Ultrasound can also change the prebiotic structure by breaking its polymerized chains and releasing components. So, they become more easily assimilated by probiotic cultures and contribute to the increase of probiotic viability (Guimaraes et al., 2019).

Conclusion

Ultrasound applications attract the attention of dairy industry. It has a high potential for use in the manufacture of probiotic fermented milk products. It increases the membrane permeability of probiotic bacteria. Thus, probiotic bacteria viability is promoted by increased amount of nutrients which they can use. Moreover, it could change the prebiotic structure, so that probiotic cultures can more easily reach prebiotics which increase the effect of probiotics. It is promising for functional dairy products including probiotics, since it increases the viability of probiotic bacteria.

***Morinda Longissima* Effect On Inflammation In Carrageenan- Induced Paw Edema In Mice - Histological Study**

Hafidha Mehallah¹ and Nouredine Djebli¹

¹Pharmacognosy and Api-Phytotherapy Laboratory, Abdelhamid Ibn Badis, University of Mostaganem-2700, ALGERIA, hafidhamehallah1995@gmail.com

Abstract

Inflammation is a biological process of the immune system to harmful stimuli, such as toxicants or pathogens, it is part of the defense mechanism of the body. Drug discovery from natural sources is going through a renaissance, despite the fact that natural product-derived compounds occupy a much greater chemical space than those created through synthetic chemistry methods. Medicinal plants possess characteristics that aids in treating diseases or improving people's health conditions. The anti-inflammatory activity of *Morinda longissima* aqueous extract was evaluated in mice. Paw edema induced by carrageenan was carried out as described (Winter et al., 1962). Mice were separated into five groups. The treated groups were pre-treated with 100, 200 and 300 mg/kg of *Morinda longissima* by gavage and 50 mg/kg of Diclofenac as standard group. The 5th group was the inflammatory control (non-treated). All groups were injected with 1 % carragennan into the right paw after one hour. For histology evaluation, skin fragments from right paw were fixed in 10% buffered formalin. The paw tissues were stained with Harris's hematoxylin and eosin. The microscopic observation of paw edema showed that treatment with 200 and 300 mg/kg presented less inflammatory cells and edema formation than the inflammatory control group. The results suggested *Morinda longissima* as a promising source of natural anti-inflammatory constituent for application in pharmaceutical industries.

Abstract

Buffalo milk is an animal food that contains high levels of food components such as milk fat, casein, serum proteins, lactose, mineral substances and vitamins, consists of particles of different sizes and has many health benefits. Due to the rich composition of buffalo milk, buffalo milk stands out as an important food source for nutrition at the point of meeting the essential components for a healthy diet. In this study, the nutritional values of the milk obtained from the buffaloes bred in the Perli neighborhood of Kutahya province were examined, the nutritional values and physicochemical quality parameters of the buffalo milk were determined. It was emphasized that buffalo milk should be used more widely in food production with reference to its rich fatty acids content, but it was understood that the disadvantage of high production costs limited the use of buffalo milk as a raw material source in dairy products. In this study, dry matter ratio, protein, lactose, fat, mineral matter and fatty acids amounts were calculated in buffalo milk samples and the results were interpreted. The nutritional contents of buffalo milk samples are respectively; Fat-free dry matter was determined as 10.27%, protein 4.48%, fat 6.5%, lactose 5.22%, mineral substance contents; Na 247.599 mg/kg, K 1095.62 mg/kg, Ca 1624.51 mg/kg, Mg 150.098 mg/kg, P 857.155 mg/kg, Fe 0.327 mg/kg, Zn 6.304 mg/kg. The ratio of total saturated fatty acids was 80.14%, monounsaturated fatty acid ratio was 14.47%, polyunsaturated fatty acid ratio was 0.93%. In conclusion, when the data obtained are interpreted, it has been determined that buffalo milk contains higher levels of components in terms of nutritional value compared to other milks, and it has been found that buffalo milk will have a very important effect on human metabolism, and useful results will be obtained in the preparation of healthy food products and in special diets.

Key Words: Buffalo milk, food, nutritional value.

