos development in fruit formation between olive cultivars

Festus Maniriho¹ and Mehmet. A. Aşkin^{1,2}

¹ University b of Rwanda,college of Agriculture, Animal Science and Veterinary Medicine,P.O.Box 210 Kigali-Rwanda, E-mail: maniriho@gmail.com

^{1,2}European University of Lefke (EUL), department of Horticulture and marketing, Northern Cyprus, P.O. Box Via Mersin 10, Turkey.

Abstract

Parthenocarpic fruits reduce olive (*Olea europaea* L.) productivity significantly. Instead of the development of a single functioning ovule in normal fertilized ovaries, the start of parthenocarpic embryos is resulting from the expansion of more than one ovule. This study was carried out to evaluate parthenocarpic incidence among seven olive cultivars in Mediterranean basin. Thirty inflorescences per olive cultivar were collected during the 8th week after anthesis, and fixed in a combination of formalin (2cc), Acetic acid (2cc), and 70% ethanol (10cc) for 1 hour. A light microscope (Leica, DM750 P) was used to make structural observations on transverse slices, and their images captured using a high-resolution digital camera placed in the microscope system. Data recorded on the number of parthenocarpic embryos were subjected to ANOVA and mean comparison was performed by Duncan multiple range test at 5%. As shown by microscope images, at blooming the ovary is composed of four ovules; after anthesis, the pistil development may continue with the selection and expansion of one functional ovule, or more ovules can expand, resulting into a single or multiple functioning ovules. Normal ovaries formation was found to be significantly higher in sikikita Pikual and toska cultivars; whereas parthenocarpic ovaries formation was significantly higher in koronaki and abrosona cultivars. Almost, a half of the ovaries investigated in this study may generate parthenocarpic embryos, and the majority of parthenocarpic ovaries have two ovules per ovary, whereas the percentage of ovaries with three or four developed ovules is fairly low, suggesting that ovaries with three or four developed ovules are quite occasional.

Key words: Anthesis, fertilization, *Olea europaea*, olive inflorescence, ovary, ovule, parthenocarpic embryos

1.Introduction

In olive trees, the final fruit count is decided during a brief, intensive phase of flower and fruit abscission during the first 5 to 7 weeks after full bloom (Ayerza & Coates, 2004). The huge proportions of ovaries that abscise, as well as the diversity across flowers in postanthesis abscission, make studying the phenomenon more difficult the time of anthesis and the subsequent growth of flowers (Rapoport et al, 1991; Orlandi et al, 2005). Between 5 and 7 weeks following anthesis, the flower and fruit population begins to decline dramatically. Shedding of staminate flowers begins shortly after full bloom and partially overlaps the abscission of unfertilized perfect flowers induced by pollination and/or fertilization of neighboring flowers, which occurs in the days after petal drop (Rosati et al, 2011). Olive fruit development is a series of biochemical and physiological activities that are tightly controlled by genetics and impacted by a variety of environmental factors (Connor & Fereres, 2005). It lasts 4–5 months and consists of five major stages: I) fertilization and fruit set, which are characterized by fast early cell division, which promote embryo development. II) seed development, a phase of fast fruit growth caused by intensive cell division and expansion, including mostly endocarp growth and development and minimal mesocarp development, III) pit hardening, when fruit growth stops as endocarp cells stop dividing and become sclerified, IV) mesocarp development, which is characterized by the enlargement of preexisting meat cells and strong oil buildup (Wu, et al, 2002; Conde et al, 2008). The presence of parthenocarpic fruitlets known as shotberries reduces olive productivity. In contrast to the selection and growth of a single functional ovule in normal fertilized ovaries, parthenocarpic growth is accompanied with the enlargement of all four ovules (Rapoport and Rallo, 1989; Bagheri et al, 2017). Olive shotberries are tiny, seedless fruits with quantitative parthenocarpic expression. They either abscise before harvest or have no commercial use if harvested. As a result, increasing shotberry incidence has a detrimental influence on fruit and oil output, and can significantly damage olive orchard economic yield self-pollination and poor pollination (Cuevas et al, 2009) have all been suggested as variables that promote shotberry development in olive trees. Koubouris et al (2010) reported that shotberry development was genotype-dependent, with Leccino olive cultivar being more susceptible than the other cultivars examined. Contemporary oliviculture necessitates the adoption of new cultivars produced either from traditional or modern genetic improvement technology, or from selection among the Mediterranean Basin's various genotypes, which are believed to number over 4000 between cultivars and accessions (Pérez-Barranco et al, 2009). The goal of this work is to describe assess and compare parthenocarpic embryos prevalence between olive cultivars using a light microscope in Mediterranean environmental conditions.

2. Material and Methods

Research site: The investigation was carried out at the European University of Lefke (EUL) grove in Northern Cyprus, with the following seven olive Cultivar : Abrosona, Arbekuina, Koronaki, Toska, Pikual, Sikitita, and Yerli. At the EUL experimental farm, trees were twenty-five years old and planted at a normal density of 270 trees ha⁻¹. That is, there were seven blocks in the orchard, each with 20 plants. The trees were cultivated under the same uniform Mediterranean circumstances and over the past five years have been receiving the same cultural practices and treatments, namely fertilization, weeding, pruning and irrigation.

Fruitlet inflorescence samples collection: Inflorescence samples for the present study were collected at the 8th week post-anthesis. Three trees /cultivar in the same light gradient were identified and chosen at blooming stage.

Figure 11 : Olive cultivars at anthesis stage

Thirty inflorescences per olive (*Olea europaea* L.) cultivar (ten per each of three trees) were taken from the 25 year-old trees. Inflorescences were harvested randomly from the top, middle and at the base of the canopy. The anthesis was fixed when at least 60% of the flowers (Alcalá & Barranco, 1992; Cuevas et al, 2009) on the selected trees were open as shown in figure1. The samples were then brought to the laboratory in ice bags for examination.

Parthenocarpic embryos analysis

At the 8th week post-anthesis, the collected 30 fruitlets per cultivars were fixed in fixative solution which was a mixture of formalin (2cc), acetic acid (2cc) and 70% ethanol (10cc) for 1 hour in marked perforated cassettes. The solution of Formal-aldehyde (formalin) was employed to preserve the samples' bio-morphological features, structural linkages, and chemical contents.

To avoid denaturation of the samples, they were submerged in a volume of solution four times bigger than the volume of the samples and then maintained at room temperature; the tissues were thus stable for analysis. After, using a sharp knife preferably a bistoury, the cross sections were prepared from ovaries of the fixed fruitlets to prepare slides for light microscope observations. The structural observations were made on transverse slices at the site of largest fruit diameter, a light microscope (Leica, DM750 P, made from Germany) and photographed using a high-resolution digital camera installed in the microscope system.

Data analysis

Fruitlet inflorescences were sampled using a completely randomized block design (CRBD). The experiment was set up as CRBD with three replications (trees) per cultivar, with each replication's value being the average of the values obtained for ten fruitlets. Seven varieties of olive trees (*O. europaea* L.) were utilized in the trials. The quantitative data recorded from the light microscope images were analyzed using statistical analysis system (SAS) for factorial Variance analysis (ANOVA) with two factors: 7 varieties and the number of embryos developed (from one to four embryos). Group mean comparison analyzed by Duncan's Multiple Range of Test (DMRT) at 0.5% level.

Figure 12: olive inflorescence samples at 8 weeks after anthesis in 2021

3. Results and discussion

As shown by the light microscopic images, at blooming the ovary is composed of four ovules. After anthesis, the pistil development may continue with an expansion of the all four ovules or one or more ovules can expand the growth that may lead to single or more functional ovule. After ovule fertilization, fruitlets grow faster from the ovary in the first 7 week post anthesis, following pollen and petal fall. The fruitlet is composed of epicarpe, mesocarpe and endocarpe which are clearly identified very early by their nature of tissues.

Figure13: Ovaries with different number ovules developed at 8 weeks after anthesis: ovary with one ovule cavity (i), ovary with two ovule cavities (ii), ovary with three ovule cavities and ovary with four ovule cavities (iv)

The presence of parthenocarpic fruitlets known as shotberries typically reduces olive productivity. Fruits produced by parthenocarpic embryos are economically worthless (Spinardi & Bassi, 2012). Normal and parthenocarpic ovaries from the cultivars have different ovule development and structural features. However, Shotberry production does not appear to be a result of abnormal ovule development, such as inadequate embryo sac formation. In contrast to the selection and growth of a single functioning ovule in normal fertilized ovaries, the beginning of parthenocarpic growth is accompanied by the enlargement of more than one ovule, sometimes up to all the four ovules (figure 3). The percentage of the parthenocarpic ovules susceptible to produce parthenocarpic embryos compare to normal embryos is presented on figure 4 below. It was distinguished that regardless of the cultivars, only up to 51% of the ovaries can expand one selected functioning ovule to produce normal embryos, while the 49% remaining ovaries are susceptible to produce parthenocarpic embryos. However, the higher percentage of parthenocarpic embryos is likely to appear in ovaries with two ovules developed. In other words the majority of parthenocarpic ovaries present two ovules per ovary, while the percentage of ovaries with three or four ovules developed are significantly low which implies less chances to happen in olive production. It was shown that, independent of cultivar, only up to 51% of ovaries can grow one functional ovule to generate normal embryos, whilst the remaining 49% of ovaries are prone to producing parthenocarpic embryos.

Figure 14 : Percentage of ovaries with various numbers of ovules developed at 8 weeks post-anthesis
Data labels with the same letter are not statistically significant at $P < 5\%$, DMRT= 1.253

In fact, the presence of parthenocarpic fruitlets known as shotberries reduces olive productivity significantly. The normal and parthenocarpic ovaries of the cultivars were investigated for ovule development and morphological features. Olive shotberries are tiny, seedless fruits that show quantitative parthenocarpy expression. They abscise before harvest or have little commercial use if harvested (Rapport, 1998). As a result, increasing shotberry incidence has a detrimental influence on fruit and oil output, and can significantly impair olive orchard economic yield. The above researcher also reported that shotberry production does not appear to be caused by abnormal ovule development, such as inadequate embryo sac formation (Rapoport et al, 20016). Indeed, the number of blooms, the number of fruit set, and the quantity of fruit during harvest time are all factors that influence a tree's fertility. As a result, increasing shotberry incidence has a detrimental influence on fruit and oil output, and can significantly impair olive orchard economic yield. On the otherhand, normal and parthenocarpic ovaries were studied for ovule development and morphological features. Shotberry production does not appear to be caused by abnormal ovule development, such as inadequate embryo sac formation (Koubouris et al, 2010).

Considering the number of ovules developed into embryos at 8 weeks post- anthesis, the table 1 shows the prevalence of parthenocarpic ovaries among olive cultivars. The two way- ANOVA analysis has revealed that the number of ovule developed per ovaries is not significantly different between cultivars, however, the variability of the number of ovule developed per ovaries is significant influenced by the type of cultivar. Thus, as it is shown from the table 1 above, the occurrence of parthenocarpic ovaries as well as normal ovaries is influenced significantly by the cultivars at a given extent. The higher significant rate of normal ovaries formation was respectively observed for Sikikita, Pikual and Toska cultivars; in contrast the high rate of parthenocarpic ovaries formation was respectively observed for Koronaki and Abrosoa cultivars.

Table 3: Occurrence of parthenocarpie among olive cultivars at 8 weeks post-anthesis

	Abrosoa	Arbekuina	Koronaki	Pikual	Sikitita	Toska	Yerli
One ovule developed/ovary	12.3 cd	15.0 bc	9.0 ef	18.0 ab	20.3 a	18.0 ab	15.3 bc

Three ovules developed/ovary	4.7 ghi	4.3 ghi	4.3	4.7 ghi	1.3	5.3 gh	2.0 hi
Four ovules developed/ovary	11.7 i	9.3 i	13.0	5.0 hi	6.0 ghi	4.7 hi	11.7 i

Data labels with the same letter (s) are not statistically significant at $P < 5\%$, DMRT= 3.315

Previous research revealed that the influence of cultivars to parthenocarpic embryos formation may be related to the amount of pollen production and/or to the stigma receptivity and pollen germination capacity. Indeed, when mature anthers dehisce, a phenomenon in which climatic variables have a direct role, it happens. The amount of pollen produced, however, appears to be a varietal trait. On the otherhand, Olive stigmas have been reported to stay responsive until 3-4 days following anthesis (Strømme & Hildrum, 2019). The period of receptivity is shortened by a premature drying of the stigma, possibly related to the time of olive tree blossoming (May-June).

Additionally, the pollen grain's germination medium is highly specific: a suitable variety's receptive stigma. An extensive output of the donor cultivar can improve the efficiency of movement during the mobile phase. Different studies indicated that when circumstances are adverse, the pistil development is usually the first to fail. During the pistil development stage, competition for assimilates between flowers and between flowers and actively developing shoots appears to be the cause of pistil abortion. However, due to abundant flowering, in most situations, pistil abortion has little effect on the olive tree's ability to produce fruit (Singh, 2006; Rosati et al, 2011). In contrast, it was reported, parthenocarpic may occur for several reasons but the most important is lack of pollination for different reasons like self- incompatibility. For the pollination to happen successfully, the pollen tube must travel the journey from the stigma to the inside of the embryonic sack, where fertilization will occur, giving rise to the future seed and, with it, the flower's conversion to fruit (Sayyad-Amin et al, 2015). Nonetheless, it is important to pursue research on number of parthenocarpic fruits or shotberries and how to control them. In attempt to reduce the shortberries in olive orchards, A research conducted by Bagheri et al (2017) on 25-year-old olive trees in Iran (2014 and 2015), to investigate polyamine alterations in connection to the development of the olive mesocarp and seed. The effects of polyamines, putrescine, and spermidine on parthenocarpic fruits (shotberries), as well as olive fruit set, were investigated. When polyamines were sprayed at full bloom, the findings revealed that putrescine was highly successful in reducing the proportion of shotberries and raising the percentage of regular fruits.

4. Conclusion

In contrast to the selection and growth of a single functioning ovule in normal fertilized ovaries, the start of parthenocarpic development is marked by the expansion of more than one ovule, occasionally all four ovules. For the present study in mediterranean basin, almost the half of the ovaries examined can produce parthenocarpic embryos. The majority of parthenocarpic ovaries have two ovules per ovary, whereas the percentage of ovaries with three or four ovules formed is quite low, implying that ovaries with three or four developed ovules are relatively less likely to occur. Further research should investigate driving factors for parthenocarpic embryos formation and possible treatments to control it. Further research should investigate the occurrence of other types of biological abnormalities and disorders mostly incomplete Pistil development as well as incomplete embryo sac formation.

Abstract

Organic compounds are classes of chemical compounds which evaporate easily from water into the air and they contain carbon. This research examined the analysis of organic compounds in industrial and effluent water of Asa River, Ilorin, Nigeria and the purpose is to ascertain that raw materials used in production have a link to the pollution of surface water, and it was carried out using Fourier Transform Infra red Spectroscopy from eight sampling locations. Findings showed that detergent company effluent and its surface water (EW-GS-1 & GS/SW1) presents peaks 3447.7-3454.2 cm⁻¹ which can be ascribed to primary amines of -N-H- distends; Pharmaceutical companies A&B (EW-TP-1&KC-GS-TP/SW1 with EW-KC-3&KC/SW1 respectively) shows the band at 750.07cm⁻¹ for effluent waters and 754.97cm⁻¹ for surface water were assigned to -C-C stretching of mononuclear aromatic hydrocarbons which is benzene while, battery company (EW-FB-4&FB/SW1) reveals energetic alp at 1271cm⁻¹ assigned to -C-O-C distends indicative of alkyl aryl ether because of strong dipole moment. This research reveals that surface water is most times polluted with organics and it has to be controlled to ensure safe water for drinking.

Data Mining Methods Used in Livestock and an Application

Gülşah Keklik¹

¹Department of Animal Science, Faculty of Agriculture, Çukurova University, Adana, Türkiye

Abstract

Data mining enables the discovery of necessary and applicable knowledge from vast amounts of information in the information industry and society. Although many data mining methods have been used, some methods applied to offer a solution to complex problems in animal husbandry have come to the fore in recent studies.

In this study, some of the data mining methods (such as artificial neural networks, Bayesian classifiers, k-means, k-nearest neighbor, decision trees) are explained and an application of data mining in the field of livestock is given.

Key words: *Data mining, Artificial neural networks, Bayesian classifiers, K-means, K-nearest neighbor*

Evaluation of Studies on the Use of Biotechnological Developments in Agricultural and Animal Production

Gülşah Keklik¹

¹Department of Animal Science, Faculty of Agriculture, Çukurova University, Adana, Türkiye

Abstract

The term biotechnology was first used by Karl Ereky in 1919 as "processes by which raw materials are converted into new products through biological systems" and developments in biology and technology have expanded the scope of this term. Biotechnology provides benefits in solving some important problems in agriculture that can not be solved through traditional breeding techniques. It has been observed that biotechnological methods, especially molecular techniques, which have made significant developments recently, provide significant advantages in increasing agricultural production. It is seen that these technologies, which are called biotechnology, ranging from classical biotechnology to modern biotechnological methods and whose level of complexity is increasing, are used in agriculture in different ways (such as gene transfer to a large part of cultural plants), taking into account the development levels of countries in science and technology. Biotechnology in animal production has focused on the isolation and characterization of growth hormone genes from some animal species. There are many innovations regarding the use of biotechnology in the field of animal husbandry. For example, the development of a recombinant form (rBST) of a natural hormone (bovine somatotropin) that increases milk production in cows by 10-15% and the transfer of resistance genes to various diseases in different fish species.

It is clear that biotechnology has important benefits in agriculture and animal husbandry. In this study, the studies on the use of biotechnological developments in agricultural and animal production areas are evaluated and the fact that the developments in this field will progress by gaining new perspectives is mentioned.

A Study on Applications of Deep Learning Network Architectures in Animal Husbandry

Gülşah Keklik¹

¹Department of Animal Science, Faculty of Agriculture, Çukurova University, Adana, Türkiye

Abstract

Deep learning is an approach that includes machine learning algorithms that enable classification and analysis for unknown data by creating a model with many layers of artificial neural networks on previously known data. This approach has emerged as a result of the increase in the applicability of artificial intelligence technology and studies have begun to increase. Deep learning is a branch of machine learning. In the process from the beginning of machine learning to the present, the interest in artificial intelligence has increased gradually and has led to the emergence of deep learning architectures, which are the most used artificial intelligence algorithms today. Deep learning architectures produce smart solutions in the field of livestock as well as in many other fields. Livestock farming is a sub-branch of agriculture that has been going on for generations and enables human beings to meet their basic food needs. Cattle, ovine, poultry and beekeeping are included in the scope of animal husbandry. Basically, it is aimed to meet the food needs of people by meeting their needs such as care and feeding of animals. Providing the needs of animals in animal farms established to meet these needs is based on human power. However, today, with the development of technology, machines are replacing human power. Therefore, it has become possible to find more comprehensive solutions to the problems encountered.

In this study, the history of deep learning, deep learning network architectures (such as Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN), Restricted Boltzmann Machines (RBM)) and models (such as LeNet, AlexNet, GoogleNet) are examined and its applications in the field of animal husbandry are given in the light of studies in the literature.

The Effects of Using Safflower Seed Flour on Quality Characteristics of Cupcakes

Ali Cingöz^{1*}

Abstract

The demand for healthier and more functional products is accelerating product development efforts. In a world where global food shortages are occurring due to global climate change, droughts, and wars, the search for alternative products is accelerating. This study is a product development study aimed at reducing the use of wheat flour and making products more functional. In the study, safflower flour, one of the raw materials used in the edible oil industry, was used as a substitute for wheat flour, and cupcakes were made from the flour mixture obtained. In this context, safflower seed flours was added to wheat flour in 5 different ratios (5, 10, 15, 20, and 30%) and cupcakes were prepared. The structural properties (volume index, symmetry index, uniformity index, upper shrinkage value, lower shrinkage value and total volume index), chemical properties, color values and texture properties of the cupcakes were determined. The results show that the addition of safflower seed flour increases the protein content and functional properties of the cupcakes. While the addition of safflower seed flour at 15% improved the structural properties of the cupcakes, negative effects occurred at higher addition levels. As a result, it was found that the safflower seed flour can be used in the production of cupcakes. It increases the functionality of the products to which it is added.

Key Words: *Functional Foods, Safflower, Cupcake*

Introduction

Safflower (*Carthamus tinctorius* L.) is a member of the family Compositae or Asteraceae. It is an annual herbaceous plant, cultivated mainly for its seed which is used for the production of edible oil and bird seed (Malakian et al. 2011). Safflower contains pigments (carthamin), lignans, polysaccharides, essential oils and fatty acids (arachidonic acid, linoleic acid, linolenic acid, palmitic acid and stearic acid). The nutritional value is associated with a high content of proteins, essential and balanced amino acid contents (Polushkin, 2007). The use of its seeds is an interesting and promising area for the processing branches of the food industry. Although studies on safflower have mainly focused on safflower oil, there are some studies on the production of healthy drinks with high antioxidant activity (Kim et al. 2022), breads enriched with functional components (Kutsenkova et al. 2019), and cookies with increased protein content (Kutsenkova et al. 2020) using safflower seeds.

Cakes, of which there are many different types and recipes in the industrial sense, are divided into 6 classes according to their shape: Ball, Slice, Stick, Shape, Cake base and Stick (Mercan and Boyacıoğlu, 1999). The standard TS 13375 ready-made cake (plain, flavored and filled) defines ready-made cake as "a packaged product prepared by mixing wheat flour or cereal flour and/or mixtures, white sugar, edible vegetable oil, eggs, salt, raising agents, flavorings, fillers and other additives with the addition of water, and then processed, shaped and baked and offered for consumption." Most of the cakes available on the market are baton and ball cakes. The fact that cupcakes can be served in one portion, are easy to eat and affordable, leads them to be consumed more frequently. In order to increase the variety of cakes and improve the functionality of cakes, studies are currently being conducted on the addition of alternative products to cakes. In the production of cake, brown rice flour and peanut butter (Asimah et al. 2016), inulin (Majzoobi et al. 2020), pregelatinized sweet potato flour (Chittrakorn and Bora, 2021), xylitol and oligofructose (Nourmohammadi and Peighambaroust, 2016), guar and xanthan gum (Zambrano et al. 2004), apple (*Musa Pumila*), banana (*Musa Sapientum*), pineapple (*Ananas Comosus*) (Offia-Olua and Ekwunife, 2015), grapefruit peel powder (Ukom et al. 2022), rapeseed press cake (Szydłowska-Czerniak et al. 2021). In this study, safflower flour, which remains after oil extraction from safflower seeds and is a raw material for the edible oil industry, was used to make cupcakes. The literature search did not find any study on the use of safflower seed in the production of cupcakes.

Materials and Methods

Materials

Wheat flour ($0.7 < \% \text{ ash} \leq 0.8$) were obtained from Birsan Birlik Gıda San. A.Ş. in Tokat, Turkey, and stored at 4°C. Safflower seed flours were purchased from Hempium Gıda in Amasya, Turkey and stored at 4 °C.

Preparation of cupcake samples

The cupcake recipe produced in the study is shown in Table 1. To prepare the cake samples, egg and sugar are whipped in the mixer (kitchen aid) until it turns into white cream (3 min). Then water and sunflower oil is added, mixed for 3 min and after adding other ingredients, it is mixed for another 1 min to obtain a homogeneous batter. The cake batters were baked at 180°C for 20 min in the oven (Kromlux). Then, the cupcakes were removed from the pan and allowed to cool for 30 min. After cooling, the cakes were packed in sealed bags until analysis.

Table 1. Formulation used in cupcake production

Ingredients	Amount (g)
Flours	100
Sugar	75
Egg	60
Safflower oil	60
Water	40
Skim milk powder	10
Baking powder	3
Salt	0.5
Vanillin	0.06
Safflower Seed Flour	Safflower seed flour was added to the cupcake samples at 5%, 10%, 15%, 20% and 30% according to the principle of substitution of special wheat flour.

Analytical methods

The dry matter and ash content of the flours were determined by the gravimetric method (AOAC, 2000). The total carbohydrate content of the samples was determined by the phenol-sulfuric acid method (Geater and Fehr, 2000). The micro-Kjeldahl (Gerhardt KB8, Königswinter, Germany) method was used to analyze the nitrogen content of the samples (AOAC, 2000) the crude protein contents of the samples were estimated using a conversion factor of 5.75. Total fat were determined with Ankom Fat Analyser (Ankom Technology Corp., Macedon, NY, USA), following the Ankom Technology Method.

Total phenolic substance and antioxidant capacity analysis

The phenolic substance of the sample was extracted by mixing 20 ml of acidified methanol (HCl/methanol/water, 1:80:10) and 1 g of sample, and the mixture was kept in a water bath (Mettler, Germany) at 25 °C for 2 hours. It was then centrifuged at 3000 rpm for 10 minutes. The clear fraction was removed and stored at -18 °C until analysis (Beta et al. 2005). **Determination of total phenolic compounds:** Analysis with 2 N Folin-Ciocalteu phenol reagent was performed according to the method described by Singleton et al. (Singleton et al. 1965). The results were calculated as “gallic acid equivalent” **Determination of antioxidant capacity by the method FRAP:** It was performed according to the method described by Benzie and Strain (Benzie and Strain, 1996), and the results were calculated as “Trolox equivalents”. **DPPH radical scavenging activity:** Antioxidant capacity was determined by the DPPH (2,2 diphenyl-1-picrylhydrazil) method described by Brand-Williams et al. (1995).

Cupcake properties

The volume, symmetry and uniformity index, upper shrinkage value, lower shrinkage value and total volume index of the samples were determined according to AACC Method (10–91). Figure 1 was used to determine the structural properties and the values were calculated using the following equations.

Volume index (mm) = |BB'|+|CC'|+|DD'| Symmetry index (mm) = $2 \times |CC'| - |BB'| - |DD'|$ Uniformity index (mm) = $|BB'| - |DD'|$ Upper shrinkage value (mm) = Upper diameter of the cake pan (65 mm) - Upper diameter of the cake (|A'E'|) Lower shrinkage value (mm) = lower diameter of the cake pan (42 mm) - lower diameter of the cake (|AE|) Total volume index (mm) = |AA'| + |BB'| + |CC'| + |DD'| + |EE'| + |AE| + |A'E'|

Figure 1. Measurement template for structural analysis of cupcakes

Color analysis

Hunter Lab Color Minolta CR-400 (Minolta Camera, Co., Ltd.) device was used to determine the color of the cupcake samples.

Texture profile analysis

The texture measurements of the cupcakes were performed at 0, 24, 48 and 72 hours after the production of cupcakes. The hardness measurements of the cupcakes were determined in Newton/cm² according to Aydın and Ögüt (1991) using a texture analyzer (a round head of 2 cm diameter and at a pressure of 10 mm) (Zwick Z0.5, Germany) at different time intervals. Texture measurements was performed (Vtest: 35 mm/min, Vreturn: 500 mm/min, Vpos1: 500 mm/min, Vpos2: 10 mm/min, Lmax: 10 mm, Fv: 0.1N).

Results and Discussion

Safflower seeds left after oil production were ground into flour. The results of chemical and functional analysis of the obtained safflower seed flours (SSF) are shown in Table 1. SSF is characterised by a high protein (35.27%) and ash (13.12%) content, and also draws attention for its functional components.

Table 2. Chemical and functional properties of safflower seed flour

	Safflower Seed Flour
Moisture (%)	5.14±0.16
Protein (g/100 g of dry weight)	35.27±0.96
Fat (g/100 g of dry weight)	6.12±0.46
T. Carbohydrate (g/100 g of dry weight)	45.49±1.28
Ash (g/100 g of dry weight)	13.12±0.71
Total Phenolic Substance (µg GAE/g)	4762±38.46
Total Antioxidant Activity (DPPH) (µM TE/100g)	68.12±0.88
Total Antioxidant Activity (FRAP) (µM TE/100g)	65.72±0.75

One of the most important criteria in the evaluation of cakes is the assessment of their structural properties. In the production of cakes, the values for volume index and total volume index do not measure the actual volume of the cake, but give an impression of the volume values of the cake. In cake manufacturing, the symmetry index is used to determine the surface appearance of the tops of the cakes. A negative (-) symmetry index value means that the cake is sunken (curved inward), a value close to zero means that the surface of the cake is flat (no curvature), and a positive (+) symmetry index value means that the surface of the cake is curved. The uniformity index is used to determine the lateral symmetry of the cake. It is desirable that the uniformity index of the cakes is zero. The lower shrinkage value of the cakes is used to express the reduction of the diameter of the base of the dough filled into the mould; the upper shrinkage value is used to express the reduction of the upper diameter of the dough (Dizlek et al. 2008).

The structural properties of the cakes with safflower seed flour are shown in Table 3. The symmetry index values of all cupcakes prepared were positive. This means that the superstructures of the cupcakes were curved. It was found that the cake sample with the highest symmetry index value was 15% SSF. The uniformity indices of the samples were close to zero, indicating that the lateral symmetry of the samples was not disturbed. Examination of the shrinkage values on the bottom and top surfaces shows that the addition of safflower seed flour does not reduce the diameter of the bottom and top surfaces of the cupcake.

Table 3. Structural properties of cupcake with safflower seed flour

	Volume Index (mm)	Symmetry Index (mm)	Uniformity Index (mm)	Upper Shrinkage Value (mm)	Lower Shrinkage Value (mm)	Total Volume Index (mm)
Control	119.6±2.2	13.9±0.9	1.1±0.1	2.9±0.7	2.1±0.5	291.0±4.2
% 5 SSF	121.3±3.3	15.9±1.4	1.4±0.2	3.5±0.2	2.5±0.2	289.3±5.1
% 10 SSF	123.7±3.1	16.1±0.9	0.5±0.3	3.3±0.8	2.5±0.6	290.2±3.0
% 15 SSF	126.0±1.8	16.4±1.2	0.2±0.1	2.8±0.6	2.3±0.5	294.7±2.7
% 20 SSF	117.2±4.4	15.1±1.3	1.2±0.2	2.9±1.2	1.8±0.4	286.2±6.3
% 30 SSF	108.7±2.1	12.4±1.2	0.8±0.2	2.0±0.4	1.2±0.2	278.8±5.1

SSF: Safflower Seed Flour

The most important reason consumers prefer a product is its color. The desired and familiar color of a food product is an effective factor in the preference for that product. The color values of the SSF-infused cupcakes are shown in Table 4. The use of SSF in cupcake production resulted in a decrease in the L values of the cupcakes. The more SSF was added, the more the L-value also decreased, and it was found that the product acquired a darker texture. The images of the cupcakes produced can be seen in Figure 2.

Table 4. Color values of cupcakes with safflower seed flour additive

	<i>L</i>	<i>a</i>	<i>b</i>
Control	61.4±1.1	-1.1±0.1	25.2±0.9
% 5 SSF	58.9±0.6	1.2±0.2	23.6±1.2
% 10 SSF	56.1±1.3	2.2±0.3	23.8±1.3
% 15 SSF	53.5±1.2	3.0±0.4	22.0±0.6
% 20 SSF	48.6±0.9	4.1±0.2	20.0±0.8
% 30 SSF	41.4±0.5	4.6±0.4	18.5±0.8

SSF: Safflower Seed Flour

The L values of the samples ranged from 41.4 to 61.4, the a values ranged from -1.1 to 4.6, and the b values ranged from 18.5 to 25.2. The samples were found to be darker and more red-yellow in color due to the addition of SSF.

Figure 2. Pictures of cupcakes made by adding safflower seed flour in various proportions

Just as important as color to a food's preference is the reason that the texture properties of that food meet the desired level. For cupcakes, a soft, non-crumby and spongy texture is desired. It is desirable for companies that the texture properties of the product remain constant and do not deteriorate during the shelf life. The hardness values of the cooled cupcake samples were determined in Nm after 24, 48 and 72 hours. The changes in the hardness values of the SSF-added cupcakes with time are shown in Figure 3. They were found to vary between 4.86-6.19 Nm for the control sample, 5.26-5.53 Nm at 5% SSF, 4.66-5.08 Nm at 10% SSF, 4.66-5.13 Nm at 15% SSF, 4.54-5.39 Nm at 20% SSF, and 4.89-5.57 Nm at 30% SSF.

Figure 3. Texture analysis of cupcake with safflower seed flour

Conclusion

Various cereals, psedocereals, and alternative wastes are added to foods to increase food functionality, enhance consumer appreciation, and provide a more functional product. During the literature search, no study was found that tested safflower seed flour in the production of cakes. This study shows that up to 15% safflower flour can be used in the production of cupcakes. Safflower flour, which improves the structural properties of cupcakes due to its high protein content, also increases the functionality of the product thanks to its high content of functional compounds. This study has shown that safflower seed flour can be used to improve the functional and nutritional content of cakes without compromising their structural properties. It also provides preliminary information for future studies.

Dietary Influence Of Monosodium Glutamate On Serum Electrolytes And Antioxidant Status Of Laying Hens

Olumuyiwa Joseph Olarotimi

Department of Animal Science, Adekunle Ajasin University, Akungba Akokmo, Nigeria

Abstract

This study assessed the serum electrolytes and antioxidant status of laying hens fed different inclusion levels of dietary monosodium glutamate. A total of 300 16-week old Isa Brown point-of-lay pullets were randomly allotted to six experimental diets containing 0.00, 0.25, 0.50, 0.75, 1.00, and 1.25 g/kg MSG respectively in an experiment that lasted twelve weeks. The experimental birds were fed *ad-libitum* with clean water provided regularly throughout the period. At end of the twelfth week, five birds per replicate were randomly isolated from feeding overnight for blood collection through the wing veins. Serum electrolytes {sodium (Na^+), potassium (K^+) and chloride (Cl^-)} and antioxidant enzymes {total antioxidant capacity (T-OAC), superoxide dismutase (SOD), and glutathione peroxidase (GSH-Px)} activities as well as oxidative status indicator {malondialdehyde (MDA)} were determined using standard procedures. Data collected were subjected to analysis of variance at $\alpha = 0.05$. The results showed that MSG inclusion at 1.00 and 1.25 g/kg diet significantly ($P < 0.05$) increased the serum Na^+ concentrations of the pullets while the serum K^+ was reduced ($P < 0.05$) at 1.25 g/kg diet when compared with birds on the control diet, whereas, the serum Cl^- concentration significantly ($P < 0.05$) decreased from 0.50 g MSG/kg diet inclusion level. On the other hand, MSG inclusion level at 0.75 g/kg diet and above increased the MDA concentration while serum SOD, GSH-Px and T-AOC concentrations significantly ($P < 0.05$) reduced respectively at this inclusion level. Therefore, inclusion of MSG above 0.50 g/kg diet could adversely predispose laying hens to oxidative stress and other physiological imbalance.

The Efficiency of Different Methods in Acceptance Queen Bees to Queenless Colonies

Mustafa Güneşdoğdu¹, Ahmet Şekeroğlu²

¹Department of Animal Science and Technologies, Faculty of Applied Sciences, Muş Alparslan University, Muş, Turkey

²Department of Animal Science and Technologies, Faculty of Agriculture Science and Technologies, Niğde Ömer Halisdemir University, Niğde, Turkey

Abstract

In honey bee colonies, queen bees are responsible for brood production and the management of worker bees' activities. It is known that the young and healthy queen bee is very important in terms of yield. The problem of the colonies not accepting the queen is quite common in the regeneration of the queen bee by beekeepers. In this study, the effectiveness of mated queen bees to enter the colonies with different methods was investigated. Artificial swarms were obtained with two framed bee-covered and sealed broods, and mated queens were given at the same time. Acceptance efficiency of queen bees, without any application outside the cage, honey, drone larvae, mixture of honey and drone larvae and lemongrass (*Cymbopogon flexuosus*) oil application, respectively; It was determined as 70%, 70%, 100%, 100% and 90%.

Key Words: Queen Bee, Acceptance, Cage, Artificial Swarm, Renewal

Anasız Kolonilere Ana Arı Kabulünde Farklı Yöntemlerin Etkinliği

Özet

Bal arısı kolonilerinde yavru üretimi ve işçi arıların aktivitelerinin yönetiminden kraliçe arılar sorumludur. Ana arının genç ve sağlıklı olması verim açısından oldukça önemli olduğu bilinmektedir. Arıcılar tarafından ana arının yenilenmesinde kolonilerin ana arıyı kabul etmemesi sorunu oldukça yaygındır. Bu çalışmada, çiftleşmiş ana arıların farklı yöntemler ile kolonilere kabul etkinliği araştırılmıştır. Yapay oğullar iki çerçeve arı kaplı ve kapalı yavruya sahip olarak elde edilmiş ve aynı anda çiftleşmiş kraliçe arılar verilmiştir. Tüm kraliçe arılar, kafes içerisinde hiçbir işçi arı olmadan kolonilere verilmiştir. Kraliçe arıların kabul etkinliği, kafes dışına hiçbir uygulama yapılmadan, bal, ezilmiş erkek arı larva sıvısı, bal ve erkek arı larvası karışımı ve limon otu (*Cymbopogon flexuosus*) yağı sürme uygulamalarında sırasıyla; %70, %70, %100, %100 ve %90 olarak belirlenmiştir.

Anahtar Kelimeler: Kraliçe Arı, Kabul, Kafes, Yapay Oğul, Yenileme

Giriş

Türkiye, arıcılık açısından gerek coğrafi yapısı gerekse çok farklı genotipte bal arılarına sahip olması nedeniyle önemli bir konuma sahiptir (Güneşdoğdu ve Şekeroğlu, 2020). Arı yetiştiriciliğinde, arıcıların bilinçsiz olması, kalitesiz ana kullanımı, zirai ilaçlama ve diğer faktörlerden kaynaklı arı ölümleri ve hastalıklar ve sağlık korumadaki yetersizliklerden dolayı, koloni başına ortalama bal verimi oldukça düşüktür. Oysa Türkiye'nin coğrafi yapısı, ekolojisi ve bitki potansiyeli koloni başına verimi 2-3 katına çıkarma potansiyeline sahiptir (Güneşdoğdu ve Akyol, 2019). Anatomik, fizyolojik, davranışsal ve kolonideki işlevleri nedeniyle kraliçe arı kolonideki en önemli bireydir (Lee ve ark., 2019). Sağlıklı ve kaliteli bal arısı kraliçesi kolonide tek yumurta üreten dişi arıdır. Çoğunlukla yumurta üretimi ve koloninin devamlılığı ile ilişkilendirilse de, arı ürünleri üretimi, hastalıklara karşı direnç ve kışlama yeteneği üzerinde hayati öneme sahiptir (Winston, 1991). Bu nedenle, etkin ve verimli bir arı yetiştiriciliği açısından yüksek kaliteli ana arıları korumak ve üretmek önemlidir (Güneşdoğdu ve Şekeroğlu, 2020). Teknik arıcılıkta, doğal oğul ve ana arı yüksükleri ile koloni çoğaltımı veya ana arı yenileme önerilmemektedir. İstenilen özellik bakımından arı kolonilerinin geliştirilmesi kaliteli ana arı üretimi ile mümkün olmaktadır. Gerek sabit arıcılıkta gerekse göçer arıcılık sisteminde ana arıların yılda bir kez genç ana arı ile değişmesi gerekmektedir (Laidlaw ve Page, 1997).

Ana arının kaliteli bir şekilde yetiştirmenin önemi kadar çiftleşmiş olarak bu ana arıların yeni kolonilere kabulü oldukça önem arz etmektedir. Bu çalışmada, farklı yöntemlerin yeni kolonilere çiftleşmiş genç anarı kabulünü belirlemek üzere yürütülmüştür.

2. Materyal ve Metod

2.1. Materyal

2.1.1 Çalışma Sahası

Çalışma, Türkiye'nin Muş (38°46'10"N 41°25'38"E) ilinde Haziran ayı içerisinde yürütülmüştür. Muş, denize uzak ve rakımın (1308 m) değişken olmasından dolayı sert karasal iklime sahip bir ildir (Anonim, 2022).

2.1.2. Arı Materyali

Çalışmada, ırkı bilinmeyen arılı kolonilerden yaklaşık olarak kapalı yavru alanı ve ergin arı popülasyonu eşit olan 2 çerçeveli yapay oğul olarak oluşturulan arılı koloniler kullanılmıştır. Ana arıları Kafkas arısı (*Apis mellifera caucasica*) Posof ekotipi damızlık materyalden üretilen kız kardeşler kullanılmıştır.

2.2. Metod

2.2.1 Ana Arıların Yetiştirilmesi

Ana arılar, saf Kafkas ırkı damızlık koloniden aynı tarihte yetiştirilmiştir. Ana arı yetiştirmede larva transfer (doolittle) metodu kullanılmıştır (Doolittle, 1915). Yetiştirilen ana arılar çiftleştirme kutularında yaklaşık bir ay yumurtladıktan sonra deneme kolonilerine verilmiştir.

2.2.2 Çiftleşmiş Ana Arıların Kolonilere Verilmesi

Ana arılar, kolonilere verilmek üzere altıgen ana arı kafeslerine yanına hiçbir işçi arı konulmadan toplanmış ve yapay (bölme) oğul kolonileri aynı anda iki çerçeve arı kaplı olarak analı kolonilerden alınarak kafesli ana arılar verilmiştir. Ana arı kafesi dışına bal, ezilmiş erkek arı larvası sıvısı, bal ve ezilmiş erkek arı larvası sıvısı karışımı, limon otu (*Cymbopogon flexuosus*) yağı ve hiçbir uygulama yapılmayan kafesler olarak 5 muamele grubu ve her grupta 10'ar adet olacak şekilde 50 adet kolonide yürütülmüştür. Uygulamada her hangibir ölçü (ml, gr vb.) kullanılmamış ve yalnızca altıgen ana arı kafeslerinin her yüzeyine parmak yardımıyla sıvılar sürülmüştür.

İstatistik Analiz

Verilerin analizinde "Microsoft Excel" programında yüzde (%) hesaplamaları kullanılmıştır.

3. Bulgular ve Tartışma

3.1. Ana Arı Kabul Oranları

Yürütülen çalışmada, Haziran ayında farklı muamele yöntemi ile yapay (bölme) oğul kolonilerine verilen ana arıların kabul oranına ait veriler Çizelge 3.1'de verilmiştir.

Çizelge 3.1 Muamel Gruplarında Ana Arıların Kabul Oranları (%)

		Muamele	n	Kabul Adedi	Kabul Oranı(%)
25.06.2022	Konum 38°46'10"N 41°25'38"E	Yalnız Ana Arı	10	7	%70
		Bal	10	7	%70
		Erkek Arı Larvası Sıvısı	10	10	%100
		Bal*Erkek Arı Larvası Sıvısı	10	10	%100
		Limon Otu Yağı	10	9	%90
		Toplam	50	43	%86

Kolonilerin ana arıları kabul oranında ortalama %86 başarı sağlanmıştır. Erkek arı larvaları ezilerek elde edilen sıvının sadece yada bal ile karışım olarak ana arı kafesi dışına uygulanması hiçbir ana kaybı olmadan %100 kabul oranı ile sonuç bulmuştur. Ruttner (1983), kolonilerin ana arı kabulünü ana arı özelliği (yaş, feromon, ağırlık), koloni özellikleri (popülasyon, hırçınlık) ve çevre özellikleri (nektar akımı, mevsim) olmak üzere 3 grupta değişim gösterdiğini bildirmiştir. Yapılan çalışmalar genellikle kafes yapısı veya ana arı yaşı ile ilgili kabul üzerine çalışmalardır. Guzman-Novaa ve ark. (1998), alıştırma kafeslerinde kabul oranını %80 olarak bildirmiştir. DeGrandi-Hoffman ve ark. (2007), yaptıkları çalışmada, ana arı yenileme sürecinde ana arılardan en fazla E-B-ocimene bileşiği tespit edildiğini ve sonbaharda kabul oranının yüksek olduğunu bildirmişlerdir. Perez-Sato ve ark. (2008), bakır ve çiftleşmiş ana arı kabulünde duman uygulamasının kabul oranını sırasıyla %31 ve %100 olarak bildirmişlerdir. Masry ve ark. (2015), farklı ağırlıktaki ana arıları sınıflandırmış ve ağır olarak belirlediği sınıfın kabul oranının %79.23 olarak tespit etmiştir.

4. Sonuç

Arıcılıkta, ana arının gençleştirilmesi işlemi verim açısından oldukça önem arz etmektedir. Ana arı gençleştirmede ana arının kabul edilmemesi hem zaman hem de ekonomik kayıplara sebep olmaktadır. Çalışma sonucuna göre, ezilmiş erkek arı larvası sıvısı ana arı kabulünde yüksek başarı sağladığı sonucuna varılmıştır. Erkek arı larvasında bulunun bir bileşenden kaynaklandığı düşünülmektedir. Bu konu üzerinde daha fazla çalışmalara gereksinim duyulmaktadır.

A Study on The Response of Triticale to Different Doses of Foliar Epibrassinolide Application

Aykut Şener¹, Sedat Kıcı¹, Muharrem Kaya¹

¹Department of Field Crops, Faculty of Agriculture, Isparta University of Applied Sciences, Isparta, Turkey

Abstract

This study was established to determine the effect of different Epibrassinolide (EBR) doses on yield and yield components of triticale. Experiments were carried out in a randomized block design with 3 replications in the vegetation period of 2021-2022. Different doses of EBR (Control, 0.5, 1.0 and 1.5 μM) were applied to the triticale leaves in the tillering period. Plant height, spike length, number of kernel per spike, kernel weight per spike, grain yield, biological yield and harvest index properties of triticale were investigated. Plant height was 76.40-80.00 cm, ear length 6.40-7.00 cm, number of grains per spike 22.80-26.27, grain weight per spike 0.763-0.973 g, grain yield 176.7-203.8 kg da⁻¹, biological yield 690.8-759.3 kg da⁻¹, harvest index varied between 25.08-28.45%. According to the research results; It was determined that foliar EBR application had positive effects on yield and yield components of triticale.

Key Words: *Triticale, Epibrassinolide, Foliar Application, Yield*

Farklı Dozlarda Yapraktan Epibrassinolide Uygulamasına Tritikalenin Tepkisi Üzerine Bir Araştırma

Özet

Bu çalışma farklı Epibrassinolide (EBR) dozlarının tritikalenin verim ve verim öğeleri üzerine etkisini belirlemek amacıyla kurulmuştur. Denemeler 2021-2022 vejetasyon döneminde tesadüf blokları deneme desenine göre 3 tekerrürlü olarak yürütülmüştür. Kardeşlenme dönemindeki tritikale bitkisinin yapraklarına farklı dozlarda (Kontrol, 0.5, 1.0 ve 1.5 μM) EBR uygulanmıştır. Tritikalenin bitki boyu, başak uzunluğu, başakta tane sayısı, başakta tane ağırlığı, tane verimi, biyolojik verim ve hasat indeksi özellikleri incelenmiştir. Başak uzunluğu, başakta tane sayısı, başakta tane ağırlığı, tane verimi, biyolojik verim ve hasat indeksi özelliklerinde EBR dozları arasındaki farklılıklar istatistiksel olarak önemli bulunmuştur. Farklı dozlarda EBR uygulanan tritikalenin bitki boyu 76.40-80.00 cm, başak uzunluğu 6.40-7.00 cm, başakta tane sayısı 22.80-26.27, başakta tane ağırlığı 0.763-0.973 g, tane verimi 176.7-203.8 kg da⁻¹, biyolojik verim 690.8-759.3 kg da⁻¹, hasat indeksi %25.08-28.45 arasında değişim göstermiştir. Araştırma sonuçlarına göre; yapraktan EBR uygulamasının tritikalenin verim ve verim öğeleri üzerine olumlu etkiler gösterdiği belirlenmiştir.