Kütahya Yöresinde Yetiştirilen Manda Sütünün Özellikleri

Özet

Manda sütü süt yağı, kazein, serum proteinleri, laktoz, mineral maddeler ve vitaminler gibi gıda bileşenlerini yüksek seviyelerde içeren ve birbirinden farklı büyüklüklerdeki taneciklerden oluşan, sağlığa birçok faydası bulunan bir hayvansal gıdadır. Manda sütünün bileşiminin zengin olması nedeniyle sağlıklı beslenme için elzem olan bileşenlerin karşılanması noktasında manda sütü, beslenme için önemli bir gıda kaynağı olarak öne çıkmaktadır. Bu çalışmada Kütahya ilindeki Perli mahallesinde yetiştirilmiş olan mandalardan elde edilen sütlerin besin değerleri incelenerek, manda sütünün besin değerleri ile fizikokimyasal kalite özellikleri saptanmış, manda sütünün beslenme için oldukça önemli olduğu, kaliteli ürün üretiminde hammadde olarak kullanılabileceği belirlenmiştir. Manda sütünün yağ asitleri içeriğince zengin olması referans alınarak gıda üretiminde daha yaygın kullanılması gerektiği vurgulanmış, ancak üretim maliyetlerinin yüksek olması dezavantajının manda sütünün süt ürünleri üretiminde hammadde kaynağı olarak kullanımını sınırlandırdığı anlaşılmıştır. Bu araştırmada manda sütü örneklerinde kuru madde oranı, protein, laktoz, yağ, mineral madde ve yağ asitleri miktarları hesaplanmış ve elde edilen sonuçlar yorumlanmıştır. Manda sütü örneklerinin besin içerikleri sırasıyla; yağsız kuru madde % 10,27, protein % 4,48, yağ % 6,5, laktoz % 5,22 olarak tespit edilirken, mineral madde içerikleri; Na 247,599 mg/kg, K 1095,62 mg/kg, Ca 1624,51 mg/kg, Mg 150,098 mg/kg, P 857,155 mg/kg, Fe 0,327 mg/kg, Zn 6,304 mg/kg seviyelerinde bulunmuştur. Toplam doymuş yağ asidi miktarları oransal olarak % 80,14, tekli doymamış yağ asidi oranı % 14,47, çoklu doymamış yağ asidi oranı % 0,93 şeklinde tespit edilmiştir. Sonuç olarak, elde edilen veriler yorumlandığında, manda sütünün diğer sütlere göre besin değeri açısından daha yüksek seviyelerde bileşenler içerdiği tespit edilmiş olup manda sütünün insan metabolizmasına oldukça önemli etkide bulunacağı, sağlıklı gıda ürünlerinin hazırlanmasında ve özel diyetlerde kullanımı durumunda da faydalı sonuçlar alınacağı bulgularına ulaşılmıştır.

Anahtar Kelimeler: Manda sütü, gıda, besin değeri.

Abstract

In today's conditions, the effect of increasing urbanization, industrialization, population and global warming the pollution and decrease of fresh water resources have become a concern in agricultural production. For this reason, the practice of deficit irrigation, in which production is carried out, has emerged with the approach of saving irrigation water by irrigating at levels less than the amount of water needed by the plant. However, under these conditions, the lack of sufficient moisture balance in the soil affects the plant physiology negatively and reduces the yield and quality as a result of preventing development and growth. Under these conditions, various organic wastes applied to the soil act as a regulating agent for soil properties and increase moisture retention in the soil. Organic wastes that support plant yield increase also contribute to environmental sustainability within the scope of waste management. In this context, the changes in the physiological properties of the pepper plant as a result of the application of varying levels of compost obtained from hazelnut husk to the soil under different drought levels were investigated in this study. As a result of the study, it was determined that chlorophyll content, leaf area and leaf relative water content decreased and electrolyte leakage increased due to increased drought, while chlorophyll content, leaf area and leaf relative water content increased and electrolyte leakage decreased with increasing hazelnut husk compost doses. The results were found to be recommendable as it showed the physiological properties of pepper improve in hazelnut husk applied to the soil in the deficit irrigation approach to be made in arid and semi-arid regions where water resources are insufficient. However, it can be also suggested that more comprehensive and long-term field studies should be carried out on this subject.

Key Words: *Deficit irrigation, Drought, Hazelnut husk compost, Pepper, Physiological properties*

Introduction

Water is one of the most valuable natural resources. However, due to anthropogenic effects such as increasing urbanization, industrialization, population and global warming, this resource is getting polluted and decreasing day by day. As a result of many studies, it is stated that water scarcity will increase significantly in the coming years, water wars will occur, production will be disrupted and various economic problems will arise (Calzadilla et al. 2011; Ercin and Hoekstra 2014; Hoekstra 2014). Burak and Margat (2016) stated that the global water need for 2050 will increase by 33% on average compared to 2010, and they pointed out that this situation is particularly concerning in arid and semi-arid regions. The lack of water in almost half of the world, especially in arid and semi-arid regions, increases the severity of these concerns (Calzadilla et al. 2011).

The Food and Agriculture Organization states that the agricultural sector constitutes the largest portion of the world's fresh water use compared to other sectors. Although the water usage rates of the countries differ between the sectors and the water consumption rates of the countries in agricultural production decrease according to the level of development, agricultural production is still a sector with high water input (Moghaddam et al. 2017). Thus, this situation reveals the necessity of carrying out agricultural production with less water use. However, in conditions where the amount of water needed by the plant cannot be met and is insufficiently met, the plant yield decreases by changing the physiological and chemical properties of the plant (Amiri et al. 2017). Comlekcioglu and Simsek (2017) stated that when the amount of water needed by the pepper plant is insufficiently met, 25% water saving is achieved, but the proportional decrease in the yield of pepper is 23%.

The deficit irrigation approach, in which production is carried out by providing water to the plant at levels lower than the amount needed by the plant, is a water-saving application. However, the decreased yield in deficit irrigation needs to be improved. This is a desirable approach in agricultural production as it covers the content of protecting-improving yield with less water. Various organic residues applied to the soil can meet this desirable approach by retaining soil moisture for a longer period and also supporting soil and plant fertility (Kul et al. 2021). In addition, within the scope of re-evaluation of wastes, environmental management can be supported and waste management can be provided in an intensive way. In this study, which was carried out by considering these valuable positive contributions, it was aimed to improve the physiological properties of pepper that support the yield by applying varying proportions of hazelnut husk compost to the soil under drought stress.

Materials and Methods

The experiment was carried out in the greenhouse, as plant material in Demre pepper cultivar (cv. Vural F1, *Capsicum annuum* L.), under varying levels of hazelnut husk compost [D0: 0% of hazelnut husk compost as control, and D1: 1% of hazelnut husk compost, D2: 2% of hazelnut husk compost and D3: 3% of hazelnut husk compost as on a dry weight basis (w/w)] at different irrigation water levels [I0: 100% irrigation level (full irrigation), I1: 67% irrigation level (33% deficit irrigation) and I2: 33% irrigation level (67% deficit irrigation)] with three replications, in 4-liter pots (diameter: 18 cm, height: 17 cm) in a total of 36 pots. During the experiment, the mean temperature and humidity in the greenhouse were $25\pm4^{\circ}\text{C}$ and $46\pm6\%$. In the experiment, the places of the pots were randomly changed in each irrigation to equalize the effect levels of the pots.

According to some analyzes of the soil prior to the experiment, it was determined that the soil had a clay loam texture (sand: 35%, silt: 21%, clay: 44%) and the pH, electrical conductivity, organic matter and total nitrogen values of the soil were 7.70, 0.65 dS m^{-1} , 1.11% and 0.09%, respectively. The hazelnut husk obtained from the heap kept in the natural environment in a hazelnut orchard was composted in an aerobic condition according to the sequential heap composting method, and the pH, electrical conductivity, organic matter and nitrogen values the hazelnut husk compost were determined as 6.31, 2.31 dS m^{-1} , 75.7% and 1.35%, respectively.

Air-dry soils were sieved through a 4 mm sieve and mixed with hazelnut husk compost in the specified proportions (D0, D1, D2, D3) in the greenhouse conditions and transferred to pots. Then the pepper seedlings were transferred to the pots and the first irrigation was carried out equally for all pots by completing the pot weight in the current moisture in the control treatment (D0) to the pot weight in the field capacity. In the next process, until the harvest period, the irrigation was carried out according to the specified irrigation water levels (I0, I1, I2) at three-four-day intervals with the approach of completing the pot weight in the current moisture determined in the control treatment to the pot weight in the field capacity.

The chlorophyll content, leaf area, leaf relative water content and electrolyte leakage values were determined by measuring and analyzing at the time of harvest. To determine the changing shade of green in the leaves depending on the chlorophyll content, the chlorophyll content was carried out as a result of SPAD measurements with a chlorophyll meter (Konica Minolta, SPAD-502) by taking ten measurements from the randomly selected mature leaves of the plant in each pot and determining the mean. Leaf area was determined by measuring mature leaves of the plant in each pot with a leaf area meter (LI-3000C). The weights of five fresh leaf samples taken from each pot were determined (FW) and the turgor weights of the same samples were obtained by keeping them in distilled water for four hours (TW) and then dry weights were determined after they were kept in an oven at 70°C for 48 hours (DW) and finally, leaf relative water content was determined using the equation: $100 \times [(FW - DW) / (TW - DW)]$ (Benešová et al. 2012). For the electrolyte leakage determined based on the measurement of the electrolyte coming out of the leaf cells, disc samples with a diameter of 10 mm were taken from five leaves from each pot and placed in 50 ml glass vials, 30 ml of distilled water was added on them, and the electrical conductivity value was measured after they were kept at room temperature for 24 hours. Then, the same samples were kept in a water bath at 95°C for 20 minutes and cooled to room temperature and the electrical conductivity was measured again. Finally, electrolyte leakage was determined by proportioning the first electrical conductivity measurement value to the second electrical conductivity measurement value (Yildirim et al. 2022).

The data obtained were evaluated with the General Linear Model analysis via the SPSS program and the significant means were compared with the Duncan multiple comparison test via some program.

Results and Discussion

The effect of irrigation and hazelnut husk compost treatments ($p<0.001$) on the chlorophyll content of pepper were found to be significant (Figure 1). While chlorophyll content decreased with decreasing irrigation water level, increased with increasing hazelnut husk compost doses. Chlorophyll values are an important indicator of the degree of water stress (Bauerle et al. 2004). As a result of the plant closing its stomata under insufficient irrigation conditions, carbon dioxide inflow is weakened and photosynthetic activity is prevented (Comlekcioglu and Simsek 2017). Decreased chlorophyll content with increasing severity of drought stress further decreases as a result of inhibition of shoot development and growth functions (Guo et al. 2015). Plants grown in drought conditions have lower chlorophyll content than plants managed under adequate irrigation conditions (Carroll et al. 2017). Decreased chlorophyll content with increasing severity of drought stress further decreases as a result of inhibition of shoot development and growth functions (Guo et al. 2015). Plants grown in drought conditions have lower chlorophyll content than plants managed under adequate irrigation conditions (Carroll et al. 2017). Comlekcioglu and Simsek (2017) also reported that low irrigation water levels significantly reduced the leaf chlorophyll index values of pepper. Nitrogen, a component of chlorophyll, increases the chlorophyll content of plants by supporting the increase in chlorophyll in leaves (Liu et al. 2018). In this study, it is thought that hazelnut husk compost supports the increase of chlorophyll with nitrogen contribution to the plant. In addition, considering that iron has an important contribution in chloroplast formation and protein development stage (Yerli et al. 2020), the iron contribution of hazelnut husk compost to pepper may have also supported the increase in chlorophyll content.

According to Alaboz et al. (2017) also reported that organic improvers applied to the soil during drought stress have a positive contribution to increasing the chlorophyll content.

Figure 1. The effect of hazelnut husk compost treatments on the chlorophyll content of pepper under drought stress (I0, I1 and I2 represent 100%, 67% and 33% irrigation water levels, respectively, and D0, D1, D2 and D3 represent 0%, 1%, 2% and 3% hazelnut husk compost doses, respectively, and *** represent $p < 0.001$).