Anahtar Kelimeler: *Tritikale, Epibrassinolide, Yaprak Uygulaması, Verim*

Determination of Quality Characteristics of Local Bean Lines Selected by Selection Breeding Method

Aykut Şener¹

¹Department of Field Crops, Faculty of Agriculture, Isparta University of Applied Sciences, Isparta, Turkey

Abstract

This research was conducted to determine the quality characteristics of different bean genotypes. In the study, ISP5, ISP13, ISP18, ISP19, ISP21, ISP22, ISP23, ISP31, ISP32, ISP34, ISP35, BUR14, BUR20, BUR21, ESK3, KON5, MAN1, DEN2, KON16, KON17, ISP72, ISP98 lines, Göynük98 and Önceler98 cultivars were used. Hundred-grain weight, thousand-grain volume, water uptake capacity, water uptake index, swelling capacity, swelling index, grain density, seed coat rate and oil rate properties were investigated. As a result of the study, it was determined that ISP21, ISP18, ISP31, ISP32, KON5, ISP5 and ISP22 in hundred-grain weight, ISP31, ISP21, ISP18 ve ISP5 in thousand-grain volume, ISP31, KON5, ISP22, ISP21, ISP32 and ISP19 in water uptake capacity, DEN2, ESK3, ISP98, ISP22 and ISP35 in water uptake index, KON5 in swelling capacity, DEN2, ISP98 and ISP34 in swelling index, ISP98 in grain density, ISP23 in seed coat rate and ISP34 in oil rate were superior. Result of the correlation analysis; It was determined that thousand-grain volume, water uptake capacity and swelling capacity have a significant positive relationship with hundred-grain weight. There was a significant positive relationship between water uptake capacity and swelling capacity, negative significant relationship with uptake capacity and seed coat rate. Water uptake index have a significant positive relationship with swelling index, grain density and seat coat rate. Also It was determined that there was a negative significant relationship between the seed coat rate and the oil rate.

Seleksiyon Islahı Yöntemiyle Seçilmiş Yerel Fasulye Hatlarının Kalite Özelliklerinin Belirlenmesi

Özet

Bu araştırma, farklı fasulye genotiplerinin kalite özelliklerini belirlemek amacıyla kurulmuştur. Çalışmada ISP5, ISP13, ISP18, ISP19, ISP21, ISP22, ISP23, ISP31, ISP32, ISP34, ISP35, BUR14, BUR20, BUR21, ESK3, KON5, MAN1, DEN2, KON16, KON17, ISP72, ISP98 hatları, Göynük98 ve Önceler98 çeşitlerinin yüz tane ağırlığı, bin tane hacmi, su alma kapasitesi, su alma indeksi, şişme kapasitesi, şişme indeksi, tane yoğunluğu, tohum kabuğu oranı ve yağ oranı özellikleri incelenmiştir. Çalışma sonucunda, yüz tane ağırlığı bakımından ISP21, ISP18, ISP31, ISP32, KON5, ISP5 ve ISP22, bin tane hacmi bakımından ISP31, ISP21, ISP18 ve ISP5, su alma kapasitesi bakımından ISP31, KON5, ISP22, ISP21, ISP32 ve ISP19, su alma indeksi bakımından DEN2, ESK3, ISP98, ISP22ve ISP35, şişme kapasitesi bakımından KON5, şişme indeksi bakımından DEN2, ISP98 ve ISP34, tane yoğunluğu bakımından ISP98, tohum kabuğu oranı bakımından ISP23 ve yağ oranı bakımından ISP34 hatlarının üstün olduğu belirlenmiştir. Korelasyon analizi sonucunda; yüz tane ağırlığı ile bin tane hacmi, su alma kapasitesi ve şişme kapasitesi arasında pozitif önemli, su alma kapasitesi ile şişme kapasitesi arasında pozitif önemli, su alma kapasitesi ile tohum kabuğu oranı arasında negatif önemli, su alma indeksi ile şişme indeksi, tane yoğunluğu ve tohum kabuğu oranı arasında pozitif önemli, tohum kabuğu oranı ile yağ oranı arasında ise negatif önemli ilişki olduğu belirlenmiştir.

Effects of Foliar Plant Growth Regulator Applications on Fruit and Essential Oil Yield of Fennel (*Foeniculum vulgare* Mill)

Arif Şanlı, Fatma Zehra Ok

Department of Field Crops, Faculty of Agriculture, Isparta University of Applied Science, 32200, Isparta, Turkey

Abstract

This study was carried out in order to determine the effects of foliar applications of Gibberellic acid (GA₃), Methyl Jasmonate (MJ), Salicylic acid (SA), Absciscic Acid (ABA) and 2,4-D on some yield characteristics and fruit and essential oil yield of fennel (*Foeniculum vulgare* Mill). Different concentrations of GA₃ (50, 100 and 150 ppm), MJ (0.1, 0.5 and 1.0 mM), SA (1 and 5 mM), ABA (50 and 100 µL) and 2,4-D (0.15% and 0.30%) were pulverized to the plant leaves by spraying at the beginning of the flowering period. Depending on the growth regulator applications, the biological yield varied between 401-682 g/plant, fruit yield between 62-145 kg/da, harvest index between 15.6-22.3%, thousand-grain weight between 6.27-10.40 g, essential oil content between 1.83-2.19% and essential oil yield between 1.32-2.80 L/da. The effects of phytohormone applications on plant growth and essential oil content differed according to the application dose. Growth-promoting phytohormones generally affected the parameters examined in the research positively, and although ABA and 2,4-D applications increased the essential oil ratio, they showed a decreasing effect on fruit yield. In the study, it was concluded that 100 ppm GA₃, 0.5 mM MJ and 5 mM salicylic acid applications could increase the fruit and essential oil yield of fennel.

Keywords: Fennel, plant growth regulators, fruit yield, essential oil content

Yapraktan Uygulanan Bazı Büyüme Düzenleyicilerinin Rezene (*Foeniculum vulgare* Mill)'de Meyve ve Uçucu Yağ Verimine Etkileri

Özet

Bu çalışma, yapraktan yapılan fitohormon (Giberelik asit (GA₃), Metil Jasmonat (MJ), Salisilik asit (SA), Absisik Asit (ABA) ve 2,4-D) uygulamalarının rezene (*Foeniculum vulgare* Mill) bitkisinde bazı verim özellikleri ile meyve ve uçucu yağ verimine etkilerinin belirlenmesi amacıyla yürütülmüştür. Çalışmada farklı konsantrasyonlarda GA₃ (50, 100 ve 150 ppm), MJ (0.1, 0.5 ve 1.0 mM), SA (1 ve 5 mM), ABA (50 ve 100 µL) ve 2,4-D (% 0.15 ve % 0.30) çiçeklenme dönemi başında bitki yapraklarına püskürtme şeklinde uygulanmıştır. Büyüme düzenleyicisi uygulamalarına bağlı olarak biyolojik verim 401-682 g/bitki, meyve verimi 62-145 kg/da, hasat indeksi % 15.6-22.3, bin dane ağırlığı 6.27-10.40 g, uçucu yağ oranı % 1.83-2.19 ve uçucu yağ verimi 1.32-2.80 L/da arasında değişim göstermiştir. Fitohormon uygulamalarının bitki gelişimi ve uçucu yağ içeriğine etkileri uygulama dozlarına göre farklılık göstermiştir. Büyümeyi teşvik edici fitohormonların araştırmada incelenen parametreleri genellikle olumlu yönde etkilemiş, ABA ve 2,4-D uygulamalarının ise uçucu yağ oranını arttırmalarına rağmen, meyve verimini azaltıcı etki göstermiştir. Çalışmada, 100 ppm GA₃, 0.5 mM MJ ve 5 mM salisilik asit uygulamaları ile rezene meyve ve uçucu yağ veriminin artırılabilceği sonucuna varılmıştır.

Anahtar Kelimeler: Rezene, bitki büyüme düzenleyicisi, meyve verimi, uçucu yağ oranı

Giriş

Apiaceae familyasına dâhil olan rezene (*Foeniculum vulgare*) doğal olarak Akdeniz iklim kuşağının bitkisi olup, Dünyada en çok Avrupa ülkeleri, Hindistan, Çin, Mısır, Arjantin, Türkiye, Pakistan ve Endonezya'da (Gedik et al., 2019), ülkemizde ise yoğun olarak Burdur, Konya ve Antalya'da yetiştirilmektedir (Anonim, 2021). Rezene gıda sektöründe ekmek, balık, et, turşu, makarna ve salatalarda, kök ve tohumlarından elde edilen sıvı ekstratlar şekerli ürünler, alkolsüz içecekler ve sirkelerde (Arabacı and Bayram, 2005), yapısında bulunan galactagogue sayesinde anne sütü salgılanmasını arttırmada, uyarıcı ve rahatlatıcı etkisiyle sindirim sistemi rahatsızlıklarında kullanılmaktadır. Ayrıca rezene tohumlarının uçucu yağı antibakteriyel, antifungal ve antioksidan özelliklerinden dolayı tıpta antiseptik olarak kullanılmaktadır (Bayaz, 2014).

Abiyotik ve biyotik faktörlerin yanı sıra ontogenetik, diurnal ve morfojenetik varyabiliter, kültürel uygulamalar ve coğrafik yapı uçucu yağ sentez ve üretimini etkileyen en önemli faktörlerin başında yer almaktadır (Gobbo-Neto and Lopes 2007). Doğal ve sentetik büyüme düzenleyicileri bitkilerin çimlenmesinden hasadına kadar biyokimyasal, fizyolojik ve morfolojik değişimleri etkileyen ve kontrol eden maddelerdir (Basra, 2000). Bitki büyüme düzenleyicilerinin birçok aromatik bitki türünde büyüme, uçucu yağ sentezi, uçucu yağ salgı yapıları ve sentezi ve uçucu yağ verimi ve bileşimi üzerine önemli derecede etki gösterdiği bilinmektedir (Prins et al., 2010; Sharafzadeh and Zare, 2011; Feizbakhsh et al., 2016). Büyüme düzenleyicilerden Metil jasmonat (MJ), kök büyümesi, çiçeklenme, olgunlaşma, yaşlanma, fotosentez, patojenlere ve böcek saldırısına karşı savunma tepkisi gibi fizyolojik süreçlerde önemli rol oynayan (Kim et al., 2009; Warabieda et al., 2010) ve bitkilerin ekolojik şartlara adaptasyonundan sorumlu birçok sekonder metabolitin biyosentezini teşvik eden hücresel

düzenleyicilerdir. Giberellinler (GA), bitki boyu ve kök uzaması, tohum çimlenmesi, çiçeklenme, meyve tutumu ve meyve gelişimini düzenleyen ve tarımsal üretimde yaygın olarak kullanılan diterpenlerdir (Spartz and Gray 2008). Salisilik asit (SA), bitkilerde özellikle stres şartlarında birçok metabolik ve fizyolojik reaksiyonu düzenleyen ve dolayısıyla bitki büyüme ve gelişmesini etkileyen (Hayat et al., 2010) ve özellikle patojen saldırılarına karşı bitkilerin savunma mekanizmalarında ve sistemik kazanılmış dirençte önemli rol oynayan (Alvarez, 2000) bitki büyüme düzenleyicisidir. Bitkilerde sentezlenen önemli bir büyüme inhibitörü olan ABA, stres anında miktarı artarak stomaların kapanmasına neden olmakta, protein sentezini yavaşlatmakta, generatif döneme geçişi hızlandırarak tohum olgunluğunu teşvik etmekte ve dormansinin oluşması ve sürdürülmesinde etkili olmaktadır. Oksinlerin fenoksi asetik asit türevi grubunda yer alan 2,4-D, günümüzde tarım alanlarındaki yabancı otların kontrolünde yaygın olarak kullanılmakta olup, bitkilerde besin maddelerinin absorpsiyonu ve floemden taşınımını engellemek suretiyle fotosentez de dahil olmak üzere birçok metabolik süreç üzerine önemli etki göstermektedir (Kaynak and Ersoy, 1997).

Fitohormonlar günümüzde bitki gelişimi, büyüme, çiçeklenme ve meyve tutumunu teşvik ederek verim ve kaliteyi arttırmaya gibi birçok kullanım alanına sahip olup, kullanımları her geçen gün yaygınlaşmaktadır. Fitohormonların rezene bitkisinde meyve verimi ve uçucu yağ sentezi üzerine etkileri konusunda yapılan çalışma sayısı oldukça sınırlıdır. Bu çalışmada, rezene bitkisinde GA₃, MJ, SA, ABA ve 2,4-D uygulamalarının meyve verimi ve verimi etkileyen özellikler ile uçucu yağ oranı ve verimine etkilerinin belirlenmesi amaçlanmıştır.

Materyal ve Yöntem

Çalışma, 2019 yılında Isparta Uygulamalı Bilimler Üniversitesi Ziraat Fakültesi Eğitim, Araştırma ve Uygulama Çiftliği deneme alanlarında yürütülmüştür. Çalışmada Burdur ilinde 2017 yılı üretim sezonunda üretimi yapılan ve rezene (*Foeniculum vulgare* Mill) tohumları ile Sigma-Aldrich firmasından temin edilen GA₃, Metil Jasmonat, Salisilik asit, Absisik Asit ve 2,4-D materyal olarak kullanılmıştır. Denemenin yürütüldüğü arazinin toprak özellikleri; tınlı, kation değişim kapasitesi %30, tuz içeriği % 0.023, organik madde % 1.0, alınabilir fosfor miktarı 19.3 mg/kg, potasyum miktarı 183 g/da KO₂, azot içeriği % 0.37, kireç oranı ise % 23'tür. Çalışmanın yürütüldüğü Isparta ilinin bazı iklim verileri Tablo 1'de verilmiştir.

Tablo 1. Isparta ilinin uzun yıllar ve 2019 yılına ait bazı iklim verileri

Aylar	Yağış (mm)		Sıcaklık (°C)		Nem (%)	
	1950-2018	2019	1950-2018	2019	1950-2018	2019

Meteoroloji Genel Müdürlüğü

Çalışma Tesadüf Blokları Deneme deseninde 3 tekerrürlü olarak kurulmuştur. Rezene tohumları Mart ayının son haftasında 30 x 5 cm ekim normunda her bir parselde 7 sıra (parsel alanı 12.6 m² (2.1 m x 6 m)) olacak şekilde el ile ekilmiştir. Çalışmada farklı konsantrasyonlarda GA₃ (50, 100 ve 150 ppm), Metil Jasmonat (0.1, 0.5 ve 1.0 mM), Salisilik asit (1 ve 5 mM), Absisik asit (50 ve 100 µM) ve 2,4-D (% 0.15 ve % 0.30) ve kontrol (saf su) olmak üzere her blokta 13, toplamda ise 39 parsel oluşturulmuştur. Ekim ile birlikte dekara 6 kg/da saf azot ve 6 kg/da saf fosfor, çiçeklenme döneminde ise 4 kg/da saf azot olacak şekilde gübreleme yapılmıştır. Fitohormon uygulamaları çiçeklenme dönemi başında motorlu sırt pülverizatörü ile (40 L/da normunda) bitki üst aksamına püskürtme şeklinde yapılmıştır. İklim koşullarına bağlı olarak çıkışlardan sonra ve çiçeklenmeden önce olmak üzere iki kez yağmurlama sulama yapılmıştır. Gerek duyulduğu dönemlerde el ile yabancı ot mücadelesi yapılmıştır.

Çalışma sonunda parsel hasadı, bitkilerin hasat olgunlukları dikkate alınarak, ana çiçek dallarındaki meyvelerin kahverengileşmeye başladığı dönemde her parsel ayrı ayrı yapılmıştır. Her parselde kenar sıralar ile parsel baş ve sonlarından 1'er metre kenar tesiri olarak ayrıldıktan sonra geriye kalan alan hasat alanı olarak değerlendirilmiştir. Hasat alanındaki tüm bitkiler biçilerek tarlada kurtulduktan sonra meyveler temizlenmiş ve meyve verimleri hesaplanmıştır. Rezene meyvelerinin uçucu yağ oranları Clevenger tipi hidro-distilasyon cihazında belirlenmiştir. Her bir tekerrürde 100'er g meyve örneği öğütüldükten sonra balon içerisine konulmuş ve 1/3 oranında su eklenerek 3 saat süre ile damıtma yapılmıştır. Damıtma sonunda uçucu yağların miktarı ml olarak ölçülmüş ve % olarak oranları (v/w) hesaplanmıştır (Marotti and Piccaglia 1992).

Araştırmadan elde edilen veriler SAS (2009) istatistik paket programında GLM prosedürü kullanılarak standart varyans analiz tekniğinde (ANOVA) analiz edilmiş ve ortalamalar arasındaki farklılıklar LSD testine göre belirlenmiştir.

Bulgular

Fitohormon uygulamalarının biyolojik verim üzerine etkileri istatistiki olarak önemli ($P<0.01$) bulunmuş, uygulamalara bağlı olarak biyolojik verim 401-682 g/bitki arasında değişim göstermiştir. Kontrol ile karşılaştırıldığında 0.1 ve 0.5 mM MJ, 100 ve 150 ppm GA₃ ve 5 mM SA uygulamaları biyolojik verimi önemli derecede arttırırken, 100 µM ABA ile her iki dozda da yapılan 2,4-D uygulamaları biyolojik verimin önemli derecede azalmasına neden olmuştur (Tablo 2). Fitohormon uygulamaları ile meyve veriminde önemli değişiklikler meydana gelmiş, bu değişiklikler istatistiki anlamda önemli ($P<0.01$) bulunmuştur. Yapılan farklı uygulamalara bağlı olarak meyve verim 62-145 kg/da arasında geniş bir varyasyon göstermiştir. Çalışmada 0.5 mM MJ uygulamaları (145 kg/da) kontrole göre (118 kg/da) meyve verimini önemli derecede arttırmış, 0.1 mM MJ, 50 ve 100 ppm GA₃ ve SA uygulamaları meyve verimini arttırmakla birlikte bu artış istatistiki olarak önemli olmamıştır. Diğer taraftan, yüksek dozlarda yapılan ABA (78 kg/da) ve 2,4-D (62 kg/da) uygulamaları meyve veriminin önemli derecede azalmasına neden olmuştur (Tablo 2). Fitohormon uygulamalarına bağlı olarak hasat indeksi değerleri % 15.6 - 22.3 arasında değişim göstermiş, bu değişim istatistiki açıdan önemli ($P<0.05$) bulunmuştur. Kontrol ile karşılaştırıldığında % 0.30 2,4-D (% 15.6), 100 µM ABA (% 15.8) ve 150 ppm GA₃ (%16.4) uygulamaları kontrole göre (% 21.3) hasat indeksinin azalmasına neden olurken, diğer uygulamalarda hasat indeksi değerleri kontrol ile benzer olarak bulunmuştur (Tablo 2).

Tablo 2. Fitohormon uygulamalarının rezenede bazı verim parametreleri ve uçucu yağ oranı üzerine etkileri

Uygulamalar	Biyolojik Verim (kg/da)	Meyve Verimi (kg/da)	Hasat İndeksi (%)	Bin tane ağırlığı (gr)	Uçucu Yağ Oranı (%)	Uçucu Yağ Verimi (L/da)
GA ₃	50 ppm	613bd	136ab	22.3a	9.50be	1.91bc
	100 ppm	666ab	140ab	21.1a	8.93e	1.88c

Fitohormon uygulamalarının bin tane ağırlığı üzerine etkileri istatistiki olarak önemli ($p<0.01$) olmuş, uygulamalara bağlı olarak meyvelerin bin tane ağırlıkları 6.27-10.40 gr arasında değişim göstermiştir. En yüksek bin tane ağırlığı 150 ppm GA₃ (10.40 g) 1 mM MJ (9.90 g), 1 ve 5 mM SA (9.77-9.97 g) ve % 0.15 2.4 D (10.30 g) uygulamalarından elde edilmiştir. Büyüme inhibitörü olan ABA uygulamaları (6.27-7.50 g) bin tane ağırlığını kontrole göre (9.30 g) önemli derecede düşürmüştür (Tablo 2). Rezene meyvelerinde uçucu yağ oranı fitohormon uygulamalarına bağlı olarak % 1.83 - 2.19 arasında değişmiş, bu değişim istatistiki açıdan önemli ($P<0.01$) bulunmuştur. Kontrolde % 1.86 olarak belirlenen meyve uçucu yağ oranı 1 mM MJ (% 2.19), 50 ve 100 µM ABA (sırası ile % 2.07 ve % 2.18) ve % 0.30 2.4 D (% 2.18) uygulamaları ile önemli derecede artmış, diğer uygulamalarda uçucu yağ oranları kontrol ile benzer olmuştur. Uygulamaların uçucu yağ verimi üzerine etkileri de istatistiki olarak önemli ($P<0.01$) olmuş, uygulamalara bağlı olarak uçucu yağ verimleri 1.32 - 2.80 L/da arasında değişim göstermiştir. Meyve uçucu yağ verimleri 100 ppm GA₃ (2.71 L/da), 0.5 mM MJ (2.72 L/da) ve 5 mM SA (2.80 L/da) uygulamaları ile kontrole (2.21 L/da) göre önemli derecede artarken, yüksek dozlarda yapılan ABA (1.69 L/da) ve 2,4-D (1.32 L/da) uygulamaları uçucu yağ veriminin azalmasına neden olmuştur (Tablo 2).

Tartışma ve Sonuç

Çalışmada, fitohormon uygulamalarının rezene bitkisinde verim ve verimi etkileyen bazı parametreler ile uçucu yağ oran ve verimi üzerine etkileri önemli bulunmuştur. Rezene meyve veriminde MJ uygulamaları ile % 22.9, GA₃ uygulamaları ile % 18.6 ve SA uygulamaları ile ise % 15.2'ye varan artış sağlanmıştır. GA₃, SA ve MJ gibi bitki gelişimini teşvik edici özellikte olan fitohormonların bitkilerde özellikle fotosentez, çiçeklenme ve meyve bağlamayı teşvik ederek meyve verimini ve biyolojik verimi arttırdığı düşünülmektedir. Salisilik asit ve jasmonatların patojen veya böcek saldırısı, mekanik yaralanma veya kuraklık, tuzluluk, düşük sıcaklık vb. gibi

abiyotik ve biyotik streslere karşı bitki savunma tepkilerini indükledikleri (Moreira et al., 2012; Fahadet et al., 2015; Farooq et al., 2016) ve bu sayede bitki gelişimi üzerine olumlu etki gösterdikleri bilinmektedir. Gibberellinler ise büyüme noktalarında hücre bölünmesini uyararak ve bitki gelişiminin düzenlenmesinden sorumlu olan bileşikler olarak tanımlanmaktadır (Khan et al., 2016). Yüksek dozda yapılan GA₃ uygulamaları bitkide fazla dal ve çiçek teşekkülüne neden olmuş, bu durum ise meyve bağlama oranını ve dolayısı ile meyve verimini azaltmıştır. Nitekim, 150 ppm GA₃ uygulamalarında biyolojik verimin yüksek olmasına rağmen meyve veriminin düşük olması bu durumu açıklar niteliktedir. MJ, 0.5 mM dozuna kadar bitki gelişimi üzerine olumlu etki gösterirken, yüksek dozda uygulandığında hem biyolojik verim hem de meyve verimini azaltıcı etki göstermiştir. Bu durum, MJ'ın bitkilerde olgunlaşma ve yaşlanma gibi süreçlerin düzenlenmesinden sorumlu olması (Wasternack, 2014) nedeniyle yüksek konsantrasyonda uygulandığında olgunlaşmayı hızlandırması ile açıklanabilir. Yüksek dozda (1.5 mM) yapılan MJ uygulamalarının kimyon bitkisinde bitki gelişimi ve meyve verimini azalttığı Şanlı et al. (2021) tarafından da bildirilmiştir. MJ'ın özellikle abiyotik stres faktörlerine karşı bitki savunma sistemini uyardıkları ve bitki gelişimini olumlu yönde etkiledikleri daha önceki araştırmacılar tarafından da bildirilmiştir (Warabieda et al., 2010; Haokip et al., 2016). Diğer taraftan, büyüme inhibitörü ABA ve oksinlerin fenoksi asetik türevi grubunda yer alan 2,4-D uygulamaları bitki gelişimini olumsuz yönde etkilemiş, bu etki yüksek dozda yapılan uygulamalarda daha belirgin olmuştur. Bitki inhibitörleri olgunlaşmadan sorumlu maddeler olup, bitkilerin generatif döneme geçişini hızlandırmaktadır. Oksin türevi olan 2,4-D ise geniş yapraklı bitkiler için yüksek konsantrasyonlarda herbisit etkisi göstermektedir. ABA'nın vejetatif gelişme dönemini kısaltması, 2,4-D'nin ise herbisit etkisi hem biyolojik verim hem de meyve veriminin azalmasına neden olmuştur. Fitohormonların bitkilerde düşük konsantrasyonlarda bulunan ve fizyolojik aktiviteleri genellikle yine düşük konsantrasyonlarda ortaya çıkan aktif moleküller olduğu ve fazlalıkları durumunda engelleyici ya da inhibitör aktivite gösterebildikleri bilinmektedir (Nambara and Marion-Poll, 2005; Teale et al., 2006). Bulgularımıza benzer olarak, aromatik bitkilerde farklı konsantrasyonlarda GA₃, SA ve MJ uygulamalarının büyüme parametrelerini, çiçeklenme ve meyve bağlamayı, tohum verimini ve kalite parametrelerini önemli ölçüde etkilediği ve meyve ve uçucu yağ verimini artırdığı bildirilmiştir (Verma and Sen, 2006; Singh et al., 2012; Haokip et al., 2016; Kusuma et al., 2019; Şanlı et al., 2021).

Rezene meyvelerinde bin tane ağırlığı yüksek dozlarda yapılan GA₃ ve % 0.15 dozunda 2,4-D uygulamaları ile artarken, ABA uygulamaları bin tane ağırlığını azaltıcı etki göstermiştir. Yüksek dozda uygulanan GA₃'in çiçeklenmenin aşırı teşvik edilmesine neden olarak meyve tutumunu azalttığı, düşük konsantrasyonda uygulanan 2,4-D'nin ise çiçeklenmeyi nispeten olumsuz yönde etkilemek suretiyle daha az meyve oluşumuna neden olduğu düşünülmektedir. ABA uygulamaları ile bin tane ağırlığında gerçekleşen azalma ise bu fitohormonun bitki gelişimini olumsuz yönde etkilemesi ile açıklanabilir. Meyve uçucu yağ oranı yüksek dozda yapılan MJ ve 2,4-D ile ABA uygulamalarında önemli derecede artmıştır. Rezene uçucu yağ verimi 100 ppm GA₃, 0.5 mM MJ ve 5 mM SA uygulamaları ile önemli derecede arttırmış, özellikle yüksek dozda ABA ve 2,4-D uygulamaları uçucu yağ verimini azaltmıştır. Birim alan uçucu yağ verimi ise SA, GA₃ ve MJ uygulamaları ile sırası ile % 26.7, % 22.6 ve % 22.5 oranında artış göstermiştir. Uçucu yağ verimi, bitkide meyve verimi ve uçucu yağ oranı ile ilgili bir özellik olup, bu parametreleri olumlu yönde etkileyen uygulamalar aynı zamanda uçucu yağ verimini de arttırmıştır. Uçucu yağ oranını artırıcı etki gösteren uygulamalar aynı zamanda bitki gelişimini ve meyve verimini olumsuz yönde etkileyen uygulamalardır. Bahsedilen uygulamaların bitki gelişimi olumsuz yönde etkileyerek bitkilerde strese neden oldukları düşünülmektedir. Aromatik bitkilerde uçucu yağ sentezinin özellikle stres şartları altında artış gösterdiği birçok araştırmacı tarafından da bildirilmiştir (Verma and Shukla 2015; Vashisth et al., 2018; Punetha et al., 2022). Fitohormonlar pirimer ve sekonder metabolit üretimi, uçucu yağların salgı ve depo yapıları, uçucu yağların biyosentez, verim ve bileşenleri üzerine farklı etkilere sahip olabilmektedirler (Prins et al., 2010; Sharafzadeh and Zare, 2011). Bulgularımız, MJ uygulamalarının bazı aromatik bitkilerde uçucu yağ oranını artırdığını bildiren çalışmalar (Kim et al., 2006; Li et al., 2007; Raouf Fard et al., 2012) ile uyum göstermektedir. Fitohormon uygulamalarının bitki gelişimi ve uçucu yağ içeriğine etkileri uygulanan fitohormonlara ve uygulama dozlarına göre önemli farklılıklar göstermiştir. Büyümeyi teşvik edici fitohormonların araştırmada incelenen parametreleri genellikle olumlu yönde etkiledikleri, ABA ve 2,4-D uygulamalarının ise uçucu yağ oranını arttırmalarına rağmen, meyve verimini azaltıcı etki gösterdikleri anlaşılmıştır. Çalışmada, 100 ppm GA₃, 0.5 mM MJ ve 5 mM salisilik asit uygulamaları ile rezenede meyve ve uçucu yağ veriminin artırılabilceği, bununla birlikte bu uygulamaların etkinliklerinin farklı ekolojilerde de belirlenmesi gerektiği sonucuna varılmıştır.

A Research on Agricultural Products Storage Warehouses in Van Province

Ünal Şirin¹, Sedat Karaman²

¹Biosystem Engineering Department, Faculty of Agriculture, Yuzuncu Yil University, Van, Turkey

²Biosystem Engineering Department, Faculty of Agriculture, Gaziosmanpasa University, Tokat, Turkey

Abstract

In this research; The current situation and problems of the cold storages in the province of Van have been studied. In this direction, 21 cold storages registered in Directorate of Van Provincial Agriculture and Forestry were visited and on-site investigations were made. The findings obtained as a result of the surveys made with their owners by considering the features of the cold storages such as the structural and mechanization status, the type of stored product have been effective in identifying problems and suggesting solutions. It is used for white meat and eggs 29% of cold storages, 29% for milk and dairy products, 29% for red meat and 13% for fruit and vegetable storage. In addition, there are 17 fruit and vegetable warehouses, 13 of which are unused, that are not registered in Directorate of Van Provincial Agriculture and Forestry, and these were excluded from the research because they were not registered. The most important problems in warehouses were experienced during the pandemic process. Lack of the technical capacity, machinery and equipment, qualified personnel, the marketing problems, maintenance and repair, rent, electricity and water expenses are the main ones. Improvement of its structural properties, modern mechanization device, establishment of unions that will enable warehouse owners to act together, eliminating the lack of qualified personnel with Van Yuzuncu Yil University, one of the most important educational institutions in the region and measures to increase export potential will play an important role in solving the problems.

Key Words: *Agricultural structures, Cold storage, Food preservation issues, Van Province.*

Van İlindeki Tarım Ürünleri Muhafaza Depoları Üzerine Bir Araştırma

Özet

Bu araştırmada; Van ilinde bulunan soğuk hava depolarının mevcut durumları ve sorunları üzerine çalışılmıştır. Bu doğrultuda Van İl Tarım ve Orman Müdürlüğü'nde kayıtlı olan 21 adet soğuk hava deposuna gidilerek yerinde incelemelerde bulunulmuştur. Soğuk hava depolarının yapısal özellikleri, mekanizasyon durumu, depolanan ürün çeşidi gibi özellikleri değerlendirmeye alınarak sahipleri ile yapılan anketler sonucunda elde edilen bulgular sorunların belirlenmesinde ve çözüm önerilerinde etkili olmuştur. Soğuk hava depolarının 6 tanesi beyaz et ve yumurta, 6 tanesi süt ve süt ürünleri, 6 tanesi kırmızı et ve 3 tanesi de meyve ve sebze deposu olarak kullanılmaktadır. Ayrıca Van İl Tarım ve Orman Müdürlüğü'nde kayıtlı olmayan 13 tanesi atıl durumda olan 17 tane meyve ve sebze deposu bulunmakta olup bunlar kayıtlı olmamaları nedeniyle araştırma dışında tutulmuştur. Depolarda en önemli sorunlar pandemi sürecinde yaşanmıştır. Teknik kapasite, makine ve teçhizat, kalifiye eleman yetersizliği, pazarlama problemleri, bakım ve onarım, kira, elektrik, su giderlerinin karşılanamaması bu sorunlardan başlıcalarıdır. Yapısal özelliklerinin iyileştirilmesi, modern mekanizasyon tertibatı, depo sahiplerinin beraber hareket etmelerini sağlayacak birliklerin kurulması, yörenin en önemli eğitim kurumlarından biri olan Van Yüzüncü Yıl Üniversitesi ile kalifiye eleman eksikliğinin giderilmesi ve ihracat potansiyelini artıracak önlemler sorunların giderilmesinde önemli rol oynayacaktır.

Abstract

This study was carried out in Isparta, Turkey during 2011 and 2012 crop seasons to determine the antifungal effects of sulphur doses (0, 2, 4, 6, 8 and 10 kg/da) and application methods (S1: application on seedbed during planting, S2: broadcast on soil before planting and S3: foliar application) on *Rhizoctonia solani* and *Fusarium solani* in potatoes. According to the results obtained from the study, application methods, doses and their interactions were found to be statistically significant in both infections. Seedbed S applications showed higher antifungal effects than soil and foliar applications for both infections. The effects of the application methods were different depending on the doses, and 8 kg/da S in seedbed applications, 10 kg/da S in soil applications, and 6 kg/da S in foliar applications were more effective. In terms of *R. solani* infection, infected tuber ratio and the infection severity were 50.7% and 36.0%, respectively in the control tubers, while these rates decreased to 18.8% and 6.0%, respectively with 10 kg/da S soil applications. Infection severity (6.8%) and infected tuber ratio (6.0) with *F. solani* were significantly decreased with 8 kg/da S seedbed applications compared to control tubers (11.4% and 14.3%, respectively). It was concluded that a significant resistance can be created against *R. solani* and *F. Solani* infections with sulphur applications, and the application of sulphur to the soil or seedbed is much more effective than the foliar application, and 6-8 kg/da S applications may be sufficient to control of fungal diseases.

Keywords: Potato, *Solanum tuberosum* L., Sulphur application, antifungal activity

Kükürt Uygulamalarının Patateste *Rhizoctonia solani* ve *Fusarium solani*'ye Karşı Antifungal Etkileri

Özet

Bu çalışma, patateste kükürt (% 98 S) uygulamalarının *Rhizoctonia solani*, *Fusarium solani* üzerine antifungal etkilerinin belirlenmesi amacıyla 2011-2012 yıllarında yürütülmüştür. Araştırmada elementel kükürt 0, 2, 4, 6, 8 ve 10 kg S/da dozlarında dikim sırasında tohum yatağına, dikimden önce toprak üzerine ve yaprağa olmak üzere 3 farklı yöntemle uygulanmıştır. Araştırmadan elde edilen sonuçlara göre, her iki enfeksiyon etmeni bakımından da kükürt uygulamaları ile uygulama x doz interaksyonu istatistiki açıdan önemli bulunmuştur. Çalışmada her iki enfeksiyon için de tohum yatağına yapılan uygulamalar toprak ve yapraktan yapılan uygulamalara göre daha yüksek antifungal etki göstermiştir. Tohum yatağına yapılan uygulamalarda 8 kg/da, topraktan yapılan uygulamalarda 10 kg/da, yapraktan yapılan uygulamalarda ise 6 kg/da S dozu daha yüksek etki göstermiştir. *R. solani* enfeksiyonu bakımından enfekteli yumru oranı ve enfeksiyon şiddeti kontrolde sırası ile % 50.7 ve % 36.0 iken, bu oran toprağa yapılan 10 kg/da S uygulamaları ile sırası ile % 18.8 ve % 6.0'ya kadar düşmüştür. Kontrolde ortalama %11.4 ve %14.3 olarak belirlenen *F. solani* ile enfekteli yumru oranı ve enfeksiyon şiddeti oranları tohumu yapılan 8 kg/da S uygulamaları ile sırası ile % 6.8 ve % 6.0'ya düşmüştür. Kükürt uygulamaları ile patates bitkisinde ekonomik zararı yüksek *R. solani* ve *F. Solani* enfeksiyonlarına karşı önemli bir direnç oluşturulabileceği, kükürdün toprak ya da tohum yatağına uygulanmasının yapraktan uygulanmasına göre çok daha etkili olduğu ve fungal hastalıklarla mücadele için 6-8 kg/da S uygulamalarının yeterli olabileceği sonucuna varılmıştır.

Red rot resistant transgenic sugarcane developed by over-expression of SUGARWIN gene(s)

Aqsa Parvaiz¹, Ghulam Mustafa², Faiz Ahmad Joyia²

¹Department of Biochemistry and Biotechnology (BBT), The Women University Multan, Pakistan.

²Centre of Agricultural Biochemistry & Biotechnology (CABB), University of Agriculture, Faisalabad, Pakistan

Abstract

Sugarcane an agroindustrial crop, not only fulfils 70% of world's sugar need but is also main impending source of biofuel. Some biotic and abiotic stresses have devastating effects on sugarcane crop and sometimes may lead to complete crop failure. Red rot is a fungal disease caused by *Colletotrichum falcatum* which severely affect yield and quality of sugarcane. To combat fungal diseases sugarcane plant is blessed with a wide variety of endogenous pathogenesis-related (PR) proteins i.e. glucanases, chitinases, chitosanases and proteases. These PR proteins hydrolyze fungal cell wall and may lead to fungal cell apoptosis. This study report the overexpression of two myco-protective genes i.e. SUGARWIN1 and SUGARWIN2 genes which have role in red rot resistance. Both genes were cloned under the CaMV35S i.e constitutive promoter. Bar gene was used as sselectable marker which confers resistance against gluphosinate (Phosphinothricin) for the selection of expression cassette. Biolistic transformation approach was used for transformation of expression cassette into embryogenic calli which were propagated from leaf whorls of sugarcane. Putative transformed plants were screened on phosphinothricin (selective agent) during regeneration. The regenerated shoots were shifted on rooting media and then plants were acclimatized. Transgenic event was confirmed by molecular analysis i.e. PCR (polymerase chain reaction). Overexpression of both genes was confirmed by expression analysis carried through qRT-PCR. Fungal bioassays of transgenic and untransformed plants were also carried out under in vitro conditions. The recent study established various parameters which may open new possibilities to gene transfer in monocots for the development of fungal resistant crops.

Key Words: *Sugarcane, Biolistic transformation, Young leaf whorls, SUGARWIN, Constitutive promoter, red rot disease, Colletotrichum falcatum.*

Tıbbi Aromatik Bitkilerin Yetiştiricilik Potansiyelinin Belirlenmesi (Amasya İli Suluova İlçesi Örneği)

Bekir Ayyıldız¹, Onur Saraçoğlu², Hakan Karadağ³, Hakan Polatcı⁴

Özet

Bu çalışmada Amasya ili Suluova ilçesinde tıbbi aromatik bitki yetiştirme potansiyelini ortaya koyabilmek için anket çalışması düzenlenmiştir. İlçe Gıda Tarım ve Hayvancılık Müdürlüğü vasıtasıyla Çiftçi Kayıt Sisteminde yer alan çiftçi sayısı belirlenmiş (2006 adet) ve kolayda örnekleme yöntemi kullanılarak 343 adet katılımcı yardımıyla anket gerçekleştirilmiştir. Çalışma kapsamındaki köylerde ve ilçe merkezinde belirlenen çiftçi sayılarına göre yüzyüze görüşme yöntemiyle anketler yapılmıştır. Yüzyüze yapılan saha anketi çalışmaları sonucunda bölge üreticilerinin genel anlamda tıbbi aromatik bitkiler hakkında bilgileri olduğu ancak yetiştiricilik konusunda bazı çekinceleri olduğu ortaya çıkmıştır. Üreticiler çoğunlukla pazarlama konusunda şüphe yaşadıklarını ve pazarlama sorunun çözüldüğü takdirde üretime geçmeye istekli olduklarını belirtmişlerdir. İlçe merkezinde kurulacak bir ürün işleme merkezinin üreticileri tıbbi aromatik bitki yetiştiriciliğine sevk edeceği anlaşılmaktadır. Üreticilerin eğitim almaya istekli oldukları ve eğitim aldıklarında ise üretime geçeceklerini belirtmişlerdir. Tıbbi aromatik bitkileri yetiştirme isteği olan üreticilerin ürünlerin işlenmeleri noktasında en önemli talepleri distilasyon ve ekstraksiyon üniteleri olmuştur. Uygun iklim ve toprak şartlarına sahip Suluova ilçesinde kurulacak “Çiftçi Eğitim Merkezi” ve merkez bünyesinde hizmet verecek “Tıbbi Aromatik Bitkiler İşleme Merkezi” ilçe üreticilerine ve ilçe ekonomisine önemli katkılar sağlayacağı üreticilerle yapılan anket sonucunda anlaşılmaktadır. Ayrıca sonuçları Güçlendirmek amacı ile SWOT analizi çalışmaya dahil edilmiştir.

Anahtar Kelimeler: Tıbbi Aromatik Bitkiler, Yetiştirici potansiyeli, Amasya, Suluova

Phytosiderophore Analog Efficiently Alleviates Iron Deficiency Symptoms in Soybean

Emre Aksoy

Department of Biological Sciences, Middle East Technical University, Ankara, Turkey

Abstract

Iron (Fe) bioavailability is dependent on soil pH. Its solubility, therefore bioavailability dramatically decrease in calcareous alkaline soils with high pH. Therefore, yields of soybean decrease when they are grown in alkaline soils, which cover 1/3th of the world's arable land. Inorganic micronutrient fertilizers with stabilizing chelates have been developed to rescue the micronutrient deficiency symptoms in crops grown in alkaline soils; yet, they bring a large economic burden to the farmers and their by-products, and accumulation causes environmental contamination. Therefore, alternative biodegradable chelated fertilizers are required to be developed to increase crop yields in sustainable agriculture. Grasses secrete phytosiderophores into the rhizosphere which increases Fe uptake by the plants, and these chemicals can help dicots, such as soybean, to uptake Fe more efficiently. Although it is difficult and expensive to produce them in a stable form, phytosiderophore 2'-deoxymugineic acid (DMA) derivative PDMA was cost-effectively produced as a stable analog. Here, we show that PDMA application from the soil eliminates the Fe deficiency symptoms in sensitive soybean plants when they are grown in calcareous alkaline soil with a pH of 8.5. Several physiological and biochemical parameters related to Fe deficiency response in soybean were increased in a dose-dependent PDMA application when they reached at V3-4 stage. Taken together, PDMA application from the soil increases the Fe uptake and accumulation in Fe deficiency-sensitive soybean cultivar, leading it to become Fe-efficient and tolerant in calcareous alkaline soil. In future studies, PDMA supplemented with different Fe sources may be formulated in a new type of micronutrient fertilizer to alleviate the Fe deficiency symptoms in dicots.

Keywords: Alkaline soil, fertilizer, iron deficiency, phytosiderophore, soybean

Can calorie intake ensure food and nutritional security? The case of peri-urban residents of North Punjab, Pakistan

***Muhammad Khalid Bashir, Muhammad Ashfaq, Arifa Zaib**

Institute of Agricultural and Resource Economics, University of Agriculture, Faisalabad, Pakistan

*Corresponding Author

Abstract

This study aims to investigate whether the calorie intake alone ensures food and nutritional security? For this purpose, panel data were collected from 105 residents of peri-urban areas of Rawalpindi, the largest city in North Punjab using stratified random technique. Dietary intake assessment method based on 7 days recall was used to measure calorie and three essential macro (protein, fats and carbohydrates) and four essential micro (iron, zinc, calcium and phosphorus) nutrients' sufficiency status. Food security indices were calculated using the sufficiency status of these nutrients. It was found that 22% of the household were measured as food insecure based on calorie sufficiency status. For essential nutrients' deficiency, it was found that 62%, 30%, 6%, 86%, 59%, 84% and 61% of the sample households were deficient in protein, fat, carbohydrate, iron, zinc, calcium and phosphorus consumption. The food and nutritional security indices confirm that calorie intake assessment does not provide enough information on food and nutritional security as 47% of the households were measured to be food insecure on weighted calculations. Furthermore, dietary patterns were also developed according to which, cereals were the main source of consumption of all the nutrients except fats. These ratios were not according to the desired dietary pattern identified in 2001. The multinomial logit model was used to identify the factors affecting household's food security. Four out of seven variables were significant. The model predictive efficiency was 55%. Monthly income was positively impacting food security while family size, perception regarding drinking water quality and incidence of water borne diseases negatively affected the household food security.

Abstract

The research was carried out within the scope of the National Sheep and Goat Breeding Project of Turkey between 2017 and 2021 in the province of Niğde. In the study, the survival of lambs (120 days old (SR4)), reproductive and growth characteristics (birth, 60 days old (LW2) and 120 days old (WW) live weight) and daily live weight gains between birth and WW (DLWG) were evaluated and the effects of some environmental factors affecting these characteristics was determined. As research material, yield records of 30923 Akkaraman sheep breeds in 7 villages at 22 farms in Niğde province were examined. The average birth weight in lambs was determined as 4.36±0.01 kg. The live weight gain of 1.84 and 5.96 kg was achieved in Akkaraman lambs in terms of body weight on the LW2 and WW between 2017 and 2021, respectively (P<0.01). The highest WW was found in 2021 (36.43±0.08 kg), in four dam age (33.87±0.12 kg), single born (33.08±0.05 kg) and male lambs (33.88±0.06 kg). The effects of the year, dam age, gender and birth type were found to be statically significant on DLWG (P<0.05). Birth rate, fecundity and litter size were determined as 91%, 1.03 and 1.13, respectively. While no statistical difference was observed between birth types (P>0.05), the differences observed between male and female lambs were found significant (P<0.05) in terms of SR4. Although the highest SR4 was determined in the birth season of 2020 (96.21%), the lowest SR4 was determined in the birth season of 2019 (88.50%) (P<0.05). As a result, between 2017 and 2021 in Akkaraman lambs, a significant genetic progress was achieved, especially in terms of growth characteristics such as LW2, WW and DLWG, and the effects of all environmental factors on these characteristics were found to be significant.

Niğde İlinde Yetiştirici Koşullarında Akkaraman Koyunların Yaşama Gücü, Döl Verimi, Büyüme Özelliklerinin Belirlenmesi Üzerine Bir Araştırma

Özet

Araştırma, Halk Elinde Küçükbaş Hayvan Islahı kapsamında 2017-2021 yılları arasında Niğde ilinde Akkaraman ırkı koyunlarda üzerinde yürütülmüştür. Araştırmada, kuzuların yaşama gücü (120 günlük yaşta (SR4)), döl verimi ve büyüme özellikleri (doğum, 60 günlük yaş (LW2) ve 120 günlük yaş (WW) canlı ağırlıkları) ve doğum ile WW arası günlük canlı ağırlık artışları (DLWG) değerlendirilmiştir ve bu özellikler üzerine bazı çevresel faktörlerin etkileri belirlenmiştir. Materyal olarak, Niğde iline bağlı 7 farklı köydeki 22 işletmede 30923 baş Akkaraman ırkı koyunların verim kayıtları incelenmiştir. Kuzularda doğum ağırlığı ortalama 4,36±0,01 kg olarak tespit edilmiştir. Araştırmada, LW2 ve WW bakımından Akkaraman kuzularında 2017 ve 2021 yılları arasında sırasıyla 1,84 ve 5,96 kg bir canlı ağırlık artışı sağlanmıştır (P<0.01). En yüksek WW (36.43±0.08 kg) 2021 yılında, ana yaşı 4 olan (33,87±0,12 kg), tek doğan (33,08±0,05 kg) ve erkek kuzularda (33,88±0,06 kg) tespit edilmiştir. DLWG üzerine etkisi incelenen yıl, ana yaşı, cinsiyet ve doğum tipinin etkisi istatistiki olarak önemli bulunmuştur (P<0.05). Doğum oranı, koç altı koyun ve doğuran koyun başına doğan kuzu sayısı sırasıyla %91, 1,03 ve 1,13 olarak tespit edilmiştir. SR4 bakımından doğum tipleri arasında istatistiki bir farklılık gözlenmezken (P>0.05), erkek ve dişi kuzular arasında gözlenen farklılıklar önemli bulunmuştur (P<0.05). En yüksek yaşama gücü 2020 (96,21%) doğum sezonunda belirlenmesine karşın en düşük yaşama gücü 2019 (88,50%) doğum sezonunda tespit edilmiştir (P<0,05). Sonuç olarak, Akkaraman kuzularda 2017 ile 2021 yılları arasında özellikle büyüme özelliklerinden LW2, WW ve DLWG bakımından yıllar itibarıyla kayda değer bir genetik ilerleme sağlanmış ve bu özellikler üzerine araştırmada etkisi incelenen tüm çevresel faktörlerin etkileri önemli bulunmuştur.

Anahtar kelimeler: Akkaraman, kuzu, döl verimi özellikleri, büyüme özellikleri, yaşama gücü,

Evaluation of nutritional and antioxidant properties of *Chenopodium ambrosioides* L. and *Crassocephalum crepidioides* leaf meal as potential feed additives

***Falowo Andrew Bamidele**

Department of Animal Science, Faculty of Agriculture, Adekunle Ajasin University, Akungba, Nigeria

*Corresponding author: anddele2013@gmail.com

Abstract

This study analyzed the proximate, minerals, phytochemical profiles and antioxidant capacity of *Chenopodium ambrosioides* L. and *Crassocephalum crepidioides* leaf meals as potential feed additives. Fresh leaf of the plants were purchased from commercial markets, air-dried in an open shade, and blended into powder for the analysis. The result of the proximate analysis revealed that *C. crepidioides* contained higher moisture (6.66%), ash (21.04%), crude fibre (3.85%), crude fat (5.41%) and crude protein (17.11%) contents than *C. ambrosioides* leaf powder ($p < 0.05$) which had 6.31% moisture, 13.69% ash, 3.09% crude fibre, 4.48% crude fat, 15.99% crude protein and 56.12% carbohydrate. The result of the phytochemical analysis revealed that aqueous extract of *C. crepidioides* possessed higher total phenolic (13.34 mgGAE/g) and flavonoid (2.29 mgrutin/g) contents than that of *C. ambrosioides* at (13.07 mgGAE/g) and (1.62 mgrutin/g) respectively, ($P < 0.05$). The aqueous extract of *C. ambrosioides* exhibited higher that antioxidant free radical scavenging activity (24.83%) than that of *C. crepidioides* (16.42%). In conclusion, this study has shown that these two vegetables contained nutrients and antioxidant and could be used as alternative feed additives in animal nutrition.

Study of ecological and chemical indicators of the Girmizi Lake

Tarana Aliyeva

Ecological Chemistry department of Baku State University

Abstract

There are more than 200 lakes with a total area of up to 3325 ha on the Absheron Peninsula. During the year, 41.5 million m³ of sewage of different composition are discharged into these lakes. The most polluted lakes are Boyuk Shor, Bulbula, Girmizi, Haji Hasan and Chukhurdere lakes. Since the concentration of oil products, heavy metals and toxic substances in the water is many times higher than the permissible norm, an increase in radionuclides is observed in the bottom sediments of the lakes. The discharge of household wastewater into lakes and surrounding areas further complicates the acute ecological situation on the Absheron Peninsula. A number of projects have been developed in order to solve environmental problems. Ecological, geological, morphological and other research works on all lakes on the peninsula have not yet been completed. In recent years, the increase in the construction of private houses and facilities in the surrounding area has caused the pollution of the Girmizi Lake. The Girmizi Lake is a lake with an average water level in this area and is in a tense ecological situation. The discharge of sewage caused a violation of the oxygen regime of the lake. For many years, this lake was used as a receiving reservoir for formation water from oil fields. Girmizi lake belongs to the group of brackish water lakes. But now the Girmizi Lake has turned into a sewage lake due to the discharge of oil and oil products and sewage. During the months of May-June 2022, samples were taken from the water of the Girmizi Lake, sewage water poured into the lake, bottom sediments, and soil in the area where the lake is located and analyzed for various physico-chemical parameters. During the months of May-June 2022, samples were taken from the water of the Girmizi Lake, sewage water poured into the lake, bottom sediments, and soil in the area where the lake is located and analyzed for various physico-chemical parameters. Water samples were taken from different depths in the lake area. Water salinity increases from west to north. Samples from the sampled soil areas were taken from different depths by drilling method. Pollution is mostly observed in the upper layers. The bottom sediments were taken from different depths (1m, 2m, 3m) by sinking with a special device. The most contamination was observed in the first 1 m depth. The amount of heavy metals in the taken samples was determined. Bottom sediment samples from Girmizi Lake contained 14.55% CaCO₃, 37.68 mg/kg As, 0.44 mg/kg Cd, 0.21 mg/kg Cr, 7.22 mg/kg Cu, 1.44 mg/kg Co, 2.78 mg/kg Hg, 1.69 mg/kg Pb, 1.22 mg/kg Ni, 51.95 mg/kg Zn, 158.14 mg/kg Al, 113 mg/kg Fe, 568 mg/kg S, 124 mg/kg total nitrogen, 12.88 mg/kg total phosphorus, 105.27 mg /kg Ca. Background radiation in bottom sediment samples taken from Girmizi Lake is 15 mkr/H. In soil samples from the vicinity of Girmizi Lake 13.35% CaCO₃, 54.33 mg/kg total phosphorus, 144 mg/kg total nitrogen, 128.97 mg/kg total Fe(III), 7.475 mg/kg total sulfate, 239.8 mg/kg total phosphate, 0.53 mg/kg As, 0.21 mg/kg Cd, 1.97 mg/kg Cr, 0.62 mg/kg Co, 2.26 mg/kg Cu, 0.2 mg /kg Hg, 0.1 mg/kg Pb, 2.63 mg/kg Ni, 8.66 mg/kg Zn were found.

Keywords: *Girmizi lake, pollution, heavy metals, water samples, bottom sediment samples*

Abstract

The liquid extraction method was used for the preparation of water samples taken from Zabrát Lake. 0.5 liters of water samples were extracted 3 times with 30 ml of dichloromethane, dried with anhydrous sodium sulfate and concentrated in a rotary evaporator until the volume remained 1 ml. Deuterated naphthalene and phenanthrene were used as internal standards. The determination of organic compounds in the samples was carried out on a mass spectrometer gas chromatography device (GC-MS (Agilent, USA) HP6890 in one-dimensional and two-dimensional mode. Ionization energy is 70 eV. Capillary silicon column RTX-5MS (30 m), temperature mode: 40°C (2 min.)-20°C/min.-300°C (10 min.). In the same way, samples of bottom sediments (1.4 and 1.6 g) were taken from the lake, extracted 3 times with 30 ml of dichloromethane, dried with anhydrous sodium sulfate, and condensed in a rotor evaporator until the volume remained 1 ml. Deuterated naphthalene and phenanthrene were used as the internal standard. The determination of organic compounds in the samples was carried out on a mass spectrometer gas-chromatography device (GC-MS (Agilent, USA) HP6890 in one-dimensional and two-dimensional mode. Ionization energy is 70 eV. Capillary silicon column RTX-5MS (30 m), temperature mode: 40°C (2 min.)-20°C/min.-300°C (10 min.).

Table 1. The amount of organic matter in the bottom sediments of Zabrát Lake

Sampling stations	Unit of measurement	S1	S2
Organic substances			
Benzene 1 µg/kg	µg/kg gm	8,53	23,33
Toluene 24 µg /l	µg/kg gm	16,43	43,09
Ethylbenzene 2 µg/kg	µg/kg gm	0,31	3,09
p-xylene 50 µg/l	µg/kg gm	3,83	51,91

As can be seen from the table, the amount of organic matter in bottom sediments exceeds the permissible limit at stations S1 and S2.

Table 2. Determination of PAHs in water samples from Zabrát Lake

Sampling stations	Unit	S25	S26
PAHs			
Naphthalene 0.02	µg /l	0,02	0,025
Acenaphthalene 0.006	µg /l	0,02	0,024
Anthracene 0.001	µg /l	0,02	0,02
Fluoranthene 0.02	µg /l	0,02	0,02
Fluorene 0.006	µg /l	0,049	0,059
Phenanthrene 0.006	µg /l	0,195	0,267
Benzaprene 0.001	µg /l	0,02	0,02
Chrysene 0.003	µg /l	0,02	0,02
Pyrene 0.02	µg /l	0,02	0,02
Benanthracene 0.006	µg /l	0,02	0,02

As can be seen from the table, the amount of PAHs other than naphthalene, pyrene, and fluoranthene exceeds the limit.

Abstract

A field trial was carried out at the Kwara State University Teaching and Research Farm in 2019/2020 cropping season. The aim of the project was to investigate the growth and yield of sesame as affected by population density of component sorghum. Seven population densities viz: 100SE:100SH, 100SE:75SH, 100SE:50SH, 100SE:25SH, 75SE:100SH, 50SE:100SH, and 25SE:100SH where SE and SH represented sesame and sorghum respectively were combined in a Randomized Complete Block Design (RCBD) and replicated three (3) times. Full population of each crop was also included in the treatment as a control. The height and grain yield of sorghum were significantly influenced by population density. The height decreased as the population density of component sesame decreased. Reduction in the population of sorghum from 75% to 25 % significantly reduced the height of sorghum between 8 and 10 weeks after planting (WAP). The seed yield of sesame was depressed by population density of component sorghum with the lowest yield (1.15 kg/ha) obtained at 100SH:25SE population ratio. The Land equivalent ratios (LER) were greater than unity where full population of sorghum was mixed with sesame and when 75% population was combined with full population of sesame. Reduction from 50-25% recorded LER value less than unity. The highest Land equivalent coefficient (LEC) value was obtained in 100SH:100SE population ratio. Aggressivity (A) values were positive for sorghum and negative for sesame in all the population ratio tested except, 50SH:100SE and 25SH:100SE population ratios. The competitive ratios (CR) values followed similar trend with the A values. The highest A value, 0.70 and -0.86 and CR, 18.2 and 4.20 respectively for sorghum and sesame were recorded at 100SH:25SE population ratios. Reasonable intercropping advantage was obtained at the treatment where full population ratio of both where intercropped.

Key words: *Sorghum, sesame, intercropping, population ratios, intercropping advantage.*

Fecal Microbiota Transplantation

Serim Tuna Koç¹

¹Biotechnology and Genetics, Institute of Natural and Applied Sciences, Trakya University, Edirne, Turkey

Abstract

The human gut contains many types of bacteria. The gut microbiota in early life is highly dynamic and is shaped by many factors, including maternal gut microbiota, mode of delivery, and breastfeeding. With the transition to an adult diet, the bacterial species in the microbiota are diversifying. The gut microbiota plays a key role in human health and many diseases. Fecal microbiota transplantation (FMT) provides replacement of beneficial bacteria with a more suitable microbiome in patients with dysbiosis. FMT is the process of giving the microbiota part of the stool taken from a healthy donor to the intestines of the sick person by passing through various processes in order to restore the intestinal microbiota of the patient. In this review, research results on fecal microbiota transplantation, how and how it is used are presented.

Özet

İnsan bağırsağı çok sayıda bakteri türü içermektedir. Erken yaşamdaki bağırsak mikrobiyotası oldukça dinamiktir ve maternal bağırsak mikrobiyotası, doğum şekli ve emzirme gibi birçok faktör tarafından şekillendirilmektedir. Yetişkin beslenme tarzına geçilmesiyle mikrobiyotadaki bakteri türleri çeşitlenmektedir. Bağırsak mikrobiyotası, insan sağlığı ve birçok hastalık açısından anahtar oynamaktadır. Fekal mikrobiyota transplantasyonu (FMT) disbiyotikli hastalarda faydalı bakterilerin daha uygun bir mikrobiyom ile değiştirilmesini sağlamaktadır. FMT, hastanın bağırsak mikrobiyotasını onarmak amacıyla sağlıklı donörden alınan gaitanın çeşitli işlemlerden geçirilerek mikrobiyota kısmının hasta kişinin bağırsaklarına verilmesi işlemidir. Bu derlemede fekal mikrobiyota transplantasyonu, nasıl ve ne şekilde kullanıldığı etkinliğine ilişkin araştırma sonuçları sunulmuştur.

Anahtar Kelimeler: *Mikrobiyota, Sağlık, Fekal transplantasyon*

Tea and Polifenols

Serim Tuna Koç¹

¹Biotechnology and Genetics, Institute of Natural and Applied Sciences, Trakya University, Edirne, Turkey

Abstract

Tea is the most widely consumed beverage in the world after water. Tea, *Camellia sinensis* (L.) Kuntze or *Thea sinensis* F. Theaceae, is a shrub or evergreen tree up to 16 m tall. Its leaves are alternate, exstipulate, lanceolate to obovate, up to 30 cm long, 2–5 cm broad, pubescent, sometimes becoming glabrous, serrate, acute or acuminate. Fresh leaves are often picked from late March and early April to July every year. Tea can be classified according to the processing procedures into black, green and oolong tea. The percentage of each type of tea produced and consumed in the world is: 75% black, 22% green, 2% oolong and 1% white tea. The chemical composition of tea is highly complex, owing to its possessing different classes of chemical compounds, including polyphenols, alkaloids, amino acids, proteins, minerals, vitamins, and carbohydrates. . The main tea polyphenols are catechins: (±)-catechin C, (-)-epicatechin EC, (+)-gallocatechin GC, (-)-epigallocatechin EGC, (-)-epicatechin gallate ECG, and (-)-epigallocatechin gallate EGCG. Epigallocatechin gallate is the most plenty catechin in green tea, which accounts for 50% of the total catechins With no fermentation, green tea leaves preserve their color and almost all of their catechin content, and therefore have greater antioxidant potential than oolong and black tea, which are semi-fermented or fully fermented, respectively. Green tea is rich in the flavonol group of polyphenol called catechin. Many epidemiological studies have been conducted to show that green tea can provide protection against several cancers such as breast, prostate, bladder, ovarian, colorectal, esophageal, lung, pancreatic, and skin cancer. It has proven the health-related anti-carcinogenic, antioxidant, anti-aging, anti-mutagenic, antimicrobial activities, anti-hypercholesterolemic and anti-inflammatory benefits of tea polyphenols. In this review, research results on tea polyphenols and their effects on health are presented.

Key Words: *Tea, Polyphenols, Catechins, Antioxidant*

Çay ve Polifenoller

Özet

Çay dünyada sudan sonra en çok tüketilen içecektir. Çay, *Camellia sinensis* (L.) Kuntze veya *Thea sinensis* F. Theaceae, 16 m yüksekliğe kadar çalı veya yaprak dökmeyen bir ağaçtır. Yaprakları alternatif, çıkıntılı, mızraklı ila obovat, 30 cm uzunluğa kadar, 2-5 cm genişliğinde, tüylü, bazen tüysüz, tırtıklı, sivri veya sivri uçludur. Taze yapraklar genellikle her yıl Mart ayının sonundan ve Nisan ayının başından Temmuz ayına kadar toplanır. Çay, işleme prosedürlerine göre siyah, yeşil, beyaz ve oolong çayı olarak sınıflandırılabilir. Dünyada üretilen ve tüketilen her çay türünün yüzdesi: %75 siyah, %22 yeşil, %2 oolong ve %1 beyaz çaydır. Çayın kimyasal bileşimi, polifenoller, alkaloidler, amino asitler, proteinler, mineraller, vitaminler ve karbonhidratlar dahil olmak üzere farklı kimyasal bileşik sınıflarına sahip olması nedeniyle oldukça karmaşıktır. Başlıca çay polifenolleri kateşinlerdir: (±)-kateşin C, (-)-epikateşin EC, (+)-gallocatechin GC, (-)-epigallocatechin EGC, (-)-epikateşin gallat ECG ve (-)-epigallocateşin gallat EGCG. Epigallocateşin gallat, toplam kateşinlerin %50'sini oluşturan yeşil çayda en bol bulunan kateşindi. Yeşil çay yaprakları fermentasyon olmadan renklerini ve kateşin içeriğinin neredeyse tamamını korur ve bu nedenle yarı fermente veya tamamen fermente olan oolong, beyaz ve siyah çaydan daha fazla antioksidan potansiyele sahiptir. Yeşil çay, kateşin adı verilen polifenolün flavonol grubu açısından zengindir. Yeşil çayın meme, prostat, mesane, yumurtalık, kolorektal, yemek borusu, akciğer, pankreas ve cilt kanseri gibi çeşitli kanserlere karşı koruma sağlayabileceğini gösteren birçok epidemiyolojik çalışma yapılmıştır. Çay polifenollerinin sağlık ile ilgili anti-kanserojen, antioksidan, anti-aging, anti-mutajenik, antimikrobiyal aktiviteler, anti-hiperkolesterolemik ve anti-inflamatuar yararlarını kanıtlamıştır. Bu derlemede çay polifenolleri ve sağlık üzerine olan etkilerine ilişkin araştırma sonuçları sunulmuştur.

Investigation of the Single-Walled Carbon Nanotube Addition to SLA Resin: Printability and Electrical Properties

Melike Tuncer¹, Müzeyyen Kalfazade², Hasan Basri Öksüz³, Dilara Gönüllü², Sevil Çıkrıkçı Erünsal^{2*}

²Food Engineering Department, Faculty of Engineering and Architecture, Konya Food and Agriculture University, Konya, Turkey

³Department of Electrical and Electronics Engineering, Faculty of Engineering and Architecture, Konya Food and Agriculture University, Konya, Turkey

Abstract

Stereolithography (SLA) method is one of the most promising approaches in additive manufacturing. SLA printing is based on photopolymerization reaction using laser light and liquid photosensitive resin. 3D complex structures could be perfectly fabricated by ready SLA resins however, they do not show sensing, optical and electrical properties alone. To develop functional 3D polymer-based structures, Single-Walled Carbon Nanotubes (SWCNTs) were incorporated into SLA resin at varying replacement ratios (10%, 20%, 30%, 50% of the resin). SWCNTs-SLA resin combination was then placed in the SLA device (Anycubic Photon Mono Se) and 3D polymer structures were fabricated at different infill densities. SWCNTs were selected due to their excellent electrical conductivity and optical properties for sensing applications. According to the printability performance, maximum replacement ratio in all geometries was found as 20% for acceptable printing process. The fabricated elements were then analyzed for their resistance measurements. Since the tablets were not a pure resistor, an AC circuit was used to measure the impedance of the element. The tablets displayed capacitive properties and did not show a significant change in electric conductivity properties with respect to SWCNTs concentration ($p \leq 0.05$). In the second part of the study, enzyme immobilization into the printed tablets (with/out SWCNTs) were investigated for adsorption capacity of the tablets. Since enzymes have protein structures, chicken albumin was used as a model protein. Tablets with/out CNT printed with different infill densities were waited in 1% protein solution for 24 h and then washed with distilled water. Then, absorbance values of protein and washing solution at 280 nm were measured by UV-vis spectrophotometer (Cary60 UV-Vis, Austria). Finally, adsorption capacity of the tablets was found with the help of calibration curve. As CNT incorporated tablets gave adsorption capacity as 534.4 ± 47.90 mg protein/g tablet, control tablets had 714.4 ± 13.55 mg protein/g tablet. In overall, the study demonstrated potential replacement of conventional SLA resin with SWCNTs up to a point (20%) to develop functional complex tablets for sensing property and deposition of proteins on the surface of tablets.

Key Words: *SLA printing, photocurable resin, carbon nanotube, protein immobilization, sensor*

Changes in Erosion Susceptibility of a Chromic Haplustert Pasture Soil by Some Polymers Under Simulated Rainfall

Tuğrul Yakupoğlu¹, Nutullah Özdemir²

¹Department of Soil Science and Plant Nutrition, Faculty of Agriculture, Yozgat Bozok University, Yozgat, Turkey

² Department of Soil Science and Plant Nutrition, Faculty of Agriculture, Ondokuz Mayıs University, Samsun, Turkey

Abstract

Due to the climate change that has become evident especially in the last ten years, the pastures in the Mediterranean climate zone have become even more vulnerable to degradation. High erosive precipitation increases the amount of erosion in these soils with increasing their erodibility. For this reason, it is inevitable to develop soil management practices by taking into account both soil/land characteristics and changes in climate components. The aim of this study was to determine to what extent some polymers such as polyacrylamide and polyvinylalcohol can prevent runoff and soil loss caused by simulated rainfall with 70 ± 5 mm intensity from erosion pans where a pasture soil was placed. For this purpose, aggregates of soil samples >8 mm from the A horizon of a Chromic Haplustert were used. Polyacrylamide and polyvinylalcohol solutions at different doses (0, 3.5, 7.0 and 14.0 kg ha^{-1}) were applied to the aggregates placed in the erosion pans by spraying. Erosion pans with slopes of 9% and 15% were exposed to simulated rainfall produced by a drop former rainfall simulator for one hour. The simulation trial was planned as 2 replications according to the randomized plots trial design (2 slopes x 2 polymers x 4 polymer doses x 2 replicates = 32 pans). During simulated rainfall, runoff water and sediment from pans were collected at 10-minute intervals. Transported soils were expressed as dry weight, and runoff waters were expressed as volumetric. According to the results obtained, the highest runoff occurred from a 15% inclined soil pan (11.06 mm) without polymer applied (control). After one hour of simulated rainfall, runoff did not occur from some pans with high-dose polymer applied. The amount of soil transported from the control pan by runoff and by splashing to the sides is 362 and 4241 kg ha^{-1} , respectively. The pan, in which the least soil is carried by splashing, was the one with a 9% slope and the highest dose of polyacrylamide (97 kg ha^{-1}). Statistical results show that polyacrylamide was more successful than polyvinylalcohol in reducing soil and water losses. These results indicate that the application of polymer to pasture soils can be a valid way to combat erosion, but the treatments should be carried out by choosing the right dose, taking into account factors such as the slope of the land, the erodibility of the soil and the erosivity of precipitation.

Key Words: PAM, PVA, Rainfall erosivity, Soil erodibility, Soil management

Chromic Haplustert Mera Toprağının Erozyona Duyarlılığında Bazı Polimerler Tarafından Yapay Yağış Altında Sağlanan Değişimler

Özet

Özellikle son on yılda kendini belli eden iklim değişikliği nedeniyle, Akdeniz iklim kuşağındaki meraları, degradasyona daha da açık hale gelmiştir. Yüksek eroziviteli yağışlar, erodibilitesi artan bu topraklarda erozyon miktarını giderek artırmaktadır. Bu nedenle, hem toprak/arazi özelliklerini hem de iklim elemanlarındaki değişimi dikkate alarak toprak yönetim uygulamaları geliştirmek kaçınılmazdır. Bu çalışmanın amacı, poliakrilamid ve polivinilalkol gibi bazı polimerlerin, mera toprağının yerleştirildiği erozyon tavalarından 70 ± 5 mm yoğunlukta yapay yağıştan kaynaklanan akış ve toprak kaybını ne ölçüde önleyebildiğini belirlemektir. Bu amaç için, bir Chromic Haplustert'in A horizonundan alınan toprak örneklerinin >8 mm olan agregatları kullanılmıştır. Erozyon tavalara yerleştirilen agregatlara, farklı dozlarda (0, 3.5, 7.0 ve 14.0 kg ha^{-1}) poliakrilamid ve polivinilalkol solüsyonları püskürtülerek uygulanmıştır. Eğimi %9 ve %15 olarak ayarlanan erozyon tavaları, bir saat süre boyunca, bir drop former yağış simülatörünün ürettiği yapay yağışa maruz bırakılmıştır. Simülasyon denemesi tesadüf parselleri deneme desenine göre 2 tekerrürlü olarak planlanmıştır (2 slopes x 2 polymers x 4 polymer doses x 2 replicates = 32 pans). Yapay yağış boyunca tavalardan oluşan yüzey akış suları ve sediment 10 dakika aralıklarla toplanmıştır. Taşınan topraklar kuru ağırlık olarak, yüzey akış suları da volumetrik olarak ifade edilmiştir. Elde edilen sonuçlara göre, en fazla yüzey akış polimer uygulanmayan % 15 eğimli toprak tavaasından (11.06 mm) meydana gelmiştir. Bir saatlik yapay yağışın sonunda yüksek doz polimer uygulanan bazı tavalardan yüzey akış oluşmamıştır. Kontrol tavaasından yüzey akışla ve yanlara sıçrama yoluyla taşınan toprak miktarları sırasıyla 362 ve 4241 kg ha^{-1} 'dir. Sıçrama yoluyla en az toprak % 9 eğim verilen ve en yüksek doz poliakrilamid uygulanan tavadan taşınmıştır (97 kg ha^{-1}). İstatistiksel sonuçlar göstermektedir ki toprak ve su kayıplarını azaltmada poliakrilamid polivinilalkolden daha başarılıdır. Elde edilen bu sonuçlar, erozyon ile mücadelede mera topraklarına polimer uygulamasının geçerli bir yol olabileceğine, ancak muamelelerin, arazinin eğimi, toprağın aşınabilirliği, yağışın erozivitesi gibi faktörler dikkate alınarak doğru doz seçimi yapılmak suretiyle gerçekleştirilmesi gerektiğine işaret etmektedir.

Effect of Biofertilizers and Organic Amendments on Germination and Seedling Growth of Common Dry Zone Forest Species in Sri Lanka: Sustainable Reforestation Practices in Sri Lanka

A.P.L.N.S. Jayakody¹, K.W.A. Madhushan², A.T. Pelawatta¹ and P. N. Yapa^{1*}

¹Department of Biological Sciences, Faculty of Applied Sciences, Rajarata University of Sri Lanka, Mihintale 50300 Sri Lanka.

²Department of Plant Sciences, Faculty of Agriculture, Rajarata University of Sri Lanka, Anuradhapura 50000 Sri Lanka.

Abstract

Most of the dry zone forests in Sri Lanka are arisen after unsustainable farming practices. Therefore, the natural regeneration of plant species in these forests reported to be very poor due to the reduced soil fertility. This study was conducted to find possible measures for the successful seed germination and seedling establishment of common dry zone forest tree species by sustainable soil fertility management. A pot trial was carried out in a greenhouse at the Faculty of Applied Sciences, Rajarata University, Mihintale, Sri Lanka. The experiment comprised of 128 pots and four replicates. Pots were assigned with different soil fertility managements: T0: control (Top soil only), T1: Arbuscular mycorrhizal fungi (AMF), T2: a traditional mixed microbial culture (Jeewamurthum), T3: Compost, T4: Biochar, T5: T1+ T2, T6: T1+ T3, T7: T1+ T4; and different forest plant species: *Manilkara hexandra*, *Feronia limonia*, *Pterospermum conscens*, and *Bauhinia racemosa*. Seed germination percentage was measured two weeks after sowing, and shoot biomass, relative plant growth rate, and AMF colonization percentage were measured after four months of germination. The results revealed that inoculation of AMF enhance the seed germination percentage of all the selected plant species. Both sole and combined application of AMF and compost gives more benefits to all the tested plant species by enhancing all the measured growth parameters. The findings of present study would be useful in reforestation programs of dry zone forests in Sri Lanka by practicing sustainable procedures.

Genetic Characterization Of *Escherichia Coli* O157: H7 Isolated From Meat In Tlemcen “Algeria”

Barka Mohammed Salih*, Cherif-Anntar Asma

Institute of applied sciences and techniques, Tlemcen University, Algeria

*Corresponding author

Abstract

In this study, we were interested in search of *E. coli* O157: H7, Shiga-toxin producing (STEC) in 230 samples of meat from different market located in Tlemcen city, Algeria. After enrichment and use of selective agents (Sorbitol Mac Conkey medium added with MUG supplement) that are intended to curb the growth of the annex flora, we have isolated 5 strains from meat. These strains presented the main characteristics of *E. coli* O157: H7, non sorbitol fermenting and negative β -Dglucuronidase, were biochemically tested for confirmation by the API 20E, and subjected to slide agglutination with the the *E. coli* Latex kit O157:H7. Genetic characterization revealed that all strains possess the genes *stx2* and *ehxA* hemolysin, one strain does not possess the *eae* gene for intimin but instead it is the only strain that has the gene *stx1*. The study of the resistance of the strains to antibiotics disclosed they are sensitive to all antibiotics tested, ampicillin (10 μ g), chloramphenicol (30 μ g), gentamycin (10 μ g), colistin 10 μ g, flumequin (30 μ g), enrofloxacin (5 μ g), nitrofurantoin (300 μ g), cephalotin (30 μ g), sulfamethoxazole-trimethoprim (1.25/23.75 μ g), nalidixic acid (30 μ g), norfloxacin (10 μ g), ofloxacin (5 μ g), kanamycin (30 μ g), neomycin (30 μ g), ceftiofur (30 μ g) and tetracycline (30 μ g). Isolates were classed as sensitive or resistant to each antibiotic according to the *Clinical and Laboratories Standards Institute (formally NCCLS) guidelines (NCCLS, 2003)*. *E. coli* strain ATCC 25922 was used for quality control.

Keywords: *E. coli* O157: H7, meat, *stx1*, *stx2*, antibiotics

The Ferritin in the Aquatic Products

Semra Küçük

Adnan Menderes University, Faculty of Agriculture, Department of Aquacultural Engineering, South Campus, 09100, Aydın/Turkey

Abstract

The aquatic productions are ones of the important world food sources on the Earth. The balance of their nutrient composition should be struggled to protect for living things on the world, even humanity future as a healthy individual in their life. Ferritin is a vital protein complex, which is a non-toxic form in order to dissolve and save the iron in a body. If it is necessary, ferritin is used to transfer or collect iron element in the fish body in order to increase growth rate, immune system activities, and reproduction. But, the iron could be produced some different forms in fish blood and they can regenerate negative effects to DNA and structure protein and it could be fatal to fish. Also, some factors cause increase or decrease the ferritin amount in fish blood. In this study, it is given more detail information about the definition, mechanism, functions of ferritin and indicating the last previous studies being conducted on the ferritin in the aquatic products.

Key Words: *Aquatic products, Ferritin, Aquaculture*

Akuatik Ürünlerde Ferritin

Özet

Yeryüzünde dünyanın önemli gıda kaynaklarından bazıları akuatik ürünlerdir. Besin kompozisyon dengesi dünyada yaşayan organizmalarda korunma mücadelesindedir. Hatta, insanlığın geleceğinde sağlıklı bireyler olarak ferritin, toksik olmayan bir form olup demirin vücutta çözünüp saklanabildiği önemli bir protein kompleksidir. Eğer, gerekli ise ferritin, demir elementini balık vücudunda transfer etmek veya biriktirmek için büyüme oranı, bağışıklık sistemi aktivitesi ve üremeyi artırmakta kullanılır. Fakat ferritin balık kanında bazı farklı formlarda bulunabilir ve bunlar DNA ve yapısal proteinlere balıklarda tekrar tekrar negatif etkiler oluşturabilir ve balıklarda belki ölümcül olabilirler. Bazı faktörler ise balıkların kanında ferritin seviyesinin yükselip düşmesine sebep olurlar. Bu çalışmada, ferritinin tanımı, mekanizması ve fonksiyonları ve akuatik organizmalar için ferritin kullanımı üzerine önceden yapılmış çalışmalar hakkında detaylı bilgiler verilmiştir.

Molecular analysis of the presence of Potato leafroll virus and Potato virus X

Muhammed Rafiq Hafiz¹, Şerife Topkaya¹

¹Plant Protection, Agricultural Faculty, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

Potato is among the most important agricultural products in the world and is a plant species that is susceptible to more than 50 virus types in natural conditions. In this study, 298 leaf samples collected from areas where potato production is intense in Afyon, Nevşehir and Bolu provinces were used to determine the viruses affecting potato production in the region. In order to detect the presence of *Potato leafroll virus* (PLRV), *Potato virus X* (PVX) from leaves of potato plants showing virus symptoms, total RNA was isolated. After complementary DNA (cDNA) treatment with the obtained RNAs, they were subjected to RT-PCR using virus-specific primers. Of the 298 leaf samples tested, 43 were infected with PLRV (14.42%) and 3 with PVX (2.82%). 18 (16.21%) samples in Afyon, 11 (11.22%) in Nevşehir and 14 (15.73%) samples in Bolu province were found to be infected with PLRV. PVX was detected in 2 (1.80%) samples in Afyon and in 1 (1.02%) sample in Nevşehir. PVX infection was not detected in Bolu province. Some isolates with positive results were sent for direct sequence analysis and their phylogenetic relationships were determined by comparing the obtained sequence data with the isolates registered in GenBank. The partial sequence of 337 nucleotide CP regions of a total of 5 PLRV isolates, 2 from Niğde and 3 from Afyon, was obtained. Sequences obtained according to the sequencing result showed 99-100% nucleotide similarity with reference PLRV isolates. PLRV has been detected intensively in Afyon, Bolu and Nevşehir provinces, and the persistent transfer of the virus from field to field with more than 10 aphids and from year to year with infected tubers plays an important role in its spread.

Key Words: *Afyon, Bolu, Nevşehir, Potato leafroll virus, Potato virus X*

Potato leafroll virus ve Potato virus X' in Varlığının Moleküler Olarak Analizi

Özet

Patates, dünyada en önemli tarımsal ürünler arasında yer alır ve doğal koşullarda 50'den fazla virüs türüne hassas bir bitki türüdür. Bu araştırmada, Afyon, Nevşehir ve Bolu illerinde patates üretiminin yoğun olarak yapıldığı alanlardan toplanan 298 yaprak örneği, bölgede patates üretimini etkileyen virüslerin belirlenmesi için kullanılmıştır. Virüs semptomu gösteren patates bitkilerinin yaprakları, *Potato leafroll virus* (PLRV), *Potato virus X* (PVX)'nin varlığını tespit etmek amacıyla, toplam RNA izolasyonu yapılmıştır. Elde edilen RNA lar ile tamamlayıcı DNA (cDNA) işleminden sonra virüs-spesifik primerler kullanılarak RT-PCR işlemine tabi tutulmuştur. Test edilen 298 tane yaprak örneğinin 43'si PLRV (%14.42) ve 3'ü PVX (%2.82) ile enfekteli bulunmuştur. Afyon'da 18 (16.21%), Nevşehir'de 11 (11.22%) ve Bolu ilinde 14 (15.73%) örnek PLRV ile enfekteli olarak bulunmuştur. PVX ise Afyon'da 2 (1.80%) ve Nevşehir'de 1 (1.02%) örnekte tespit edilmiştir. Bolu ilinde ise PVX enfeksiyonu tespit edilmemiştir. pozitif sonuc veren bazı izolatlar direkt sekans analizine gönderilmiş ve elde edilen sekans verilerinin GenBank'a kayıtlı izolatlarla karşılaştırılması yapılarak filogenetik ilişkileri belirlenmiştir. Niğde ilinden 2 ve Afyon ilinden 3 PLRV izolatı olmak üzere toplam 5 tane PLRV izolatının 337 nükleotidlik CP bölgesinin kısmı sekansı elde edilmiştir. Sekans sonucuna göre elde edilen sekanslar, referans PLRV izolatları ile %99-100 oranında nükleotid benzerliği göstermiştir. PLRV Afyon, Bolu ve Nevşehir illerinde yoğun olarak tespit edilmiş ve etmenin 10'dan fazla afid ile persistent olarak tarladan tarlaya ve enfekteli yumrularla yıldan yıla taşınması yayılmasında önemli rol oynamaktadır.

Abstract

It was investigated whether *Justicia carnea* leaf meal (JLM) could improve the performance and immunoglobulins of broiler chickens fed diets contaminated with aflatoxin (AF). A total of 240 broiler chickens were randomly distributed (60 birds/treatment; 10 birds/replicate) into 4 treatments (Diet 1: No supplementation; Diet 2: 0.5mg/kg AF; Diet 3: 0.5mg/kg AF+ 250mg/kg JLM; Diet 4: 0.5mg/kg AF+ 500mg/kg JLM) in a 42 day feeding trial experiment. The final body weight and body weight gain recorded for birds fed diets 3 and 4 were higher ($P<0.05$) than in diets 1 and 2. The final body weight and body weight gain were significantly ($P<0.05$) lower in diet 2 compared to the rest diets. The feed intake of birds in diet 2 was significantly ($P<0.05$) lower than in diet 1 and the rest treatment groups. The immunoglobins A, E, G and M of the broiler chickens fed AF contaminated diet (diet 2) reduced ($P<0.05$) compared to the control (diet 1); however, there were improved ($P<0.05$) immunoglobins concentration in the birds fed the AF contaminated and JLM supplemented diets (diets 3 and 4), compared to diet 2. The 0.5 mg/kg AF dietary contamination impaired the body weight gain, feed intake and immunoglobulin level of the broiler chickens. However, the 250mg/kg and 500mg/kg JLM dietary supplementation ameliorated the effect of the toxin on the performance characteristics and immunoglobulin levels of the broiler chickens.

Determination Of Chemical And Microbiological Quality In Commercial Tahini Samples

Zeynep Kilci¹, Ramazan Ulku Cetin²

¹ Department of Food Processing, Vocational School of Susurluk, Bandirma Onyedi Eylul University, Balıkesir, Turkey

²Department of Food Processing, Vocational School of Susurluk, Bandirma Onyedi Eylul University, Balıkesir, Turkey

Abstract

Tahini samples from 10 different brands were gathered for this study from vendors and stores that sell it in Balıkesir and Bursa. Samples were taken from two different lot numbers for each company. As a result of the analyzes made on the tahini samples, it was determined that the total oil amount of the samples changed between 49.76-58.7%, the salt amount changed between 0.001-0.0027%, the ash amount was between 1.02%-1.28% and the moisture value was between 1.1-1.5%; an average of 75 cfu/g viability was found after microbiological cultivations in which the presence of yeast and mold were examined, although none of the tahini samples had any samples that were contaminated with *Escherichia coli*, *Staphylococcus aureus*, or *Salmonella* spp. One of the tahini samples was not found in accordance with the Turkish Food Codex Tahini Communiqué in terms of the amount of oil. It is concluded that 90% of the samples were manufactured in line with the TGK when the results of the chemical and microbiological analyses were combined.

Piyasada Satılan Tahin Örneklerinde Kimyasal Ve Mikrobiyolojik Kalitenin Belirlenmesi

Özet

Bu çalışma kapsamında Balıkesir ve Bursa illerindeki üreticilerden ve ticari olarak satış yapılan marketlerden 10 farklı markaya ait tahin numunesi toplanmıştır. Numuneler her bir firma için iki farklı parti numarasından olacak şekilde alınmıştır. Tahin numunelerine yapılan analizler neticesinde örneklerin toplam yağ miktarının %49.76-58.7, tuz miktarının %0.001-0.0027, kül miktarının %1.02-1.28, nem değerinin %1.1-1.5 aralığında değiştiği; maya ve küf varlığının analiz edildiği mikrobiyolojik ekimler sonucunda ortalama 75 kob/g canlılık belirlenirken tüm tahin numuneleri içerisinde *Escherichia coli*, *Staphylococcus aureus*, *Salmonella* spp kontamine olmuş örnek bulunmadığı tespit edilmiştir. Tahin numuneleri içerisinde bir firmaya ait tahin örneği yağ miktarı açısından Türk Gıda Kodeksi Tahin Tebliği'ne uygun bulunmamıştır. Kimyasal ve mikrobiyolojik analiz sonuçları bir arada değerlendirildiğinde numunelerin %90'ının TGK'ya uygun kalitede üretildiği yorumlanmaktadır.

Determination Of Chemical And Microbiological Quality In Commercial Tahini Halva Samples

Zeynep Kilci¹, Ramazan Ulku Cetin²

¹ Department of Food Processing, Vocational School of Susurluk, Bandirma Onyedi Eylul University, Balıkesir, Turkey

²Department of Food Processing, Vocational School of Susurluk, Bandirma Onyedi Eylul University, Balıkesir, Turkey

Abstract

40 samples of tahini halva from 5 different firms, in 4 distinct varieties—plain, hazelnut, carob, and vanilla—were gathered for this study from producers in the provinces of Balıkesir and Bursa as well as from commercial markets. Samples were taken from two different lot numbers for each company. As a result of the analyzes made on the tahini halva samples, it was determined that the total amount of sesame oil varied between 24.67-38.87%, the total amount of tahini ranged between 59.34-69.7%, the total moisture amount was between 0.1-0.9%, the total ash amount was 0.089-3.16%, and the total salt amount was between 0.001-0.024%; as a result of microbiological cultivations in which the presence of yeast and mold were analyzed, an average of 10 cfu/g in plain tahini halva samples, an average of 90 cfu/g in hazelnut tahini halva samples, an average of 45 cfu/g in carob tahini halva samples, and an average of 25 cfu/g in vanilla tahini halva samples were determined. All samples of tahini halva were found to be free of contamination with *Salmonella* spp., *Staphylococcus aureus* or *Escherichia coli*. When all of these findings were taken into consideration, it was found that one of the sampled firms did not produce in accordance with the Turkish Food Codex Communique on Tahini Halva (2015/28) in terms of total sesame oil (%) and ash content (%) of two companies. Combined, the findings of the chemical and microbiological analyses indicate that 85% of the samples were prepared in line with the TFC.

Piyasada Satılan Tahin Helvası Örneklerinde Kimyasal Ve Mikrobiyolojik Kalitenin Belirlenmesi

Özet

Bu çalışma kapsamında Balıkesir ve Bursa illerindeki üreticilerden ve ticari olarak satış yapılan marketlerden; sade, fındıklı, keçiyoynuzlu ve vanilyalı olmak üzere 4 farklı çeşitte ve 5 farklı firmaya ait toplam 40 tahin helva numunesi toplanmıştır. Numuneler her bir firma için iki farklı parti numarasından olacak şekilde alınmıştır. Tahin helvası numunelerine yapılan analizler neticesinde toplam susam yağı miktarının %24.67-38.87, toplam tahin miktarının %59.34-69.7, toplam nem miktarının %0.1-0.9, toplam kül miktarının %0.089-3.16, toplam tuz miktarının %0.001-0.024 aralığında değiştiği; maya ve küf varlığının analiz edildiği mikrobiyolojik ekimler sonucunda sade tahin helvası numunelerinde ortalama 10 kob/g, fındıklı tahin helvası numunelerinde ortalama 90 kob/g, keçiyoynuzlu tahin helvası numunelerinde ortalama 45 kob/g, vanilyalı tahin helvası numunelerinde ortalama 25 kob/g canlılık belirlenirken tüm tahin helvası numuneleri içerisinde *Escherichia coli*, *Staphylococcus aureus*, *Salmonella* spp kontamine olmuş örnek bulunmadığı tespit edilmiştir. Tüm bu sonuçlar değerlendirildiğinde numune alınan firmalardan bir tanesinin toplam susam yağı (%), iki firmanın ise kül miktarı (%) değeri açısından Türk Gıda Kodeksi Tahin Helvası Tebliği (2015/28)'ne uygun üretim yapmadığı belirlenmiştir. Kimyasal ve mikrobiyolojik analiz sonuçları bir arada değerlendirildiğinde toplanan numunelerin %85'inin TKG'ya uygun kalitede üretildiği yorumlanmaktadır.

Abstract

This study assessed the proximate composition, sensory quality and consumer acceptability of beef sausage fortified with edible meat waste. Lean beef and edible meat waste (EMW) samples were obtained from commercial abattoir and combined in ratio 50:50 and 70:30 and designated as T1 and T2 respectively, while CT contained 90% lean meat and 10% fat. The fresh T1, T2 and CT sausages were thermal processed using microwave and oven-grilling cooking methods. The results showed significant difference in moisture, protein, lipid and ash content of raw and cooked sausages across treatments ($p < 0.05$). Raw sausage fortified with EMW had higher protein and lower lipid contents compared to control treatment (90/10, CT). Cooking of the sausage significantly decreased moisture and increase lipid, protein and lipid content, with microwaved sausage having higher values. The results of sensory quality showed that beef sausage fortified with EMW were all acceptable to consumers, irrespective of the cooking methods used. The distribution of consumers who liked the appearance, colour, texture and flavour of the sausage meat containing EMW were higher than those who dislike the products. Therefore, this study shows that EMW could be successfully used in meat industry to improve quality of sausage during production.

Keywords: *Edible meat waste, fat replacer, meat sausage, nutritional content, sensory quality*

Introduction

Throughout the continent, one or more processed meat products such as sausage, nuggets and meatball are extensively consumed on daily basis, although they may be costly at times (Elbakheet et al., 2017, Carballo, 2021). To ensure consistent availability of these products including sausage, researchers are working hard to reduce the cost of production by producing different varieties without compromising their nutritional and sensory quality (Hall, 2015; Carballo 2021). The processing of sausage involves the addition of different food components (ground lean meat, animal fat, salt, spices, and other flavouring ingredients) that could enhance digestibility and human well-being (Alao et al., 2021). The combination of these components also provide functional properties that improve the structure, nutritional and health qualities of the finished products (Fernández-Ginés et al., 2005). Processing of animal carcass at the abattoir involves the production of substantial amount of edible animal by-products/wastes which could be blended with lean meat to make good sausages and reduce cost of production (Alao et al., 2017). In fact, some studies have revealed that some edible by products such as liver and blood could be used either partly or wholly during the making of sausage meat (Estévez et al., 2005; Yun-Sang and Cheon-Jei, 200; Amaral et al., 2013; Silva et al., 2013). The blending of lean meat with offals (liver, kidney, heart) and other meat products (edible meat waste) can also provide a rich animal protein with a better flavour. In Finland, liver sausage is considered appealing and approved by the general public whereas liver pâté's are customarily prepared in France and Spain (Estévez et al., 2005). In this regard, the act of using edible meat by products in meat processing has been very effective in producing sustainable meat production system (Jayathilakan et al., 2012; Lobato et al., 2014).

However, the amount of the edible meat by-products that has been utilized is to a greater degree smaller as compared to the amount produced at the abattoir. An example is the recovery of edible meat waste for sausage production (Alao et al., 2021). The edible meat waste refers to meat waste generated during the cutting and trimming of the meat at processing unit in the abattoir (Alao et al., 2021). This edible meat waste possess inherent capability to be used on a large scale in the meat processing industry for value-addition without any threat to nutritional content and consumer's acceptability (Alao et al., 2021).

After production, different culinary methods such as grilling, microwave cooking, oven grilling and frying are employed for cooking sausages (Singh et al., 2015; Adam and Abugroun, 2015). The type of cooking methods used usually contribute to the adhesion properties, tenderness and sensory properties of the sausage meat (Obuz et al., 2003; Koziol et al., 2016). Although the consumers' decision and overall judgement are influenced by the tenderness of meat and other factors such as flavour, juiciness, appearance, price, colour and food safety (Troy and Kerry, 2010). Therefore, the objective of this study was to determine the nutritional content, sensory quality and consumer acceptability of sausage meat fortified with edible meat wastes and thermal treated using microwave and oven-grilling cooking methods.

Materials and methods

Study Site and ethical statement

The study was carried out in Meat Science laboratory, Department of Livestock and Pasture Science, University of Fort Hare, South Africa. Before the commencement of the experiment, permission was obtained and approved by the University of Fort Hare's Research Ethics Committee (UREC) with certificate reference number MUC341SBAB01.

Sample Collection and Beef Sausage Production

The lean beef meat and edible meat waste (EMW) for production of the novel beef sausage were collected separately from slaughtered cattle at the commercial abattoir in East London in Eastern Cape Province of South Africa. The fresh meat samples were stored in a cooler box and transported immediately to Meat Science laboratory for sausage production. In production of sausage, the lean beef and edible meat waste samples were combined in ratio 50:50 and 30:70 and designated as T1 and T2 respectively, while the control contained 90% lean meat and 10% fat as CT. Each meat sample was spiced, mixed and minced through a 5mm plate using a mincer (TC22 EL ELEG.PLUS, Italy) and processed within 24 hours following their storage at 4°C. The meat samples were then pumped and stuffed lightly into 25mm diameter sheep sausage casing (Freddy Hirsch Company, Capetown, South Africa) with Tre-spade sausage filler tool.

The meat samples were thermal processed using microwave and oven-grilling cooking methods. In microwave method, fresh sausage samples (T1-MW, T2-MW and CT-MW) were cooked at 80°C for 4min. During oven-grilling (T1-OV, T2-OV and CT-OV), doneness was determined by inserting a probe thermometer (Thermo-pro TP- food thermometer) into geometrical centre of the sausage to measure its internal temperature. The samples were considered done when the digital thermometer gave an alarm and flashed green light. The samples were cooled at room temperature, vacuumed packed and stored at 80°C until the laboratory analysis was carried out.