The effect of irrigation ($p < 0.001$) and hazelnut husk compost treatments ($p < 0.01$) on the leaf area of pepper were found to be significant (Figure 2). While leaf area decreased with decreasing irrigation water level, increased with increasing hazelnut husk compost doses. Insufficient moisture conditions in the soil reduce the plant's ability to feed from the soil, reducing the physical development parameters (Camoglu et al. 2011). Kusvuran et al. (2011) reported that as a result of drought stress, physiological parameters related to growth such as green parts of the plant, root and stem fresh and dry weights, plant height and diameter, number of leaves and leaf area are adversely affected. Tekin et al. (2016) stated that depending on the decreasing irrigation water level in the pepper plant, the physical properties of the pepper weakened so that the economic yield of the pepper would decrease. However, different organic or chemical fertilizers increase the physical properties of pepper (Ozkan et al. 2013). Amiri et al. (2017) stated that the reduced leaf area under irrigation water stress conditions can be improved with the contribution of organic materials added to the soil. This can be explained by improving the nutritional balance of pepper. In addition, the nitrogen additive provides a better development opportunity by improving the physiological properties of the plant (Aminifard et al. 2012). In this study, it is thought that hazelnut husk compost supports the increase of leaf area with nitrogen contribution to the plant. Similarly, Shrestha et al. (2013) stated that the leaf area of the pepper increased with the nitrogen contribution of the compost applied to the soil in pepper cultivation.

Figure 2. The effect of hazelnut husk compost treatments on the leaf area of pepper under drought stress (I0, I1 and I2 represent 100%, 67% and 33% irrigation water levels, respectively, and D0, D1, D2 and D3 represent 0%, 1%, 2% and 3% hazelnut husk compost doses, respectively, and ** and *** represent $p < 0.01$ and $p < 0.001$).

The effect of irrigation ($p < 0.001$) and hazelnut husk compost treatments ($p < 0.01$) on the leaf relative water content of pepper were found to be significant (Figure 3). While leaf relative water content decreased with decreasing irrigation water level, increased with increasing hazelnut husk compost doses. The stomata of plants grown in drought conditions close and leaf temperatures increase (Ozturk 2015). Although the plant tries to conserve the water in the leaf with increasing leaf temperatures, water loss from the leaves occurs with increasing water stress. Decreased leaf area and number and shoot growth result in less leaf relative water content (Yildirim et al. 2022). Omami and Hammes (2006) reported that leaf relative water content decreases under increasing drought conditions and this decrease is associated with a decrease in the osmotic potential of the plant. Various organic regulators applied to the soil under water stress conditions can improve the leaf relative water content as a result of increasing the water holding capacity of the soil by improving the soil physical properties (Kul et al. 2021). Akhtar et al. (2014) stated that biochar added to the soil as an organic regulator in drought conditions increases the leaf relative

water content of the plant with the contribution of organic matter and nutrients. In this study, it is thought that the leaf relative water content increases due to the ease of water uptake of the plant as a result of the improvement of soil physical properties with the organic matter contribution of hazelnut husk compost. Organic matter at a sufficient level supports the plant to take nutrients and water more easily (Pühringer 2016). In addition, the addition of organic matter provides a better root development to the plant (Srinivas et al. 2015) may have facilitated the uptake of water and nutrients from the soil. Thus, the pepper plant with increased drought resistance may have exhibited higher leaf relative water content.

Figure 3. The effect of hazelnut husk compost treatments on the leaf relative water content of pepper under drought stress (I0, I1 and I2 represent 100%, 67% and 33% irrigation water levels, respectively, and D0, D1, D2 and D3 represent 0%, 1%, 2% and 3% hazelnut husk compost doses, respectively, and ** and *** represent $p<0.01$ and $p<0.001$).

The effect of irrigation ($p<0.001$) and hazelnut husk compost treatments ($p<0.01$) on the electrolyte leakage of pepper were found to be significant (Figure 4). While electrolyte leakage increased with decreasing irrigation water level, decreased with increasing hazelnut husk compost doses. Water stress disrupts the functionality of the plant's cell membrane system, causing membrane damage and thus an increase in electrolyte leakage (Yildirim et al. 2021). Plants growing in water deficiency close their stomata and leaf temperatures increase, and membrane systems are damaged with increasing temperature, and cell death occurs with increasing water stress (Ozturk 2015). Therefore, the effect of drought on electrolyte leakage can be evaluated as related to the decrease in the relative water content of the leaf (Figure 3). In addition, decreasing photosynthesis rate as the plant closes its stomata under drought conditions is also effective on electrolyte leakage (Bhardwaj et al. 2021). Similarly, Masoumi et al. (2010) also stated that electrolyte leakage increased as a result of damage to cell membrane systems due to increased drought stress. In this study, it is thought that the electrolyte leakage of hazelnut husk compost decreases with the increase of leaf relative water (Figure 3). In this study, it is thought that electrolyte leakage decreases with increasing leaf relative water (Figure 3) with hazelnut husk compost treatments. Similarly, Rahbarian et al. (2014) stated that leaf relative water decreases and electrolyte leakage increases under drought stress conditions, but the increase in electrolyte leakage decreases as a result of the increase in leaf relative water of manure applied to the soil. Nadeem et al. (2017) reported that the increase in electrolyte leakage in drought-managed plants can be reduced by the compost treatments applied to the soil.

Figure 4. The effect of hazelnut husk compost treatments on the electrolyte leakage of pepper under drought stress (I0, I1 and I2 represent 100%, 67% and 33% irrigation water levels, respectively, and D0, D1, D2 and D3 represent 0%, 1%, 2% and 3% hazelnut husk compost doses, respectively, and ** and *** represent $p<0.01$ and $p<0.001$).

Conclusion

As a result of this study, in which the effects of varying levels of hazelnut husk compost treatments at different irrigation water levels on the chlorophyll content, leaf area, leaf relative water content and electrolyte leakage contents of pepper, it was determined that chlorophyll content, leaf area and leaf relative water content decreased

and electrolyte leakage increased due to increased drought, while chlorophyll content, leaf area and leaf relative water content increased and electrolyte leakage decreased with increasing hazelnut husk compost doses. The data obtained showed that hazelnut husk compost improves the physiological properties of pepper in regions where water resources are insufficient or in the deficit irrigation approach to saving water but conducting more comprehensive and long-term field studies on this subject was found to be a recommendable as a result of this study.

Abstract

Alzheimer's disease is a neurodegenerative disease that causes a progressive and definitive deterioration of nerve cells leading to a clinical picture of dementia. Medicinal plants are currently considered a promising source for identifying new therapies. The aim of this study is to evaluate *in vivo* the neuroprotective effect of the ketone extract of *Passiflora edulis* seeds. The mice received *Passiflora edulis* extract at 100 and 200 mg/kg intragastrically for 45 days followed by induction of Alzheimer's disease by D-galactose at 120mg/kg (intraperitoneal) and aluminum chloride ALCL3 at 100 mg/kg (oral). The reference used in this study is rivastigmine, considered an anti-Alzheimer's. The results of the behavioral tests showed a significant improvement ($p < 0.01$) in learning and memory capacity of Alzheimer's mice treated at 100 and 200 mg/kg (ALZ-ED1) (ALZ-ED2) respectively. The histological study confirmed these results, an improvement in aberrant cyto-architecture of the brain, showed decrease in the senile plaques and neurons in degeneration in the cerebral cortex of the treated mice. Finally, this current research allows us to affirm a possible neuroprotective activity of *Passiflora edulis* seeds including antidepressant and nootropic properties.

Abstract

In the production of ornamental plants, especially in the cultivation of potted ornamental plants, attention should be paid to the quality of seedlings so that the production can be of higher quality. Today, commercial seedling enterprises, it is aimed to produce strong seedlings with sufficient rooting, and no risk of disease and pests. However, sometimes small-sized seedlings appear in this seedling production. Although some cultural practices are preferred against this problem, growth retardants are generally preferred due to their effective results. In this study, 0, 25, 50, and 100 ppm doses of paclobutrazol were applied to dahlia seeds. In order to eliminate the possible retarding effects of paclobutrazol, GA₃ was applied by spraying on leaves at doses of 0, 100, and 200 ppm, 1 week after planting the seedlings in pots. In this study, the effects of paclobutrazol on seedling height and germination rate on the 25th and 40th days were examined as a first stage. In the second stage, plant height (cm), plant stem diameter (mm), flower diameter (mm), flower number (piece), number of leaves (piece), spad value, fresh biomass (g), dry biomass (g), root fresh weight (g), root dry weight (g), root length (cm), time from seed to harvest (days) and time from seedling to harvest (g) were investigated. At the end of the study, 25 ppm paclobutrazol application showed better results compared to control (4.68 cm-67.59%) at seedling height (5.08 cm) and germination rate (80.56%). As the doses of paclobutrazol increased, there was a decrease in the specified parameters. In the second stage, although there were no statistical differences in terms of plant growth in the seedlings treated with paclobutrazol alone, 50 ppm paclobutrazol application plant height (47.87 cm) and plant stem diameter (6.55 mm), 0 ppm paclobutrazol application root wet weight (7.02 g) and 50 ppm paclobutrazol application. The application showed the best results in root length (22.70 cm). In GA₃ applications at different concentrations, the 100 ppm GA₃ application gave the best results in terms of plant growth compared to other applications. With the combination of paclobutrazol and GA₃ applications, 50 ppm paclobutrazol and 100 ppm ga₃ applications were more effective in plant growth. It was concluded that 25 ppm paclobutrazol can be used for height control of seedlings in terms of growth and flowering, and 100 ppm GA₃ should be applied to eliminate possible retarding effects and quality plant growth.

Key Words: Paclobutrazol, Plant Growth Regulator, Diameter, Plant Height, Biomass

Büyüme Geciktirici ile Yetiştirilen Dahlia Bitkilerinin Giberellik Asit ile Büyümesinin Hızlandırılması