Determination of proximate content and Warner-Bratzler shear force (WBSF)

The raw and cooked meat samples were analysed in triplicates for determination of moisture, ash, fat and crude protein content using method described by AOAC. Warner-Bratzler shear force (WBSF) values were determined on meat samples as indicators of tenderness using instron machine. Coring was obtained using hand-held coring device to make round core of about 10mm from the cooked samples. About 3 core was obtained at the center of each sample of the sausage. Shearing was done using Warner-Bratzler shear machine, with the speed of 400mm/min. The thickness of the vee-shaped cutting blade was about 1.02mm. The cored sausage was placed on the machine and cutting blade was used to cut through the sample. The maximum force (N) required to shear for each specimen was measured and the mean was recorded for tenderness.

Sensory Analysis of the meat sausage

A total of 60 untrained panellists (staff and students) were recruited and asked to rate their attributes on a 9-point hedonic scale, with 1 being "disliked extremely" and 9 being "liked extremely" in the middle "neither like nor dislike". The six most widely used sausage sensory characteristics were selected and panelists were asked to score each sample for overall likeness as well as the acceptability of appearance, flavour, taste, texture, and juiciness using a 9 hedonic scale. Before evaluation, the sausages were cut into slices of approximately 4 mm thickness and served at room temperature on white paper plates. The sausage samples were named according to their mixing ratio and cooking methods. Fresh clean water was provided for rinsing the palate before each sample was tested. For each sample, the panellists were expected score the overall acceptability as well as the acceptability of appearance, flavour, taste, hardness and juiciness.

Statistical analysis

The Statistical Analysis System (SAS version 9.1.3 of 2007) was used for all the analyses. PROC GLM procedure of SAS was used to consider the effects of the types of cooking used (microwave and oven-grill) and meat type (90/10, 30/70, and 50/50) on the nutritional content and tenderness of beef sausage. Significant differences between the least square means for cooking methods were performed using the Fishers' least significance difference (LSD) method of SAS, with a significance level of $p < 0.05$. Data generated on sensory quality were analysed and summarized as frequencies of respondent profiles on consumer's acceptability.

Results and Discussion

Sausage meat is one of the most widely utilized meat products among all processed meats because they can easily be produced from different meat types and varieties of meat products including edible meat waste and edible offal (Alao et al., 2021). The result of the proximate analysis of the uncooked and cooked meat sausage is presented in Table 1 and 2. The moisture content of the uncooked sausage ranges from 63.54 to 70.34% with CT (90/10 meat sausage) having the highest value (70.34%, Table 1, ($P < 0.01$)). The increase in moisture content of the T3 may be attributed to the presence of higher amount of lean meat (90%) compared to other treatments. Study has showed

quality sausage with high lean meat tend to have higher moisture content compared to less lean meat sausage (Cashman, 2017; Cunningham et al., 2015). This results is in contrast with finding of Youssef et al. (2012) who reported that high-fat patties had lower moisture content than low-fat patties. In Table 2, the cooked sausages treatments had the lowest moisture contents which ranged from 53.36 to 56.3% compared to the uncooked sausage ($P < 0.01$). The results indicated that, uncooked sausage contained higher level of moisture than cooked sausage. The decline in moisture content can be as a result of evaporation during the cooking process as the temperature rises (del Pulgar et al., 2012). Earlier study has shown that majority of water loss during cooking is due to temperature-induced denaturation or structural changes in meat proteins (Pang et al., 2021). This result is in agreement with report of Youssef et al. (2012) who found that cooked meat sampled had lower moisture content compares to uncooked samples. Also, the results from this study also showed that cooking methods had a significant effect on moisture content of the sausages ($P < 0.01$). The oven-grilled samples had the highest moisture contents (57.55%) as compared to microwaved samples (51.37%). It was also observed that the interaction of sausage treatment with cooking methods was significant at $P < 0.01$ with the water content of the treatments. This result is similar to report of Janicki and Appledorf (2007) who found that beef patties cooked by microwave had lower moisture content than other cooking methods.

The amount of lipid content in raw sausages for T1 (30/70), T2 (50/50) and C3 (90/10) were 11.29%, 7.49% and 13.91%, respectively, with T3 having the highest value (Table 2). This is suggesting that edible meat wastes used in this study as fat replacer contain moderate amount of lipid content compared to animal fat used. Moreover, the value of lipid recorded in this study fall within the range of standard fat content for meat sausage (Lee et al. 2015). In comparison with raw sausage, cooking methods increased the lipid content of meat sausage with microwaved samples having higher content (13.05%) than oven-grilled samples (8.58%)(Table 2). The increase of lipid content in the microwaved sausage can be attributed to its ability to reduce moisture loss and increase amount of extractable lipids in the muscle samples compared to other cooking methods. This result is in line with findings of Alfaia et al. (2010) who reported a significant differences ($p < 0.01$) in total lipid content of microwaved sausage compared other treatments. In contrast, Janicki and Appledorf (2007) and Youssef et al. (2012) reported that meat samples cooked using microwave and grilling, respectively, had lower fat content compared to other cooking method. Generally, different studies have shown that cooking and cooking methods can increase the lipid and protein content of meat compared to uncooked meat (Cunningham et al., 2015; Falowo et al., 2017).

The ash content of the raw sausage significantly increased in T1 (4.41%) and T2 (4.38%) compared to CT (3.64%). Ash value is known as a pointer of total mineral content in a sample. This result is suggesting that sample T1 and T2 could possessed more mineral content than sample T3. However, the value of ash increased in the cooked sausage treatments with T1 (30/70), T2 (50/50) and CT (90/10) having 5.47%, 5.79% and 8.71%, respectively ($P < 0.01$). This is indicating that cooking could lead to significant changes in ash content of meat samples. For instance, cooking with a microwave (5.06%) and oven-grilling (8.25%) increased the ash content of the cooked sausage. These results are in agreement with Lopes et al. (2015) who reported that microwave and grilling are dry cooking methods and may be responsible for greater retention of ash compared to other cooking methods that involved cooking in water.

The protein content in the uncooked sausages was significantly higher in T1 (30/70) 13.9% and T2 (50/50) 19.34% compared to CT (90/10) 11.02%. This is unexpected as protein content in CT should be higher since it contained larger proportion of lean meat than other treatments. This is suggesting that edible meat wastes are rich in nutrient and could be used to enhance the nutritional quality of meat sausage. The results further showed that cooking significantly increased the protein content of the meat sausages with T1 (26.13%) and T2 (26.17%) having the higher values compared to CT (21.04%)($P < 0.01$). This showed that cooking and cooking methods had a significant effect on the protein retention in the meat samples. These results are similar to the findings of Youssef et al. (2012), Cunningham et al. (2015) and Karimian-Khosroshahi et al. (2016) who reported that cooking reduces moisture content and subsequently increase the concentration of lipid and protein.

Figures 1abc and 2abc show the results obtained from the sensory analysis and indicates the differences between the appearance, colour, texture, flavour and overall acceptance attributes of the sausage meats containing edible meat waste and control treatment. The results revealed that sausages containing edible meat waste were all acceptable to the consumers, irrespective of the cooking methods used, when compared to control treatment. This result is in accordance with findings of Magoro et al. (2020) who reported no significant difference in sensory quality of sausage meat formulated with edible offal compared to control group. However the distribution of those who liked the appearance, colour, texture and flavour of the sausage meat were higher than those who dislike the products. This indicates that edible meat wastes can be successfully used in meat industry to replace fat in sausage production. Also, report has shown that edible meat waste consists of carbohydrates, proteins and fat based constituents that are needed for fat substitutes in sausage production (Weiss, 2010). Furthermore, the percentage of consumers who liked T1-MW (84.7%) were higher than those of T2-MW (65.5%) but comparable to those on T1-MW (83.1%)(Table 1). The decrease in acceptability of T2-MW may be as a result of aroma of the edible meat waste which may affect the sensory attributes and thus, reduce the acceptability of the sausage (Alao et al. 2021). Similarly, the percentage of consumers that liked T1-OV (56.1%) were the same with that of T2-OV (56.9) (Table1) but lowered than those of CT-OV. This suggests the consumers preferred microwaved meat sausage more than the oven-grilled sausages. However, the tenderness of sausage treatments are significantly different from one another at $P < 0.01$ and there was an interaction between the tenderness of the sausage samples and cooking methods at $P < 0.01$ (Figure 3). The texture and overall acceptability of sausages formulated with edible meat waste were all tender and acceptable by panelists,

Table 1: Proximate composition of raw sausage made with edible meat waste as fat replacer

Parameters	Sausage Type				
(%)	CT (90/10)	T1 (30/70)	T2 (50/50)	SEM	P-Value

CT 90/10 (Control, 90% lean beef +10%Fat), T1 50/50 (50% lean beef+50% edible meat waste), T2 30/70 (30% lean beef+70% edible meat waste)

Conclusion

Sausage is one of the important meat products that are in high demand throughout the world and this is likely to increase in the coming years. Unfortunately, the cost of the meat products such as sausage are sometimes on the high side. The results of the study also showed that, edible meat waste could be successively as fat replacer in beef sausage production without compromising its nutritional quality. The use of microwave during cooking will help to preserve the nutritional content of meat. Furthermore, this study has shown that the replacements of fat with edible meat waste in sausage production has overall acceptance in most of the attributes scored (colour, appearance, taste, texture and flavour) and these were above the desirable average. Thus, the utilization of the edible meat waste in production of sausages has the potential to increase profitability in meat industry and minimise meat waste in the industry.

Wide Temperature Range Palm-Based Chocolate Spread

Norazura Aila Mohd Hassim¹ and Sivaruby Kanagaratnam¹

¹Food and Feed Technology Unit, Malaysian Palm Oil Board, Kajang, Malaysia

Abstract

The study screened blended base oils (various ratio of palm superolein (POOo) and sunflower oil (SFO)) and waxes (0% - 3.5% sunflower wax (SFW), carnauba wax (CW) and bees wax (BW)) for the production of chocolate spread at wide range of temperature (5°C-45°C). Main parameters for the blended base oil screening were solid fat content (SFC) as well as hardness and spreadability of the chocolate spread from the blended base oils. Main parameters for the waxes screening were SFC of the selected blended base oil and waxes as well as hardness, spreadability and stability of chocolate spread containing selected blended base oil with different percentage of wax (OSW). Blended oil of POOo: SFO at 50:50 ratio was chosen as base oil as its SFC does not affected by temperature and its chocolate spread was still spreadable at 5°C and projected hardness of below commercial chocolate spread at 5°C. Chocolate spread produced from OSW of 3.5% SFW and 3.5% CW showed promising and positive results of spreadability at 5°C, hardness at 5°C as well as stability structure (no oiling out) at 5°C-40°C after 24 hr of storage. The SFC of OSW with 3.5% SFW showed constant trend at experimental temperatures of 5°C-45°C while the SFC of 3.5% CW showed constant trend at experimental temperatures of 15°C-40°C.

Key Words: *Sunflower wax, Carnauba wax, Bees wax, spreadability, phase separation*

Optimization of Nucleic Acid Isolation in High-Fat Dairy Products

Erdem Artuvan¹, Salih Aksay²

¹Mersin Food Control Laboratory Directorate, Gazi Mh. 1314 Sk. No:9 33140 Yenişehir/Mersin/TURKEY

² Mersin University, Food Engineering Department, 33343 Çiftlikköy/Mersin/TURKEY

Abstract

Butter and cream are dairy products produced with milk fat and consumed heavily by consumers. Butter produced from sheep, goat and cow milk and their mixtures, and cream products produced from buffalo and cow milk and their mixtures are available in the market and find buyers at high prices. Extraction of nucleic acids to be analyzed is a very important step in Real Time PCR methods, which directly affects the result. It is necessary to obtain isolates of sufficient quality and concentration for PCR in products containing high fat and undergoing certain processes such as butter and cream. Commercial kit methods available on the market can sometimes be insufficient for products with high oil content. In the study, nucleic acid isolations were made in goat butter product with isolation kits belonging to Biotecon, Roche and Promega brands. During the isolations, it is aimed to increase the isolation efficiency by making changes in the parameters of extraction temperature, extraction time and sample amount. It is aimed to determine the optimum isolation conditions and to use these conditions in further analyzes to determine the Real Time PCR based origin determination and % milk mixture ratios in future studies.

Key Words: *Nucleic acid; Butter; Cream; Cow's milk; Goat's milk*

Yüksek Yağ İçeren Süt Ürünlerinde Nükleik Asit İzolasyonu Optimizasyonu

Özet

Tereyağı ve kaymak, süt yağı ile üretilen ve tüketiciler tarafından yoğun şekilde tüketilen süt ürünleridir. Koyun, keçi ve inek sütlerinden ve bunların karışımlarından üretilen tereyağları ile manda ve inek sütlerinden ve bunların karışımlarından üretilen kaymak ürünleri piyasada bulunmakta ve yüksek fiyatlarla alıcı bulmaktadır. Analizi yapılacak nükleik asitlerin özütlenmesi, Real Time PCR metotlarında, sonucu direkt etkileyen, oldukça önemli bir basamaktır. Tereyağı ve kaymak gibi yüksek yağ içeren ve belirli proseslerden geçmiş ürünlerde, PCR için yeterli kalitede ve konsantrasyonda izolatların elde edilmesi gerekmektedir. Piyasada bulunan ticari kit metotları yüksek yağ içeren ürünlerde kimi zaman yetersiz olabilmektedir. Yapılan çalışmada, Biotecon, Roche ve Promega markalarına ait izolasyon kitleri ile keçi tereyağı ürününde nükleik asit izolasyonları yapılmıştır. İzolasyonlar sırasında özütleme sıcaklığı, özütleme süresi ve numune miktarı parametrelerinde değişiklikler yapılarak, izolasyon verimlerinin artırılması hedeflenmiştir. Optimum izolasyon şartlarının belirlenmesi ve bu şartların, daha sonraki çalışmalarda, Real Time PCR temelli orijin tayini ve % süt karışım oranlarının belirlenebilmesine yönelik ileri analizlerde kullanılabilmesi amaçlanmıştır.

Anahtar Kelimeler: *Nükleik asit; tereyağı; kaymak; inek sütü; keçi sütü*

Giriş

Süt lipitleri, sütün, kloroform, benzen, eter, petrol eteri vb. organik çözücülerde çözünen fakat suda çözünmeyen, hayvan hücrelerinde sentezlenen doğal bir besin ögesidir. Süt lipitleri genellikle süt yağı veya trigliseritler ve lipitler veya minör lipitler olmak üzere 2 grupta incelenir (Metin, 2001).

Süt yağı, yağ asitlerinin, 3 değerli bir alkol olan gliserin ile oluşturduğu trigliserit esterleridir. Süt yağı, süt lipitlerinin %98-99'unu oluşturur.

Süt yağından krema, tereyağı, kaymak, lüle kaymağı gibi bazı ürünler elde edilir. Sütün santrifüje edilmesiyle veya kendi halinde bırakılmasıyla elde edilen ve en az %18 süt yağı içeren süte krema, en az %82 süt yağı içeren ve içerisinde süt yağından başka yağ bulunmayan süt ürününe tereyağı, kaynatılmış sütün yüzey alanı geniş bir kapta bekletilmesi ile elde edilen süt yağınca zengin ve başka yağ içermeyen ürüne kaymak ve manda sütünden özel bir yöntemle elde edilen süt yağınca zengin ürüne lüle kaymağı denilmektedir (Metin, 2001).

Tereyağı ve kaymağın ekonomik değerini ve popülaritesini üretildikleri sütün orijini belirlemektedir. Örneğin keçi tereyağı, inek tereyağına göre oldukça değerlidir. Keçi sütü, özellikle çocuk ve yaşlı bireylerin beslenmesinde, fizyolojik rahatsızlıkların düzenlenmesinde ve vücut gelişiminde önemli pozitif etkilere sahiptir. Alerjenik özellikleri bakımından da keçi sütü, kendine has tadı ve lezzeti ile inek sütünün önünde yer almaktadır.

Koyun tereyağı da keçi tereyağı gibi, anti alerjenik özelliği ve inek tereyağına kıyasla daha yüksek mineral içeriği sebebiyle tercih edilmektedir.

Koyun, keçi ve manda sütleri ile üretilmiş tereyağı ve kaymakların popülaritesi ve ekonomik değerleri, bu ürünlerde taklit ve tağşiş yapılma ihtimalini de beraberinde getirmektedir. Piyasada yoğun şekilde bulunan koyun, keçi ve manda süt ürünlerine inek sütü de karıştırılabilmekte ve karışımın oranına bağlı olmakla birlikte, tağşişin saptanması tat ve kokudan mümkün olamamaktadır (Di Pinto ve diğerleri, 2017).

PCR temelli yöntemler, hayvan türlerinin tanımlanması için, süt ürünlerinde de çok sayıda testte başarılı bir şekilde uygulanmıştır. Bu yöntemler, yüksek oranda olgunlaştırılsa bile, hem sütte hem de peynirde somatik hücrelerden çıkarılan genomik DNA'nın kalıcılığına dayanır (Artuvan & Aksay, 2022). Türlerin tanımlanması için en yaygın deneyler, türe özgü mitokondriyal DNA (mtDNA) dizilerinin PCR analizine dayanır. Aslında, mtDNA doğal olarak büyütülmüş bir genetik değişkenlik kaynağı olarak düşünülebilir. Diğer teknikler, 28S ve 18S rRNA çoklu kopya genleri veya β -kazein genleri gibi nükleer DNA sekanslarına dayanarak süt ürünlerinin hayvansal teşhisi için iyi bilinen markerlerdir. PCR temelli hayvansal orijin analizlerinde mtDNA, kaynağa özgü daha fazla gen içermesi ve nükleer DNA'ya kıyasla çeşitliliği daha fazla gen dizilimi içermesi sebebiyle tercih edilmektedir. Tek türün tespitine dayanan PCR yöntemlerinin yanında, birden fazla türü aynı anda tespit edebilen çoklu (multiplex) PCR yöntemleri, daha hızlı ve daha ekonomik orijin tayini yapılabilmesini sağlamaktadır (Bottero ve diğerleri, 2003; Lopparelli ve diğerleri, 2007; Xue ve diğerleri, 2017; Kotowicz ve diğerleri, 2007).

PCR analizlerinde analiz edilecek dizileri mtDNA açısından zenginleştirmek önemli bir avantaj olmaktadır. Bu sebeple özellikle belirli işleme proseslerinden geçmiş ürünlerde yüksek kaliteli mtDNA izolasyonu önem taşımaktadır. PCR gibi moleküler yöntemlerin süt ürünlerinde kullanılması, ürünlerdeki nükleik asitlerin verimli bir şekilde özütlenmesini hedefleyen etkili ekstraksiyon stratejileri geliştirilmesine bağlıdır. Hayvansal ürünlerden DNA izolasyonuna yönelik ticari olarak üretilmiş farklı izolasyon kitleri bulunmaktadır. Bu kitler farklı performans değerleri göstermekte ve pahalı yöntemler olabilmektedir (Liao J. ve diğerleri, 2017; Volk ve diğerleri, 2014; Sanches ve diğerleri, 2013).

PCR analizlerinde analizin ilk basamağı olan nükleik asit izolasyonu, analizin sonucunu etkileyen en önemli aşamadır (Gryson, 2010). Yeterli konsantrasyon ve kalitede nükleik asit izole edilememesi halinde zincir reaksiyonları uygun verimle gerçekleştirilemeyeceği için analiz sonucu doğru olmayacaktır (Cankar ve diğerleri, 2006). Bu amaçla, nükleik asit izolasyonuna yönelik farklı çalışmalar yapılmıştır (Artuvan & Aksay, 2022).

Özellikle GDO analizlerinde nükleik asit ekstraksiyon metodlarının karşılaştırılmasına dayanan çalışmalar (Smith ve diğerleri, 2005; Elsanhoty ve diğerleri, 2011; Turkeç ve diğerleri, 2015) göze çarpmaktadır. Bu çalışmaların dışında Liao, J. ve ark. 2017 yılında yaptıkları çalışmada, çiğ süt ve ısıtılmış süt ürünlerinde hızlı bir nükleik asit özütleme yöntemi geliştirilmesi üzerine çalışmışlardır. Çalışma sonucunda özellikle ısıtılmış süt ürünlerinde mtDNA izolasyonuna yönelik endüstride kullanılması amacıyla bir metod tanımlaması yapmışlardır (Liao J. ve diğerleri, 2017).

Liao, J. ve ark. 2016 yılında yaptıkları bir başka çalışmada süt tozundan DNA izolasyonuna yönelik bir ekstraksiyon metodu geliştirilmesini amaçlamışlardır. Çalışma sonunda geliştirdikleri metod ile süt tozunda taşıyıcının saptanması amacı ile PCR analizlerinde kullanılacak DNA'nın izole edilmesini sağlayacak bir metod optimize etmişlerdir (Liao J. ve diğerleri, 2016).

Pokorska, J. ve ark. 2016 yılında yaptıkları çalışmada, süt somatik hücrelerinden DNA izolasyonuna yönelik yeni bir metod geliştirmeye çalışmışlardır. Çalışma sonunda geliştirdikleri metod ile düşük miktarlardaki çiğ süt hücrelerinden DNA izole edilmesini sağlayacak bir metod geliştirmişlerdir (Pokorska ve diğerleri, 2016).

Volk, H. ve ark. 2014 yılında yaptıkları bir çalışmada, süttan DNA izole edilmesi amacıyla ticari izolasyon metodlarından 6 tanesi ile, ticari olmayan 3 izolasyon metodu ile ve kendi geliştirdikleri 2 izolasyon metodu ile karşılaştırma çalışması yapmışlardır. Çalışma sonucunda, kullandıkları metodlar ile izole ettikleri DNA'ların konsantrasyonlarını ve kalitelerini kıyaslamışlardır (Volk ve diğerleri, 2014).

Pirondini, A. ve ark. 2010 yılında yaptıkları bir çalışmada 7 farklı DNA ekstraksiyon prosedürünü kıyaslamışlardır. Çiğ süt, pastörize süt, UHT süt, yoğurt, krema, tereyağı ve Emmental Peynirinden DNA izolasyonu yapılmış ve DNA konsantrasyonları, kalite değerleri, agaroz jeldeki ve PCR'daki performansları karşılaştırılmıştır (Pirondini ve diğerleri, 2010).

Materyal ve Yöntem

İzolasyon çalışmalarında kullanılmak üzere, yüksek yağ içeren süt ürününü temsil etmesi amacıyla, Mersin Piyasası'ndan temin edilmiş keçi tereyağı kullanılmıştır.

Numunelerde Biotecon foodproof® Sample Preparation Kit III (BT) metoduna göre (Biotecon Diagnostics, 2016), MagNA Pure Compact Nucleic Acid Isolation Kit I (MP) metoduna göre (Roche Molecular Systems, Inc., 2012) ve Maxwell® RSC PureFood GMO and Authentication Kit (PM) metoduna göre (Promega Global, 2018) nükleik asit izolasyonları gerçekleştirilmiştir.

İzolasyon metodlarında verimi etkileyeceği düşünülen parametrelerde değişiklikler yapılmış, 3 farklı izolasyon sıcaklığı (65, 75 ve 85°C), 3 farklı numune miktarı (0.2, 0.5 ve 1 g) ve 3 farklı izolasyon süresi (30, 60 ve 120 d) seçilmiş ve bu faktörlerin verime etkileri incelenmiştir.

Shimadzu BioSpec-Nano Micro-Volume UV-Vis Spektrofotometre cihazı kullanılarak, izolatların 260 nm'deki absorbans değeri ile DNA konsantrasyonu (ng/ μ L), 260 nm/230 nm absorbans oranı ile DNA kalitesi ölçülmüştür (Manchester, 1996).

İzolasyon parametrelerinde yapılacak değişikliklerin verime etkisinin istatistiki olarak belirlenmesi amacıyla, IBM Istatistics SPSS 20.0 yazılımı ile konsantrasyon ve kalite değerlerinde tanımlayıcı istatistik testleri, varyans analizleri ve Post-Hoc testleri uygulanmıştır.

Bulgular ve Tartışma

Çalışma sırasında izolasyon sıcaklığının, izolasyon süresinin ve numune miktarının nükleik asit konsantrasyonuna olan etkisi araştırılmıştır. 3 farklı izolasyon kiti kullanılmıştır. Bu kitlerden MP (Roche Molecular Systems, Inc., 2012) ve PM (Promega Global, 2018) kitleri izolasyon robotu ile çalışan, BT (Biotecon Diagnostics, 2016) ise manuel çalışan kitlerdir. Parametreler seçilirken, kullanılan kitlerin standart metod basamaklarını da içerecek şekilde, bu basamakların altında ve üzerinde değerler tercih edilmiştir.

İzolasyon sıcaklığı olarak 65°C (kit verisinin altındaki değer), 75°C (kit verisi) ve 85°C (nükleik asitlerin denatürasyon sıcaklığının (90-95°C) (Kahya ve diğerleri, 2013) altındaki yüksek değer) değerleri seçilmiştir.

İzolasyon süresi olarak 30 d, 60 d ve 120 d değerleri seçilmiştir. 30 d değeri kitin önerdiği izolasyon süresidir. Çalışma öncesi yapılan ön denemelerde 120 d üzeri (yarım gün ve tam gün) izolasyon süreleri çalışılmış ancak izole edilen nükleik asit konsantrasyonunu artırıcı yönde bir etki görülmemiştir. Bu nedenle 120 d izolasyon süresi üst sınır olarak seçilmiştir.

İzolasyon denemeleri sırasında, kuru ısı bloğu çalışma prensibi ile ve kitlerin sarf malzemeleri ile uyumlu olarak 2 ml hacimli tüpler kullanılmıştır. Bu tüplerin kapasitelerinin izin verdiği ölçüde numune miktarı seçilmiş ve bu nedenle en yüksek numune miktarı olarak 1 g seçilmiştir. 0,2 g numune miktarı, kitin önerdiği numune miktarı değeri olarak 0,5 g ise ara basamak olarak seçilmiştir.

Her bir izolasyon parametresi 3 paralel çalışılmıştır. İzole edilen nükleik asitlerin spektrofotometrik olarak kalite ve konsantrasyon (ng/μl) değerleri ölçülmüştür. Ölçüm sonuçlarının istatistiki analizi IBM Istatistics SPSS 20.0 yazılımı ile yapılmış, verilerin normal dağıldığı tespit edilmiş ve parametrik analizlerle sonuçlar değerlendirilmiştir. Sonuçların ortalama değerleri grafiğe geçirilmiştir (Şekil 1).

İzolasyon çalışmalarında, izolasyon robotu ile çalışan kitlerin, manuel kit metoduna göre daha anlamlı sonuçlar verdiği görülmüştür. Sıcaklık, süre ve numune miktarı parametrelerinin etkisi, izolasyon robotu ile çalışan metodlarda daha belirgin olarak ortaya çıkmıştır.

BT metodu ile yapılan çalışmalarda 1,14-7,57 ng/μl arası konsantrasyonda izolatlar elde edilmiştir. En yüksek konsantrasyon olan 7,57±0,87 ng/μl değeri, 85°C'de 0,5g numune ile 60 d süre izolasyon sonucunda elde edilmiştir (Şekil 1.a). Bu izolasyonun kalite değeri 2,87±0,44 olarak saptanırken, BT metodundaki tüm çalışmalarda, izolasyon kalitesinin 0,7 ile 4,3 arasında dalgalandığı görülmüştür. Kalite değerlerinde çok fazla değişkenlik saptanmıştır (p<0,05). Özütlenecek nükleik asitlerin konsantrasyonlarının düşük olması ve kalite değerinde anlamlı sonuçlar çıkmaması sebebiyle BT metodunun, optimum koşulların belirlenmesine uygun olamayacağı düşünülmüş ve optimum metod olarak seçilmemesine karar verilmiştir.

MP metodu ile gerçekleştirilen izolasyonlarda izolatların kalite değerlerinin 1,47-2,29 arasında değiştiği gözlenmiştir. PM metodu ile yapılan çalışmalarda ise 1,57-2,56 aralığında kalite değişimleri belirlenmiştir. İzolasyon robotlarında elde edilen nükleik asit izolatlarının kalite değerlerinin Real-Time PCR analizleri için optimum değerler olan 1,8-2,0 aralığına daha yakın olduğu saptanmıştır (Wang ve diğerleri, 2011).

MP metodu çalışmalarında, sıcaklıktaki artışın özütlenecek nükleik asit konsantrasyonunu artırıcı yönde etki yaptığı belirgin olarak göze çarparken (Şekil 1.b), PM metodunda sıcaklık değişimindeki etkiden ziyade aynı sıcaklık uygulaması içerisinde numune miktarlarının etkisi daha belirgindir (Şekil 1.c) (p<0,05).

MP metodu ile 0,2 g numune alınarak, 65°C sıcaklıkta, 60 d süre ile yapılan izolasyonda 2,90±0,85 ng/μl konsantrasyon ve 1,74±0,46 kalite değeri ile en düşük verim elde edilmişken; PM metodundaki en düşük değer olan 4,30±1,20 ng/μl konsantrasyon ve 2,24±0,37 kalite değeri, 0,2 g numune, 75°C sıcaklık ve 30 dk izolasyon süresinde elde edilmiştir (p<0,05).

En yüksek verim elde edilen koşullar ise, MP metodunda, 0,2 g numune, 85°C sıcaklık ve 120 d özütlemede elde edilirken, PM metodunda aynı sıcaklık ve sürede izolasyonla 1 g numune, çalışılarak elde edilmiştir. MP için en yüksek değer, 17,10±0,14 ng/μl konsantrasyon ve 1,95±0,07 kalite; PM için en yüksek değer ise, 17,06±0,57 ng/μl konsantrasyon ve 2,41±0,12 kalite değerleri olarak saptanmıştır (p<0,05).

Post-Hoc testlerinde, tüm çalışmalardaki konsantrasyon değerleri ile hesaplama neticesinde MP metodu ile 85°C'de 1 g numune alınarak 120 d izolasyon yapılması ile en optimum koşulun sağlanacağı belirlenmiştir (p<0,05).

Yüksek yağ içeren süt ürünlerinde, yüksek konsantrasyonda ve kaliteli nükleik asit ile devam edilecek olan Real-Time PCR metodlarının daha doğru sonuçlar vereceği düşünülmektedir. Piyasada yaygın olarak tüketime sunulan koyun, keçi, manda ürünlerinde inek sütü ile taşış olması muhtemeldir. Bu ürünlerde nükleik asit temelli nitel ve nicel analizlerle sonuç verilirken optimum şartları belirlenmiş izolasyon metodlarının kullanılması, analizin daha kesin sonuçlar vermesine katkı sağlayacaktır.

Şekil 1. İzole edilen nükleik asit konsantrasyonları (ng/μl) (a. BT (Biotecon Diagnostics, 2016), b. MP (Roche Molecular Systems, Inc., 2012), c. PM (Promega Global, 2018))

Mathematical Modeling of Fresh Green Pepper (*Capsicum L.*) Dried at Different Powers in Microwave Oven

Fatma Coşkun Topuz¹

¹ Department of Nutrition and Dietetics, Faculty of Health Sciences, Hakkari University, Hakkari, Turkey

Abstract

In this research, fresh green peppers were dried in a kitchen microwave oven at 600W, 700W and 800W. The drying curves of the study were compared with 5 different thin layer drying models in the literature. The changes in the moisture values of the samples against time were expressed graphically. R^2 , χ^2 and RMSE values were used to determine the most suitable model for dried green peppers. Color values of fresh and dried peppers were determined. It was found that the L^* and b^* values of the dried peppers were lower and the a^* value was higher than the fresh green peppers. In addition, the rehydration rate of dried peppers was calculated. It was determined that the rehydration ability of the peppers decreased as the applied microwave power increased. For this reason, it was found that the peppers with the highest rehydration rate were those dried with 600W. Also, it was found that the most suitable model for all microwave powers among the five drying models was the Logarithmic drying model. It was calculated that the R^2 values of the drying models ranged between 0.830-0.999, χ^2 values between 0.0001- 0.4684 and RMSE values between 0.0014-0.6121. It was determined that the highest R^2 (0.997-0.999), the lowest χ^2 (0.0001-0.0002) values and the lowest RMSE (0.0014-0.0035) values for all microwave powers belong to the Logarithmic drying model.

Key Words: Drying, Mathematical Modeling, Microwave, Nonlinear analysis, Green pepper.

Mikrodalga Fırında Farklı Güçlerde Kurutulan Taze Yeşilbiberin (*Capsicum L.*) Matematiksel Modellemesi

Özet

Bu araştırmada, taze yeşilbiberler mutfak tipi mikrodalga fırında 600W, 700W ve 800W güçlerde kurutuldu. Çalışmaya ait kuruma eğrileri, literatürde yer alan 5 farklı ince tabaka kurutma modeli ile karşılaştırıldı. Örneklerin zamana karşı nem değerlerindeki değişim grafiksel olarak ifade edildi. Kurutulan yeşilbiberlere en uygun modelin tespiti için R^2 , χ^2 ve RMSE değerlerinden yararlanıldı. Taze ve kuru biberlerin renk değerleri belirlendi. Taze yeşilbiberlere göre kuru biberlerin L^* ve b^* değerlerinin daha düşük, a^* değerinin ise daha yüksek olduğu saptandı. Bunun yanı sıra, kuru biberlerin rehidrasyon oranı hesaplandı. Uygulanan mikrodalga gücü arttıkça, biberlerin rehidrasyon kabiliyetlerinin azaldığı tespit edildi. Bu sebepten, en yüksek rehidrasyon oranına sahip biberlerin 600W ile kurutulanlar olduğu belirlendi. Beş kurutma modeli içerisinde bütün mikrodalga güçleri için en uygun modelin Logaritmik kurutma modeli olduğu bulundu. Kurutma modellerine ait R^2 değerlerinin 0.830-0.999, χ^2 değerlerinin 0.0001- 0.4684 ve RMSE değerlerinin 0.0014-0.6121 arasında değiştiği saptandı. Bütün mikrodalga güçleri için en yüksek R^2 (0.997-0.999), en düşük χ^2 (0.0001-0.0002) ve en düşük RMSE (0.0014-0.0035) değerlerinin Logaritmik kurutma modeline ait olduğu belirlendi.

Anahtar Kelimeler: Kurutma, Matematiksel Modelleme, Mikrodalga, Nonlineer analiz, Yeşilbiber.

Abstract

The pot experiment was carried out during the period from August to December, 2019 at the field laboratory of Soil, Water and Environment discipline, Khulna University, Khulna, Bangladesh to investigate growth, yield and nutrient uptake as affected by phosphorous of T-aman rice. Soil samples were collected from the Mailmara, Batiaghata at Khulna District in Bangladesh which are Bajoa soil series. The experiment was laid to fit a completely randomised design (CRD) with six treatments and three replications. The levels of phosphorus T1: 0kg P ha⁻¹, T2: 50kg P ha⁻¹, T3: 75kg P ha⁻¹, T4: 100kg P ha⁻¹, T5: 125kg P ha⁻¹ and T6: 150kg P ha⁻¹ were used in this experiment. Agronomic data (plant height and tiller number) revealed that at 45, 60, 75 and 120 days after transplanting (DAT) and at the time of harvest. Other agronomic parameter such as effective tiller, panicle length, 1000-grain weight, plant fresh weight and dry biomass also took after harvesting. P and K nutrient uptake of plants also observed. Highest panicle length was observed at T5: (P₂O₅ 125 kg/ha) treatment and treatment T4: (P₂O₅ 100 kg/ha) was the best for T. aman grain yield. Highest P uptake by T. aman rice grain was found at T6: (P₂O₅ 150 kg/ha) treatment. P and K uptake for grain, straw and root were also affected by applying phosphorous fertilizer.

Key Words: T-aman rice, yield, Nutrient uptake, Phosphorus, Agronomic parameter

Introduction

Rice is the staple food of Bangladesh. Bangladesh is not only a rice-growing country but also a country of rice-eating people. Rice is cultivated in three seasons namely Aus (mid-March to mid-August), Aman (mid-June to November) and Boro (mid-December to mid-June). T. Aman rice covers about 50.92% of the rice areas of Bangladesh (BBS, 2005) of which modern T. Aman varieties cover 60% (BBS, 2005). In Ganges tidal floodplain Agroecological zone-13 T. aman is the main crop because the salt concentration in this region is high. The agro-ecological condition of this area favors the large-scale cultivation of T. aman rice. The larger portion of the saline area (0.65 million ha) exists in the districts of Khulna, Satkhira, Bagerhat, Barguna, Patuakhali, Pirojpur and Bhola on the western coast (west of Meghna) and the smaller portion (0.18 million hectares) in the districts of Chittagong, Cox's Bazar, Noakhali, Lakshimpur, Feni and Chandpur on the eastern coast (east of Meghna) (SRDI, 2009). Salinity causes an unfavorable environment and hydrological situation that limits normal crop production all year round. Low land rice like T. aman is the major component of cropping systems in these areas during the rainy season. In this period the salt is being leached out with percolating water from the root zone. In that case, the soil is suitable for growing submerged crops such as T. aman rice. Munns *et al.* (2006) reported that plant growth in saline soils is adversely affected because of reduced water uptake, salt toxicity, and nutrient imbalance.

Salinity is one of the major obstacles to increasing crop production in those regions of the world. Increasing concerns about rapid population growth and limited water resources in many countries exacerbate existing salinity problems in crop production and producers use poor quality water for irrigation. Rice (*Oryza sativa* L.) is considered one of the most important food crops in the world, but it is also considered to be very sensitive to salt (Maas and Hoffman, 1977).

Among the various essential elements, P is involved in all biochemical energy processes, storage, the nucleic acid formation, and plant reproduction. About 20-30% of the applied phosphate is available to plants, while about 80-90% of phosphorus is converted to other forms that are not readily available to plants and eventually lost to the environment causing water eutrophication (Schindler *et al.*, 2016). Stress caused by low availability of P is one of the major nutritional factors limiting rice grain yield worldwide (Rose *et al.*, 2013). According to the latest report, 46% of the world's arable land has low P-use Efficiency (PUE) (MacDonald *et al.*, 2011).

Materials and Methods

A pot experiment was conducted at the field laboratory of Soil, Water and Environment Discipline in Khulna University. The soil sample was collected from a farmer's field of Batiaghata. The soil series was Bajoa and the location was Mailmara, Jolma, Batiaghata. In USDA Soil Taxonomy it is Typic Haplaquepts. The physiography was high Ganges River Floodplain. The experiment was carried out in the Robi season (August-December). The crop name was T. aman and the variety name was Vitti Aman was used as planting material.

Soil and pot preparation

Earthen pots were used in this experiment. The size of the pot was 23 × 29 cm. The collected soils were air-dried and then pulverized. All weeds, stubble and crop residues were removed from the soil. Each pot contains 5 kg sieved soil and was made ready for transplanting.

Fertilizer application and experimental design

According to FRG fertilizer recommendation guide (2012) basal doses of urea, muriate of potash (MoP), gypsum and zink sulfate as the sources of nitrogen, potassium, sulfur, and zink were estimated and that are given in table 1. And Triple Superphosphate (TSP) fertilizer level is variable for treatments.

Table. 1. Fertilizer Name and Fertilizer Level

Sl. No.	Name of the fertilizer	Fertilizer level (kg ha ⁻¹)
1.	MoP	70
2.	Gypsum	60
3.	Zinc Sulphate	8
4.	Urea	180

Different levels of Triple superphosphate were used as a phosphorous treatment Completely Randomized Design including 6 treatments with 3 replications. Thus, the total number of experimental pots is 18 and the treatments were randomly distributed to each pot. The treatments are shown in Table. 2.

Table. 2. Name of the treatments and fertilizer of Triple Superphosphate

Name of the treatment	Dose of fertilizer(kg/ha)
T1	0
T2	50
T3	75
T4	100
T5	125
T6	150

Transplanting

As it was T. aman, the seedlings should be uprooted from the seedbed when they are suitable for transplanting. The seedlings of 27 day-olds were transplanted in the pot on 8th August, 2019. Two hills were planted in each pot and then placed the pots according to CRD.

Harvesting and agronomic data collection

The crops were harvested on 12th December 2019 when they were in full maturity. Plant height recorded at 15 days interval starting from 45 to 120 days after transplantation (DAT). Tiller number hill⁻¹ counted on 45, 60, 75 and 120 DAT up to harvest maintaining 15 days interval and effective tiller number hill⁻¹ was counted only after harvest. Panicle length and 1000-grain weight(g) were measured after harvest. Weight was taken in an electric balance and the weight was adjusted to 14% moisture content (MC) by using the formula (Gomez and Gomez, 1984).

$$1000 \text{ grain weight at } 14\% \text{ MC} = \frac{(100 - \text{sample MC}) \times 1000 \text{ grain weight at sample MC}}{(100 - 14)}$$

The yield of grain in g per pot was adjusted at 14% moisture content of grain:

$$\text{Grain yield at } 14\% \text{ MC} = \frac{10(100 - \text{sample MC}) \times \text{pot yield (g) at sample MC}}{(100 - 14) \times \text{pot area (m}^2\text{)} \times 1000}$$

Straw yield, Root yield were measured after harvesting by sun-dried to get constant weight. The biological yield was calculated by the following formula (Gomez and Gomez, 1984):

$$\text{Biological yield (pot}^{-1}\text{)} = \text{grain yield} + \text{straw yield} + \text{root yield}$$

Chemical analysis of plants

Plants samples were collected from the field experiment analyzed for P and K content. The samples were digested with HNO₃- HClO₄ (2:1) as suggested by Jackson (1973) for the determination of P and K. The P was determined by vanadomolybdate yellow color method (Jackson, 1973). The K was measured by Flame analyzer (JENWAY).

Physical and chemical analysis of soil

The particle size analysis of the soils was done by the combination of the sieving and hydrometer method as described by Bouyoucos in 1936. Textural classes were determined using Marshall's Triangular Coordinate systems. Soil pH was determined electrochemically with the help of glass electrode pH meter using soil to water ratio of 1:2.5 as suggested by Jackson in 1967. The EC of the soil was measured at a soil: water ratio of 1:5 with the help of EC meter and then converted into a 1:1 ratio as USDA. The CEC of the soils was determined by extracting the soil with 1N KCl (pH 7.0) followed by replacing the potassium in the exchange complex by 1 N NH₄OAc. The displaced potassium was determined by a flame analyzer at 589 nm (Jackson, 1967). Soil organic carbon was determined by Walkley and Black's wet oxidation method as outlined by Jackson. Soil organic matter was calculated by multiplying the percent value of organic carbon by the conversion factor 1.724. Available Phosphorus was extracted from the soil with 0.5 M NaHCO₃ (Olsen, 1954) at pH 8.5 and the ascorbic acid blue color method was employed for determination (Murphy and Riley, 1962). Exchangeable K in soil with by extracting soils with 1 N NH₄OAc (pH 7.0) and then the K was measured by using a flame photometer (Kundsén et al., 1982).

Nutrient Uptake

After a chemical analysis of straw and grain samples, the nutrient uptake was calculated from the nutrient content and yield of rice crop by the following formula

$$\text{Nutrient uptake} = \text{Nutrient content (\%)} \times \text{yield (kg ha}^{-1}\text{)} / 100$$

Statistical Analysis

Data were analyzed statistically by ANOVA to examine whether treatment effects were significant. Mean values were compared by Statistix 10.0 software.

Results and Discussion

The results present the effect of different rates of phosphorous fertilizer with applying procedure on P and K uptake as well as growth and yield of BR 23 T. aman Rice including soil physical and chemical properties. The soil physical and chemical properties are shown in Table. 3.

Yield contributing characteristics of T. aman

The yield components include the plant height at different days after transplanting, panicle length, number of tillers at different days after planting, effective and non-effective tiller number and 1000-grain weight.

Plant height

The plant height was measured at 15 days interval from 45 to 120 days after transplanting. Plant height of T. aman rice was significantly influenced at DAT 45 due to the application of triple super phosphate fertiliser alone but non-significant in DAT 60, DAT 75, DAT 90 and DAT 120 (Fig. 1). Plant height varied from 84.33 cm (T1) at DAT 45 to 105.50 cm (T1) at harvest time (DAT 120) (Fig. 1.).

Fig. 1. Plant height at DAT

Number of tillers, panicle length, 1000 grain weight

The number of tillers has been counted on 45, 60, 75 DAT up to harvest. At DAT 45 and DAT 60 tiller number is significantly affected with the phosphorous treatment which is shown in Table. 4. but it is non-significant at DAT 75 (Table. 4.) and harvest time (DAT 120) (Table. 4.). Table. 4. also shows that tiller number varying from 9.33(T1) to 12 (T6).

Table. 4. Tiller number at DAT

Treatment	45 DAT	60 DAT	75 DAT	120 DAT

Columns annotated with the same letter are not significantly different at $p < 0.05$ according to Tukey test

Rice grain yields are highly dependent upon the number of panicle-bearing tiller produced per plant. The effective and non-effective tiller is not significantly affected by the phosphorous treatment (Table. 5.). Observation showed that at harvest effective and non-effective tiller number varied from 17(T1) to 19(T6) with an average of 18.28 and from 0.33(T1) to 1.76(T2) (Table. 5.). Panicle length of T. aman rice was significantly influenced by the different treatments (Table. 5.). Panicle length due to different treatments varied from 23.11 cm in T1 to 23.56 cm in T2. The 1000-grain weight of T. aman rice was influenced non-significantly due to the application of triple super phosphate fertilizer alone and ranged from 26.43 (T1) to 24.90 (T6) g with the average 25.39 g (Table. 5.). Table. 5. Effective Tiller, Non-effective tiller, panicle length, 1000 grain weight at harvesting time.

Yields of grain, straw and root

Data on grain, straw and root of T. aman rice were significantly influenced by different P treatments have been presented in Table 6. The grain yield ranged from 4662.67 kg ha⁻¹ (T1) to 5660 kg ha⁻¹ (T6) which was affected by the treatment (Fig. 2). The straw yield ranged from 12344 kg ha⁻¹ (T1) to 16037.33 kg ha⁻¹ (T6) which was affected by the treatment (Table. 6.). The root yield ranged from 832 kg ha⁻¹ (T1) to 1692 kg ha⁻¹ (T6) which was affected by the treatment (Table. 4.4.). And for this the biological yield was also significantly affected for applying P treatment which is shown in Fig. 2. The fig.2. also shows that biological yield varies from 17838.67 kg ha⁻¹ (T1) to 23389.33 kg ha⁻¹ (T6) with an average 20847.78 kg ha⁻¹ for P treatment.

Table. 6. Effect of treatments on grain yield, straw yield, root yield and biological yield

Phosphorous and Potassium content

Results presented in Table. 7. indicated that phosphorous content in grain and root and for this total content by T. aman rice was significantly influenced by different P treatments under study. P content of grain was affected and varies 0.03% (T1) to 0.29% (T6). But P content of straw was not significantly affected (Table. 7.). P content of root was affected and varies 0.04% (T1) to 0.03% (T6). And total P content also affected by P treatment (Fig. 3.). The P content varies from 0.11%(T1) to 0.36% (T6).

Potassium (K) content was significantly affected only grain but non-significantly affected in root and straw content by different P treatment. The K content result was presented in table. 7. The K content was no significantly changed by P treatment which is shown in Fig. 4.

Phosphorous and Potassium uptake

Phosphorous uptake by T. aman rice in grain, straw and root was significantly affected by various P treatments which were presented in Table. 8. Grain uptake of P ranges from 1.27 kg ha⁻¹ (T1) to 16.17 kg ha⁻¹ (T6), straw uptake of P ranges from 4.99 kg ha⁻¹ (T1) to 7.14 kg ha⁻¹ (T6) and root uptake of P ranges from 0.37 kg ha⁻¹ (T1) to 0.57 kg ha⁻¹ (T6) (Table. 8). In case of P uptake, T. aman rice was significantly influenced by different P treatment (Fig. 5.). The P uptake due to different treatments ranged from 6.63 kg ha⁻¹ (T1) to 23.89 kg ha⁻¹ (T6). Potassium uptake by T.aman rice in grain, straw and root was significantly affected by various P treatments (Table. 8.). The K uptake by grain varied from 11 kg ha⁻¹ (T1) to 13 kg ha⁻¹ (T6), in straw varied from 20.40 kg ha⁻¹ (T1) to 26.51 kg ha⁻¹ (T6) and root varied from 31.05 kg ha⁻¹ (T1) to 63.15 kg ha⁻¹ (T6) which are shown in Table 4.8. In case of this the K uptake also affected by applying triple superphosphate treatment which was shown in Fig. 6. and it varied from 51.56 kg ha⁻¹ (T1) to 89.78 kg ha⁻¹ (T6).

Abstract

The pot experiment was carried out during the period from August to December, 2019 at the field laboratory of Soil, Water and Environment discipline, Khulna University, Khulna, Bangladesh to investigate growth, yield and nutrient uptake as affected by phosphorous of T-aman rice. Soil samples were collected from the Mailmara, Batiaghata at Khulna District in Bangladesh which are Bajoa soil series. The experiment was laid to fit a completely randomised design (CRD) with six treatments and three replications. The levels of phosphorus T1: 0kg P ha⁻¹, T2: 50kg P ha⁻¹, T3: 75kg P ha⁻¹, T4: 100kg P ha⁻¹, T5: 125kg P ha⁻¹ and T6: 150kg P ha⁻¹ were used in this experiment. Agronomic data (plant height and tiller number) revealed that at 45, 60, 75 and 120 days after transplanting (DAT) and at the time of harvest. Other agronomic parameter such as effective tiller, panicle length, 1000-grain weight, plant fresh weight and dry biomass also took after harvesting. P and K nutrient uptake of plants also observed. Highest panicle length was observed at T5: (P₂O₅ 125 kg/ha) treatment and treatment T4: (P₂O₅ 100 kg/ha) was the best for T. aman grain yield. Highest P uptake by T. aman rice grain was found at T6: (P₂O₅ 150 kg/ha) treatment. P and K uptake for grain, straw and root were also affected by applying phosphorous fertilizer.

Key Words: *T-aman rice, yield, Nutrient uptake, Phosphorus, Agronomic parameter*

Introduction

Rice is the staple food of Bangladesh. Bangladesh is not only a rice-growing country but also a country of rice-eating people. Rice is cultivated in three seasons namely Aus (mid-March to mid-August), Aman (mid-June to November) and Boro (mid-December to mid-June). T. Aman rice covers about 50.92% of the rice areas of Bangladesh (BBS, 2005) of which modern T. Aman varieties cover 60% (BBS, 2005). In Ganges tidal floodplain Agroecological zone-13 T. aman is the main crop because the salt concentration in this region is high. The agro-ecological condition of this area favors the large-scale cultivation of T. aman rice. The larger portion of the saline area (0.65 million ha) exists in the districts of Khulna, Satkhira, Bagerhat, Barguna, Patuakhali, Pirojpur and Bhola on the western coast (west of Meghna) and the smaller portion (0.18 million hectares) in the districts of Chittagong, Cox's Bazar, Noakhali, Lakshimpur, Feni and Chandpur on the eastern coast (east of Meghna) (SRDI, 2009). Salinity causes an unfavorable environment and hydrological situation that limits normal crop production all year round. Low land rice like T. aman is the major component of cropping systems in these areas during the rainy season. In this period the salt is being leached out with percolating water from the root zone. In that case, the soil is suitable for growing submerged crops such as T. aman rice. Munns *et al.* (2006) reported that plant growth in saline soils is adversely affected because of reduced water uptake, salt toxicity, and nutrient imbalance. Salinity is one of the major obstacles to increasing crop production in those regions of the world. Increasing concerns about rapid population growth and limited water resources in many countries exacerbate existing salinity problems in crop production and producers use poor quality water for irrigation. Rice (*Oryza sativa* L.) is considered one of the most important food crops in the world, but it is also considered to be very sensitive to salt (Maas and Hoffman, 1977).

Among the various essential elements, P is involved in all biochemical energy processes, storage, the nucleic acid formation, and plant reproduction. About 20-30% of the applied phosphate is available to plants, while about 80-90% of phosphorus is converted to other forms that are not readily available to plants and eventually lost to the environment causing water eutrophication (Schindler *et al.*, 2016). Stress caused by low availability of P is one of the major nutritional factors limiting rice grain yield worldwide (Rose *et al.*, 2013). According to the latest report, 46% of the world's arable land has low P-use Efficiency (PUE) (MacDonald *et al.*, 2011).

Materials and Methods

A pot experiment was conducted at the field laboratory of Soil, Water and Environment Discipline in Khulna University. The soil sample was collected from a farmer's field of Batiaghata. The soil series was Bajoa and the location was Mailmara, Jolma, Batiaghata. In USDA Soil Taxonomy it is Typic Haplaquepts. The physiography was high Ganges River Floodplain. The experiment was carried out in the Robi season (August-December). The crop name was T. aman and the variety name was Vitti Aman was used as planting material.

Soil and pot preparation

Earthen pots were used in this experiment. The size of the pot was 23 × 29 cm. The collected soils were air-dried and then pulverized. All weeds, stubble and crop residues were removed from the soil. Each pot contains 5 kg sieved soil and was made ready for transplanting.

Fertilizer application and experimental design

According to FRG fertilizer recommendation guide (2012) basal doses of urea, muriate of potash (MoP), gypsum and zink sulfate as the sources of nitrogen, potassium, sulfur, and zink were estimated and that are given in table 1. And Triple Superphosphate (TSP) fertilizer level is variable for treatments.

Table. 1. Fertilizer Name and Fertilizer Level

Sl. No.	Name of the fertilizer	Fertilizer level (kg ha ⁻¹)
5.	MoP	70
6.	Gypsum	60
7.	Zinc Sulphate	8
8.	Urea	180

Different levels of Triple superphosphate were used as a phosphorous treatment Completely Randomized Design including 6 treatments with 3 replications. Thus, the total number of experimental pots is 18 and the treatments were randomly distributed to each pot. The treatments are shown in Table. 2.

Table. 2. Name of the treatments and fertilizer of Triple Superphosphate

Name of the treatment	Dose of fertilizer(kg/ha)
T1	0
T2	50
T3	75
T4	100
T5	125
T6	150

Transplanting

As it was T. aman, the seedlings should be uprooted from the seedbed when they are suitable for transplanting. The seedlings of 27 day-olds were transplanted in the pot on 8th August, 2019. Two hills were planted in each pot and then placed the pots according to CRD.

Harvesting and agronomic data collection

The crops were harvested on 12th December 2019 when they were in full maturity. Plant height recorded at 15 days interval starting from 45 to 120 days after transplantation (DAT). Tiller number hill⁻¹ counted on 45, 60, 75 and 120 DAT up to harvest maintaining 15 days interval and effective tiller number hill⁻¹ was counted only after harvest. Panicle length and 1000-grain weight(g) were measured after harvest. Weight was taken in an electric balance and the weight was adjusted to 14% moisture content (MC) by using the formula (Gomez and Gomez, 1984).

$$1000 \text{ grain weight at } 14\% \text{ MC} = \frac{(100 - \text{sample MC}) \times 1000 \text{ grain weight at sample MC}}{(100 - 14)}$$

The yield of grain in g per pot was adjusted at 14% moisture content of grain:

$$\text{Grain yield at } 14\% \text{ MC} = \frac{10(100 - \text{sample MC}) \times \text{pot yield (g) at sample MC}}{(100 - 14) \times \text{pot area (m}^2) \times 1000}$$

Straw yield, Root yield were measured after harvesting by sun-dried to get constant weight. The biological yield was calculated by the following formula (Gomez and Gomez, 1984):

$$\text{Biological yield (pot}^{-1}\text{)} = \text{grain yield} + \text{straw yield} + \text{root yield}$$

Chemical analysis of plants

Plants samples were collected from the field experiment analyzed for P and K content. The samples were digested with HNO₃- HClO₄ (2:1) as suggested by Jackson (1973) for the determination of P and K. The P was determined by vanadomolybdate yellow color method (Jackson, 1973). The K was measured by Flame analyzer (JENWAY).

Physical and chemical analysis of soil

The particle size analysis of the soils was done by the combination of the sieving and hydrometer method as described by Bouyoucos in 1936. Textural classes were determined using Marshall's Triangular Coordinate systems. Soil pH was determined electrochemically with the help of glass electrode pH meter using soil to water ratio of 1:2.5 as suggested by Jackson in 1967. The EC of the soil was measured at a soil: water ratio of 1:5 with the help of EC meter and then converted into a 1:1 ratio as USDA. The CEC of the soils was determined by extracting the soil with 1N KCl (pH 7.0) followed by replacing the potassium in the exchange complex by 1 N NH₄OAc. The displaced potassium was determined by a flame analyzer at 589 nm (Jackson, 1967). Soil organic carbon was determined by Walkley and Black's wet oxidation method as outlined by Jackson. Soil organic matter was calculated by multiplying the percent value of organic carbon by the conversion factor 1.724. Available Phosphorus was extracted from the soil with 0.5 M NaHCO₃ (Olsen, 1954) at pH 8.5 and the ascorbic acid blue color method was employed for determination (Murphy and Riley, 1962). Exchangeable K in soil with by extracting soils with 1 N NH₄OAc (pH 7.0) and then the K was measured by using a flame photometer (Kundsen et al., 1982).

Nutrient Uptake

After a chemical analysis of straw and grain samples, the nutrient uptake was calculated from the nutrient content and yield of rice crop by the following formula

$$\text{Nutrient uptake} = \text{Nutrient content (\%)} \times \text{yield (kg ha}^{-1}\text{)} / 100$$

Statistical Analysis

Data were analyzed statistically by ANOVA to examine whether treatment effects were significant. Mean values were compared by Statistix 10.0 software.

Results and Discussion

The results present the effect of different rates of phosphorous fertilizer with applying procedure on P and K uptake as well as growth and yield of BR 23 T. aman Rice including soil physical and chemical properties. The soil physical and chemical properties are shown in Table. 3.

Table. 3. General properties of soil

Yield contributing characteristics of T. aman

The yield components include the plant height at different days after transplanting, panicle length, number of tillers at different days after planting, effective and non-effective tiller number and 1000-grain weight.

Plant height

The plant height was measured at 15 days interval from 45 to 120 days after transplanting. Plant height of T. aman rice was significantly influenced at DAT 45 due to the application of triple super phosphate fertiliser alone but non-significant in DAT 60, DAT 75, DAT 90 and DAT 120 (Fig. 1). Plant height varied from 84.33 cm (T1) at DAT 45 to 105.50 cm (T1) at harvest time (DAT 120) (Fig. 1.).

Fig. 1. Plant height at DAT

Number of tillers, panicle length, 1000 grain weight

The number of tillers has been counted on 45, 60, 75 DAT up to harvest. At DAT 45 and DAT 60 tiller number is significantly affected with the phosphorous treatment which is shown in Table. 4. but it is non-significant at DAT 75 (Table. 4.) and harvest time (DAT 120) (Table. 4.). Table. 4. also shows that tiller number varying from 9.33(T1) to 12 (T6).

Table. 4. Tiller number at DAT

Rice grain yields are highly dependent upon the number of panicle-bearing tiller produced per plant. The effective and non-effective tiller is not significantly affected by the phosphorous treatment (Table. 5.). Observation showed that at harvest effective and non-effective tiller number varied from 17(T1) to 19(T6) with an average of 18.28 and from 0.33(T1) to 1.76(T2) (Table. 5.). Panicle length of T. aman rice was significantly influenced by the different treatments (Table. 5.). Panicle length due to different treatments varied from 23.11 cm in T1 to 23.56 cm in T2. The 1000-grain weight of T. aman rice was influenced non-significantly due to the application of triple super phosphate fertilizer alone and ranged from 26.43 (T1) to 24.90 (T6) g with the average 25.39 g (Table. 5.).

Table. 5. Effective Tiller, Non-effective tiller, panicle length, 1000 grain weight at harvesting time

Yields of grain, straw and root

Data on grain, straw and root of T. aman rice were significantly influenced by different P treatments have been presented in Table 6. The grain yield ranged from 4662.67 kg ha⁻¹ (T1) to 5660 kg ha⁻¹ (T6) which was affected by the treatment (Fig. 2). The straw yield ranged from 12344 kg ha⁻¹ (T1) to 16037.33 kg ha⁻¹ (T6) which was affected by the treatment (Table. 6). The root yield ranged from 832 kg ha⁻¹ (T1) to 1692 kg ha⁻¹ (T6) which was affected by the treatment (Table. 4.4.). And for this the biological yield was also significantly affected for applying P treatment which is shown in Fig. 2. The fig.2. also shows that biological yield varies from 17838.67 kg ha⁻¹ (T1) to 23389.33 kg ha⁻¹ (T6) with an average 20847.78 kg ha⁻¹ for P treatment.

Table. 6. Effect of treatments on grain yield, straw yield, root yield and biological yield

Phosphorous and Potassium content

Results presented in Table. 7. indicated that phosphorous content in grain and root and for this total content by T. aman rice was significantly influenced by different P treatments under study. P content of grain was affected and varies 0.03% (T1) to 0.29% (T6). But P content of straw was not significantly affected (Table. 7.). P content of root was affected and varies 0.04% (T1) to 0.03% (T6). And total P content also affected by P treatment (Fig. 3.). The P content varies from 0.11%(T1) to 0.36% (T6). Potassium (K) content was significantly affected only grain but non-significantly affected in root and straw content by different P treatment. The K content result was presented in table. 7. The K content was no significantly changed by P treatment which is shown in Fig. 4.

Phosphorous and Potassium uptake

Phosphorous uptake by T. aman rice in grain, straw and root was significantly affected by various P treatments which were presented in Table. 8. Grain uptake of P ranges from 1.27 kg ha⁻¹ (T1) to 16.17 kg ha⁻¹ (T6), straw uptake of P ranges from 4.99 kg ha⁻¹ (T1) to 7.14 kg ha⁻¹ (T6) and root uptake of P ranges from 0.37 kg ha⁻¹ (T1) to 0.57 kg ha⁻¹ (T6) (Table. 8). In case of P uptake, T. aman rice was significantly influenced by different P treatment (Fig. 5.). The P uptake due to different treatments ranged from 6.63 kg ha⁻¹ (T1) to 23.89 kg ha⁻¹ (T6). Potassium uptake by T.aman rice in grain, straw and root was significantly affected by various P treatments (Table. 8.). The K uptake by grain varied from 11 kg ha⁻¹ (T1) to 13 kg ha⁻¹ (T6), in straw varied from 20.40 kg ha⁻¹ (T1) to 26.51 kg ha⁻¹ (T6) and root varied from 31.05 kg ha⁻¹ (T1) to 63.15 kg ha⁻¹ (T6) which are shown in Table 4.8. In case of this the K uptake also affected by applying triple superphosphate treatment which was shown in Fig. 6. and it varied from 51.56 kg ha⁻¹ (T1) to 89.78 kg ha⁻¹ (T6).

Determination of Biogas Energy Potential to be Obtained from Animal Manures in Van Province

Ünal Şirin¹, Sedat Karaman², Fatih Şevki Erkuş¹, Şefik Tüfenkçi¹

¹Biosystem Engineering Department, Faculty of Agriculture, Yuzuncu Yıl University, Van, Turkey

²Biosystem Engineering Department, Faculty of Agriculture, Gaziosmanpaşa University, Tokat, Turkey

Abstract

Researchers have turned to alternative studies in order to benefit more from renewable energy sources due to fossil resources will be insufficient in the near future, environmental pollution as a result of fuel combustion and increasing energy demand. Biogas production, which is used in many areas such as heating, transportation, electricity, natural gas and chemical production, is one of the most attractive alternatives among these studies. Animal manure is also an important material used as a substrate in the production of biogas. For this purpose, the province of Van, which is one of the leading provinces of our country in terms of animal production and where cattle, sheep and poultry are grown intensively, was chosen as the research area. In the research, TÜİK (Turkish Statistical Institute) 2021 data were used. It was made evaluations on the animal numbers data of the province of Van for 2021 and the amount of total manure and the biogas potential were determined. As a result of the research; The total amount of usable manure that can be obtained from animal waste in Van province is 1.449.597,063 tons/year and its conversion potential into biogas energy is calculated as 57.452.155,16 m³/year. It has been determined that it is equivalent to 270.025.129,3 kWh of electricity or 67.793.543,09 m³ of natural gas energy of the total biogas potential. This too; when evaluated with today's prices, it saves approximately 221 to 337 million TL/year, depending on the area of use.

Key Words: *Agricultural structures, Animal manure, Biogas potential, Biosystems, Van Province.*

Van İlindeki Hayvan Gübrelerinden Elde Edilebilecek Biyogaz Enerji Potansiyelinin Belirlenmesi

Özet

Fosil kaynaklarının yakın gelecekte yetersiz durumda kalacak olması, yakıtların çevre kirliliği oluşturması, enerji gereksiniminin gün geçtikçe artması, araştırmacıları, yenilenebilir enerji kaynaklarından daha fazla yararlanabilmek için alternatif çalışmalara yönlendirmiştir. Isınma ve ısıtma, ulaşım, elektrik, doğalgaz ve kimyasal madde üretimi gibi birçok alanda kullanılan biyogaz üretimi bu çalışmalar arasında en cazip alternatiflerden biridir. Hayvan gübreleri de biyogaz üretiminde substrat (enzimlerin tepkimelerinde işlenen madde) olarak kullanılan önemli bir materyaldir. Bu amaçla hayvasal üretim açısından ülkemizin önde gelen illeri arasında bulunan ve yoğun bir şekilde büyükbaş, küçükbaş ve kanatlı hayvan yetiştiriciliği yapılan Van ili, araştırma sahası olarak seçilmiştir. Araştırmada TÜİK (Türkiye İstatistik Kurumu) 2021 verileri kullanılmıştır. Van ili 2021 yılı hayvan sayıları verilerine ilişkin değerlendirmeler yapılarak gübre miktarları ile biyogaz potansiyeli belirlenmiştir. Araştırma sonucunda; Van ilinde hayvansal atıklardan elde edilebilecek toplam kullanılabilir gübre miktarı 1.449.597,063 ton/yıl ve bunun biyogaz enerjisine dönüşüm potansiyeli 57.452.155,16 m³/yıl olarak hesaplanmıştır. Toplam biyogaz potansiyelinin; 270.025.129,3 kWh elektrik ya da 67.793.543,09 m³ doğalgaz enerjisine eşdeğer olduğu saptanmıştır. Bu da; günümüz fiyatları ile değerlendirildiğinde kullanım alanına göre yaklaşık 221 ila 337 milyon TL/yıl arasında tasarruf sağlamaktadır.

The effect of pomegranate (*Punica granatum* L.) flower extracts on the physicochemical properties of heat-treated chicken sausages

Cem Okan Özer¹, Ganime Beyzanur Var¹, Ezgi Demir Özer²

¹Department of Food Engineering, Faculty of Engineering and Architecture, Nevşehir Hacı Bektaş Veli University, Nevşehir, Turkey

²Department of Gastronomy and Culinary Arts, School of Applied Sciences, Cappadocia University, Nevşehir, Turkey

Abstract

This study aimed to determine the effect of water and ethanol extracts of pomegranate flowers, which have the potential to be used as a natural antioxidant source in food products on the physicochemical properties of chicken sausage. In the study, pomegranate flower was extracted with water and ethanol and then lyophilized. Water and ethanol extracts were used in sausage at the dose of 350 and 200 ppm, respectively. In addition to extracts, sodium nitrite was used in sausages at the dose of 50, 100 and 150 ppm. The changes in color, TBARS, pH, moisture, ash, protein, fat and sensorial parameters were determined in chicken sausages prepared with pomegranate flower extracts during 30 days of storage. The results showed that using extracts in sausage production has no significant effects on moisture, ash, protein, and fat contents, and these were determined to average 53,24 %, 2,23%, 21,02%, and 23,95%, respectively. According to the TBARS analysis results, was no determined difference between the 1th and 7th days, while were observed significant differences between the 7th, 15th and 30th days. The TBARS values for all groups increased during the storage period. When the TBARS values on the, 15th and 30th days were examined, it was determined that the TBARS values decreased as the pomegranate flower concentration increased. When the pH value were examine, it was determined that the pH values decreased as the pomegranate flower concentration increased. On the 7th day, an increase occurred in the pH value of only the nitrite containing group, while the pH value of the other groups decreased. In addition, there were no significant changes in pH values on other days of storage. The results of the sensory analysis show that the sausages produced by adding pomegranate flower extract were less liked by the panelists compared to the control group samples, but at an acceptable level. The results of the present study showed that the aqueous and ethanolic extracts of pomegranate flowers can be used to improve the physicochemical properties of chicken sausage.

Key Words: Pomegranate flower extract, water extraction, ethanol extraction, chicken sausage.

Nar (*Punica granatum* L.) çiçeği ekstraktlarının ısıtılmış tavuk sucuklarının fizikokimyasal özellikleri üzerine etkisi

Özet

Bu çalışma, gıda ürünlerinde doğal bir antioksidan kaynağı olarak kullanılma potansiyeline sahip nar çiçeklerinin su ve etanol ekstraktlarının tavuk sucuğunun fizikokimyasal özelliklerine etkisinin belirlenmesi amaçlamıştır. Çalışmada nar çiçeği su ve etanol ile ekstrakte edildikten sonra liyofilize edilmiştir. Su ve etanol ekstraktları sucukta sırasıyla 350 ve 200 ppm dozlarında kullanılmıştır. Ekstraktlara ek olarak, sucuklarda 50, 100 ve 150 ppm dozlarında sodyum nitrit kullanılmıştır. Nar çiçeği ekstraktları ile hazırlanan tavuk sucuklarında 30 günlük depolama süresince renk, TBARS, pH, nem, kül, protein, yağ ve duyusal parametrelerdeki değişimler belirlenmiştir. Sonuçlar, sucuk üretiminde ekstrakt kullanımının nem, kül, protein ve yağ içerikleri üzerinde önemli bir etkisinin olmadığını ve bunların sırasıyla ortalama %53,24, %2,23, %21,02 ve %23,95 düzeyinde olduğu tespit edilmiştir. TBARS analiz sonuçlarına göre 1. ve 7. günler arasında fark belirlenmezken, 7. 15. ve 30. günler arasında anlamlı farklar gözlenmiştir. Tüm gruplar için TBARS değerleri depolama süresi boyunca artmıştır. 15. ve 30. günlerdeki TBARS değerleri incelendiğinde, nar çiçeği konsantrasyonu arttıkça TBARS değerlerinin düştüğü belirlenmiştir. pH değeri incelendiğinde nar çiçeği konsantrasyonu arttıkça pH değerlerinin azaldığı tespit edilmiştir. 7. günde sadece nitrit içeren grubun pH değerinde artış meydana gelirken diğer grupların pH değerinde düşüş meydana gelmiştir. Ayrıca depolamanın depolamanın diğer günlerinde pH değerlerinde önemli bir değişiklik olmamıştır. Duyusal analiz sonuçları nar çiçeği ekstraktı ilave edilerek üretilen sucukların panelistler tarafından kontrol grubu örneklerle kıyasla daha az beğenildiğini ancak kabul edilebilir seviyede olduğunu göstermektedir. Bu çalışmanın sonuçları, nar çiçeklerinin sulu ve etanolik ekstraktlarının tavuk sucuğunun fizikokimyasal özelliklerini iyileştirmek için kullanılabileceğini göstermiştir.

Anahtar Kelimeler: Nar çiçeği ekstresi, su ekstraksiyonu, etanol ekstraksiyonu, tavuk sucuğu

Investigating Rural Households' Willingness To Pay For Improved Solid Waste Management And Its Driving Factors. Evidence From Nigeria

Ridwan Mukaila*

Department of Agricultural Economics, University of Nigeria, Nsukka, Nigeria

*Corresponding author

Abstract

Improper disposal of solid waste has serious health and environmental implications. However, most solid waste management interventions in Nigeria focus on urban areas, with little attention to rural areas. Therefore, this study aims to investigate rural area solid waste management methods, their willingness to pay for improved solid waste management services, and the drivers of their willingness to pay. Data collected from 160 households was analysed with an open-ended elicitation method, descriptive statistics, and Probit regression. The findings revealed that rural households engaged in open-burning, indiscriminate bush throwing, nearby open dumpsites, land-filling, rivulets, roadside dumping, and dumping into drainage systems, all of which are poor solid waste management practices. The majority were aware (93.13%) of the health implications of these practices and were willing to pay (80.63%) a monthly premium of N452 (USD 1.06) for improved solid waste management. The factors influencing rural households' willingness to pay are awareness of the negative impact of improper solid waste disposal on health and the environment; education level; income; weekly solid waste volume; occupation; and marital status. These results call for more solid waste management awareness creation, sensitization, and provision of improved solid waste management with a monthly premium that will not exceed N452 (USD 1.06) in rural areas.

Nephroprotective effect of Algerian date seed extract (*Phoenix dactylifera* L.) against mercuric chloride-Induced alterations of kidney tissue

Hadjer Chenini-Bendiab*, Nouredine Djebli

Pharmacognosy & Api-Phytotherapy Laboratory, Mostaganem University-27000 –Algeria

Abstract

Oxidative stress is a molecular mechanism that generates important renal damage in mercury toxicity. The present study was undertaken to evaluate the ability of Algerian date seed extract (ADSE) to prevent mercuric chloride (HgCl₂) nephrotoxicity. Female Wistar rats were given a single intraperitoneally injection of HgCl₂ (1.5 mg/kg B.W) after ten days of administration of date seed extracts by gastric gavage. Only the control group (C) received an injection of the vehicle (physiological water). The groups Hg-ADSE1, Hg-ADSE2 and Hg-STD were treated with aqueous date seed extracts at 150, 300mg/kg and ascorbic acid at 50mg/kg respectively, while the HgCl₂ group received distilled water. Renal function tests and a histological study of the kidneys were carried out 24 hours after HgCl₂ exposure. Serum urea and creatinine results showed a highly significant decrease ($P \leq 0.001$) in the treated groups Hg-ADSE1, Hg-ADSE2 compared to the HgCl₂ group. This decrease was almost normal in the Hg-ADSE1 group compared to the control (C). The biochemical results were confirmed by histological examination of the kidneys, which showed significant restoration of the renal glomeruli in the treated groups by ameliorating the alterations following HgCl₂ exposure. The results suggest a nephroprotective effect of Algerian date seeds (*Phoenix dactylifera* L.). The therapeutic action of this natural product would probably be due to the increase of the antioxidant defence mechanism in the toxicity induced by mercuric chloride.

Investigation of the Effect of Fertilizer Doses on Bean Pod Properties

Leyla İdikut¹, Duygu Uskutoğlu¹

¹Department of Field Crops, Faculty of Agriculture, Kahramanmaraş Sutcu Imam University, Kahramanmaraş, Türkiye

Abstract

The bean plant is a legume plant that binds free nitrogen of the air by the nodosity formed in the roots. For this reason, it was aimed to investigate the effect the pod of bean characteristics of bean by applying different doses of phosphorus and nitrogen on Göksun beans cultivar. In the study, 0, 3, 6, 9 kg da⁻¹ phosphorus and 0, 4, 8, 12 kg da⁻¹ nitrogen doses were applied to Göksun bean variety. The pod length (cm), pod width (mm), pod diameter (mm), number of pods per plant (adet), weight of a single pod (g), number of seeds per pod (pieces), weight of single seeds (g) of Göksun bean cultivar were investigated. In the research, it was noted that the effect of phosphorus doses only on the pod diameter, the effects of nitrogen doses on the pod length, pod diameter, pod width, single seed weight and seed number of pod were significant. The differences in number of pods in the plant, seed number of pods, pod length, pod weight, single seed weight in terms of phosphorus and nitrogen interaction were founded statistically significant. According to the results of the research, it was determined that 4 kg da⁻¹ and above nitrogen dose applications made a positive contribution in terms of pod properties.

Keywords: *Bean, pod characteristics, phosphorus, nitrogen doses.*

Fasulyenin Bakla Özelliklerine Gübre Dozlarının Etkisinin Araştırılması

Özet

Fasulye bitkisi köklerinde oluşan nodozite ile havanın serbest azotunu bağlayan bir baklagil bitkisidir. Bu nedenle, Göksun fasulye çeşidine farklı fosfor ve azot dozu uygulanarak, bakla özelliği üzerindeki etkisini araştırılması amaçlanmıştır. Araştırmada 0, 3, 6, 9 kg da⁻¹ fosfor ve 0, 4, 8, 12 kg da⁻¹ azot dozları Göksun fasulye çeşidine uygulanmıştır. Göksun fasulye çeşidinin bakla uzunluğu (cm), bakla genişliği (mm), bakla çapı (mm), bitkide bakla sayısı (adet), tek bakla ağırlığı (g), baklada tane sayısı (adet), tek tane ağırlığı (g) incelenmiştir. Yapılan araştırmada, fosfor dozlarının sadece bakla çapına, azot dozlarının fasulye bitkisinin bakla uzunluna, bakla çapına, bakla genişliğine, tek tane ağırlığına, bakla tane sayısına, fosfor x azot interaksyonu bitkide bakla sayısına, bakla tane sayısına, bakla uzunluna, bakla ağırlığına, tek tane ağırlığına istatistiksel olarak önemli etkide bulunduğu kaydedilmiştir. Araştırma sonuçlarına göre 4 kg da⁻¹ ve yukarı azot doz uygulamalarında bakla özellikleri yönünden olumlu katkı sağladığı belirlenmiştir.

Anahtar Kelimeler: *Fasulye, bakla özellikleri, azot ve fosfor dozları.*

Giriş

Canlıların hayat kaynağı tarımla var olmaktadır. Tarımın gelişmesi toplumların hayat standartlarını da arttırmaktadır. Gelişmekte olan ülkeler besin kaynaklarını bitkisel ürünlerden sağlamaktadır. Baklagil bitkileri insan sağlığına önemli katkıda bulunurken, sürdürülebilir tarımda toprak sağlığını da geliştirmektedir. Öncelikle yetiştirilecek bitkinin insana doğaya ve çevreye katkısının bilinmesi gereklidir. Baklagiller ucuz ve yüksek kaliteli bitkisel protein kaynağı olmalarının yanı sıra, tahıl tanelerinden yaklaşık iki kat fazla protein % 20-28, ayrıca %40.80-46.31 nişasta ve %1.02-1.77 yağ bulundurmaktadır (İdikut ve Karabacak 2020; Pekşen ve Artık 2005). Baklagil bitki grubunda bulunan, bilim dünyasında *Phaseolus vulgaris* L. olarak adlandırılan fasulye, iklim koşullarına göre bir dönem meyve veren, otsu bitkilerden olup, meyvesi taze ya da kuru olarak tüketilen sebzedir. Anavatanı Amerika olarak bilinen fasulyenin kalsiyum, protein ve vitamin bakımından zengin olması, en fazla B1 ve B2 vitaminleri bulundurması, tüm dünyada bolca tüketilen önemli bir kültür bitkisi olmasını sağlamıştır (Abacı ve Kaya, 2018; Suarez-Martinez, 2016). Fasulye bitkisinin toprağı koruyan iyi bir ekim nöbeti bitkisidir (Aserse ve ark 2020). Fasulye verimliliği, özellikle N ve P olmak üzere toprak besin maddesi mevcudiyeti ile sınırlıdır. Nitrojen eksikliği tane verimini azaltır çünkü N, depolanan karbonhidratların ve proteinlerin üretimi için gerekli olan klorofil, amino asitler, nükleik asitler ve lipidler dahil olmak üzere çeşitli temel moleküllerin yapısal bir bileşenidir. Verim kayıplarını önlemek için büyüme mevsimi boyunca toprağı azotlu gübre eklenebilir; ancak, sentetik değişiklikler pahalıdır, erişilmesi zordur. Bunun yerine fasulye yetiştiricileri, mahsulleri için bir besin kaynağı olarak simbiyotik nitrojen fiksasyonu yoluyla türetilenler de dahil olmak üzere organik N formlarına güvenilerek tarımın canlanmasını önermiştir (Wilker ve ark 2020). Toprağın kalitesi ve verimlilik tartışmaları 1980'den günümüze kadar gelişerek devam etmektedir. Günümüzdeki toprakların kalite ve verimlilikleri hakkında yapılan tartışmalar, seçilen toprak yönetim metotları tarafından toprakların dinamik özelliklerinin etkilenmesi dikkate alındığı için önceki tartışmalardan farklılık göstermektedir. Buradaki farklılık yalnızca azot, fosfor, potasyum ve toplam organik madde düzeyi gibi toprak karakteristiklerinde ortaya çıkmamakta, toprakların biyolojik aktiviteleri, organik madde fraksiyonları, suyun infiltrasyon özelliği ve strüktürel agregasyon gibi birçok

karakteristikleri de barındırmaktadır. (Lewandowski ve Zumwinkle, 1999) Fosforlu gübreler tohum veriminde yüksek etki etiklerinin yanı sıra tohumun kalitesinin yükselmesinde de oldukça önemlidir. Ayrıca fosforlu gübreler nodülasyonu ve nitrogenaz aktivitesine etki ederek topraktaki azotun yararlanılabilirliğini arttırmaktır (Arioğlu, 1994). Baklagillerde fosfor değerli bir makro element olup, ekimden önce toprağa muhakkak fosforlu gübre verilmelidir. Etiyopya gibi yarı kurak bölgelerde fasulye üretimi için 69 kg P₂O₅ ha⁻¹ tavsiye edilebileceği belirtilmiştir (Girma, 2009). Baklagiller kendi azot ihtiyaçlarını karşılayabilir ama fosfor ihtiyaçlarını karşılayamazlar. Önder ve Akçin (1995) yaptıkları bir çalışma sonucunda tabana 0 azot ve 4 kg da fosfor dozu uygulayarak en yüksek dane verimini elde etmişlerdir. Bu sebepten dolayı toprakta yeterli miktarda fosfor yoksa, gübreleme işlemi ile katkı sağlanmalıdır (Parsak, 2006). Farklı fosfor dozlarının bitki boyu, bitki başına yan dal sayısı, baklada tohum sayısı ve bakla boyu üzerinde önemli bir farklılık oluşturmadığı, ilk bakla yüksekliği, bitki başına bakla sayısı ve bin tohum ağırlığı üzerine önemli etki bıraktığı tespit edilmiştir (Çetin ve Öztürk, 2012). Ülkemizde ticaret gübrelere kullanımı bazı bölgeler hariç, gübre kullanımı yoğun ve bilinçli bir uygulama şeklinde değildir. Yoğun kullanımın olduğu bölgelerde ise bu kullanım ne kadar fazla gübre o kadar fazla ürün mantığı ile yapılması nedeni ile sağlıklı bir gübreleme gerçekleştirilememektedir. Bu şartlar altında dahi ülkemiz gübre tüketimi birçok Avrupa ülkesi tüketiminin gerisinde bulunmaktadır. Rakam verilerine bakıldığında birim alanda kullanılması gereken azotlu gübre miktarı 83.7 kg N/ha iken, kullanılan azotlu gübre miktarı ise 38.5 kg N/ha olarak gerçekleşmiştir. Birim alanda kullanılması gereken fosforlu gübre miktarı 57.3 kg P₂O₅ /ha iken tüketilen fosforlu gübre (P₂O₅) miktarı 22.3 kg P₂O₅/ha olmuştur. (Eyüpoğlu, 2002). Alberto fasulye genomunda bazı tarımsal özelliklerine ve tane verimine etkilerini saptamak hedefiyle 2016 yılında Konya ili Altınkekin ilçesi çiftçi tarlasında yürütülen çalışmada, bir yıl süreli olması sebebiyle kesin bir sonuç önerilmeyecek olmasına rağmen, fasulye yetiştiriciliğinde yüksek tane verimi elde edilebilmek için ekimde 5 kg/da N uygulamasının önerilmesinin daha uygun olacağı bildirilmiştir (Altunkaynak, 2018), Önder ve Akçin (1995) yaptıkları bir çalışmada tabana N0P4 dozunda en yüksek tane verimini elde etmişlerdir. Fasulye bitkisinin ürün olarak değerlendirilen kısmı baklalarıdır ve mutfaklarımızın vazgeçilmez besinidir. Bu nedenle toprağa uygulanan makro besin elementlerinden fosfor ve azot gübre dozlarının fasulyenin bakla özellikleri üzerindeki etkisinin araştırılması amaçlanmıştır.

Materyal ve Yöntem

Araştırma Kahramanmaraş koşullarında 2020 yılı Mart-Haziran ayları arasında yürütülmüştür. Denemede kullanılan Göksun fasulye çeşidi Tarımsal Araştırma Enstitüsünden (DAGTEM) temin edilmiştir. Fasulye tohumları sıra arası 50 cm ve sıra üzeri 10 cm ekim sıklığında ve tesadüf bloklarında bölünmüş parseller deneme desenine göre ekimi yapılmıştır. Gübre uygulamalarından 0, 0.3, 0.6, 0.9 kg ha⁻¹ fosfor ana parsellere ekimle birlikte toprağa karıştırılmıştır. Alt parsellere uygulanan azotun 0, 0.4, 0.8, 1.2 kg ha⁻¹ dozlarının yarısı ekimle diğer yarısı da bitkiler yaklaşık 10-15 cm yüksekliğinde uygulanmıştır. Fosfor gübresi olarak Triple süper fosfor, azot olarak ise % 46 üre gübresi kullanılmıştır. Kahramanmaraş, 37-38 kuzey enlemleri ve 36-37 doğu boylamları arasında yer almaktadır. Denemenin yürütüldüğü Mart, Nisan, Mayıs, Haziran aylara ait meteorolojik değerler sırasıyla ortalama sıcaklıklar 12.5, 15.9, 15.9, 25.4, yağışlar 173.4, 61.8, 18.5, 0.3, nispi nem % 67.3, 58.2, 47.2, 46.9 olarak kaydedilmiştir (Anonim, 2020a). Çalışmanın yapıldığı alanın 0-30 cm derinlik toprak özellikleri pH 7.71 (hafif alkalin) suya doymuşluk % 69.96 (killi tınlı), organik madde % 1.58 (düşük), CaCO₃ % 6.09 (orta) tuz % 0.05 (tuzsuz) P₂O₅ (kg de⁻¹) 2.84 (çok az), K₂O miktarı(kg da⁻¹) 55.51 (yüksek) (Anonim, 2020b). Bitkinin durumu ve toprak durumu gözlenerek damla sulama sistemi uygulanarak, bitkinin su ihtiyacı karşılanmıştır. Göksun fasulye çeşidinin bakla uzunluğu (cm), bakla genişliği (mm), bakla çapı (mm), bitkide bakla sayısı (adet), tek bakla ağırlığı (g), baklada tane sayısı (adet), tek tane ağırlığı (g) incelenmiştir (Karabacak, 2018). Elde edilen veriler JMP paket programı kullanılarak bölünmüş parseller deneme desenine göre analiz edilmiştir. Ortalamaların karşılaştırılmasında ise Duncan çoklu karşılaştırma testi uygulanmıştır.

Bulgular ve Tartışma

Kahramanmaraş koşullarında Göksun fasulye çeşidine uygulanan farklı fosfor ve azot dozlarının etkisinin incelendiği Göksun fasulye çeşidinin bakla uzunluğu (cm), bakla çapı (mm), bakla genişliği (mm), bitkide bakla sayısı (adet), tek bakla ağırlığı (g), baklada tane sayısı (adet), tek tane ağırlığına (g) ait ortalamalar ve ulaşan gruplar sırasıyla Çizelge 1., 2., 3., 4., 5., 6 ve 7 verilmiştir.

Bakla Uzunluğu (cm)

Göksun fasulye çeşidine uygulanan farklı gübre doz uygulamasında azot dozları, fosfor x azot doz intereksiyonunun %1 önem seviyesinde bakla uzunluğunda farklılık oluşturduğu kaydedilmiştir. Uygulanan 0, 0.4, 0.8, 1.2 kg ha⁻¹ azot dozlarında Göksun fasulye çeşidinin bakla uzunluğu 6.635 ile 9.085 cm arasında değişmiştir. En yüksek bakla uzunluğu 0.4 kg ha⁻¹ azot uygulamasından elde edildiği, azotun 0.8 kg ha⁻¹ doz uygulamasında 8.973 cm bakla uzunluğu ile 0.4. kg ha⁻¹ doz uygulamasından istatistiksek farklılık oluşturmamıştır. En düşük bakla uzunluğu 0 N doz uygulamasından elde edildiği ve onu 0.8 kg ha⁻¹ uygulamasının izlediği kaydedilmiştir. Azot 0.8 ve 1.2 kg ha⁻¹ doz uygulamaları bakla uzunluğunda azalışa neden olmuştur. Farklı fosfor (0, 0.3, 0.6, 0.9 kg ha⁻¹) doz uygulamalarında bakla uzunluğu 8.736 ile 9.06 cm arasında değişmiştir. Uygulanan farklı fosfor

dozları bakla uzunluğu üzerinde istatistiksel önemli farklılıklar oluşturmamıştır. Fosfor x azot dozları interaksyonunda en yüksek bakla uzunluğu fosforun 0.9 kg ha⁻¹ ile azotun 4 kg ha⁻¹ gübre dozlarından 9.943 cm olarak belirlenmiştir. En düşük bakla uzunluğu ise 8.100 cm olarak fosforun 9 kg ha⁻¹ ile azotun 1.2 kg ha⁻¹ gübre dozlarında kaydedilmiştir. Diğer fosfor x azot doz interaksyonunda bakla uzunlukları 9.053-8.40 cm arasında değişen değerlere sahip olmuştur (Çizelge 1). Ülker ve Ceyhan (2008) Orta Anadolu ekolojisinde Sarayönü ve Çumra ilçesinde yetiştirilen 17 adet fasulye genotipinin bakla boyunun 8.22-10.84 cm arasında değiştiğini kaydetmişlerdir. Elde edilecek sonuçları, uygulanan besin elementleri olumlu veya olumsuz etkileyecektir. Bir besinin artmasıyla birlikte, diğer besin maddelerinin bulunabilirliği veya bitkilerin genetik potansiyeli sınırlayıcı faktörler haline gelmesiyle ilgili olabileceği vurgulanmıştır. (Marschner, 2012). Gübre dozlarının bakla boyu üzerinde interaksiyon etkisini daha önceki çalışmada elde edilen bulgular desteklemektedir.

Çizelge 1. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin bakla uzunluğuna ait ortalamalar ve oluşan gruplar.

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar
0 kg ha ⁻¹ azot	8.546 c-f	8.400 ef	8.686 c-f	8.906 a-e	8.635 c
0.4 kg ha ⁻¹ azot	8.806 b-e	8.986 a-e	9.053 a-d	9.493 a	9.085 a
0.8 kg ha ⁻¹ azot	9.166 abc	8.866 a-e	9.412 ab	8.446 def	8.973 ab
1.2 kg ha ⁻¹ azot	8.933 a-e	8.913 a-e	8.993 a-e	8.100 f	8.735 bc
Ortalamalar	8.863	8.791	9.036	8.736	8.857

Bakla Çapı (cm)

Kahramanmaraş koşullarında farklı gübre dozları uygulanarak yetiştirilen Göksun fasulyesinin bakla çapları, fosfor dozlarına göre istatistiksel olarak %5, azot dozlarına göre %1 önemlilik göstermiştir. Bakla çapında en düşük değer 0 kg he⁻¹ fosfor doz uygulamasından elde edildiği ve diğer uygulamalardan istatistiksel olarak önemli farklılık gösterdiği belirlenmiştir. Diğer uygulamalarda bakla çapı sırasıyla 0.694, 0.697 ve 0.708 cm ile 0.9, 0.3, 0.6 kg he⁻¹ fosfor doz uygulamasından elde edildiği ve kendi aralarında istatistiksel farklılık oluşturmadığı, aynı grupta yer aldıkları kaydedilmiştir. Fasulyenin bakla çapı en yüksek sırasıyla 0.729 ve 0.705 cm ile 0.4 ve 0.8 kg he⁻¹ azot uygulamasından elde edildiği ve istatistiksel olarak aralarında farklılık oluşmadığı kaydedilmiştir. Azotun diğer 0 ve 0.8 kg he⁻¹ dozunda bakla çapı sırasıyla 0.666 ve 0.662 cm olduğu kendi aralarında istatistiksel farklılık oluşturmadığı, aynı grupta yer aldığı tespit edilmiştir. Azotun 2. dozundan sonraki 3. ve 4. dozunda bakla çapında düşüşün olduğu görülmüştür. Fosfor x azot doz interaksyonunun yönünden bakla çaplarında istatistiksel önemli farklılıklar görülmemiştir. Bakla çapları fosfor x azot doz interaksyonlarına göre 0.624-0.774 cm arasında değişim göstermiştir. Bakla çapı en iyi performansını azot dozunda 0.4 kg he⁻¹, fosfor dozunda ise 0.6 kg he⁻¹ dozunda göstermiştir (Çizelge 2). Verma ve ark., (2014) Meghalaya’da 34 fransız fasulye genotipiyle yapılan çalışmada bakla çapının 0.72- 1.56 cm arasında olduğu ve genetik varyasyonun % 40 aşagısında olduğunu ifade etmişlerdir. Balint ve ark (2018) üç fasulye üzerindeki farklı gübre uygulamalarının etkisinin araştırıldığı çalışmada bakla çapının 0.610-0.785 cm arasında değiştiği kaydedilmiştir.

Çizelge 2. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin bakla çapına ait ortalamalar ve oluşan gruplar.

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar

Bakla Genişliği (cm)

Farklı gübre dozları uygulanan Göksun fasulyesinin bakla genişliği üzerinde azot dozlarının %1 önem seviyesinde etkili olduğu, fakat fosfor dozlarının ve fosfor x azot doz interaksyonunun istatistiksel olarak önemli olmadığı kaydedilmiştir. En fazla bakla genişliği 1.016 cm ile 0.8 kg he⁻¹ azot uygulamasından elde edildiği, onu ikinci sırada 0.4 kg he⁻¹ azot doz uygulaması 0.908 cm ile izlediği belirlenmiştir. Bakla genişliğinde en az 0 kg he⁻¹ azot doz uygulamasından 0.728 cm ve onu ikinci sırada 0.777 cm ile 1.2 kg he⁻¹ azot doz uygulamasının izlediği görülmüştür. Bakla genişliği fosfor dozlarına 0.786-0.903 cm arasında, fosfor x azot interaksyonunda ise 0.753 – 1.313 cm arasına değişim gösterdiği kaydedilmemiştir (Çizelge 3). Farklı sulama yönteminin uygulandığı çalışmada bakla genişliğini Sezen ve ark. (2005) 13.2-15.2 mm, Önder ve ark. (2006) 10.5-11.2 mm, Büyükcangaz ve ark. (2008) 14-17 mm arasında değiştiğini kaydetmişlerdir. Ülker ve Ceyhan (2008) Orta Anadolu ekolojisinde

Sarayönü ve Çumra ilçesinde yetiştirilen 17 fasulye genotipinin bakla genişliğini 0.900-1.172 cm arasında değiştiği kaydedilmiştir. Yapılan daha önceki çalışmadan da anlaşıldığı bakla genişliği çeşit özelliği yanı sıra çevresel faktörlerden etkilenmektedir.