Özet

Süs bitkileri üretiminde özellikle saksılı süs bitkileri yetiştiriciliğinde üretimin daha kaliteli olabilmesi için fide kalitesine dikkat edilmelidir. Günümüzde ticari fide işletmelerinde yeterli köklenme sağlanmış, hastalık ve zararlı riski bulunmayan ve güçlü fidelerin üretilmesi hedeflenmektedir. Ancak bu fide üretiminde bazen küçük boyutlu fideler ortaya çıkmaktadır. Bu soruna karşı bazı kültürel uygulamalar tercih edilsede de genellikle etkili sonuçları sayesinde büyüme geciktiriciler tercih edilmektedir. Bu çalışmada, dahlia tohumlarına 0, 25, 50 ve 100 ppm dozlarında paclobutrazol uygulaması yapılmıştır. Paclobutrazolün sağladığı olası geciktirici etkilerini ortadan kaldırmak amacıyla fidelerin saksılara dikiminden 1 hafta sonra 0, 100 ve 200 ppm dozlarında yaprakтан püskürtülerek GA₃ uygulaması yapılmıştır. Bu çalışmada, ilk aşama olarak paclobutrazolün 25. ve 40. günde fide boyuna etkilerine ve çimlenme oranına bakılmıştır. İkinci aşamada ise bitki boyu (cm), bitki gövde çapı (mm), çiçek çapı (mm), çiçek sayısı (adet), yaprak sayısı (adet), spad değeri, yaş biyokütle (g), kuru biyokütle (g), kök yaş ağırlığı (g), kök kuru ağırlığı (g), kök uzunluğu (cm), tohumadan hasada kadar geçen süre (gün) ve fideden hasada kadar geçen süreler (g) incelenmiştir. Çalışma sonunda, fide döneminde, fide boyunda (5.08 cm) ve çimlenme oranında (%80.56) 25 ppm paclobutrazol uygulaması kontrole göre (4.68 cm-%67.59) iyi sonuçlar göstermiştir. Paclobutrazol dozları arttıkça belirtilen parametrelerde düşüşler yaşanmıştır. İkinci aşamada ise, tek başına paclobutrazol uygulanan fidelerin bitki gelişimi açısından istatistiksel farklılıklar olmamasına rağmen 50 ppm paclobutrazol uygulaması bitki boyu (47.87 cm) ve bitki gövde çapında (6.55 mm), 0 ppm paclobutrazol uygulaması kök yaş ağırlığı (7.02 g) ve 50 ppm paclobutrazol uygulaması ise kök uzunluğunda (22.70 cm) en iyi sonuçları göstermiştir. Farklı konsantrasyonlardaki GA₃ uygulamalarında ise 100 ppm GA₃ uygulaması diğer uygulamalara kıyasla bitki gelişimi açısından en iyi sonuçları vermiştir. Paclobutrazol ve GA₃ uygulamalarının kombine edilmesiyle bitki gelişiminde ağırlıklı olarak 50 ppm paclobutrazol ve 100 ppm GA₃ uygulamaları daha etkili olmuştur. Fidenin büyüme ve çiçeklenme açısından boy kontrolünde 25 ppm paclobutrazol kullanılabileceği, kaliteli bitki gelişimi ve olası geciktirici etkileri ortadan kaldırmak için 100 ppm GA₃ uygulanması gerektiği sonucuna varılmıştır.

Effects of Different Levels of Compost and Fertilization Applications on the Growing Media on Gerbera (*Gerbera jamesonii* sp.) Plant Growth and Flowering

Onur Sefa Alkaç¹, Muhammed Esat Tuncel¹, Esra Öndeş¹, Rümeyza Temir¹, Mehmet Güneş¹

¹Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Tokat Gaziosmanpaşa Üniversitesi, Tokat, Türkiye

Abstract

Different rates of compost (0-20% and 40%) and different EC levels (EC 750 μ S/cm – EC 1100 μ S/cm and EC 1450 μ S/cm) were applied to the growing medium. In the study, which was carried out for two years (2021-2022), a factorial arranged randomized blocks experimental design was used to evaluate the effects of the applications and it was carried out with 3 replications. In the study, flower stalk length (cm), flower stalk thickness (mm), flower diameter (mm), plant height (cm), branch weight (g), spad value, vase life (days), root length (cm), gerbera plant root fresh weight (g) and root dry weight (g) parameters were investigated. At the end of the study, when the effects of different compost ratios on plant growth were examined, it was determined that no compost application (0%) was applied to the flower stalk length, flower stalk thickness, flower diameter, branch weight, spad value, vase life, root length, root fresh weight, root dry weight, and yield parameters.) environments, the best results were obtained. When the effect of different fertilization levels was examined, the best results were found at the EC 1100 μ S/cm fertilization level in flower stalk length, flower diameter, branch weight, vase life, root length, root dry weight, and yield parameters. As a result of combining compost and fertilization applications at different rates, it was observed that 0% compost application had a positive effect on flower stem length, flower stem thickness, flower diameter, branch weight, and vase life parameters compared to other applications in growing environments with an EC level of 0.75. It is the most beneficial in growing environments with 40% compost application at plant height and 1100 μ S/cm EC level, 0% compost application at spad value and root length, and EC level 1100 μ S/cm, 0% EC level at root wet weight and 1450 μ S/cm EC level. good results have been obtained. When the two-year data were compared, it was determined that the growth and flowering of the gerbera plant were better in the second year with the effect of its development and applications. As a result, it has been determined that the increase in the compost ratio in gerbera restricts plant growth in general. In fertilization applications, it was observed that the EC level of 1100 μ S/cm had a more positive effect on plant growth compared to other applications.