Çizelge 3. Farklı fosfor ve azot doz uygulamalarının Göksun fasulye çeşidinin genişliğine ait ortalamalar ve gruplar

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar
0 kg ha ⁻¹ azot	0.693	0.713	0.766	0.740	0.728 c

1.2 kg ha ⁻¹ azot	0.753	0.743	0.826	0.786	0.777 bc
Ortalamalar	0.903	0.828	0.838	0.786	0.857

Bitkide bakla sayısı (adet)

Kahramanmaraş koşullarında 0, 0.4, 0.8, 1.2 kg ha⁻¹ azot doz uygulamasında Göksun fasulye çeşidinin bakla sayısı 12.100-14.450 adet arasında değiştiği ve azot gübre dozlarının istatistiksel olarak etkisinin önemsiz olduğu kaydedilmiştir. Farklı fosfor (0, 3, 6, 9 kg da⁻¹) doz uygulamaların da bakla sayısı 9.850 ile 15.083 adet arasında olduğu, istatistiksel olarak önemli farklılığın olmadığı belirlenmiştir. Bakla sayısı azot X fosfor etkileşimini yönünden istatistiksel olarak %5 önem seviyesinde önemli olmuştur. Bakla sayısı en yüksek 18.733 adet olarak 0.6 kg fosfor ile 1.2 kg ha⁻¹ azot etkileşiminden da gerçekleşmiştir. En düşük bakla sayısı ise 6.866 adet ile 0.9 kg fosfor ve 1.2 kg azot ha⁻¹ etkileşiminden da görülmüştür. Diğer etkileşimlerde bakla sayıları 9.400-16.866 adet arasında değişim göstermiştir (Çizelge 4). İyigün ve Kayan (2019) Eskişehir koşullarında 8 fasulye genotipi ile yapılan çalışmada bitkide bakla sayısı 14.00-26.01 adet arasında değiştiğini ve çeşitler arasında bitkide bakla sayısı yönünden istatistiksel farklılığın önemli olduğu vurgulanmıştır. Kaçar ve ark (2004) Bursa koşullarında üç fasulye çeşidine uyguladıkları azot dozlarının bitkide bakla sayısında önemli farklılık oluşturduğu, en az bakla sayısının kontrolde olduğu, 3 ve 6 kg da⁻¹ azot uygulaması ile arasında farklılığın olmadığı, en yüksek bakla sayısının 12 kg da⁻¹ azot uygulamasından elde edildiği ve 9 kg da⁻¹ azot uygulaması ile arasında önemli farklılığın olmadığı kaydedilmiştir. Özsoy Altınkaynak (2018) Alberto fasulye çeşidine uygulanan farklı azotlu gübrelemede en düşük bitkide bakla sayısının kontrolde elde edildiği, en yüksek bitkide bakla sayısının 5 kg da⁻¹ azotun ekimde uygulamasından elde edildiğini bildirmiştir. Öztürk (2019) Fasulye bitkisine azotlu gübre bölerek ve sulama durumunda dikkate alınarak yapılan çalışmada bitkide bakla sayısının, azot gübre uygulamasından etkilenmediği ve bakla sayısının 13.93-16.13 adet arasında değiştiği kaydedilmiştir. Zewdie ve Hassen (2021) Fasulye bitkisine uygulanan 0, 1, 2, 3, 4 kg da⁻¹ fosfor dozlarının, kontrole göre bitkideki bakla sayısını önemli derecede artırdığını kaydetmişlerdir. En yüksek bakla sayısı 2 kg da⁻¹ fosfor uygulamasından alındığı, 3 ve 4 kg uygulamasında daha düşük bakla sayısı elde edildiği belirlenmiştir. Farklı bölgelerde de araştırılması gerektiğini, fosfor alımını, toprağın mineral içeriğinin engelleyeceğini belirtmiştir. Deneme alını için 6 kg da⁻¹ azot önerildiğini vurgulamıştır. Pang ve ark. (2018) Fosforun yeterince alınmasının bitki büyümesi ve gelişmesi için çok önemli olduğu, azalan kullanılabilirlik ürün veriminde bir düşüşe neden olacağı vurgulanmıştır. Tesfaye ve Balcha (2015) fasulye bitkisi için fosfor dozunun artması bitkide bakla oranını artırdığı, fakat 13.2 kg ha⁻¹ üzerindeki P oranının üzerindeki uygulamalardaki düşüş P kaynağının optimal seviyeye ulaşması veya fasulye verim potansiyelinin sınırlandırılması, bir besinin artmasıyla birlikte diğer besin maddelerinin bulunabilirliği veya bitkilerin genetik potansiyeli sınırlayıcı faktörler haline gelmesiyle ilgili olabileceği vurgulanmıştır. (Marschner, 2012). Besin maddelerinin artan P düzeyine sahip olması (Mengel ve Kirkby, 2001) veya tane verimindeki artış hızının P arzındaki artış oranından kaynaklanacağı belirtilmiştir.

Çizelge 4. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin bakla sayısına ait ortalamalar ve oluşan gruplar.

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar

Tek Bakla Ağırlığı (g)

Göksun fasulyesinin tek bakla ağırlığı uygulanan farklı fosfor ve azot gübre dozları yönünden istatistiksel olarak önemli farklılık oluşturmamıştır. Farklı azot doz uygulamasında tek bakla ağırlığı 1.428-1.549 g arasında değişim

göstermiştir. Tek bakla ağırlığı farklı fosfor dozları yönünden 1.407-1.640 g arasında değişen değerlere sahip olmuştur. Fosfor X azot gübre dozları etkileşimini istatistiksel olarak tek bakla ağırlığına %1 önem düzeyinde etkili bulunmuştur. Tek bakla ağırlığında en yüksek 1.723 g olarak 0.3 kg fosfor ile 0.4 kg ha⁻¹ etkileşiminin da kaydedilmiştir. En düşük bakla ağırlığı ise 1.186 g ile 0.9 kg fosfor ve 0 kg azot ha⁻¹ etkileşiminde belirlenmiştir. Diğer etkileşimlerde tek bakla ağırlıkları 1.673-1.230 g arasında değişen değerlere sahip olduğu kaydedilmiştir (Çizelge 5). Sakız fasulyesine farklı dozlarda molibden uygulamasında (Müftüoğlu ve ark., 2021) tek bakla ağırlığının 410-502 mg arasında değiştiği ve molibden uygulamasının istatistiksel olarak önemli farklılık oluşturmadığını kaydedilmiştir.

Çizelge 5. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin tek bakla ağırlığı ait ortalamaları ve oluşan grupları

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar

azot X fosfor etkileşimini %1 önemli

Baklada Tane sayısı (adet)

Farklı gübre dozlarının uygulandığı Göksun fasulye çeşidinin baklada tane sayıları azot dozları, fosfor x azot doz etkileşimini yönünden %5 önem düzeyinde istatistiksel olarak farklılık oluşturduğu kaydedilmiştir. Baklada tane sayısı en yüksek 5.016 adet ile 0.4 kg ha⁻¹ azot uygulamasından elde edildiği, onu ikinci sırada 5.000 ile azotun 0.8 kg ha⁻¹ doz uygulamasının, üçüncü sırada 1.2 kg ha⁻¹ doz uygulaması 4.766 adetle izlediği ve en az 4.641 adet ile 0 dozundan elde edildiği kaydedilmiştir. Fosfor x azot dozları etkileşiminde en yüksek baklada tane sayısı 5.466 adet ile fosforun 3 ve azotun 1.2 kg ha⁻¹ gübre uygulama etkileşiminde görülmüştür. En düşük bakla tane sayısı ise sırasıyla 4.366 ve 4.466 adet ile azotun 1.2 kg x fosforun 0 kg ha⁻¹ ve yine azotun 1.2 kg x fosforun 9 kg ha⁻¹ doz etkileşiminden elde edildiği ve aynı grupta yer aldığı kaydedilmiştir. Baklada tane sayısı ile ilgili diğer etkileşimlerde ise değerler 4.600-5.330 adet arasında değişim göstermiştir. Farklı fosfor dozları yönünden bakla tane sayısında istatistiksel farklılık görülmemiştir. Baklada tane sayısı uygulanan fosfor dozlarına göre 4.716-5.083 adet arasında değişim gösterdiği tespit edilmiştir (Çizelge 6). Topal (2019), farklı ekim zamanı ve farklı bakla çeşidi ile yapılan çalışmada baklada tane sayısının 2.38-4.00 adet arasında değiştiğini belirlemiştir. Yeken ve ark (2018) Türkiye'deki yerel kuru fasulye çeşitlerinde baklada tane sayısının 4-6.4 adet arasında olduğunu kaydetmişlerdir.

Çizelge 6. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin tane sayısı ait ortalamalar ve oluşan grupları

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar

Ortalamalar	4.766	5.083	4.858	4.716	4.856

Tek tane Ağırlığı (g)

Göksun fasulye çeşidine uygulanan farklı gübre doz uygulamasında azot dozları (%1), fosfor x azot doz etkileşiminin (%5) istatistiksel olarak tek tane ağırlığında önemli farklılık oluşturduğu belirlenmiştir. Tek tane ağırlığı en az 0.205 g ile 0 kg ha⁻¹ azot doz uygulamasından elde edilmiştir. Diğer 0.4, 0.8, 1.2 kg ha⁻¹ azot dozlarında, sırasıyla bakla tane ağırlığı 0.251, 0.250, 0.240 g olduğu ve istatistiksel olarak aralarında önemli farklılık oluşturmadığı, aynı grupta yer aldığı kaydedilmiştir. Fosfor x azot dozları etkileşiminde en yüksek tek tane ağırlığı 0.293 g ile fosforun 0.6 ve azotun 0.8 kg ha⁻¹ gübre doz etkileşiminde tespit edilmiştir. En düşük tek tane ağırlığı ise 0.166 g olarak fosforun 9 ile azotun 0 kg ha⁻¹ gübre doz etkileşiminde kaydedilmiştir. Diğer fosfor x azot doz etkileşiminde tek tane 0.200-0.280 g arasında değişim göstermiştir. Farklı fosfor (0, 0.3, 0.6, 0.9 kg ha⁻¹) doz uygulamaların da tek tane ağırlığı 0.209-0.255 g arasında değişmiştir. Uygulanan farklı fosfor dozları tek tane ağırlığı üzerinde istatistiksel önemli farklılıklar oluşturmamıştır. (Çizelge 7). Topal (2019), farklı ekim zamanı ve farklı bakla çeşidi ile yapılan çalışmada yüz tane ağırlığı 22.53-48.16 g arasında değiştiği, diğer bir ifadeyle tek tane ağırlığı 0.225-0.481 g arasında olduğu anlaşılmaktadır.

Çizelge 7. Farklı fosfor ve azot dozları uygulanan Göksun fasulye çeşidinin tek tane ağırlığı ait ortalamalar ve oluşan gruplar

	0 kg da ⁻¹ fosfor	0.3 kg ha ⁻¹ fosfor	0.6 kg ha ⁻¹ fosfor	0.9 kg ha ⁻¹ fosfor	Ortalamalar
0 kg ha ⁻¹ azot	0.200 efg	0.223 c-f	0.233 b-e	0.166 g	0.205 b
0.4 kg ha ⁻¹ azot	0.253 a-d	0.266 abc	0.256 abc	0.230 b-f	0.251 a
0.8 kg ha ⁻¹ azot	0.203 d-g	0.246 a-e	0.293 a	0.256 abc	0.250 a

Ortalamalar	0.209	0.250	0.255	0.233	0.236

Sonuç

Kahramanmaraş koşullarında Göksun fasulye çeşidine fosfor ve azot dozlarının dört farklı dozları uygulanarak bakla özelliği üzerindeki etkisi araştırılmıştır. Araştırmada fasulye baklasının bakla uzunluğu, bakla genişliği, bakla çapı, bitkide bakla sayısı, tek bakla ağırlığı, baklada tane sayısı, tek tane ağırlığı incelenmiştir. Fosfor dozlarının etkisi incelenen özelliklerden sadece fasulyenin bakla çapı üzerinde, azot dozlarının etkisi bakla uzunluğu, bakla çapı, bakla genişliği, tek tane ağırlığı, bakla tane sayısı üzerinde görülmüştür. Bitkide bakla sayısı, bakla tane sayısı, bakla uzunluğu, bakla ağırlığı, tek tane ağırlığı fosfor x azot dozu interaksiyonundan etkilenmiştir. Araştırma sonunda 4 kg da⁻¹ ve yukarı azot doz uygulamaları bakla özellikleri üzerinde olumlu katkıda bulunurken, fosfor etkisinin net görülemediği belirlenmiştir. Fosforun etkisini gözlemek için azotun sabitlenmesi gerektiği sonucuna varılmıştır.

Teşekkür

Bu çalışma, Kahramanmaraş Sütçü İmam Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenen 2019/2-21 M numaralı projenin bir kısmını kapsamaktadır.

Abstracts

Despite the global challenges of high food insecurity, covid-19 set-in which is said to have contributed to the phenomenon. However, most recent studies were conducted during the COVID-19 lockdown, indicating a need to assess households' food security after the lockdown. Therefore, this study investigated rural households' (who are mostly farmers) food security status and dietary diversity as a proxy for nutrition status in Nigeria. Two hundred and forty farming households were randomly selected for the study. The data collected was analysed using descriptive statistics, the USDA 18 food security questionnaire core module, the household dietary diversity score, and logit regression. The results revealed that the majority of the farming households were food insecure (66.3%) and malnutrition was also prevalent among rural farming households as 62.9 per cent had a low dietary diversity score. The positive determinants of household food security were access to credit, cooperative membership, income, and marital status. While household size negatively influenced rural household food security. This study calls for development agents' and governments' intervention to reduce the high level of food insecurity and malnutrition among rural farming households through the provision of financial support and awareness creation on family planning.

Abstract

Due to global warming and erratic rainfall in dry and semi-arid regions, agricultural water resources have been depleted over time. Mulching has a critical influence as a water-saving practice in rain-fed crop production to minimize water stress in agriculture. It is primarily crucial for retaining soil moisture, regulating soil temperature, and minimizing soil evaporation, all of which have an impact on crop productivity. Mulching has several strategic implications for the soil ecology, crop development, and climate. Mulch insulates the soil, assisting in the creation of beautiful and protected landscapes by providing a barrier from cold and hot temperatures. Water use inside the soil root zone is a critical event for increasing water efficiency and conserving water resources through mulching. Mulching is also responsible for the attractiveness of farmlands in addition to being a water-saving practice. Mulch material selection is mostly determined by availability, climate, durability, and cost-effectiveness. It must also be environmentally feasible to be used indefinitely. As a result, it is determined that the various mulching materials used in agriculture may save water resources, resulting in increased crop production in rain-fed agriculture.

Abstract

Fermented milk products, which have a history equal to human history, constitute an important part of the dairy industry today. While yogurt is at the beginning of fermented milk products in our country, it is seen that buttermilk and then kefir have an important place in the beverage scale. Milk proteins, on the other hand, show specific functions that positively affect healthy nutrition due to the bioactive components in their composition, as recently determined, that they provide the necessary amino acids for growth and development. In our study, the changes in ACE activity and antioxidant capacity of the samples were examined in the in vitro digestion process by enriching the kefir samples with whey proteins, casein, and skimmed milk powder, which are the natural components of milk. While ACE inhibition values were in the range of 78.63-90.30% pre-digestion, they changed in the range of 86.97-96.38% after gastrointestinal digestion. It was determined that the %ACE inhibition values of the control (K) sample remained at the lowest level at all stages of digestion and that the difference between the K sample and the protein-rich samples was significant ($p<0.05$). Antioxidant activity value ranging from 0.3615-0.5512 meq Ascorbic acid/ μ g before digestion was determined as 1.3796-1.9313 meq Ascorbic acid/ μ g after gastrointestinal digestion ($p<0.05$). In the study, the sample with the highest % ACE inhibition activity among kefir samples was determined as casein-rich kefir sample at all stages of digestion. In terms of antioxidant activity capacity, kefir samples containing whey protein at all stages of digestion were identified as the samples with the highest potential. Considering the increasing trend of healthy nutrition and the therapeutic effects in fermented products, kefir with increased protein content can be considered as an alternative product for fermented beverages, which is the most preferred in our country. In the light of these results, it can be said that protein-rich fermented beverages will contribute to a healthy eating model due to their health-supporting effects.

Abstract

The aim of this study was to reveal the trends in age-related growth, feed intake and some reproduction traits in a Anadolu-T ($A2 \times A1$) and Ross-308 female PS breeders, as well as growth, feed intake, feed conversion ratio, and livability characteristics in four-way Anadolu-T [$(B2 \times B1) \times (A2 \times A1)$] and Ross-308 hybrids. In the study, 120 d-old male and female PSs were randomly allocated to floor pens (2.2×1.8 m) in 4 replications of 30 chicks each (7.5 birds/ m^2) and reared up to 18 weeks of age. At 20 weeks of age, two groups were randomly formed from female PS breeders (40 hens in each group) for the laying period. In order to obtain four-way hybrid, female PSs ($A2 \times A1$) was assigned 5 males from ($B2 \times B1$) (male:female ratio: 1/8). Regarding the four-way hybrids, 90 male-female mixed chicks from both genotypes for each parental age were placed in each pen with 1.8×2.2 sizes with 3 replicates of each genotype with 30 chicks.

Regarding the PS breeders, the body weight (BW), average daily feed intake (ADFI), age at first egg (AFE, in d), number of eggs, egg weight and egg mass were determined during 64 weeks. Catalog values of Ross-308 PSs were used to compare the same parental traits. For four-way hybrid and commercial genotype, weekly BW, weekly cumulative FI, feed conversion ratio (FCR) and liveability characteristics were compared by averaging the values observed at 32 and 52 weeks of age. Total feed intake for Anadolu-T and Ross-308 PS males were 52012 g (116.1 g/d) and 50904 g (114 g/d), and for females 55014 g (122.8 g/d) and 55062 g (123 g/d), respectively. Anadolu-T PSs reached age at 5% production age 5 days later than Ross-308 and laid 16 fewer eggs. Anadolu-T PS hens laid heavier eggs, with an average egg weight of 65.1 g in Anadolu-T vs 62.1 g in Ross-308. Egg mass of Anadolu-T and Ross-308 PSs was calculated as 37.1 g and 42.6 g, respectively. The 6-weeks BW ($P < 0.001$), FI ($P < 0.05$) and FCR ($P < 0.001$) of Anadolu-T and Ross-308 hybrids was 2787.6 g and 3048.8 g; 4673.0 g and 4453.8 g; and 1.674 and 1.473, respectively.

In conclusion, the fewer egg production in Anadolu-T PSs with the contribution of delayed sexual maturity limits chick production. Therefore, selection for earlier sexual maturity and higher egg production in Anadolu-T dam lines is considered very important in increasing reproductive performance. The fact that hybrid performances were also higher in Ross-308 indicates that multi-trait intensive selection is required in Anadolu-T sire lines, which takes into account FCR, breast yield and abdominal fatness, as well as fast growth.

Key Words: Broiler, Hybrid, Egg number, Feed efficiency, Body weight

Introduction

The rapid increase in the world population has increased the demand for protein-rich animal products and puts pressure on the livestock sector (Steinfeld et al., 2006). World chicken meat production has more than doubled in the last 20 years and reached 120 million tons (FAOSTAT, 2022), and it is estimated that chicken meat will be the most consumed form of animal protein in the world in the near future (OECD/FAO, 2021).

Turkey is completely foreign-dependent in terms of genetic material used in hybrid production, and an increasing number of parent stock (PS) and partially grandparent stock chicks are imported every year. Although Turkey is in a good position in world broiler production, no significant progress has been made in the breeding and production of pure lines from which hybrids are produced (Sarica et al., 2018). Today, there are only three companies on the world market engaged in breeding and selection of fast-growing broiler pure lines: Aviagen Broiler Breeders, Cobb-Vantress and Hubbard (de Jong et al., 2017). This monopolized structure makes sustainable production difficult for the Turkish broiler industry. In addition, the avian-flu epidemic in Europe and UK in 2021 has restricted the production of commercial breeding companies that keep stock flocks mostly in these countries (DAERA, 2022; IZSvE, 2022). This highlights the importance of local breeding and the availability of genetic resources against stockbreeding problems. For these reasons, in order to meet at least a certain part of the broiler production in Turkey with local resources, the breeding and selection of 5 pure line breeders (3 dam and 2 sire lines) at the national level was started in 2015 (Sarica et al., 2016) and these broiler lines were registered as “Anadolu-T” in 2020 (Sarica et al., 2021). However, there is no study revealing the performance of four-way cross hybrids produced for commercial use and their two-way cross parent stock.

The aim of this study was to reveal the trends in age-related growth, feed intake and some reproduction traits in a Anadolu-T ($A2 \times A1$) and Ross-308 female PS breeders, as well as growth, feed intake, feed conversion ratio, and livability characteristics in their four-way hybrids.

Materials and Methods

The Anadolu-T parent stock (PS) material of the study was provided from “Eskişehir Geçit Kuşağı Agricultural Research Institute”, and four-way cross hybrids were produced in Ondokuz Mayıs University, Agricultural Faculty, Research and Application Farm. All procedures were approved by the Ondokuz Mayıs University Animal Care and Use Ethics Committee (Decision no: 2017/31; date: 30.06.2017).

The Anadolu-T male PSs ($B2 \times B1$) used in the study were obtained by crossing the males of the B2 line and the females of the B1 line, while Anadolu-T female PS breeders ($A2 \times A1$) were obtained by crossing the females of the A1 line and the males of the A2 line. Catalog values of Ross-308 were used as commercial PS flock (Aviagen, 2021). In the production of four-way cross hybrid [$(B2 \times B1) \times (A2 \times A1)$], males of ($B2 \times B1$) PSs and females of ($A2 \times A1$) PS breeders were mated. In comparison of Anadolu-T hybrids, Ross-308 hybrids at the same breeder age from a commercial enterprise were used.

In the study, 120 d-old male and female PSs were randomly allocated to floor pens (2.2×1.8 m) in 4 replications of 30 chicks each (7.5 birds/m²) and reared up to 18 weeks of age. Wood shavings were used as litter material. Water was given freely through nipple drinkers. All PS birds were fed ad-libitum for the first 14 days with chick starter crumbs (2,800 kcal/kg ME; 20.0% CP; 1.30% dig. Lys; 0.60% dig. Met; 1.00% Ca; 0.50% aP). However, after this age, restricted feeding has been implemented up to 64 weeks; grower (15-42 days; 2,750 kcal/kg ME; 18.0% CP; 0.75% dig. Lys; 0.35% dig. Met; 1.20% Ca; 0.45% aP) and developer (between 43-126 days; 2,750 kcal/kg ME; 14.5% CP; 0.65% dig. Lys; 0.33% dig. Met; 1.50% Ca; 0.40% aP) feeds were used. All PS birds were vaccinated against Marek's, New castle disease, Gumboro, Fowl Typhoid, Fowl Pox, and all sanitary and biosecurity practices were strictly implemented during the study. House temperature and humidity values were kept at optimum (32-33 °C in the first 3 d-old, gradually decrease to 21 °C up to 28 d-old, then continue as 21-22 °C). The photoperiod was 24L:0D for the first 3 days, 10L:14D for the 14-140 days, and the first light stimulation was implemented at 141 days, the lighting program was 14L:10D at 24 weeks onwards.

At 20 weeks of age, two groups were randomly formed from female PS breeders (40 hens in each group) for the laying period. In order to obtain four-way hybrid, female PSs ($A2 \times A1$) was assigned 5 males from ($B2 \times B1$) (male:female ratio: 1/8). To encourage the nest using PS breeder hens, a nest box per 4.5 birds was placed in each pen at 20 weeks of age. Groups of 40 females and 5 males were reared in a floor system with 3.5×3.5 m (3.8 birds per m²) pen sizes in the climate controlled house between 24 to 64 weeks. Feeding of males and females was done separately. The feeder area per hen was 15 cm, and 26 cm for the male. Water was freely supplied by 8 nipple drinkers per pen (5.6 birds per nipple). All birds were fed with pre-laying ration from 127 to 154 days of age and with laying ration at 155 days afterwards.

In order to produce four-way broiler hybrids at 32 and 52 weeks of age, 120 hatching eggs were collected and incubated with Ross-308 eggs taken from the commercial enterprise at the same week of parental age. After 21 days of incubation, 90 male-female mixed chicks from both genotypes were placed in each pen with 1.8×2.2 sizes with 3 replicates of each genotype with 30 chicks. Both broiler test studies were carried out in the same broiler house for 6 weeks. Standart temperature (first 3 days 32-33 °C, gradually decrease to 21 °C until 28 d-old onwards), relative humidity (50-70%), ventilation, lighting (first 3 days 24L:0D, 4-14 days 20L:4D, 4-6 days 18L:6D) procedures were applied. All birds were fed ad-libitum with chick starter (1-15 days; 23% CP, 3000 kcal/kg ME), chick (16-28 days; 22% CP, 3100 kcal/kg ME), broiler (29-35 days; 21%, 3100 kcal/kg ME) and finisher (39-42 days; 18% CP, 3100 kcal/kg ME) feeds.

Regarding the PS breeders, the growth (individual weekly body weight [BW, in g]), and average daily feed intake [ADFI, in g/day per bird], total feed intake [g/bird] in both male and female PS breeders, reproduction (age at first egg [AFE, in d], number of eggs [n/hen], egg weight [in g]) and egg mass (g egg weight/hen per week) determined in only PS hens during 64 weeks. Catalog values of Ross-308 PSs were used to compare the same parental traits (Aviagen, 2021). For four-way hybrid and commercial genotype, weekly body weight (BW, in g), weekly cumulative feed intake (FI, in g), feed conversion ratio (FCR, g.feed intake/g.body weight gain) and liveability (%) characteristics were compared by averaging the values observed at 32 and 52 weeks of age. For PS breeder characteristics, evaluations were made on the means of each trait. In comparison of hybrids with commercial one, one-way analysis of variance was used for each trait and Tukey HSD post-hoc test was implemented for multiple comparisons when $P < 0.05$.

Results and Discussion

Parent stocks (PSs)

The BW and ADFI trends of Anadolu-T and Ross-308 PSs between 0-64 weeks are shown in Figure 1A and Figure 1B, respectively. Growth period (0-23 weeks) BW values were very close in both PS groups. However, after 40 weeks of age, both male and female Anadolu-T PSs had lower BW than Ross-308. The ADFI of Anadolu-T female PSs were very close to Ross-308. However, Anadolu-T male PSs showed more stable ADFI from 24 to 64 weeks, while there was a linear increase in Ross-308s. Total feed intake for Anadolu-T and Ross-308 PS males were 52012 g (116.1 g/d) and 50904 g (114 g/d), and for females 55014 g (122.8 g/d) and 55062 g (123 g/d) d), respectively (Aviagen, 2021).

Figure 1. Trends of weekly body weight (A), average daily feed intake (ADFI, in g/day/hen per week) (B) in Anadolu-T and Ross-308 PSs from 0 to 64 weeks.

Cumulative egg number (n of eggs/hen), laying percentage (% hen/week), egg weight (g) and egg mass (g/hen) of Anadolu-T and Ross308 PSs are shown in Figure 2A, 2B, 2C and 2D, respectively. From the first egg, Anadolu-T PSs had fewer cumulative egg number than Ross-308, with approx. 16 fewer eggs at 64 weeks (Figure 2A). Similarly, the laying percentage was lower in Anadolu-T PS up to 55 weeks, but close to Ross-308 after that age (Figure 2B). Also, age at first egg was 179 d and age at 5% production 180 d (26 weeks) in Anadolu-T and 175 d (25 weeks) in Ross-308 PS hens (unpublished data). The impaired reproductive performance in Anadolu-T PS seems possibly to be due to a delayed age at first egg or 5% production (Wolc et al., 2020). Because Anadolu-T PSs reached age at 5% production age 5 days later than Ross-308 and laid 16 fewer eggs (Aviagen, 2021). Although the mean egg weight was similar at the beginning and end of the laying period between two genotypes, Anadolu-T PS hens generally laid heavier eggs, with an average egg weight of 65.1 g in Anadolu-T vs 62.1 g in Ross-308 (Figure 2C). Egg mass values also had a similar trend to the laying percentage, while in the peak and last period, egg mass of Anadolu-T and Ross-308 PSs was calculated as 37.1 g and 42.6 g, respectively. The heavier egg weight in Anadolu-T PSs seems to be most likely related to the delayed first laying or sexual maturity (Arango et al., 2007; Wolc et al., 2020). The lighter egg mass in Anadolu-T PS is due to the lower weekly lay percentage.

Figure 2. Trends of cumulative egg number (n of eggs/hen) (A), laying percentage (% hen-week) (B), egg weight (in g) (C), and egg mass (g egg weight/hen per week) (D) in Anadolu-T and Ross-308 PS hens between 24 and 64 weeks.

Hybrids

Body weight (BW), feed intake (FI), feed conversion ratio (FCR) and liveability values of Anadolu-T and Ross-308 hybrids between 0-6 weeks of age are given in Figure 3A, 3B, 3C and 3D, respectively. The difference between Anadolu-T and Ross-308 hybrids, which were similar in terms of chick weights, emerged from 1 week of age and was 2787.6 g and 3048.8 g at 6 weeks of age, respectively ($P < 0.001$, Figure 3A). The FI at first week was higher in Ross-308 ($P < 0.001$), while it was lower at week 6 weeks ($P < 0.05$), with similar feed intake amounts between 2 and 5 weeks of age (Figure 3B). While FCR values at 1 and 2 weeks of age were similar between genotypes, Ross-308 benefited significantly more effectively from 3 to 6 weeks ($P < 0.05$) and was determined as 1.674 and 1.473 for Anadolu-T and Ross-308 hybrids at 6 weeks of age, respectively ($P < 0.05$, Figure 3C). The fact that the Ross-308's FCR is 0.2 units better is due to its higher BW value by intaking less feed during 6 weeks. As is known, FCR (or its components BW and FI) is a heritable trait and has a moderate (0.30-0.40) heritability. Genetic selection for FCR in broilers for long generations has produced chickens that can benefit from feed more effectively (Prakash et al., 2020; Marchesi et al., 2021; Berger et al., 2022). In addition, selection for increasing breast yield and reducing abdominal fatness in multi-trait models contributed to the improvement of FCR due to genetic correlations between these traits (Le Bihan-Duval et al., 1998; Chen et al., 2021). We know from our previous observations that Anadolu-T hybrids have approximately 3% less breast yield and 1.3% more abdominal fat compared to Ross-308 (unpublished data). There was also no significant difference in liveability between hybrid genotypes (Figure 3D).

Figure 3. Trends of body weight (in g) (A), cumulative feed intake (in g) (B), feed conversion ratio (g.feed intake/g.weight gain) (C), and liveability (%) (D) in Anadolu-T and Ross-308 hybrids from 0 to 6 weeks.

ns: no significant difference between two hybrid genotypes; *: $P < 0.05$; **: $P < 0.001$.

In conclusion, regarding the parental traits, excessive BW increase was successfully prevented in Anadolu-T PSs with daily restricted feeding. The fewer egg production in Anadolu-T PSs with the contribution of delayed sexual maturity limits chick production. Therefore, selection for earlier sexual maturity and higher egg production in Anadolu-T dam lines is considered very important in increasing reproductive performance. The fact that hybrid performances were also higher in Ross-308 indicates that multi-trait intensive selection is required in Anadolu-T sire lines, which takes into account FCR, breast yield and abdominal fatness, as well as fast growth.

Research on the Bio-ecology, Morphology and Seasonal Variation of *Dendrobaena veneta* (Rosa, 1886)

Aysel Kekillioglu¹, Ali Aslan Erdoğ an²

^{1,2}Nevşehir Hacı Bektas Veli University, Faculty of Science Department of Biology, Nevşehir, TÜRKİYE

Abstract

Dendrobaena veneta (Rosa, 1886) (Annelida: Clitellata: Lumbricidae) is one of the most widely used compost worms which has; 50–70 mm body length, with striated red pigmentation and clitellum on segments 27–33. This taxon is now widely distributed all over Europe. The origin of this species is suggested to be in the East Mediterranean. *D. veneta* has been the subject of several cell-biological, immunological, soil and environmental studies. In this context, the main purpose and content of the study is to analyze the bio- ecology, morphology and seasonal variation of *D. veneta* with the data which was obtained from the observations and examinations carried out during 2020-2022 in two different habitat locality in Nevşehir province

Key Words: *D.veneta*, biology, Ecology, Morphology, Seasonal variation, Nevşehir

***Dendrobaena veneta* (Rosa, 1886)’nın Biyo-ekolojisi, Morfolojisi ve Mevsimsel Varyasyonu Üzerine Araştırma**

Özet

Dendrobaena veneta (Rosa, 1886) (Annelida: Clitellata: Lumbricidae) en yaygın kullanılan kompost solucanlarından ve morfolojik olarak; 50-70 mm gövde uzunluğu, çizgili kırmızı pigmentasyon ve 27-33 segmentlerinde yer alan klitellum özelliklerine sahiptir. Bu takson Avrupa genelinde yaygın olarak dağılım göstermektedir. *D.veneta* türünün kökeninin Doğu Akdeniz olduğu ileri sürülmektedir. *D. veneta* çoğunlukla; hücre biyolojisi, immünoloji, toprak ve çevresel konulardaki çeşitli çalışmalara konu olmaktadır. Bu bağlamda; bu çalışmanın temel amaç ve içeriğini, Nevşehir ili kapsamında iki farklı localitede yer alan habitatlarda 2020- 2022 yılları arasında sürdürülen araştırma ve gözlem verilerinden elde edilen sonuçların biyo-ekolojik, morfolojik ve mevsimsel varyasyon bakımından incelenmesi oluşturmaktadır.

Determination of the Recreational Status of the Marmaris National Park

Sevgi Belikırık¹, Cengiz Yücedağ²

¹Directorate of Marmaris National Park, 4th Regional Directorate of Nature Conservation and National Parks, Muğla, Turkey

²Department of Landscape Architecture, Faculty of Engineering and Architecture, Burdur Mehmet Akif Ersoy University, Burdur, Turkey

Abstract

In this study, it was aimed to determine the recreational status of Günnücek Sweetgum Forest, Pamucak Local Icmeler Beach, Adaağzı Locality Cennet Island and Adaköy-Aktaş Areas and recreational pressures on these areas in Marmaris National Park. Marmaris National Park provides different recreational activities due to its historical, biological and ecological structure, geomorphological, geological, natural and cultural resource values. The size of the National Park and its location intertwined with Marmaris town center resulted in the excess of uncontrolled usage areas. This situation was evaluated as a factor that increases the recreational pressure.

Key Words: Recreation, Recreational Pressure, Marmaris National Park

Marmaris Milli Parkı Rekreatsyonel Durumunun Belirlenmesi

Özet

Bu çalışmada Marmaris Milli Parkı içerisinde yer alan Günnücek Sığla Ormanı, Pamucak Mevki İçmeler Sahili, Adaağzı Mevki Cennet Adası ve Adaköy-Aktaş Mevki alanlarının rekreatsyonel durumları ve bu alanlar üzerine olan rekreatsyonel baskıların belirlenmesi amaçlanmıştır. Marmaris Milli Parkı, konumu itibarıyla sahip olduğu tarihi, biyolojik ve ekolojik yapısı, jeomorfolojik, jeolojik doğal ve kültürel kaynak değerler nedeniyle farklı rekreatsyonel aktiviteler sunmaktadır. Milli Parkın büyüklüğü ve Marmaris ilçe merkezi ile iç içe geçmiş bir konumda bulunması kontrolsüz kullanım alanlarının artmasına neden olmaktadır. Bu durum ise rekreatsyonel baskıyı artıran faktör olarak değerlendirilmiştir.

Anahtar Kelimeler: Rekreatsyon, Rekreatsyonel Baskı, Marmaris Milli Parkı

Giriş

İnsan doğada varoluşundan bu yana, doğaya egemen olmaya çalışmıştır. Hızla artan nüfus ve beraberinde getirmiş olduğu talep çeşitliliği, sanayi ve teknolojik gelişmeler doğal kaynaklar üzerindeki baskıyı ortaya çıkarmıştır. Plansız ve kontrolsüz doğal kaynak tüketiminin yanında getirdiği birtakım çevre sorunlarının artışıyla birlikte insanoğlu, doğal kaynakların korunması ve yönetimine ilişkin gelecek nesillere aktarılması gerektiği kanaatiyle bir takım koruma yönetim arayışına girmiştir. Türkiye’de ise, 1937 yılında doğanın korunması konusunda yürürlüğe giren 3116 ve 3117 Sayılı Kanun’lar ile koruma ve yönetim anlayışı oluşmaya başlamıştır. 1956 yılında kabul edilen 6831 Sayılı Orman Kanunu ile milli parkların ve orman alanlarının oluşturulmasına yönelik ilk çalışmalar başlamıştır. Yine bu kanunun 25. maddesi ile ender ekosistemleri içinde barındıran yerlerin milli park statüsü içerisine alınması sağlanmıştır. 2022 yılı itibarıyla Türkiye’de milli park sayısı 48, bu alanların yüzölçümü 884 566 ha (DKMP, 2022) olup, bu alanların ülke yüz ölçümüne oranı ise %1,13’dir.

1996 yılında milli park ilan edilen Marmaris Milli Parkı, 29206 ha büyüklüğünde (%85’i karasal alan, %15’i ise denizel alan) olup, birçok ekosistemi içerisinde barındırmaktadır. Milli Park içerisinde yer aldığı “Datça-Bozburun Yarımadaı”, Avrupa’da korunması gereken 100 orman sıcak noktasından, ülkemizde ise 9 orman sıcak noktasından biridir. Ayrıca, milli park Dünya Doğayı Koruma Vakfı’nın (WWF) doğa koruma açısından küresel düzeyde öncelikli 200 ekolojik bölgeden biri olan “Akdeniz Ormanları” ve denizel olarak “Akdeniz Bölgesi” içinde yer almaktadır. Biyolojik çeşitlilik ve tehdit açısından Akdeniz Bölgesi dünyanın 25 sıcak ve önemli noktasından biridir. Milli Park; önemli doğa alanı, önemli bitki alanı, endemik bitki alanı, önemli kuş alanı ve önemli memeli alanı içinde yer almaktadır (Anonim, 2015).

Günümüzde artan yoğun kentleşme ve endüstriyel gelişmelerin artışıyla ortaya çıkan doğa yoksunu kentlerin yaşam koşulları, insanlar üzerinde bazı baskılar oluşturmaktadır. Bu baskılardan kaçış ve kentsel yeşil alanların nitelik ve niceliklerinin yetersizliği, insanların kent merkezlerine yakın, doğal ve açık alanlardaki rekreatsyonel faaliyetlere yönelimini artırmaktadır. Çağdaş toplumun gittikçe artan temposu ve stresi göz önüne alındığında, rekreatsyonun öneminin artmaya devam edeceği ve rekreatsyonel etkinliklere olanak sağlayan parkların da ön plana çıktığı görülmektedir (Manning ve More, 2002). Günümüzde rekreatsyonel etkinliklerin büyük bir kısmı doğada bulunmakta ve kaynak olarak çoğunlukla doğal kaynaklar kullanılmaktadır (Karaküçük 1999). Bu sebeple bireylerin kent yaşamının olumsuz etkilerinden kurtularak fiziksel ve ruhsal yenilenme gereğiyle yönelecekleri çevre, kuşkusuz doğal çevredir (Akesen, 1984).

Milli parklar, içinde yaşayan canlılar da dâhil olmak üzere olağanüstü güzellikteki manzaraları korumak ve insanlara bu yerleri gezip görme fırsatı vermek için kurulmuş ve bu nedenle korunmuştur (Straaten, 1997). Batı ülkelerinin sanayi devrimini daha önce yaşamaları, doğal kaynak talebinin artması, koruma fikrinin zamanla oluşması, ekonomik gelirin artması ve insanların farklı bir mekâna gitmek istemeleri milli parklar gibi önemli korunan alanları ziyaret etme düşüncesini doğurmuştur (Kervankıran ve Eryılmaz, 2014). Bu bağlamda doğal ve kültürel bakımdan içerisinde barındırdığı zengin peyzaj özellikleri ile rekreasyonel kaynak değeri olan milli parklar çeşitli etkinliklere imkan sağlaması açısından her geçen gün daha fazla ilgi görmektedir.

Yukarıda verilen bilgiler ışığında, bu çalışmada Marmaris Milli Parkı içerisinde yer alan Günnücek Mevki Sığıla Ormanı, Pamucak Mevki İçmeler Sahili, Adaağzı Mevki Cennet Adası ve Adaköy-Aktaş Mevki alanlarının rekreasyonel durumları ve bu alanlar üzerine olan rekreasyonel baskıların belirlenmesi amaçlanmıştır.

Materyal ve Yöntem

Bu çalışmanın materyalini Marmaris Milli Parkı oluşturmıştır. Marmaris Milli Parkı'nın rekreasyonel durumu, Günnücek Sığıla Ormanı, Pamucak-İçmeler Sahili, Cennet Adası ve Adaköy-Aktaş Mevki alanları esas alınarak belirlenmiş ve değerlendirilmiştir (Şekil 1).

Şekil 1. Çalışma alanlarının konumu

Çalışmanın ilk aşamasını alanının seçimi oluşturmaktadır. Sonra, belirlenen çalışma alanının, doğal ve kültürel kaynak değerleri ile ilgili literatür taraması yapılmıştır. Bu çerçevede, çalışma alanlarının mevcut rekreasyonel alan kullanımları belirlenmesi ve rekreasyonel kaynak değerlerinin saptanmasına yönelik arazide gözlem ve tespitler yapılmıştır. Yapılan arazi gözlem ve tespitler neticesinde, araştırma alanının rekreasyonel durumu ile rekreasyonel baskılar belirlenmiştir. Gözlem ve tespitler araziden alınan fotoğraflarla da desteklenmiştir.

Bulgular ve Tartışma

Rekreasyonel Kullanım Durumları

Marmaris Milli Parkı'nın konumu ve jeomorfolojik yapısı nedeniyle ziyaretçilerin rekreasyonel eğilimi genellikle orman içi, su kıyıları veya açık alanlar olmaktadır. Milli park içerisinde karstik yapıda 2. derece doğal sit statüsüne sahip Nimara (Cennet) Adasındaki Nimara Mağarası ile Turunc yerleşmesinde yer alan Kumlubük Mağarası bulunmaktadır. Yine, milli parkta bulunan Physkos (Marmaris) ve Amos (Kumlubük) şehirleri 1. Derece Arkeolojik Sit Alanı statüsünde olup, bu antik kentlerin ziyaret edilmesi amacıyla belirlenen tur güzergahları bulunmaktadır. Milli parkta kaynak değerlerinin daha iyi algılanması, kanyon, mağara ve diğer jeolojik - jeomorfolojik oluşumların, orman alanlarının ve bunların çevresindeki görsel peyzaj değerlerinin izlenebilmesini

sağlayan dört yürüyüş yolu ve beş tur güzergahı bulunmaktadır. Marmaris Milli Parkı'nın deniz yoluyla da gezilebilmesi ve görülebilmesi amacıyla, Marmaris, Kumlubük ve Ekincik'in başlangıç veya bitiş noktaları olduğu, mevcutta da yoğun olarak kullanılan tekne tur güzergahları bulunmaktadır. Milli Park alanının izlenmesine yönelik olarak yürüyüş yolları ile ulaşım yolları üzerinde, önemli vista alanlarında yedi manzara seyir noktası düzenlenmesi önerilmiş olup, mevcutta üç seyir terası rekreasyonel kullanım alanı olarak hizmet sunmaktadır. Milli Park içinde yaban keçilerinin ve kuşların doğal ortamlarında gözlemlenebilmesi amacıyla, alanın kuzey bölümlerinde iki yaban hayatı gözlem noktası önerilmiş, ancak henüz alanda mevcut bir kullanım bulunmamaktadır (Şekil 2).

Ziyaretçiler milli parka, hem Muğla ili D400 devlet karayolu hem de hava ve deniz yolu ile ulaşım imkanına sahip olabilmektedir. Marmaris şehir merkezinde yer alan uluslararası liman milli parkın önemli bir ziyaretçi ağını oluşturmaktadır. Marmaris ilçesinin turizm şehri olması sebebiyle, mayıs ile eylül ayları arasında ziyaretçi yoğunluğu oluşmaktadır. Marmaris Milli Parkı'nın 2018-2022 arasındaki ortalama yıllık ziyaretçi sayısı 11 330 062'dir.

Milli park içerisinde düzenlenen rekreasyonel alanların büyük çoğunluğu turizme yönelik kullanılmaktadır. Bu nedenle, kentte yaşayan nüfusun rekreasyonel ihtiyaçlarına yönelik hizmet sunacak alanlar sınırlı kalmakta ve bu durum bölge halkını rekreasyonel talepler için milli parka yönlendirmektedir.

Milli Park içerisinde ziyaretçilerin günübirlik rekreasyon ihtiyaçlarını karşılamaları için genellikle insan faaliyet etkilerinin daha çok hissedildiği alanlar olan İçmeler Mahallesi'nde iki (GB-1 ve GB-2), Günnücek-Aktaş mevkiileri arasında bir (GB-3) ve Adaağzı mevkinde bir (GB-4) olmak üzere toplam dört günübirlik kullanım alanı bulunmaktadır (Şekil 2).

Marmaris Milli Parkı Uzun Devreli Gelişme Planı (2020) kapsamında, Milli Park içinde ziyaretçilerin çadırli konaklama ihtiyaçlarının karşılanması amacıyla, Adaağzı mevkiinde Nimara Adası'na ulaşan asfalt yolun doğusunda çadırli kamp alanı önerilmiştir (Şekil 2). Bu alanda çadırlar, idari birim, hizmet birimi, sıhhi tesis (tuvalet, mutfak vb. kullanımları içeren), uyarı, tanıtım ve bilgilendirme panoları, çeşme, çöp kutuları, duş, soyunma kabinleri ile otopark kullanımlarının bulunabileceği alanlar öngörülmüştür. Milli parkta öngörülen çadırli kamp alanı mevcutta faaliyeti bulunmayan bir alan olup, planlanma aşamasında olduğu bilinmektedir. Milli park alanı içerisinde çadırli konaklama imkanının mevcutta bulunmaması, planlanan alanın faaliyete geçmesiyle birlikte bu açığı kapatarak milli parkın rekreasyonel değerlerine katkı sağlayacak niteliktedir.

Milli Park içinde ziyaretçilere bungalov konaklama olanağı sağlanması amacıyla, Adaağzı mevkinde, Gökburun Tepe'nin güneyinde, mevcutta kır evlerini barındıran alan, bungalov kamp alanı öngörülmüştür (Şekil 2). Ancak kır evleri kamp alanının mevcutta herhangi bir kullanıma söz konusu olmadığı gözlemlenmiştir.

Marmaris Milli Parkı Uzun Devreli Gelişme Planı (2020)'nda Milli Park alanı içerisinde İçmeler yerleşmesinin doğusunda yer alan, geçmişte eğitim ve dinlenme tesisinin bulunduğu bilinen alanda, denizel biyoçeşitliliğin ve kirliliğin araştırılması, izlenmesi ve tanıtılması amacıyla denizel biyoçeşitlilik araştırma merkezi oluşturulması önerilmiştir. Bu merkezde toplantı salonu, araştırma laboratuvarı, kütüphane, deniz müzesi, idari birimler, eğitim birimleri, konaklama üniteleri, yeme-içme birimleri ile otopark alanına yer verilerek planlama yapılabileceği öngörülmüştür. Mevcut durumunda ise henüz faaliyette olmayan bir alandır.

Günnücek Sığla Ormanı

Milli Parkın kuzeyinde bulunan ve Marmaris-Aksaz Karayolu ile ulaşım sağlanan Günnücek Sığla Ormanı 26 ha'dır. Yöresel olarak halk arasında Sığla Ağacı Günnük Ağacı denildiği için, alana Günnücek adı verilmiştir. 1. Derece Doğal Sit Alanı statüsü olan alanda, Marmaris Milli Park Müdürlüğü idari binası, Doğa Eğitim Merkezi, personel lojmanı ve otoparkının yer aldığı ziyaretçilere günübirlik kullanım olanağı sağlayan bir alandır (Şekil 3). Günnücek Sığla Ormanı, taban suyunun yüksek olması sebebiyle içerisinde özellikle Sığla ağaçlarını barındırması ile alana kendine özgü görsel peyzaj değeri bulunmaktadır. Bunun yanı sıra, alan içerisinde kızılçam ve Akdeniz defnesi yaygın olarak görülmektedir. Mevcut alan içerisinde doğal güzelliklerin izlenebileceği güzergahlar belirlenerek planlanmış, toplamda uzunluğu yaklaşık 1 km olan ahşap yürüyüş yolları bulunmaktadır (Şekil 4). Tür çeşitliliği ile aromaterapi etkisi bulunan alanda, planlanan ahşap yürüyüş yolları ile ziyaretçilere rekreasyonel alan kullanımı yaratılmıştır. Günnücek Sığla Ormanı içerisinde alana adını veren Sığla Ağacının ziyaretçilere tanıtımının yapılabilmesi maksatlı mevsimsel döngüsü, yayılış alanlarını vb. özellikleri içeren bilgilendirme levhalarına yer verilmiştir.

Alan içerisinde Marmaris Milli Parkı'nın kaynak değerlerinin yerinde tanıtıldığı Biyoçeşitlilik Yolu yer almaktadır. Biyoçeşitlilik yolu güzergahında, tanıtımı yapılmak istenen türlerin hemen yanı başında ahşap tabelalar tasarlanmış ve ilgili tür hakkında açıklayıcı bilgilere yer verilmiştir. Bu alanın tasarlanmasıyla, hem Marmaris Milli Parkı'nın kaynak değerleri ziyaretçilere tanıtılarak farkındalık oluşması amaçlandığı hem de ilgili teknik personel tarafından öğrenim seviyelerine göre öğrencilere biyoçeşitlilik eğitimlerinin yerinde verildiği bir alan kullanımı yaratılmıştır. Yine alan içerisinde yer verilen Doğa Eğitim ve Sergi Alanında, milli parkın flora ve fauna türlerinin tanıtıldığı ahşap test panoları yer almaktadır (Şekil 5).

Şekil 2. Marmaris Milli Parkı Mevcut Rekreatiyonel Kullanımları

Şekil 3. Günnücek Sığla Ormanı vaziyet planı.

Şekil 4. Günnücek Sığla Ormanında ahşap yürüyüş yolları

Şekil 5. Günnücek Sığla Ormanı biyoçeşitlilik yolu ile doğa eğitim ve sergi alanı
Günnücek Sığla Ormanı içerisinde derelerin denize döküldüğü alanda küçük dere yatakları doğal olarak gölet oluşturmuştur. Alan içerisinde planlanan ahşap yürüyüş yolu ile bağlantı sağlanan gölet, deniz yönüne dökülürken alana özgü estetik bir değer katmıştır. Görsel peyzaj değeri yüksek olan gölet kenarında yaklaşık 45 m²'lik ahşap bir platform ve ahşap oturma birimleri tasarlanmış olup, ziyaretçilere sunulan rekreasyonel imkanlar artırılmıştır (Şekil 6).

Şekil 6. Günnücek Sığla Ormanı ahşap yürüyüş yolu ve ormanı göleti
Günnücek Sığla Ormanı doğal ortamın ziyaretçilere sunduğu rekreasyonel kaynak değerinin yanında, yeni alan kullanım planlanmalarıyla doğa yürüyüşleri, botanik ve kuş gözlemciliği, bisiklet turu, oryantiring gibi doğa temelli rekreatif faaliyetlere imkan sağlamaktadır (Şekil 7).

Şekil 7. Günnücek Sığla Ormanı sahili sığla köprüsü, ahşap platform ve iskele ile sahili (MMPM Arşivinden)

Pamucak-İçmeler Sahili

Milli Parkın batı yönünde yer alan Pamucak-İçmeler sahili turizm merkezi sınırı içerisinde yer aldığından, alan kullanımları turizm ağırlıklı rekreasyonel faaliyetlerden oluşmaktadır (Şekil 8).

Şekil 8. Pamucak-İçmeler Sahili Vaziyet Planı.

Milli Park alanı içerisinde ziyaretçilerin günübirlik rekreasyon ihtiyaçlarını karşılamaları için genellikle insan faaliyet etkilerinin daha çok hissedildiği alanlarda belirlenen günübirlik kullanım alanlarından iki tanesi (GB-1 ve GB-2) çalışma alanı içerisinde yer almaktadır. Bu alanlarda; alanın özelliklerine göre kır lokantası/kır kahvesi, büfe, piknik masası, çöp bidonu, çeşme, yağmur barınağı, tuvalet, ocak, çocuk oyun alanı, tanıtım ve bilgilendirme panoları, otopark, seyyar yöresel ürün satış stantları, açık alan aktivite alanları, duş, gölgelik, soyunma kabini gibi temel ihtiyaçlara yönelik ünitelere yer verilmesi öngörülerek, rekreasyonel kullanımlara hizmet edecek nitelikte kullanımlar desteklenmiştir.

Günübirlik kullanım alanı (GB-1)'nda mevcut olarak İçmeler sahil güzergahında bir büfe ve plaj işletmeciliği bulunmaktadır. Ziyaretçiler günübirlik alan kullanımlarında temel ihtiyaçlarını mevcutta bulunan büfeden sağlamaktadır. Bu alanların özellikle yaz aylarında yoğun bir şekilde kullanıldığı gözlemlenmiştir. Üst yol kotunda bulunan günübirlik kullanım alanının (GB-2) seyir amaçlı önemli bir işlevi olduğu ve bölgede ihtiyacın sağlanması açısından önemli bir rekreasyonel alandır (Şekil 9).

Şekil 9. Pamucak-İçmeler Sahili günübirlik kullanım alanı (GB-2) seyir alanından görünüm.

Pamucak-İçmeler bölgesi, bulunduğu bölge itibariyle genel olarak içerisinde günübirlik sahil kullanımının yanında, turizme hizmet eden otel kullanımlarını bulundurmaktadır. Otel kullanımları genel olarak kıyı boyunca devam etmekte olup, otel önündeki kumsal alanlar da otel müşterilerinin kullanımındadır. Bölgede yine otellerin kullanımında olan beş iskele yer almaktadır.

Alan içerisinde günübirlik kullanımlara açık olan halk plajı, sahil boyunca yürüyüş yolu ve bisiklet yolu (Şekil 10) yer almaktadır. Yine aynı güzergah üzerinde devam eden sahil güzergahında, Milli Park Müdürlüğü'nce Kültür Turizm Bakanlığı'na tahsis edilen ücretsiz halk plajı yapım işi devam etmektedir.

Şekil 10. Pamucak-İçmeler sahil yürüyüş yolu ve bisiklet yolu

Pamucak- İmeler sahili deniz, gneř, kum lsnden oluřan kitle turizminin yanı sıra ekoturizme de olanak saėlayan doėal yapısı ile yerli ve yabancı turistlerin ilgisini eken bir blgedir. Alan, konumu ve byklė aısından blge iin nemli bir rekreasyon alanı olarak ne ıkmaktadır.

Cennet Adası

Bakir kıyıları, yaban hayatı ve endemik türler açısından zengin olan Cennet adası, Marmaris Milli Parkı'nın güneyinde yer almakta ve Marmaris körfezinin önemli bir bölümünü kapsamaktadır (Şekil 11). Adanın kuzey ve batı yönünde özel mülkiyete konu taşınmazlar bulunmaktadır.

Şekil 11. Cennet Adası vaziyet planı.

Cennet Adası, yöre halkının “Yalancıboğaz” adını verdikleri yaklaşık 700 m uzunluğundaki tombolo ile ana karaya bağlanmaktadır. Cennet Adası’na ana kara ile tek bağlantı noktası olan tombolo, Milli Park sınırı dışında kalmaktadır (Şekil 12).

Şekil 12. Cennet Adasına ulaşım sağlanan tombolo ve yat marinası (MMPM Arşivi) ile giriş güzergahı

Cennet Adası'nın tamamı Turizm Merkezi sınırları içerisinde yer almakla birlikte 2. derece doğal sit alanı statüsü bulunmakta ve içerisinde yer alan Nimara Mağarası 1. Derece Arkeolojik Sit Alanı statüsü taşımaktadır. Nimara Mağarası, milli parkın yerli ve yabancı ziyaretçilerinin en sık ziyarette bulunduğu, doğal ve kültürel peyzaj değerlerinin bir arada izlenebildiği rekreasyonel değeri yüksek bir bölgedir. Nimara Mağarası mevcut orman yolu üzerinden devam eden yürüyüş tur güzergahı (TG-4), yaklaşık 12,5 km olup, ziyaretçi kullanımına açık bir alandır. Bu güzergah üzerinde doğa yürüyüş etkinlikleri yapılarak milli parkın kültürel ve doğal peyzaj değerlerini tanıma imkanı desteklenmektedir. Aynı zamanda bisiklet tur güzergahı da bu güzergahta yer almaktadır (Şekil 13).

Şekil 13. Cennet Adası yürüyüş tur güzergahı ve bisiklet yolu güzergahı

Cennet Adası içerisinde yer alan Küçükçargı mevki, Marmaris yerleşmesi, körfez ve Bedir Adasının izlenebildiği manzara seyir terası bulunmaktadır. Yine aynı güzergahta Çamçuru mevki yakınından başlayarak Nimara Mağarası, Çetili Tepe, Asartepe ve Çamlık Tepe'den devam ederek Büyükçargı mevkiine yakın bir noktada son bulan yaklaşık 6 km uzunluğundaki yürüyüş yolu güzergahı üzerinde gerçekleşen doğa yürüyüşleri ile milli parkın görsel peyzaj değerlerinin izlenebilmesine olanak sağlayan rekreatif olanaklar bulunmaktadır (Şekil 14).

Şekil 14. Cennet Adası manzara seyir terası ve yürüyüş yolu güzergahı

Cennet Adası'nda bulunan ve tehlikede (EN) kategorisinde yer alan Marmaris semenderi (*Lyciasalamandra flavimembris*) bölge için büyük önem arz etmektedir. Ekim ayı sonu ile kasım ayı başlangıcına kadar gözlenebilen Marmaris semenderi milli parkın sunduğu rekreasyonel imkanlara ayrıcalık katmaktadır. Ayrıca, Cennet adası içerisinde yer alan yürüyüş yolu ve tur güzergahlarında gerekli kurumlardan izin alınarak arıcılık faaliyetlerinin yapıldığı noktalar gözlemlenmiştir.

Adağzı-Aktaş Mevkii

Milli park alanı içerisinde insan faaliyetlerinin en çok hissedildiği alan olarak bilinen Aktaş Mevkii, Marmaris girişinden Günnücek Sığla Ormanı güzergahı üzerinde Aksaz Deniz Üst Komutanlığına ulaşan yaklaşık 15 metre genişliğinde olan asfalt yolun çatallaşarak güney istikamette devam ettiği bölgede yer almaktadır. Milli park alanı içerisinde insan faaliyetlerinin en çok hissedildiği alanlar içerisinde kalan Aktaş Mevkii, ziyaretçilerin günübirlik faaliyetlerini gerçekleştirdiği bir bölgedir. Aktaş Mevkii ulaşım yol güzergahı, Marmaris Milli Parkı Uzun Devreli Gelişme Revizyon Planı (2020)'nda Aksaz yoluna devam eden yaklaşık 10. km'den bölünerek ulaşım sağlanması, mevcutta bulunan yolun ise araç trafiğine kapatılarak kullanımın sağlanması planlanmıştır. Bu durum mevcutta yer

alan yolun araç trafiğine kapatılarak yalnızca yürüyüş tur güzergahı rotası istikametinde rekreasyonel faaliyetlerin gerçekleştirilmesi, alandaki kullanım değerinin arttıracak yönde olacağı tespit edilmiştir (Şekil 15).

Aktaş Mevkiinin tamamı Turizm Merkezi Sınırı içerisinde yer alırken bir kısmı ise 2. derece doğal sit statüsünde kalmaktadır. Alan içerisinde özel mülkiyetlerin yoğunlaştığı alanlar milli park alanı dışında bırakılmıştır. Marmaris Milli Parkı Uzun Devreli Gelişime Revizyon Planı(2020)’nda Aktaş Mevkii de milli parkın yönetim, denetim ve kontrol faaliyetlerinin sağlıklı bir şekilde yürütülebilmesi için hizmet birimleri önerilmiştir (Şekil 15).

Şekil 15. Adaağzı-Aktaş Mevkii vaziyet planı

Alan içerisinde Milli Park alanının daha iyi algılanması, kaynak değerlerinin korunarak tanıtılması ve gezi parkurlarının geliştirilmesi için belirlenen Tur Güzergahı-4 rotası bulunmaktadır. Günnücek Sığla Ormanı’ndan başlayarak Aktaş mevki içerisinde devam etmekte ve Cennet Adası içerisinde son bulan Tur Güzergahı-4 rotası yaklaşık 12,5 km olarak planlanmıştır. Tur Güzergahı-4 mevcut yol güzergahından planlanmış ve milli parkın doğal kaynak değerlerinin izlenerek tanındığı rekreasyonel değeri yüksek olan bir güzergahtır.

Marmaris Milli Parkı Uzun Devreli Gelişime Revizyon Planı (2020)’nda Aktaş Mevkii de su sporlarının yapılmasına yönelik yat/tekne yanaşma yeri önerilmiş olup, alan planlama safhasındadır. Su sporları alan planlamasının son aşamasına gelinip hizmet verdiği noktaya varmasıyla birlikte milli parkın doğal güzelliklerinin içerisinde doğa temelli rekreatif olarak sağlanan bir alan kazandırılmış olacaktır.

Milli Park içinde ziyaretçilere bungalov konaklama olanağı sağlanması amacıyla, Adaağzı mevkinde, Gökburun Tepe’nin güneyinde, mevcutta kır evlerini barındıran alan, bungalov kamp alanı olarak önerilmiştir. Ancak, bungalov kamp alanında her ne kadar mevcut yapıların bulunduğu gözlemlense de, alanda herhangi bir işletmecilik faaliyeti bulunmadığından rekreasyonel alan kullanımı bulunmamaktadır. Bulunduğu konum itibarıyla kıyıya kenarı olan alanda kıyı kesiminin taş duvar dolgu ile kaplanması kıyı doğal görünümü kaybetmiş vaziyettedir.

Bölgede Kırzeytin deresinden beslenerek oluşan doğal Sığla ormanı, doğal yayılım gösteren Kızılçam ormanı ile iç içe geçmiş alanlar bulunmaktadır. Taban suyu yüksek olan bölgede Sığla ağacının doğal yayılım gösterdiği iki alandan birisi olarak öne çıkmaktadır. Bu durumla bağlantılı olarak bölgenin doğal kaynak değerleri öneminin artması ile kontrolsüz rekreasyonel kullanımları da yoğunlaştırdığı bir bölge olarak da tanımlanabilir. Bu bölgeyi kuzeyinden sınırlayan Kırzeytin Deresi’nin oluşturduğu, milli parkın önemli jeomorfolojik özelliklerinden birisi olan delta, aynı zamanda balıklar için beslenme ve yumurtlama alanıdır.

Milli Park alanı içerisinde ziyaretçilerin günlük rekreasyon ihtiyaçlarını karşılamaları için çalışma alanı içerisinde iki günlük kullanım alanı bulunmaktadır. Aktaş bölgesinin tamamen denize kıyısının olması, bölge de özellikle otel bölgeleri dışında konaklama adına kamp alanının olmaması sebebiyle Aktaş bölgesine olan ilgi ve kullanımları arttırmakta, bu durum ziyaretçiler tarafından sıkça ziyaret edilen bir bölge olmasına sebep olmaktadır.

Milli park alanında günlük kullanım alanı olarak belirlenen bölgelerde de Marmaris Milli Park Müdürlüğü’nce kamp yapılamayacağı bilgisi ziyaretçilere verilerek bu durumun önüne geçilmektedir. Bu durum ise bazen ziyaretçilerin rekreasyonel aktivitelerini gerçekleştirememelerine ya da rekreasyonel aktivitelerin günlük gerçekleştirilememesine neden olmaktadır. Ziyaretçilerin Aktaş bölgesinde kamp yapabilecekleri belirlenen günlük kullanım alanlarında herhangi bir sosyal donatıya rastlanılmamış olup, ziyaretçiler kendi imkanları ile günlük rekreasyonel faaliyetlerini gerçekleştirmektedir.

Aktaş bölgesi konumu itibariyle bölge için geçiş bölgesi olarak da öne çıkmaktadır. Ziyaretçilere rekreasyonel faaliyet olarak bölgenin doğal güzellikleri içerisinde kamp alanı arayışını gidermek adına Milli Park Müdürlüğü'nce Adağzı mevkinde, Nimara Adası'na ulaşan asfalt yolun doğusunda çadırlı kamp alanı ve hemen yanında karavanlı kamp yapılabilmesi önerilmiştir. Bu alanda çadırlar, idari birim, hizmet birimi, sıhhi tesis (tuvalet, mutfak vb. kullanımları içeren), uyarı, tanıtım ve bilgilendirme panoları, çeşme, çöp kutuları, duş, soyunma kabinleri ile otopark alanlarının yer alabileceği alanlar olarak planlama aşamasında olduğu bilinmektedir. Planlanan alanın kullanıma açılmasıyla ziyaretçilerin milli parkın doğal güzellikleri arasında çadırlı konaklama ihtiyaçlarının karşılanması gerçekleşirken, milli parkın rekreasyonel faaliyetleri de artmış olacaktır.

Milli Park Üzerindeki Rekreasyonel Baskılar

Günnücek Sığla Ormanı

Günnücek Sığla Ormanı dört mevsim yoğun olarak rekreasyonel amaçlı ziyaret edilmekte olup, rekreasyonel faaliyetlerden kaynaklanan çevre sorunlarını belirlemeye yönelik olarak her mevsim döneminde arazi gözlemleri yapılmıştır. Günnücek Sığla Ormanındaki sığla topluluklarının rekreasyonel baskıdan neredeyse en fazla etkilenen peyzaj değeri olduğu gözlemlenmiştir. Yine alan içerisinde Marmaris Milli Park Müdürlüğü idari binasının bulunması alandaki rekreasyonel aktiviteler ve koruma kontrol faaliyetlerinin ilgili personel tarafından sağlanması yönünden olumlu yönde katkı sağlamaktadır.

Marmaris ve yakın çevresinde planlanmış ve düzenlenmiş tek alan olan Günnücek Sığla Ormanı, bölgedeki artan rekreasyon taleplerini karşılayamaması sonucunda yoğun rekreasyonel baskıya maruz kalmaktadır. Bu durum alanda hakim olarak bulunan sığla topluluklarının topraktaki kompaktlaşma ve sıkışmalar sonucu zarar görmesine sebep olduğu gözlemlenmiştir. Marmaris Milli Park Müdürlüğü'nce her ne kadar Günnücek Sığla Ormanı'nın içerisinde yaklaşık 1 km lik uzunlukta ve yerden yaklaşık yer yer 40-50 cm yüksekliklerde ahşap yürüyüş yolları alandaki sığla topluluklarında oluşan rekreasyonel baskının azalması için tasarlanırsa da, geçmiş zamanlardan gelen kontrolsüz kullanımlar bugün ki topraktaki kompaktlaşma ve sıkışmaların oluşmasına sebep olmuştur.

Milli park hakkında yerel halkın düştüğü en belirgin yanılgı, milli parkın sadece Günnücek Sığla Ormanı'ndan ibaret olduğunun bilinmesi ve bundan dolayı alandaki ziyaretçi sayısının artışı aşırı rekreasyonel baskıya sebep olmaktadır.

Pamucak-İçmeler Sahili

Milli Parkın Pamucak-İçmeler sahili Turizm Merkezi sınırı içerisinde yer alması ile birlikte alan kullanımları turizm ağırlıklı rekreasyonel faaliyetlerden oluşması göz önüne alındığında rekreasyonel baskılarında turizm faaliyetlerinden kaynaklı gerçekleştiği anlaşılmıştır.

Marmaris Milli Park Müdürlüğü'nce alan içerisinde belirlenen alan kullanım fonksiyonlarının günübirlik kullanım ve konaklamalı kullanım niteliği taşıması rekreasyonel baskı oranını değiştiren bir etken oluşturmaktadır. Yapılan gözlemler neticesinde, ziyaretçiler tarafından yaz aylarında özellikle sahilin kontrolsüz kullanım yoğunluğu ile rekreasyonel baskı artmaktadır. Alan içerisinde Milli Park Müdürlüğü'nce Kültür Turizm Bakanlığı'na tahsis edilen ve mevcutta halk plajı yapım işi kapsamında uygulama süreci devam eden projenin tamamlanmasıyla birlikte ziyaretçiler tarafından oluşan kullanımlar sınırlandırılmış olacağından mevcut rekreasyonel baskının da sınırlandırılacağı beklenmektedir.

Turizm faaliyetlerinden kaynaklı rekreasyonel baskı alan içerisinde yer alan Günübirlik Kullanım Alanı-1 noktasının büfe ve plaj işletmeciliği işi kapsamında değerlendirildiğinde, büfe işletmecisinin hizmet sağlayabileceği kapasite kadar kullanım alanı sınırlaması olduğu ve böylelikle alandaki rekreasyonel kullanımı da sınırlandırmış olduğu gözlemlenmiştir.

Cennet Adası

Bakir kıyıları, yaban hayatı ve endemik türler açısından zengin olan ve Marmaris körfezinin önemli bir bölümünü kapsayan Cennet adasında yapılan gözlemler sonucunda alanın ender ekolojik özelliklere sahip olması bağlamında turizm merkezi sınırı içerisinde yer alması dikkat çekmektedir. Alan içerisinde özel mülkiyete konu alanların bulunduğu alanlar ve bunun dışında yine çalışma alanı içerisinde olup milli park dışında bırakılan özel mülkiyet alanları yer almaktadır. Özel mülkiyetlerin alan içerisinde ortaya çıkardığı rekreasyonel baskılar alan kullanımlarının turizme hizmet eden otel kullanımlarının olmasından kaynaklı ulaşım sağlanan yolun milli park alanı içerisinde önemli güzergahlardan ilerlemesi ile ilgilidir.

Cennet Adası içerisindeki özel mülkiyet alanlarının ilgili kurum olan Marmaris Milli Park Müdürlüğü'nden zorunlu temel ihtiyaçlarını karşılaması adına içme suyu isale hattı, enerji nakil hattı, haberleşme hattı veya ulaşım yolu gibi kullanımlar için izin taleplerinin söz konusu olmasıyla, milli parkın önemli peyzaj değerlerini bölerek ilerlemesine veya ender ekosistem özelliklerini de zarar verecek bir etki yaratmaktadır. Özellikle bölgede yalnızca milli park içerisindeki yayılışı Cennet Adası içinde olan ve tehlikede (EN) kategorisinde yer alan Marmaris semenderi yaşam alanı üzerinde ciddi bir tehdit unsuru oluşturacaktır.

Özellikle yaz aylarında ziyaret edilen bu alanda, rekreasyonel faaliyetlere hizmet edecek nitelikte olan manzara seyir terası etrafında çevre kirliliğine sürekli olarak rastlanılmaktadır.

Alanın içerisinde yer alan tur güzergahı-4 noktasında uygulanan granit küptaş yer döşemesi her ne kadar doğal malzeme olduğu için uygulama yapılsa da, uygulama kısmında bordürler için kullanılan beton malzeme alanın kendine özgü peyzaj kalitesini olumsuz yönde etkilemektedir.

Cennet Adası içerisinde yer alan Nimara Mağarası, milli parkın yerli ve yabancı ziyaretçilerinin en sık ziyarette bulunduğu, doğal ve kültürel peyzaj değerlerinin bir arada izlenebildiği rekreasyonel değeri yüksek olan bu bölgede yapılan gözlemler neticesinde, ziyaretçilerin böylesine önemli bir kültürel değerin önemini bilmemesi sebebiyle mağara içerisinde ateş yakıldığına dair görüntülerle karşılaşmış, çevre kirliliklerinin olduğu, mağara duvarlarında bulunan resim ve yazılar yazıldığı tespit edilmiştir. İlgili kurum olarak bulunan Marmaris Kültür Turizm Ofisi tarafından bu gibi sorunların önüne geçilemediği ve bu sebeple alanın tel çitlerle ziyaretçi girişine kapatıldığı bilgisine erişilmiştir. Bu durum doğal kaynak değerlerinin korunması yanında kültürel kaynak değerlerinin de korunması ve gelecek nesillere aktarılması konusunda tehlike arz etmektedir.

Adaköy-Aktaş Mevkii

Araştırma kapsamında Milli park alanı içerisinde insan faaliyetlerinin en çok hissedildiği alan olan Adaköy-Aktaş Mevkii, ziyaretçilerin günübirlik faaliyetlerini sıkça gerçekleştirdiği bir bölge olması ile her ne kadar alan günübirlik alan kullanım alanı tanımlı yer olsa da doğal kaynakları dışında herhangi bir günübirlik kullanım alanı özelliği taşımayan fonksiyonu olduğu için ziyaretçiler tarafından kontrolsüz ve alan kapasitesinin üzerinde rekreasyonel faaliyetlere açıktır. Bu durum alandaki ziyaretçi kullanımlarını sınırlandırmayan bir faktör olarak saptanmış, rekreasyonel baskıyı arttıran bir husus olarak ortaya çıkmıştır.

Ziyaretçilerin Adaköy-Aktaş Mevkiiyi milli park sınırları içerisinde kaldığı bilincinde olmayıp, denize kıyısının da olması nedeniyle yaz mevsiminde sıkça çadır kurarak konaklama yaptıkları bir alan haline dönüştürmektedir. Bu durum alandaki üst örtünün tahribine veya zaman zaman kontrolsüz kullanımlardan kaynaklı yangın vb. olayların yaşanmasına sebep olmaktadır. Alanda, özellikle yaz aylarında konaklama amaçlı rekreasyonel faaliyette bulunmak isteyen ziyaretçilere Marmaris Milli Park Müdürlüğü personeli tarafından milli park alanında bu tür konaklama faaliyetlerin yapılamayacağı bilgisi verilerek koruma faaliyetleri yapılmaya devam edildiği tespit edilmiştir.

Çalışma alanı içerisine bağlantı yol güzergahının varlığı ile deniz kıyısındaki günübirlik kullanımlarını artırırken alanın araç trafiğinden kaynaklı baskı altında olduğu tespit edilmiştir. Milli Park Müdürlüğü tarafından bahsi geçen güzergahın araç trafiğine kapatılması ile alanın rekreasyonel baskısını olumlu yönde etkileyeceği düşünülmektedir. Su sporları alan planlamasının devam ettiği alanda mevcut olarak ziyaretçiler tarafından kontrolsüz biçimde kullanımlar söz konusudur. Bu kontrolsüz kullanımlar beraberinde çevre kirliliği sorunlarını da beraberinde getirdiği gözlemlenmiştir. Alan içerisinde ziyaretçilerin araçlarını kumsala kadar yakınlara kadar yaklaşarak alan kapasitesinin üzerinde rekreasyonel faaliyetlerde bulunma durumları alanın özgün peyzaj değerlerini ciddi derece etkilemiş, sığla topluluklarının da olduğu bu alanın rekreasyonel baskılarının arttığı ortaya çıkmıştır.

Bungalov kamp alanı bölgesi olarak belirlenen alanda mevcutta herhangi bir faaliyet gerçekleşmemesine rağmen, kıyı kesiminin taş duvar dolgu ile kaplanması ile rekreasyonel baskının devam ettiği bir durum söz konusudur.

Sonuç ve Öneriler

Milli parklar, sahip oldukları eşsiz doğal, kültürel, tarihi, topoğrafik veya jeolojik özellikleri nedeniyle korunan, aynı zamanda rekreasyon alanı olarak planlanan ve halkın yararına sunulan alanlardır. Kontrolsüz kullanımları sonucunda, rekreasyon kaynaklarının doğal ve kültürel karakterinde bozulmalar meydana gelmekte ayrıca rekreasyonel deneyim kalitesinde düşüşler yaşanmaktadır. Oysa milli parkların koruma altına alınmasındaki temel maksat alanın sahip olduğu doğal ve kültürel kaynak değerlerinin bozulmadan gelecek nesillere aktarılabilmesidir. Günnücek Sığla Ormanı'nın rekreasyonel baskılarını azaltıcı nitelikte öncelikli olarak alan kullanım kapasite hesaplarının yapılarak ziyaretçi yönetim planlamasının gerçekleştirilmesi ile ziyaretçi sayısının kontrol altında tutulması, alan kapasitesinin aşılmayacağı bir sistemle yönetilmesi ve bu sayede rekreasyonel baskının azaltılabileceği düşünülmektedir.

Milli park hakkında yerel halkın, yerli ve yabancı ziyaretçilerin düştüğü en belirgin yanlış milli parkı yalnızca Günnücek Sığla Ormanı olarak bilmeleridir. Milli parkın sınırları konusunda herhangi bir fikirleri bulunmamaktadır. Diğer belirgin bir yanlış da körfezin milli park olduğunun bilinmemesidir. Bu durum, yetkili kurumlarca iş birliği sağlanarak alanın korunan alan olduğunu belirten, doğal ve kültürel kaynak değerlerini anlatan bilgilendirme ve tanıtım materyalleri kullanılarak farkındalık oluşturarak çözülebilir.

Günnücek Sığla Ormanı içerisinde yer verilen biyoçeşitlilik tanıtım materyallerinin tasarlandığı noktalar çoğaltılarak, doğa eğitimlerinin düzenli olarak programlanması ve daha çok kitleye hitap edilmesi beklenmektedir. Ayrıca Marmaris ilçesinin turizm şehri olması da göz önüne alınarak milli park içerisindeki konaklama tesislerinde konaklama yapan ziyaretçilere bulundukları alanın milli park olduğunu bildiren tanıtım levhaları veya bilgilendirme broşürleri ile aktarılması gerektiği düşünülmektedir.

Pamucak İçmeler sahilinde planlaması devam eden halk plajında ve bunun gibi uygulamalarda mutlak suretle planlama aşamasında alanın taşıma kapasitesinin belirlenmesi, uygulama esnasında bu durumunda göz ardı edilmemesi gerekmektedir.

Milli park içerisinde planlanan yürüyüş yolları ve tur güzergahlarının milli parkın kaynak değerlerinin tanınabilirliği ve rekreasyonel değerine katkı sağlaması açısından milli park ziyaretçilerini bilgilendirme, yönlendirme, tanıtım amaçlı tabelalara yer verilmesi gerekmektedir. Nimara Mağarasında gözlemlenen rekreasyonel baskılara çözüm olacak nitelikte, yetkili kurumlarca iş birliği yapılarak alanın güvenliğinin ve yoğun ziyaretçi dönemlerinin kontrolünün sağlanması gerekmektedir.

Çalışma kapsamında rekreasyonel alan kullanım tanımlaması yapılan alanların, rekreasyonel faaliyet için gerekli fiziki olanaklarının olmadığı saptanmıştır. Bu bağlamda, Marmaris Milli Parkı doğal, kültürel ve rekreasyonel kaynak değerlerine sahip olduğundan koruma alanlarının korunarak devamlılığının sağlanması, koruma-kullanma dengesi içerisinde gelecek kuşaklara bir miras olarak bırakılabilmesi amacıyla, koruma altına alınan alanların uzun devreli gelişme planlarında strateji ve hedeflerin uygulanabilmesi büyük önem arz etmektedir. Bu amaçla, Marmaris Milli Parkının tüm kaynak değerleri ulusal ve uluslararası kabul görmüş standartlar ve uygulamalarla sürdürmek, uzun devreli gelişme revizyon planındaki strateji ve hedeflere yönelik uygulamaları hayata geçirmek, uygulamada karşılaşılan problemleri gidermek ve faaliyetlerin daha etkin ve verimli yürütülmesini sağlamak maksadıyla görev alanlarının/sınırlarının yeniden belirlenerek Bakanlığımız Makamının 18.11.2014 tarihli ve 254 sayılı Olur'u ile, Marmaris Milli Park Müdürlüğü'ne bağlı olarak Adaağzı Milli Park Şefliği ve İçmeler Milli Park Şefliği kurulmuştur.

Ayrıca, bu çalışma 2020 yılı içerisinde yürütülmüştür. Ancak, 2021 yılı içerisinde Marmaris Milli Parkı sınırları içerisinde ve çalışma alanı sınırlarının görsel peyzaj kalitesini ortaya koyan iki farklı bölgede, farklı tarihlerde orman yangını meydana gelmiştir. 27 haziran 2021 tarihinde 38 ha büyüklüğünde ormanlık alan zarar görürken, 29 temmuz.2021 tarihinde ise 2516 ha büyüklüğünde bir orman varlığı zarar görmüştür. 2021 yılı içerisinde yaşanan orman yangınlarıyla mücadele kapsamında Valilik Makamınca 04 ağustos 2021 tarihli ve 2021/2 sayılı kararı gereğince; 6831 sayılı Orman Kanunun 74. Maddesi ve 5442 sayılı İl idaresi Kanununun 9. ve 66. Maddeleri gereğince Muğla İl sınırları içerisindeki ormanlık alanlara 1 ekim 2021 tarihine kadar görevli personel dışındaki kişilerin girmesi ve il sınırları içerisindeki ormanların çevrelerinde mola verilmesi, piknik yapılması, mangal, semaver ve ateş yakılması yasaklanmıştır. Yine, Valilik Makamının 30 mayıs 2022 tarih ve 2022/2 sayılı kararı ile sınırları belirtilen ormanlara ve ormanlık alanlara girişler 1 haziran-31 ekim 2022 tarihleri arasında yetkili makamların iznine tabi tutulmuştur. Bu kararı ile belirtilen sahaların çevresinde ve içinden geçen yollarda, orman kenarlarında etkinlik ve piknik yapmak, ateş yakmak ve konaklamak yasaklanmıştır.

Söz konusu orman yangınlarının milli parkın sahip olduğu doğal kaynak değerler üzerinde, özellikle turizm amaçlı rekreasyonel faaliyetlerin olduğu bölgede gerçekleşmesi, ileriki çalışmalarda milli parkın rekreasyonel durumunun ve üzerindeki rekreasyonel baskıların tekrar değerlendirilmesinin ne kadar büyük önem arz ettiğini göstermektedir.

Teşekkür

Çalışmanın kaynak temini ve arazideki gözlem ve tespit çalışmalarına katkıda bulunan Doğa Koruma Milli Parklar Genel Müdürlüğü, Manisa IV. Bölge Müdürlüğü Milli Parklar Şube Müdürü Fatih OĞUZ'a, Marmaris Milli Park Müdürü Mehmet Mesut GÜMÜŞ'e, Orman Mühendisi Altuğ DENİZ'e ve Marmaris Milli Park Müdürlüğü'nde görev yapan tüm personele sonsuz teşekkürlerimizi sunarız.

A Study on Morphological Characteristics of Some Angiosperm Ornamental Plant Seedlings

Ali Üney¹, Cengiz Yücedağ¹

¹Department of Landscape Architecture, Faculty of Engineering and Architecture, Burdur Mehmet Akif Ersoy University, Burdur, Turkey

Abstract

The aim of this study was to examine the morphological growth of containerized seedlings of some angiosperm ornamental plants that are frequently used in urban plantation. For this purpose, shoot height, root collar diameter and number of branches were determined in 30 saplings for 10 species grown in Antalya Forest Nursery. According to TSE (1988) seedling quality class, 1+0 aged jujube and orchid tree species were included in the quality seedling class. In the seedlings of 2+0 aged tree species, the almond showed higher performance in terms of both the shoot height and root collar diameter compared to the other species. In addition, positive correlations were found between seedling height and root collar diameter in Mediterranean laurel, walnut, jujube, almond and buckthorn species.

Key Words: Angiosperm, Quality Seedling, Antalya, Ornamental Plant

Bazı Kapalı Tohumlu Süs Bitkisi Fidanlarının Morfolojik Özellikleri Üzerine Bir Araştırma

Özet

Bu çalışmanın amacı, kent ağaçlandırmalarında sıklıkla kullanılan bazı kapalı tohumlu süs bitkilerinin tüplü fidanlarının morfolojik gelişimlerini incelemektir. Bu amaçla Antalya Orman Fidanlığı'nda yetiştirilen her tür için 30 fidanda fidan boyu, kök boğazı çapı ve dal sayısı karakterleri belirlenmiştir. TSE (1988) fidan kalite sınıfına göre, 1+0 yaşlı hünnap ve orkide ağacı türleri kaliteli fidan sınıfında yer almışlardır. 2+0 yaşlı ağaç türlerinin fidanlarında ise, badem türü hem fidan boyu hem de kök boğazı çapı bakımından diğer türlere göre daha yüksek performans göstermiştir. Ayrıca, Akdeniz defnesi, ceviz, hünnap, badem ve iğde türlerinde fidan boy ile kök boğazı çapı arasında pozitif yönlü ilişkiler bulunmuştur.

Anahtar Kelimeler: Kapalı Tohumlu Ağaçlar, Kaliteli Fidan, Antalya, Süs Bitkisi

Giriş

Günümüzde insan nüfusunun artmasıyla birlikte yapılaşma da hızla artmaktadır. Gün geçtikçe artan yapılaşmanın yanında ortaya çıkan çevre sorunları kent ağaçlandırılması ve yönetiminin giderek önem kazanmasına neden olmaktadır. Önceden ağaçların kent ekosistemine ve kent insanına sağladığı hizmet ve katkılar doğal kaynakların aşırı ve bilinçsizce tüketilmesinden kaynaklı göz ardı edilmiş olsa da şu anda kentlerde ve kırsal peyzaj alanlarında insanların ilgisini fazlasıyla çekmektedir.

Ağaçlar kentlerin biçimi için hayati öneme sahiptirler, kentsel yapıdan ayrılamazlar ve bütün bir kenti birbirine bağlayan tasarımsal öğelerdir (Urban, 2008). Ekosisteminde ağaç bulunmayan kent yarım kalmış bir kent olarak nitelendirilebilir. Kent içerisindeki beşerî yapısal unsurlar ne kadar modern ve özenilmiş olsa dahi ağaçsız bir kent içinde bulundurduğu insanların psikolojisini olumsuz yönde etkileyecektir (Ata, 2015). Ağaçlar birçok açıdan insan hayatını etkiler, türlerine göre sahip oldukları estetik, sağlık, kültür ve işlevsel değerleri sayesinde kentlerde kullanımı önem arz etmektedir. Kentin doğayla bütünleşmesini sağlarlar. Bulundukları çevrenin ekosistemini belirler ve kendilerine has mikro klimalar oluştururlar. Kent içerisinde iklimin düzenlenmesi, yaz ve kış aylarında harcanan enerjinin kullanımının azalmasında önemli rol oynarlar böylece hava kirliliğinin azalmasını sağlarlar (Dirik ve Ata, 2005).

Kentlerde kullanılması gereken ağaç türlerinin fidanları kalite bakımından üstün olması gerekmektedir. Kaliteli fidanın önemli özelliklerinden birisi morfolojik özelliklerdir (Gezer ve Yücedağ, 2013). Bilir ve ark. (2009) tarafından fidan boyu ve kök boğaz çapı önemli morfolojik özellikler olarak belirtilmiştir. Kent ağaçlandırmalarında kalite fidanların kullanılmasıyla sadece fidanların hayatta kalması sağlanmayacak, aynı zamanda ülke ekonomisi zarar verilmemiş olacaktır. Bu bağlamda, bu çalışmada kent ağaçlandırmalarında sıklıkla kullanılan bazı kapalı tohumlu süs bitkilerinin fidanlarının fidanlık koşullarında morfolojik gelişimleri incelenmiştir.

Materyal ve Yöntem

Çalışma Antalya Orman Fidanlığı'nda (30° 31' doğu, 36° 36' kuzey) yürütülmüştür. Denizden yüksekliği ortalama 40-50 m'dir. Fidanlık güney tarafından çevre yoluna bağlanması nedeniyle ulaşım kolaylığına sahiptir. Fidanlığın toplam alanı 162 000 m²'dir. 83 200 m²'si fidan üretim alanıdır (Şekil 1).

Şekil 1. Antalya Orman Fidanlığı konumu

Fidanlığın pH değeri ortalama 8,3 olup, orta alkali toprak grubuna girmektedir. Her ne kadar azot miktarı az olsa da, fosfor ve sodyum mineralleri yeterli düzeydedir. Antalya’da ortalama yıllık yağış miktarı 1060 mm, ortalama sıcaklık değeri 18,8 °C ve ortalama güneşlenme süresi ise 8,2 saattir (URL-1, 2022).

Araştırmada altı 1+0 ve dört 2+0 yaşlı olmak üzere 10 süs bitkisine ait tüplü fidanlarda ölçümler gerçekleştirilmiştir (Tablo 1). Türlerin tohumları ekim işleminden önce ağzı kapalı hava ve ışık almayan galvanizli kaplar içinde saklanmıştır. Tohum ekimleri aralık-ocak aylarında yapılmıştır. Ekim derinliği her tür için tohum büyüklüğünün 3 katı olacak şekilde ayarlanmıştır. Büyüme ortamı olarak kullanılan tüplerin boyutları 15x30 cm’dir. Tüp materyali 5 birim toprak, 2 birim hayvan gübresi, 2 birim humus ve 1 birim dere kumu karışımıdır. Fidanlara denge gübresi verilmiş, rutin sulama ve ot alma işlemleri yapılmış ama malçlama ve çapalama işlemleri yapılmamıştır.

Tablo 1. Çalışmada kullanılan türlerin orijinleri ve fidan yaşları

Türkçe adı	Latince adı	Orijini	Kullanılan fidan yaşı
Akdeniz defnesi	<i>Laurus nobilis</i> L.	Antalya-Manavgat	1+0
Ceviz	<i>Juglans regia</i> L.	Elazığ-Keban	
Gülibrişim	<i>Albizia julibrissin</i> Willd.	Antalya-Merkez	
Hünnap	<i>Ziziphus jujuba</i> Mill.	Isparta-Sütçüler	
Keçiboynuzu	<i>Ceratonia siliqua</i> L.	Antalya-Gazipaşa	
Orkide ağacı	<i>Bauhinia variegata</i> L.	Antalya-Merkez	
Badem	<i>Prunus amygdalus</i> L.	Isparta-Eğirdir	2+0
Erguvan	<i>Cercis siliquastrum</i> L.	Antalya-Merkez	
İğde	<i>Elaeagnus angustifolia</i> L.	Isparta-Yalvaç	
Tespah ağacı	<i>Melia azedarach</i> L.	Manisa-Akhisar	

Tür başına 30 fidanda ölçümler yapılmıştır. Her fidanın boyu, kök boğazı çapı ve dal sayısı morfolojik özellikleri belirlenmiştir. Fidan boyu cetvel yardımıyla 1 mm hassasiyette, KBC ise fidanın toprak altı ile toprak üstü kısmının birleştiği yerdeki çapı olup, 0,01 mm hassasiyetli elektronik kumpas yardımıyla saptanmıştır.

Elde edilen verilere tek-yönlü varyans analizi, Duncan testi ve korelasyon analizleri uygulanmıştır. Analizler için SPSS programı kullanılmıştır. Analizler bitkilerin yaşı dikkate alınarak yapılmıştır.

Bulgular ve Tartışma

1+0 yaşlı türler içinde en yüksek fidan boyuna (42,5 cm) ceviz, kök boğazı çapı (6,5 mm) ve dal sayısına hünnap (12) sahip olmuştur. En düşük boy keçiboynuzunda (18,2 cm), kök boğazı çapı cevizde (1,1 mm) ve dal sayısı ceviz, gülibrişim ve keçiboynuzu türlerinde (1) belirlenmiştir. Tüm morfolojik özellikler üzerine tür faktörü 0,001 önem düzeyinde etkili bulunmuştur (Tablo 1; Şekil 2). 1+0 yaşlı ceviz fidanlarında önceki bir çalışmada (Yıldız, 2001) bu çalışmadaki fidan boyundan daha az, kök boğazı çapından daha fazla değerler elde edilmiştir. Keçiboynuzu fidanları üzerine yapılan bir araştırmada (Şahin ve ark., 2004) 1+0 yaşlı fidanların ortalama 20,2 cm boy ve 6,2 mm kök boğaz çapı yaptığı tespit edilmiştir.

Kapalı tohumlu orman ağacı fidanları için Türk Standartlar Enstitüsü’nün belirlemiş olduğu kalite sınıflarına göre (Anonim, 1988), 1+0 yaşlı bir fidanın boyu 30 cm’den büyük ve kök boğazı çapı 4 mm’den büyük olması gerekmektedir. Buna göre, ortalama fidan boyları bakımından ceviz, hünnap ve orkide ağacı, ortalama kök boğazı çapları bakımından ise Akdeniz defnesi, hünnap ve orkide ağacı kaliteli fidan sınıfına girmektedir. Görüldüğü üzere, ceviz türü her ne kadar fidan boyu bakımından kaliteli fidan sınıfına girmiş olsa da, kök boğazı çapı bakımından sınıfın dışında kalmıştır. Özpay ve Tosun (1993) ile Yücedağ ve Gailing (2012)’nin belirttikleri üzere, ağaçlandırmalarda fidanlarda daha yüksek yaşama oranı ve daha iyi bir büyümenin büyük fidanlardan elde edilebileceğini de unutmamak gerekir.

Tablo 1. Morfolojik özellikler üzerine 1+0 yaşı türlerin etkisi

Türler	Morfolojik Özellikler		
	Boy (cm)	Kök Boğazı Çapı (mm)	Dal Sayısı
Akdeniz defnesi	28,5c ¹	4,0bc	2b
Ceviz	42,5a	1,1d	1c
Gülibrişim	20,6d	3,6c	1c
Hünnap	32,5b	6,5a	12a
Keçiboynuzu	18,2d	3,5c	1c
Orkide ağacı	41,0a	4,3b	2b
Ortalama	30,6	3,8	3
Min-Mak	10-55	1-9	1-19
F	66,7	120,2	273,1
P	0,000	0,000	0,000

¹: sütunlarda benzer harflerle gösterilen ortalamalar önemli derecede farklı değildir (p<0,05)

2+0 yaşı türler arasında en yüksek fidan boyuna (75,9 cm) iğde, kök boğazı çapına (9,1 mm) badem ve dal sayısına (14) iğde türleri sahip olmuştur. En düşük fidan boyu (34 cm) erguvanda, kök boğazı çapı (1,4 mm) iğdede ve dal sayısı (2) erguvan ve tespih ağacı türlerinde ortaya çıkmıştır. Tüm morfolojik özellikler üzerine tür faktörü yine 0,001 önem düzeyinde etkili bulunmuştur (Tablo 2; Şekil 2).

Tablo 2. Morfolojik özellikler üzerine 1+0 yaşı türlerin etkisi

Türler	Morfolojik Özellikler		
	Boy (cm)	Kök Boğazı Çapı (mm)	Dal Sayısı
Badem	67,2b ¹	9,1a	4b
Erguvan	34,0d	4,5b	2c
İğde	75,9a	1,4c	14a
Tespih ağacı	58,5c	5,4b	2c
Ortalama	58,9	5,1	5
Min-Mak	21-95	1-65	1-19
F	92,9	10,5	383,3
P	0,000	0,000	0,000

¹: sütunlarda benzer harflerle gösterilen ortalamalar önemli derecede farklı değildir (p<0,05)

Şekil 2. Badem, Erguvan ve Tespih Ağacı fidanlarına ait görünüm

Akdeniz defnesi, ceviz, hünnap, badem ve iğde türlerinde fidan boy ile kök boğazı çapı arasında pozitif yönlü ilişkiler bulunmuştur. Erguvan ve tespih ağacı türlerinde fidan boyu ile dal sayısı arasında pozitif yönde bir ilişki vardır. Öte yandan, hiçbir türde kök boğazı çapı ile dal sayısı arasında bir ilişki bulunmamıştır (Tablo 3). Benzer şekilde, Yücedağ ve Gailing (2012) tarafından dört farklı kapalı tohumlu orman ağacı fidanlarında yapılan çalışmada da, tüm türlerde fidan boyu ile kök boğazı çapı arasında kuvvetli ve önemli ilişkiler tespit edilmiştir. Aynı zamanda, Aydın orijinli fıstıkçamu fidanlarında morfolojik özellikleri araştıran bir çalışmada da (Bilir ve ark., 2010) fidan boyu ile kök boğazı çapı arasında ilişkiler bulunmuştur.

Tablo 3. Türe göre fidan morfolojik özellikleri arasındaki ilişkiler

		Boy	Kök Boğazı Çapı	Dal Sayısı
Akdeniz defnesi	Boy	-		
	Kök Boğazı Çapı	0,544**	-	
	Dal Sayısı	-0,098ns	0,120ns	-
Ceviz	Boy	-

Tespah ağacı	Boy	-		
	Kök Boğazı Çapı	-0,225ns	-	
	Dal Sayısı	0,681**	-0,209ns	-

İlişki 0.05 (*) ve 0,01 (**) düzeylerinde önemli ya da önemsizdir (ns).