Key Words: Sustainable Agriculture, Biodegradable, Vase Life, Flower Stalk Length, Yield

Yetiştirme Ortamına Farklı Seviyelerde Kompost ve Gübreleme Uygulamalarının Gerbera (*Gerbera jamesonii* sp.) Bitkisinin Büyüme ve Çiçeklenmesine Etkileri

Özet

Yetiştirme ortamına farklı oranlarda kompost (%0- %20 ve %40) ve farklı EC seviyelerine sahip (EC 750 μ S/cm – EC 1100 μ S/cm ve EC 1450 μ S/cm) gübreleme uygulamaları yapılmıştır. İki sene yürütülen çalışmada (2021-2022) uygulamaların etkilerini değerlendirmek amacıyla faktöriyel düzenlenmiş tesadüf blokları deneme deseni kullanılmıştır ve 3 tekerrürlü olarak yürütülmüştür. Çalışmada gerbera bitkisinin çiçek sap uzunluğu (cm), çiçek sap kalınlığı (mm), çiçek çapı (mm), bitki boyu (cm), dal ağırlığı (g), spad değeri, vazo ömrü (gün), kök uzunluğu (cm), kök yaş ağırlığı (g) ve kök kuru ağırlığı (g) parametreleri incelenmiştir. Çalışmada sonunda, farklı kompost oranlarının bitki gelişimine etkisi incelendiğinde, çiçek sap uzunluğu, çiçek sap kalınlığı, çiçek çapı, dal ağırlığı, spad değeri, vazo ömrü, kök uzunluğu, kök yaş ağırlığı, kök kuru ağırlığı ve verim parametrelerinde kompost uygulaması yapılmayan (%0) ortamlarda en iyi sonuçlar elde edilmiştir. Farklı gübreleme düzeylerinin etkisine bakıldığında ise, EC 1100 μ S/cm gübreleme seviyesinde, çiçek sap uzunluğu, çiçek çapı, dal ağırlığı, vazo ömrü, kök uzunluğu, kök kuru ağırlığı ve verim parametrelerinde en iyi sonuçlar saptanmıştır. Farklı oranlarda kompost ve gübreleme uygulamalarının kombine edilmesi sonucunda ise, çiçek sap uzunluğu, çiçek sap kalınlığı, çiçek çapı, dal ağırlığı ve vazo ömrü parametrelerinde %0 kompost uygulaması ve EC düzeyinin 0.75 olduğu yetiştirme ortamlarında diğer uygulamalara kıyasla olumlu etki yaptığı görülmüştür. Bitki boyunda %40 kompost uygulaması ve EC düzeyinin 1100 μ S/cm, spad değerinde ve kök uzunluğunda %0 kompost uygulaması ve EC düzeyinin 1100 μ S/cm, kök yaş ağırlığında ise %0 kompost uygulaması ve EC düzeyinin 1450 μ S/cm olduğu yetiştirme ortamlarında en iyi sonuçlar elde edilmiştir. İki yıllık veriler kıyaslandığında ise gerbera bitkisinin gelişim özelliği ve uygulamalarında etkisiyle ikinci yılda büyüme ve çiçeklenmenin daha iyi olduğu saptanmıştır. Sonuç olarak, gerberada kompost oranının artması genel itibariyle bitki gelişimini kısıtladığı tespit edilmiştir. Gübreleme uygulamalarında ise EC düzeyinin 1100 μ S/cm olması bitki gelişimi açısından diğer uygulamalara kıyasla daha olumlu etki yaptığı görülmüştür.

The Effects of Different Rhizobacteria and Mycorrhiza Applications on Root Growth of Rose Cuttings

Onur Sefa Alkaç¹, Fulya Okatar¹

¹Bahçe Bitkileri, Ziraat Fakültesi, Tokat Gaziosmanpaşa Üniversitesi, Tokat, Türkiye

Abstract

Growth regulators such as IBA are generally used to promote root formation of rose cuttings. However, today, within the scope of sustainable agricultural practices, research studies of new materials and methods alternative to synthetic chemicals in the plant production process are gaining momentum. At the beginning of such alternative applications are rhizobacteria (PGPR) and mycorrhizal fungi, which are increasingly used today. In this study, green cuttings taken from rose plants were prepared with a length of 12-15 cm. Rhizobacteria (*Bacillus cereus* (ZE-7) and *Pseudomonas putida* (ZE-12) and mycorrhiza (6000 ppm) were applied separately and both applications together. 10 seconds in mycorrhiza suspension, 30 minutes in rhizobacteria suspension, in the solution prepared for mycorrhiza + rhizobacteria applications) After waiting for 10 seconds (mycorrhiza) + 30 minutes (rhizobacteria), they were planted in the rooting medium. Perlite was used on the rooting table with fogging and underfloor heating. In the study, in order to determine the effects of applications on cuttings root growth; the number of rooted cuttings (%), callus formation (%), decay rate (%), root number (number) and root length (cm) parameters were checked, the most suitable biological preparation was determined. As a result of the study, the highest rooting percentage was obtained in the ZE-12 application (19.44%), while was followed by the ZE-12 application, respectively. ZE-7 + ZE-12 application and mycorrhiza (6000 ppm) with a rooting percentage of 11.11, control group with 8.33%, ZE-7 with 5.56% followed the steps. While the highest decay rate (38.89%) was measured in the control group, the lowest decay rate was found in the ZE-7 application (8.33%). In the formation of calcification, the highest value (38.89%) was determined in the ZE-12 application. The number of roots varies between 4.33 pieces and 8.64 pieces. Root length varies between 3.05 cm and 11.87 cm. As a result, it was concluded that mycorrhizal and bacterial applications had a positive effect on rooting rate, callus and root number and these applications could be preferred for rooting with IBA.