Günümüzde insan nüfusunun artmasıyla birlikte kentlerde ağaçlandırma ihtiyacı giderek artmaktadır. Kullanılacak fidanların kalite standartları bakımından dengeli bir gelişim sergilemeleri önem taşımaktadır. Bu bağlamdan bu çalışmanın sonuçlarına göre, 1+0 yaşlı ağaç türlerinden hünnap ve orkide ağacı kaliteli fidanlar vermiştir. 2+0 yaşlı ağaç türlerinden ise kalite sınıflaması olmadığından, hem fidan boyu hem de kök boğazı çapının diğer türlere göre daha yüksek olması bakımından badem ağacı yüksek performans göstermiştir.

Teşekkür

Antalya Orman Fidanlığı personeline emsalsiz yardım ve destekleri için teşekkür ederiz.

The Effects of Demographic Characteristics on Plant Preference of People Living in Detached Houses: The Case of Fethiye, Turkey

Canberk Akkoç¹, Cengiz Yücedağ¹

¹Department of Landscape Architecture, Faculty of Engineering and Architecture, Burdur Mehmet Akif Ersoy University, Burdur, Turkey

Abstract

The aim of this study was to determine the plant preferences of the people living in a detached house in Fethiye and the demographic factors affecting their preferences. For this purpose, a face-to-face questionnaire was applied to a total of 100 people. According to the results of the study, it was revealed that the majority of the participants preferred diffuse-scattered and fragrant ornamental plants in their gardens, they wanted to deal with the garden, they wanted the visual function of the plants and they wanted the plants to frame the landscape as a design element. It was determined that the most existing species in their gardens are olive and lemon, and the most preferred species are lavender and redbud. The men participants stated that they did not buy ornamental plants or they provided them free of charge and they wanted to grow more vegetables. It was revealed that 36-55 aged participants mostly wanted to deal with garden, while 26-45 aged participants did not buy ornamental plants. It has been determined that officers did not buy more seedlings, while the retired participants provided seedlings from either free of charge or private nurseries. In conclusion, for the sustainability of the Fethiye urban ecosystem, the use of species suitable for urban ecology with their aesthetic and functional characteristics should be increased.

Key Words: *Fethiye, Detached House, Ornamental Plant, Preference, Demography*

Müstakil Evde Yaşayan İnsanların Bitki Tercihleri Üzerine Demografik Özelliklerin Etkileri: Fethiye Örneği

Özet

Bu çalışmanın amacı, Fethiye’de müstakil evde yaşayanların bitki tercihlerini ve tercihleri üzerine etkili demografik faktörleri belirlemektir. Bu amaçla, toplam 100 kişiye yüz yüze anket uygulanmıştır. Çalışmanın sonuçlarına göre, katılımcıların çoğunluğunun bahçelerinde yayılıcı-dağınık formu ve güzel kokulu süs bitkilerini tercih ettikleri, bahçeyle uğraşmak istedikleri, bitkilerde görsel işlevini istedikleri ve tasarım ögesi olarak bitkilerin manzara çerçevesi olmasını istedikleri ortaya çıkmıştır. Bahçelerinde en çok mevcut türlerin zeytin ve limon, en çok tercih etmek istedikleri türlerin ise lavanta ve erguvan olduğu belirlenmiştir. Erkekler süs bitkisi almadıklarını ya da ücretsiz temin ettiklerini ve daha çok sebze yetiştirmek istediklerini belirtmişlerdir. 36-55 yaşlı katılımcıların daha çok bahçe ile uğraşmak istedikleri, bunun yanında 26-45 yaşlı katılımcıların ise süs bitkisi almadıkları ortaya çıkmıştır. Memurların daha çok fidan almadığı, emeklilerin ise ya ücretsiz ya da özel fidanlıklardan fidan temin ettikleri saptanmıştır. Sonuç olarak, Fethiye kent ekosisteminin sürdürülebilirliği için estetik ve işlevsel özellikleriyle birlikte kent ekolojisine uygun türlerin kullanımının yaygınlaştırılması gerekmektedir.

Anahtar Kelimeler: *Fethiye, Müstakil Ev, Süs Bitkisi, Tercih, Demografi*

Giriş

İnsanların doğadan uzaklaşması, doğaya olan hasretin ve çevre sorunlarının ortaya çıkmasının sebebi kentleşmenin başlayıp hızla ilerlemesidir. Kentleşmeyle birlikte, peyzaj tasarımlarında kullanılan dış mekan süs bitkileri tercihi çok fazla artmıştır. Dış mekan süs bitkilerinin seçiminde ve yetiştirilmesinde insanlar tarafından tercih edilme düzeyleri ve ihtiyaç duyulması önemli unsurlardır. Süs bitkileri kullanıldıkları alana estetik açıdan katkı yapmalarının yanında, sosyal, kültürel, insan ve çevre sağlığı ile turizm açılarından da çok fazla fayda sağlamaktadırlar. Ayrıca, peyzaj çalışmalarında bitkilerin tercih edilmesinde estetik özellikler başta olmak üzere bitkilerin fonksiyonel ve ekolojik özellikleri önem arz etmektedir (Acar ve Sarı, 2010).

Günümüzde süs bitkileri kentsel dokunun oluşmasında en önemli unsurlardır (Aslan ark., 2013). Tasarım ilkeleri çerçevesinde süs bitkileri kompozisyon oluşturacak şekilde kullanılır. Yan yana gelişlerinden, kullanım amaçlarına kadar birçok kompozisyonda bu ilkeler rol oynamaktadır (Taşcıoğlu ve Kuzucu, 2019). Konut ve yakın çevresinin insanlara huzur ve mutluluk verebilecek şekilde süs bitkileriyle tasarlanması gerekmektedir (Taşkan, 2014). Bitkisel tasarımlarda süs bitkilerinin renk, doku, çiçek, form, meyve ve mevsimlik renk değişimleri gibi özelliklerinin yanı sıra, biyolojik onarım, erozyon kontrolü, rüzgâr, gölgeleme ve gürültü perdesi oluşturma gibi özelliklerinden de yararlanılmaktadır (Özer ve ark., 2009).

Bugüne kadar Alanya (Yücedağ ve ark., 2018), Burdur (Yücedağ ve ark., 2019), Antalya (Kaya ve ark., 2018) ve Malatya (Aslan ve ark., 2013) kentlerinde kent insanının ev bahçelerindeki bitki tercihi üzerine çalışmalar yürütülmüştür. Ancak, insanların ev bahçelerindeki bitki tercihi üzerine demografik özelliklerin etkilerini inceleyen bir çalışma mevcut değildir. Bu nedenle, bu çalışmada hem Fethiye kent merkezinde müstakil ev

sahiplerinin dış mekân süs bitki tercihleri hem de bu tercihleri üzerine demografik özelliklerin etkilerini ortaya koymak amaçlanmıştır. Çalışmada ulaşılan sonuçların hem Fethiye’de hem de Türkiye’nin benzer ekolojik koşullara sahip diğer kentlerinde yapılacak olan bitkisel tasarım çalışmalarına katkı sağlaması hedeflenmektedir.

Materyal ve Yöntem

Çalışma Muğla ilinin Fethiye ilçesinde (36°37' kuzey, 29°6' doğu) yürütülmüştür (Şekil 1). Akdeniz Bölgesi'nin batısında yer alan Fethiye'nin yüzölçümü 3059 km²'dir. Muğla il merkezi de dahil en geniş yüzölçüme sahip ilçedir. Doğu ve güneydoğusu Antalya ili, güneyi, güneybatısı ve batısı Akdeniz, kuzeybatısı Dalaman ilçesi, kuzeyi Denizli ve Burdur illeriyle çevrilidir (URL-1, 2021). Fethiye ilçesinin toplam nüfusu 170 379'dur (TÜİK, 2021).

Şekil 1. Çalışma alanının konumu

Fethiye’de karakteristik Akdeniz İklim Tipi görülmektedir. Fethiye ve yakın çevresinin yer şekilleri iklim üzerinde etki eden asıl faktördür. Arazinin çok engebeli olması farklı klimatolojik ortamlar yaratmaktadır. İklime etki eden dağların uzanış yönü ve yükseklikleri Fethiye’de insanın temel faaliyetlerine etki ettiği gibi iklim, toprak ve bitki örtüsü gibi faktörlerin kısa mesafelerde değişmesine neden olmaktadır. Yöredeki dağların uzanışı rüzgâr yön ve hızını da etkilemektedir (URL-2, 2021). Fethiye’de yıllık ortalama sıcaklık 21 °C’dir. Fethiye’de yıllık yağış 882 mm miktarıdır (URL-3, 2022).

Fethiye’de müstakil evde yaşayan 100 kişiye 2020 yılının aralık ayı içerisinde yüz yüze anket uygulaması gerçekleştirilmiştir. Anket formunun hazırlanmasında Yücedağ ve ark. (2019)’nın yapmış oldukları çalışmadan yararlanılmıştır. Anket demografik özellikler, bitkilerde tercih edilen özellikler, formlar ve işlevleri, bahçelerinde mevcut olan türler ve kendi bahçelerinde tercih etmek istedikleri otsu ve odunsu süs bitki türleri üzerine soruları kapsamaktadır.

Elde edilen verilere öncelikle frekans analizi yapılmıştır. Çalışmanın verileri normal dağılım göstermediği için bazı değişkenlerin demografik özellikler açısından ortalamalarının eşit olup olmadığı parametrik olmayan yöntemlerden Mann-Whitney U ve Kruskal Wallis H testleriyle analiz edilmişlerdir. İstatistiksel analizlerde SPSS programı kullanılmıştır.

Bulgular ve Tartışma

Katılımcıların 53'ü erkek, 47'si ise kadındır. Katılımcıların çoğunluğunu 36-45 orta yaş grubundaki önlisans ve lisans mezunu ev sahibi katılımcılar oluşturmaktadır. Katılımcıların 64'ü evli, 36'sı bekdir. Çoğunluğu diğer meslek grubunu seçmesiyle birlikte, ikinci sırada emekli katılımcılar yer almıştır (Tablo 1).

Katılımcıların 65'inin bahçeyle uğraşmak istediği saptanmıştır (Tablo 1). Bu bulguya benzer şekilde, Yücedağ ve ark. (2018) Alanya'da katılımcıların %87'sinin mümkün olduğunda bahçe işleri ile uğraşmak istediklerini belirtmişlerdir.

Katılımcılar tarafından süs bitkilerinde en çok tercih edilen özellik güzel kokulu olması, en az tercih edilen ise su isteğinin az olması olarak ifade edilmiştir (Şekil 2). Benzer şekilde, Taşcıoğlu ve Kuzucu (2019) tarafından Kilis kentinde yapılan bir araştırmada da bitkilerle ilgili tercih edilen en önemli özellik olarak kokulu olması bulunmuştur. Son yıllarda dünyada ve Türkiye’de iklim değişikliğinin ve buna bağlı olarak küresel ısınmanın yaşandığı gerçeğine rağmen, katılımcıların az su isteği olan bitkileri en son olarak tercih etmesi oldukça ilginçtir.

Tablo 1. Katılımcıların demografik özellikleri ile bahçeyle uğraşma durumları

Cinsiyet	f	Medeni Durum	f
Kadın	47	Evli	64
Erkek	53	Bekar	36
Yaş		Meslek	
18-25	7	Öğrenci	2
26-35	17	Memur	22
36-45	29	İşçi	4
46-55	25	Ev hanımı	14
56-65	12	Emekli	22
66 ve üstü	10	Diğer	30
Eğitim Durumu		Mülkiyet Durumu	
İlkokul	-	Kiracı	40
Ortaokul	1	Ev Sahibi	60
Lise	21	Bahçe ile Uğraşma İsteği	
Önlisans	24	Evet	65
Lisans	42	Hayır	35
Lisansüstü	12		

Şekil 2. Katılımcıların Süs Bitkilerinde Tercih Ettikleri Özellikler

Şekil 3. Katılımcıların Süs Bitkilerini Temin Etme Durumları

Katılımcıların süs bitkilerinin temini incelendiğinde, çoğunlukla süs bitkisi almadıkları ya da ücretsiz olarak sağladıkları sonucu ortaya çıkmıştır (Şekil 3). Bu çalışmada 36 katılımcı süs bitkisini fidanlıklardan temin etmektedir. Benzer şekilde, Erzurum kentinde yapılan bir araştırmada da (Yılmaz ve Zengin, 2003), kent halkının %34'lük kısmı fidanlıklardan sağlamaktadır.

Katılımcılar birinci sırada süs bitkilerini, ikinci sırada ise meyve ağaçlarını bahçelerinde yetiştirmek istemektedirler (Şekil 4). Kaya ve ark. (2018) Antalya kentinde ve Yılmaz (2006) Tekirdağ kentinde yürüttükleri çalışmalarda elde ettikleri sonuçlar bu çalışmanın bulgularıyla benzerlik göstermektedir.

Şekil 4. Katılımcıların En Çok Yetiştirmek İstedikleri Bitkiler

Katılımcılar süs ağaçlarında en çok yayılcı-dağınık, en az ise sütun formlarını tercih etmektedirler (Şekil 5). Bu sonuçlara karşılık, Yücedağ ve ark. (2018) Alanya kentinde katılımcıların %42'sinin salkım formu bitkileri tercih ettikleri sonucuna ulaşmışlardır. Bunun yanında, Yılmaz (2006) Tekirdağ'da katılımcıların çoğunluğunun bitkilerin formları konusunda hiçbir fikri olmadığını belirtmiştir.

Şekil 5. Katılımcıların Süs Ağaçlarında En Çok Tercih Ettikleri Formlar

Katılımcıların süs bitkilerinde en çok görsel zevk verme işlevini tercih etmişlerdir. Buna karşılık, ilginç şekilde bitkilerin ekolojik hizmetlerinden olan havayı temizleme, gölge oluşturma, erozyon kontrolü gibi işlevlerini fazla tercih etmemişlerdir (Şekil 6). Bu çalışmanın bulgularına karşılık, Aslan ve ark. (2013) Malatya kentinde katılımcıların büyük oranda gölge yapan türleri tercih ettiklerini bulmuşlardır.

Şekil 6. Katılımcıların Süs Bitkilerinde Tercih Ettikleri İşlevler

Katılımcılar bitkisel tasarımda en çok manzara çerçevelemesi, en az ise yumuşatıcı olma öğelerini tercih etmişlerdir (Şekil 7). Yılmaz (2006) Erzurum kentinde yürüttüğü çalışmada katılımcıların manzara çerçeveleme tasarım öğesini ikinci sırada tercih ettiğini bulmuştur.

Şekil 7. Katılımcıların Bitkisel Tasarımda Tercih Ettikleri Öğeler

Katılımcılar bahçelerinde birinci sırada *Olea europaea* (zeytin), ikinci sırada *Citrus x limon* (limon) türlerinin mevcut olduğunu ifade etmişlerdir. En az mevcut türün ise *Tagetes erecta* (Kadife çiçeği) olduğu ortaya çıkmıştır (Şekil 8).

Şekil 8. Katılımcıların Bahçelerinde Mevcut Türler

Katılımcıların bahçelerinde yetiştirmek için birinci sırada *Lavandula angustifolia* (Lavanta) türünü, ikinci sırada *Cercis siliquastrum* (Erguvan) tercih etmişlerdir. En az tercih edilen tür ise *Jacaranda mimosifolia* (Jakaranda) türüdür (Şekil 9).

Şekil 9. Katılımcıların Bahçelerinde Tercih Etmek İstedikleri Türler

Bahçe ile uğraşma ve süs bitkisi temini üzerine cinsiyet, yaş ve meslek etkili bulunmuştur. En çok yetiştirmek istediği bitki üzerine ise sadece cinsiyet etkili olmuştur (Tablo 2). Buna göre, kadınlar erkeklerle kıyasla daha çok bahçe ile uğraşmak ve en fazla da süs bitkisi yetiştirmek istemektedirler. Erkekler süs bitkisi almadıklarını ya da ücretsiz temin ettiklerini belirtmişlerdir. Erkekler ise daha çok sebze yetiştirmek istemektedirler. 36-55 yaşlı katılımcıların daha çok bahçe ile uğraşmak istedikleri, bunun yanında 26-45 yaşlı katılımcıların ise süs bitkisi almadıkları ortaya çıkmıştır. Memurların daha çok fidan almadığı, emeklilerin ise ya ücretsiz ya da özel fidanlıklardan fidan temin ettikleri saptanmıştır.

Tablo 2. Demografik özelliklerin katılımcıların bitki tercihi üzerine etkileri

		Bahçe ile uğraşma ¹	Süs bitkisi temini	En Çok yetiştirmek istediği bitki
Cinsiyet	MW-U	700	649	915
	Z	-4,258	-3,995	-2,086
	p	0,000***	0,000***	0,037*
Yaş	X ²	17,208	16,850	0,907
	sd	5	5	5
	p	0,004**	0,005**	0,970ns
Meslek	X ²	31,474	18,634	6,963
	sd	5	5	5
	p	0,000***	0,002**	0,223ns

¹Demografik özellik ilgili tercih üzerine 0.05 (*), 0,01 (**) ve 0,001 (***) düzeylerinde önemli ya da önemsizdir (ns).

Sonuç olarak, Fethiye’de müstakil evde yaşayan insanların bahçelerinde daha çok süs bitkilerinin ön plana çıkmasını istedikleri ve boş zamanlarında bahçeyle uğraşmak istedikleri ortaya çıkmıştır. Katılımcıların çoğunun süs bitkilerinde tercih ettikleri en önemli özellik güzel kokulu olması, süs ağaçlarında en çok tercih ettikleri form yayılcı-dağınık olması, süs bitkilerinde tercih ettikleri en öne çıkan işlevin görsel zevk vermesi, bitkilerin tasarımında tercih ettikleri en öne çıkan öge ise manzara çerçeveleyici olmasıdır. Katılımcıların bahçelerinde en çok mevcut olan türler zeytin ve limon, en çok tercih etmek istedikleri türler ise lavanta ve erguvan olmuştur.

Bu sonuçlara göre, müstakil bahçeye sahip kişilerin dış mekân bitki tercihlerinin dikkate alınarak ilgili gruplar tarafından kentin yeşil dokusunun zenginleştirilmesi yönünde gerekli çalışmaların yapılması büyük önem taşımaktadır. Bu bağlamda bu çalışmanın sonuçları konut bahçelerinin bitkisel tasarım çalışmalarında oldukça yararlı olacaktır. Nitekim kullanıcıların istek ve görüşleri doğrultusunda şekillenen mekanların daha yoğun ve işlevsel bir kullanıma sahip olacağı aşikârdır.

Development of an Antimicrobial Topical Skin Cream with Using Wood Apple (*Limonia acidissima* L.) Pulp Against *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Candida albicans*

Fathima Fasha¹ and P. Neelamanie Yapa^{1*}

¹Department of Biological Sciences, Faculty of Applied Sciences, Rajarata University of Sri Lanka, Mihintale 50300 Sri Lanka.

Abstract

Skin inhabiting microbes mostly non-pathogenic and commensals on the skin. Among them *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans* often responsible for symptomatic skin infections. Cellulites, impetigo, ecthyma, red lesions and candidiasis are some of the common microbial skin diseases caused by skin pathogens. Wood apple (*Limonia acidissima* L.) is an underutilized fruit in Sri Lanka and, all parts of this plant have medicinal value. Considering the high therapeutic value, the aqueous extract of wood apple pulp was used. Antibacterial activity against *Staphylococcus aureus*, *Pseudomonas aeruginosa* and antifungal activity against *Candida albicans* was evaluated by using the standard well diffusion method. Above tested bacterial and fungal species were suspended in 3 mL of sterile distilled water separately and 10^8 CFU/mL population count was prepared. Aliquots of 100 μ L of each suspension were inoculated and uniformly spread on Muller Hinton agar plates separately in triplicates. Wells were filled aseptically placing 50 μ L of wood apple extracts, antimicrobial compounds specifically as the positive control for bacteria and fungi and sterile distilled water as the negative control. The plates were incubated at 37 °C for 24 - 48 hours and the diameter of the growth inhibition zones around the wells were measured. Furthermore, minimum inhibition concentrations of each extract were also evaluated. Comparisons were performed using one-way ANOVA followed by Tukey's Pairwise Comparisons. The antimicrobial topical skin cream was prepared using 0.5 g mL⁻¹ of wood apple pulp with sterile distilled water, mixed with the formulated standard ingredients. The results revealed that the aqueous extracts of wood apple pulp concentrations range from 0.15 g mL⁻¹ to 1g mL⁻¹ showed the antimicrobial potential of above skin pathogens variably ranged inhibition zone diameter 16 mm to 34 mm. The antimicrobial effect of the formulated cream against these pathogens was repeatedly tested. Further testing procedures needed to be followed before recommending wood apple topical antimicrobial skin cream as a marketable product.

Abstracts

Despite the global challenges of high food insecurity, covid-19 set-in which is said to have contributed to the phenomenon. However, most recent studies were conducted during the COVID-19 lockdown, indicating a need to assess households' food security after the lockdown. Therefore, this study investigated rural households' (who are mostly farmers) food security status and dietary diversity as a proxy for nutrition status in Nigeria. Two hundred and forty farming households were randomly selected for the study. The data collected was analysed using descriptive statistics, the USDA 18 food security questionnaire core module, the household dietary diversity score, and logit regression. The results revealed that the majority of the farming households were food insecure (66.3%) and malnutrition was also prevalent among rural farming households as 62.9 per cent had a low dietary diversity score. The positive determinants of household food security were access to credit, cooperative membership, income, and marital status. While household size negatively influenced rural household food security. This study calls for development agents' and governments' intervention to reduce the high level of food insecurity and malnutrition among rural farming households through the provision of financial support and awareness creation on family planning.

Abstract

Water has supreme importance in the universe, but unfortunately contaminated with various sources. Water purification is a major problem in all over the world and specially in the developing countries like Pakistan. For purification natural coagulants (i.e. *Moringa oleifera*) are beneficial and has advantage to chemical methods of water purification as biodegradable and easily available. *Moringa oleifera* seed has protein that act as purifying and coagulating agent in water, almost 37% of this is presented in the seed. As hardness, turbidity and acid-base ratio is most important quality parameter of drinking water and *Moringa oleifera* seed protein is more effective in purifying the turbid water as; it reduces the turbidity 98% and hardness 90% of water. *Moringa oleifera* seed also has antimicrobial effect as; disinfectant in drinking water, retard the reproduction process of bacteriophage in water and also removed 90% *Total coliforms* from water. This study aims to assess the purification method of *Moringa oleifera* seed. In the current it has a great demand for developing countries to use this cheap and eco-friendly method of purification.

Key word: Water, Purification, Contamination, *M. oleifera*.

Sunflower Growth, Yield And Nutrient Uptake As Influenced By Different Nitrogen Levels

Jannatul Ferdous¹, Md. Sadiqul Amin¹, Jannatun Nayeema¹, Tithi Sarker¹

¹ Soil, Water and Environment, Life science, Khulna University, Khulna, Bangladesh

*Corresponding author: jannatunnayeema2@gmail.com

Abstract

This study was undertaken to assess the influence of different nitrogen levels on sunflower's growth, yield and nutrient uptake. The selected variety was hybrid Hysun 33. There were six levels of nitrogen viz. (i) T₁ (0 kg N ha⁻¹), (ii) T₂ (60 kg N ha⁻¹), (iii) T₃ (90 kg N ha⁻¹), (iv) T₄ (120 kg N ha⁻¹), (v) T₅ (150 kg N ha⁻¹), (vi) T₆ (180 kg N ha⁻¹) and the experiment was laid out in a Randomized Complete Block Design (RCBD) with three replications. Different levels of nitrogen showed significant effect on growth, yield and nutrient uptake of sunflower. Individually nitrogen had significant effect on growth and yield parameters such as plant height, head diameter, stem diameter, grain yield, stover yield, thousand-grain weight except leaf numbers plant⁻¹. The highest plant height, head diameter, stem diameter, grain yield, stover yield, thousand grain weight was recorded from T₆ (180 kg N ha⁻¹) where the lowest from T₁ (0 kg N ha⁻¹). Similarly, the nutrient uptake such as N, P and K significantly affected by nitrogenous fertilizer. The highest N, P and K uptake of sesame was found at T₆ (180 kg N ha⁻¹) where the lowest from T₁ (0 kg N ha⁻¹). We can summarize that there is a synergistic interaction of N with sunflower growth, yield and nutrient (N, P, K) uptake.

Keywords: Nitrogen fertilizer, Sunflower, Growth parameters, Grain yield, Stover yield, Nutrient uptake.

Introduction

Sunflower (*Helianthus annuus L.*) is the perpetual herb. It is a widely used oilseed crop around the world. Sunflower seeds are palatable and it is a decent wellspring of protein, nutrients, calcium, nitrogen and iron. Its seed contains 40-45% non-unstable oil and about 55% linoleic corrosive. Aproximate piece of sunflower seed is protein 20.8%, lipid 54.8%, starches 18.4%, debris 3.9% (Gopalan, 1982). In past, sunflower was developed willfully in our nation. Later on, a couple of individuals began developing it industrially. Considering the suitability of sunflower cultivation, it would be a fruitful endeavor in the beachfront regions of Bangladesh. At that point when the saltiness expands after the assault of super violent winds like Sidr and Aila, it is the most proper time to begin sunflower development. Sunflower is better adjusted to districts of delayed dry spell; because of its capacity to extricate put away soil water in the more profound soil profile (Nahar, 2015).

Yet, Nitrogen assume a basic job in augmentation of harvest yields (Massignam *et al.*, 2009) and improves the yield just as nature all things considered (Ullah *et al.*, 2010). Moreover, higher paces of N increments photosynthetic procedures, leaf zone creation, leaf territory length just as net absorption rate (Ahmad *et al.*, 2009; Munir *et al.*, 2007). Improvement and development of leaf area, crop growth rate and radiation interception are affected by the utilization of nitrogen (Nasim *et al.*, 2012). The advancement of individual leaf zone and complete leaf region of harvest plant and eventually contributing towards higher grain yield (Rafiq *et al.*, 2010). Numerous analysts (Bange *et al.*, 2000) inferred that N builds grain yield by influencing the development and improvement of sunflower.

Materials and Methods

A field experiment was conducted at field laboratory of Soil, Water and Environment Discipline, Khulna University, Khulna to assess the influence of different nitrogen levels on sunflower's growth, yield and nutrient uptake. The experiment was designed with six levels of nitrogen such as (i) T₁ (0 kg N ha⁻¹), (ii) T₂ (60 kg N ha⁻¹), (iii) T₃ (90 kg N ha⁻¹), (iv) T₄ (120 kg N ha⁻¹), (v) T₅ (150 kg N ha⁻¹), (vi) T₆ (180 kg N ha⁻¹). The treatments were replicated three times. The test crop was sunflower (hybrid Hysun 33). Fertilizers such as TSP (160 kg ha⁻¹), MoP (150 kg ha⁻¹), Gypsum (150 kg ha⁻¹), Zn Sulphate (8 kg ha⁻¹) and Boric acid (10 kg ha⁻¹) used as basal dose recommended by Azad *et al.* (2017). The unit plot size was 2 m x 1m following Randomized Complete Block Design (RCBD). Seeds were treated with fungicide Vitavax-200 before 24 hours of sowing at the rate of 3 g kg⁻¹ seed and were soaked overnight before sowing. After seedling emergence, the vacant hills were filled up by resowing. The growth performance was measured and recorded at day 45, 65, 85, 105. After harvesting, the plant sample was prepared to evaluate the yield parameters and measured the nutrient uptake.

Analytical procedure

The particle size analysis of the soil was done by hydrometer method as described by Day (1965). Textural classes were determined using Marshall's Triangular Coordinate systems. Soil pH was determined electrochemically with the help of glass electrode pH meter using soil to water ratio of 1:2.5 as suggested by Jackson (1962). The EC of the soil was measured by a soil: water ratio of 1:5 with the help of EC meter and then converted into 1:1 ratio as suggested U.S. Salinity Laboratory Staff (1954). The CEC of the soil was determined by Distillation method (Chapman, 1965). Soil organic carbon was determined by Walkley and Black's wet oxidation method as outlined by Jackson (1973). Exchangeable and water soluble calcium was determined by complexometric titration method (Schwarzenbach and Ackermann, 1947). Plant samples were digested with HNO₃-HClO₄ (2:1) as suggested by Jackson (1973) for the determination of N, P and K. The N and P were determined by Micro kjeldhal method and yellow colour method (Jackson, 1973) respectively. K was measured by Flame analyzer (JENWAY).

Nutrient uptake was calculated from nutrient contents using the following formula:

$$\text{Uptake} = [\text{Nutrient content (\%)} \times \text{Yield (kg/ha)}] / 100$$

Statistical analysis

Analysis of variance was carried out using ANOVA technique (Gomez and Gomez, 1984) and mean values were compared by Duncan's Multiple Range Test (DMRT) by Statistix 10.

Results and Discussion

The experiment was conducted to study the Sunflower growth, yield and N, P, K uptake as influenced by different nitrogen levels. This chapter contains analytical results, statistically analysis of the results, presentation and discussion of the results.

General properties of soil

Some general properties of soil are given in Table 1.

Table 1. Properties of the soil of the experimental field

Parameters		Value
Particle size analysis	Sand	24%
	Silt	47%
	Clay	29%
Soil texture		Clay Loam
Soil pH		7.82
Soil EC (dS m ⁻¹)		0.1
Soil organic carbon (%)		1.22
Soil CEC (cmol kg ⁻¹)		25.83
K (cmol kg ⁻¹)		0.95
Ca (cmol kg ⁻¹)		28
Na (cmol kg ⁻¹)		1.15

Growth Parameters

Plant height

The consecutive plant height at day 45, 65, 85, 105 presented in Fig. 1 show that the effect of different N level on sunflower plant height was significant. The highest plant height was 50.47cm at day 45, 136.33cm at 65, 190.67 cm at day 85 and 202.33 cm at day 105 recorded from T₆ (180 kg N ha⁻¹). At the same time, the lowest plant height was 37.03 cm at day 45, 90.33 cm at 65, 144.00 cm at day 85 and 158.67 cm at day 105 recorded from T₁ (0 kg N ha⁻¹). These results are similar with the findings of Solemani *et al.* (2012) who concluded that with the increasing nitrogen rates, the height of plants increases.

Fig. 1. Plant height with different N treatments in different days.

Leaf numbers

The consecutive leaf numbers of sunflower at day 45, 65, 85, 105 presented in Fig. 2 show that the effect of different N level on leaf numbers of sunflower was not significant. In 45 day, the leaf number was higher in treatment T₁ (0 kg N ha⁻¹) and T₃ (90 kg N ha⁻¹). In 65 day, the leaf number was higher in T₄ (120 kg N ha⁻¹) and T₅ (150 kg N ha⁻¹). In 85 day, the highest leaf number was found in T₃ (90 kg N ha⁻¹) and the lowest leaf number was found in T₂ (60 kg N ha⁻¹). In 105 day, the highest leaf number was found in T₁ (0 kg N ha⁻¹) and T₅ (150 kg N ha⁻¹).

Fig. 2. Leaf number with different N treatments in different days.

Head diameter

Results (Fig. 3) show that the response of different N levels on sunflower head diameter was statistically significant. It was observed that the highest head diameter was 22.67 cm which was recorded from T₆ (180 kg N ha⁻¹) and lowest head diameter was 17 cm recorded from T₁ (0 kg N ha⁻¹). The improvement of the head diameter may be accredited to more vegetative growth due to fertilizer etc. These results collaborated the findings of Sadiq *et al.* (2000) and Iqbal and Ashraf (2006) who have shown positive effects of nitrogen on head diameter of sunflower crop.

Fig. 3. Sunflower head diameter with different N treatments.

Stem diameter

Results (Fig. 4) delineate that the response of different N levels on sunflower stem diameter was statistically significant. It was observed that the highest stem diameter was 8.33cm which was recorded from T₆ (180 kg N ha⁻¹) and lowest stem diameter was 6.53cm recorded from T₁ (0 kg N ha⁻¹).

Fig. 4. Sunflower stem diameter with different N treatments.

Yield parameters

The yield performance of sunflower under different N levels was significantly affected which is shown in Table 2.

Table 2: Yield of sunflower as affected by different N application

Treatments	Grain Yield	Stover Yield	Thousand grain weight (gm)
	Kg ha ⁻¹		
T ₁ (0 kg N ha ⁻¹)	1554.4c	1130.93b	45.3c
T ₂ (60 kg N ha ⁻¹)	1803.47bc	1476.93ab	47.83c
T ₃ (90 kg N ha ⁻¹)	2037.33bc	1506.93ab	61.9b
T ₄ (120 kg N ha ⁻¹)	2204.00b	1986.53a	61.07ab
T ₅ (150 kg N ha ⁻¹)	2912.67a	2207.07a	62.6ab
T ₆ (180 kg N ha ⁻¹)	2953.33a	2209.20a	68.87a

Grain yield

The mean grain yield of sunflower statistically different under different N levels. The highest (2953.33 kg ha⁻¹) grain yield was recorded from T₆ (180 kg N ha⁻¹) and lowest (1554.4 kg ha⁻¹) grain yield was recorded from T₁ (0 kg N ha⁻¹). Similarly, Abdel- Motagally and Osman (2010) has stated that grain yield of sunflower is attributed with increasing N rates.

Stover yield

The mean stover yield of sunflower statistically different under different N levels. The highest (2209.20 kg ha⁻¹) stover yield was recorded from T₆ (180 kg N ha⁻¹) and lowest (1130.93 kg ha⁻¹) stover yield was recorded from T₁ (0 kg N ha⁻¹). Nasim et al. (2011) have also earlier demonstrated positive effect of N fertilizer on dry matter production. This may be due to N effects on cell elongation, as well as N being the principal component of proteins, enzymes, hormones, vitamins, chlorophyll and it accelerates the meristematic activity of plant which leads to progressive increases in internode length, protein synthesis and photosynthetic area leading to higher plant height and dry matter production.

1000-grain weight

The thousand-grain weight of sunflower at different nitrogen levels was significantly affected. Among different N levels, Maximum thousand-grain weight (68.87 g) was recorded from T₆ (180 kg N ha⁻¹). The minimum thousand-grain weight (45.3 g) was recorded from T₁ (0 kg N ha⁻¹).

Nutrient uptake

The nutrient uptake of sunflower under different N levels was significantly affected which is shown in Table 3.

Nitrogen uptake (N)

Grain: The nitrogen uptake by sunflower grain was significantly increased with the increasing levels of N application. The maximum (23.57 kg ha⁻¹) nitrogen uptake by sunflower grain was observed at T₆ (180 kg N ha⁻¹) and the minimum (5.88 kg ha⁻¹) nitrogen uptake by sunflower grain was observed at T₁ (0 kg N ha⁻¹). The recorded highest grain N uptake (23.57 kg ha⁻¹) under T₆ (180 kg N ha⁻¹) was significantly higher than all other treatments.

Stover: The nitrogen uptake by sunflower stover was significantly increased with the increasing levels of N application. The maximum stover N uptake (59.65 kg ha⁻¹) was recorded from T₆ (180 kg N ha⁻¹). The minimum stover N (13.80 kg ha⁻¹) of sunflower stover was observed at T₁ (0 kg N ha⁻¹).

Table 3: Nutrient uptake of sunflower as influenced by different N levels

Treatments	N		P	K
	Uptake (Kg ha ⁻¹)			
	Grain	Stover	Total	Total
T ₁ (0 kg N ha ⁻¹)	5.88 e	13.80 f	162.63 f	72.35 d
T ₂ (60 kg N ha ⁻¹)	8.33 d	29.83 e	237.93 e	94.49 c
T ₃ (90 kg N ha ⁻¹)	10.27 d	34.66 d	247.74 d	96.41 c
T ₄ (120 kg N ha ⁻¹)	12.96 c	46.48 c	320.03 c	148.28 b
T ₅ (150 kg N ha ⁻¹)	19.57 b	53.19 b	494.16 b	164.74 a
T ₆ (180 kg N ha ⁻¹)	23.57 a	59.65 a	605.98 a	164.90 a

Phosphorus (P) uptake: Different N levels significantly influenced P uptake by sunflower. The maximum P uptake (605.98 kg ha⁻¹) by sunflower was recorded from T₆ (180 kg N ha⁻¹) and the minimum phosphorus uptake (162.63 kg ha⁻¹) was recorded from T₁ (0 kg N ha⁻¹). This could be attributed to the fact that there is a synergistic effect i.e. positive interaction between N and P uptake (Zubillaga *et al.*, 2002).

Potassium (K) uptake: The potassium uptake was significantly increased with the increasing levels of N application. The highest K uptake ($164.90 \text{ kg ha}^{-1}$) by sunflower was observed from T_6 (180 kg N ha^{-1}) where the lowest K uptake (72.35 kg ha^{-1}) was observed from T_1 (0 kg N ha^{-1}). This could be attributed to the fact that there is a synergistic effect i.e. positive interaction between N and K uptake (Zubillaga *et al.*, 2002).

The Effect of Using Drawn Combs on Colony Weight Gain and Honey Yield

Sabri Demir¹, H. Vasfi Gençer², Yasin Kahya²

¹ Graduate School of Natural and Applied Science, Ankara University, Ankara, Turkey

² Animal Science, Faculty of Agriculture, Ankara University, Ankara, Turkey

Abstract

Using the drawn empty combs during the main nectar flow is expected to increase honey yield. However, there is no available data to what extent an increase in honey yield occurs when drawn empty combs are used instead of comb foundations. This investigation aimed to determine the effect of using drawn combs during main nectar flow on colony weight gain and honey yield. The investigation was carried out with 42 colonies at the apiary of the Animal Science Department at Ankara University in the spring and summer seasons of 2017. The colonies were randomly allocated into two groups. The supers with drawn empty combs were added to 21 colonies in one group, while comb foundations in supers were added to 21 in the other group. Before adding super to each colony, the initial colony weight (the weight of empty hive + the weight of broodnest combs + the weight of colony population) and the total number of adult bees were determined. The honey supers were added to the hives as the colonies required space throughout the nectar flow. The final colony weight, the weight gain, the weight of harvested combs, and the net honey yield of each colony were determined during the harvesting of honeycombs. The statistical analysis (ANOVA) of the data demonstrated that the mean values of initial colony weight, the weights of broodnest combs and adult bee population and the number of adult bees were not significantly different between colonies that received either drawn combs or comb foundations. The mean values of the final colony weight at harvest (126.0 kg and 113.4 kg), the colony weight gain (82.7 kg and 70.9 kg), the weight of harvested combs (70.7 kg and 58.3 kg) and the net honey yield (58.8 kg and 49.2 kg) were significantly higher ($P<0.01$) in drawn comb group than in comb foundation group. The use of drawn combs in the supering process resulted in a 17%, 21% and 20% increase in the colony weight gain, the harvested comb weight and the net honey yield, respectively.

Key Words: *Apis mellifera*, Honey bee colony, Drawn comb, comb foundation, weight gain, Honey yield

Kabartılmış Petek Kullanımının Koloni Ağırlık Kazanımı ve Bal Verimine Etkisi

Özet

Ana nektar akımı döneminde bal arısı kolonilerine kabartılmış boş kullanımının veriminde artış sağlaması beklenir. Ancak, temel petek yerine kabartılmış petek kullanımının bal verimi artışına katkısını ortaya koyan veri yoktur. Bu araştırma; ana nektar akımında kolonilere kabartılmış petek vermenin koloni ağırlık kazanımı ve bal verimine etkisini belirlemek amacıyla yürütülmüştür. Ankara Üniversitesi Ziraat Fakültesi Zootečni Bölümü arılığında 2017 yılı üretim sezonunda 42 koloni rasgele 2 gruba ayrılmış, bir gruptaki 21 koloniye kabartılmış petekli ballıklar, diğer gruptaki 21 koloniye ise temel petekli ballıklar yerleştirilmiştir. Her koloniye ballık ekleme işlemi öncesi koloni başlangıç ağırlığı (boş kovan ağırlığı + kuluçkalık peteklerin ağırlığı + ergin arı popülasyonu ağırlığı) ve ergin arı sayısı saptanmıştır. Nektar akımı boyunca kolonilerin gelişimi izlenerek ballık ekleme işlemi sürdürülmüştür. Bal hasadı sırasında her koloni tartılarak hasat öncesi son ağırlık, her koloninin ağırlık kazanımı, hasat edilmiş her peteğin ağırlığı ve net total bal verimi saptanmıştır. Varyans analizine (ANOVA) göre; temel petek verilmiş koloniler ile kabartılmış petek verilmiş kolonilerin koloni başlangıç ağırlığı, kuluçkalık peteklerinin ağırlığı, ergin arı popülasyonu ağırlığı ve ergin arı sayısı ortalama değerleri arasındaki farklar önemsizdir. Hasat öncesi son ağırlık (126.0 kg ve 113.4 kg), koloni ağırlık kazanımı (82.7 kg ve 70.9 kg), hasat edilmiş peteklerin ağırlığı (70.7 kg ve 58.3 kg) ve net bal verimi (58.8 kg ve 49.2 kg) ortalama değerleri ise kabartılmış petek verilmiş kolonilerde temel petek verilmiş kolonilerden daha yüksek ($P<0.01$) bulunmuştur. Kabartılmış petek kullanımı; koloni ağırlık kazanımının %17, hasat edilmiş peteklerin ağırlığının %21 ve net bal veriminin %20 artmasına neden olmuştur.

Effects of Ultrasonication on Probiotics and Prebiotics in Dairy Technology

Vildan Akdeniz¹

¹Department of Dairy Technology, Faculty of Agriculture, Ege University, İzmir, Türkiye

Abstract

There is a growing consumer interest in functional foods to help prevent chronic disorders such as cardiovascular diseases, cancer, chronic respiratory diseases and diabetes, which are closely related to human diet. In this context, foods containing probiotics and prebiotics gain importance. Probiotics and prebiotics are frequently used ingredients in dairy products due to their functional effects. Probiotics are live microorganisms, which confer health benefits such as prevention of gastrointestinal diseases, enhancement of the immune system, reduction of serum cholesterol level and blood pressure, and anti-carcinogenic activity, on the host when administered in adequate numbers. Prebiotics are non viable and non digestible ingredients that are selectively utilized by host microorganisms conferring a health benefit and increasing the effect of probiotics. Ultrasound is an innovative and promising technology in the dairy industry that can improve the viability and functionality of probiotic bacteria , and can facilitate access to probiotics by changing the prebiotic structure. Ultrasound application promotes probiotic viability by increasing the membrane permeability of bacteria. Thus, the transport of nutrients necessary for cell growth is facilitated across the membrane. In addition, the extracellular release of intracellular enzymes, especially β -galactosidase, as a result of the increase in membrane permeability accelerates both transgalactosylation and lactose hydrolysis and releases some components characterized as growth factors. Consequently, the growth of probiotic bacteria is promoted. Ultrasound can also change the prebiotic structure by breaking its polymerized chains and releasing components. So, they become more easily assimilated by probiotic cultures and contribute to the increase of probiotic viability.

Key Words: *Ultrasound, Probiotic, Prebiotic, Functional Dairy Products*

Introduction

Foods are not only for satisfy hunger and for deliver essential nutrients but also they prevent the development of nutrition-related diseases. Therefore, the functional foods containing probiotics are mostly preferred by the health-conscious consumers (Sarkar, 2010). According to the Food and Agriculture Organization of the United Nations (FAO) and the World Health Organization (WHO), probiotics are defined as live microorganisms, which when administered in adequate amounts, confer a health benefit on the host (FAO/WHO, 2002). There is a growing demand on functional foods including probiotics. The health benefits of probiotics have been reported in numerous studies (Ghasempour et al., 2020; Irin et al., 2018; Manovina et al., 2021).

Probiotics act as biological agents that modify the intestinal microbiota to provide healthy digestive function and provide therapeutic benefits for the host. Human gut has an important role in host health especially in defense function, and impact brain-gut responses. Promoting the intestinal microflora for beneficial bacteria is essential to maintain the presence of natural probiotic bacteria and to provide protection against newly ingested microorganisms, especially pathogens (Kalip and Atak, 2018). Diseases in which probiotics are effective and beneficial are given Figure 1 (Ahmed and Koul, 2021; Irin et al., 2018; Manovina et al., 2021). In addition, probiotics have anti-microbial and anti-tumor effects, and also they can decrease the side effects of chemotherapy (Śliżewska et al., 2021; Tian et al., 2019).

It is indicated that foods should contain more than 10^6 cfu/g probiotic bacteri to exert a probiotic effect. The viability of probiotic cultures, especially in fermented milks, depends on several factors such as acidity, pH, dissolved oxygen content, redox potential and hydrogen peroxide (Dinkçi et al., 2019; Özer et al., 2005). In addition, it is stated that prebiotics are used to encourage the growth and activity of probiotics in foods (Vinderola et al., 2011). Prebiotics are non-viable and non-digestible ingredients that are selectively utilized by host microorganisms conferring a health benefit and increasing the effect of probiotics (Akalin and Erisir, 2008).

Alongside its health benefits and nutritional value, there is a growing consumer interest for food quality. Thus, new safe and effective food production methods come to the fore to meet the consumer demand for high quality foods. Ultrasound is one of these methods (Akdeniz, 2022).

Ultrasound

Ultrasound is a form of energy generated by sound waves with frequency which exceeds the hearing limit of the human ear, typically higher than 20 kHz. It is considered as green technology since it is environmentally friendly as sound waves are non-toxic. It is also safe, simple, fast, cost-effective, and energy-efficient. High-power ultrasound, which has a frequency between 20-100 kHz and intensity between 10-1000 W/cm², creates mechanical, chemical and biochemical effects in liquid foods through acoustic cavitation (Higuera-Barraza et al., 2016; Huang et al., 2017).

Fig. 1. Diseases that probiotics are beneficial

Fig. 2. Ultrasonic cavitation (Soria and Villamiel, 2010).

In liquid foods, acoustic cavitation occurs as a result of the interaction between ultrasonic waves, liquid, and dissolved gas. As shown in Fig. 2, the cavitation bubbles grow due to the compression and rarefaction. When they reach a critical size, they violently collapse (Soria and Villamiel, 2010). The explosion of cavitation bubbles generates high temperature and pressure regions (Akdeniz and Akalın, 2019). As a consequence, acoustic streaming, shock waves, microjets, turbulence, and shear forces are created (Ashokkumar, 2011).

Effect of Ultrasound on Milk Fermentation

Fermentation process is one of the long and energy-consuming steps in fermented dairy products manufacture. Therefore, it is important to shorten the fermentation time without adversely affecting the quality of the final product (Abesinghe et al., 2019). There are studies showing that ultrasound accelerates the fermentation process (Abesinghe et al., 2019; Nguyen et al., 2009; 2012). It is stated that ultrasound increases enzymatic activity. This is attributed to the increase in membrane permeability of probiotic bacteria. So, the intracellular enzyme β -galactosidase accelerates lactose hydrolysis by being released out of the cell (Guimaraes et al., 2019; Nguyen et al., 2009; 2012).

Effects of Ultrasound on Probiotic Bacteria Viability and Prebiotics

It is an innovative and promising technology in the dairy industry that can improve the viability and functionality of probiotic bacteria and can facilitate access to prebiotics by changing the prebiotic structure (Guimaraes et al., 2019). Ultrasound application promotes probiotic viability by increasing the membrane permeability of bacteria. Thus, the transport of nutrients necessary for cell growth and also removal of waste products are facilitated across the membrane. In addition, the extracellular release of β -galactosidase, which is the intracellular enzyme, as a result of the increase in membrane permeability releases some components characterized as growth factors. Consequently, the growth of probiotic bacteria is promoted (Nguyen et al., 2009). Akdeniz (2022), Gurram (2007), Niamah (2019) and Nguyen et al. (2009) found that ultrasound application stimulated the growth of probiotic bacteria, especially bifidobacteria.