Key Words: *Bacillus cereus*, *Pseudomonas putida*, mycorrhiza, cutting, rooting

Farklı Rizobakteriler ve Mikoriza Uygulamalarının Gül Çeliklerinde Kök Gelişimine Etkileri

Özet

Gül çeliklerinin kök oluşumunu teşvik etmek amacıyla genellikle IBA gibi büyüme düzenleyiciler kullanılmaktadır. Ancak, günümüzde sürdürülebilir tarım uygulamaları kapsamında, bitkisel üretim sürecinde sentetik kimyasallara alternatif yeni materyallerin ve yöntemlerin araştırma çalışmaları giderek hız kazanmaktadır. Bu tür alternatif uygulamaların başında ise, günümüzde kullanımı gittikçe yaygınlaşan rizobakteriler (PGPR) ve mikoriza mantarları yer almaktadır. Bu çalışmada, gül bitkilerinden alınan yeşil çelikler 12-15 cm uzunluğunda hazırlanmıştır. Çeliklere rizobakteriler (*Bacillus cereus* (ZE-7) ve *Pseudomonas putida* (ZE-12) ve mikoriza (6000 ppm) ayrı ayrı ve her iki uygulama birlikte yapılmıştır. Mikoriza süspansiyonunda 10 saniye, rizobakteri süspansiyonunda 30 dakika, mikoriza + rizobakteri uygulamaları için hazırlanan çözeltide ise 10 saniye (mikoriza) + 30 dakika (rizobakteri) bekletildikten sonra köklendirme ortamına dikilmiştir. Sisleme ve alttan ısıtma sistemi olan köklendirme masasında perlit kullanılmıştır. Çalışmada, uygulamaların çelik kök gelişimine etkilerini belirlemek amacıyla; köklenen çelik sayısı (%), kallüs oluşumu (%), çürüme oranı (%), kök sayısı (adet) ve kök uzunluğu (cm) parametrelerine bakılmıştır, köklenmede kullanılabilecek en uygun biyolojik preperat belirlenmiştir. Çalışma sonucunda; en yüksek köklenme yüzdesi ZE-12 uygulamasında (% 19.44) elde edilirken bunu sırasıyla %11.11'lik bir köklenme yüzdesi ile ZE-7 + ZE-12 uygulaması ve mikoriza (6000 ppm), %8.33 ile kontrol grubu, %5.56 ile ZE-7 uygulamaları takip etmiştir. Çürüme oranında ise en fazla çürüme (%38.89) kontrol grubunda ölçülürken en düşük çürüme oranı ise ZE-7 uygulamasında (%8.33) saptanmıştır. Kalüslenme oluşumunda ise en yüksek değer (%38.89) ZE-12 uygulamasında belirlenmiştir. Kök sayısı 4.33 adet ile 8.64 adet arasında değişmektedir. Kök uzunluğu ise 3.05 cm ile 11.87 cm arasında değişmektedir. Sonuç olarak, mikoriza ve bakteri uygulamaları köklenme oranı, kallüslenme ve kök sayısına olumlu etki yaptığı ve bu uygulamaların IBA ile de köklendirmede tercih edilebileceği sonucuna varılmıştır.

Anahtar Kelimeler: *Bacillus cereus*, *Pseudomonas putida*, mikoriza, çelik, köklendirme

The Effect of Compost, Bacteria, and Mycorrhiza Applications on the Phytochemical Contents of Edible Tulip Petals

Onur Sefa Alkaç¹, Esat Tuncel¹, Emircan Dinçer¹, Alperen Donat¹

¹Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Tokat Gaziosmanpaşa Üniversitesi, Tokat, Türkiye

Abstract

Edible flowers have been in the human diet and culinary preparations since ancient times. Today, it is preferred by consumers thanks to its health benefits and nutritional effects. For these reasons, edible flowers are marketed as an innovative and promising product in the food industry, in the design and development of functional food and dietary supplements. In this study, the effects of bacteria and mycorrhiza applications on media containing compost at different rates (0%-20% and 40%) were examined. In the study, tulip bulbs were immersed in bacterial suspensions with 0.3 absorbances (Abs) value for 30 minutes and in 5000 ppm mycorrhizal suspension for 10 seconds, and then planted in plastic crates 20 cm deep x 40 cm wide x 60 cm long. Total phenol ($\mu\text{g GAE/g fw}$), TEAC ($\mu\text{mol TE/g fw}$), and total flavonoid (mg KE/L fw) contents in tulip petals harvested at the end of cultivation were investigated. At the end of the study, when only compost applications were compared, the highest TP (28682.63 $\mu\text{g GAE/g fw}$) and Total Flavonoid (1011.96 mg KE/L fw) were measured in the tulip petals taken from the environments with 40% compost, while the highest (0%) in the environments without compost. a high TEAC (9.46 $\mu\text{mol TE/g fw}$) value was measured. In bacteria and mycorrhiza applications, environments without microorganism application gave better results compared to the application environments. As a result of the combination of different compost ratios and bacterial applications, the highest TP (28833.42 $\mu\text{g GAE/g fw}$) and Total Flavonoid (1014.07 mg KE/L fw) contents were measured in petals taken from environments with 40% compost application and bacteria application, while the highest TEAC (9.80 mg) contents were measured. $\mu\text{mol TE/g fw}$ was measured in petals taken from media containing 40% compost and free of bacteria. When the effects of different compost ratios and mycorrhiza applications are compared, the highest TP (29944.53 $\mu\text{g GAE/g fw}$), TEAC (10.13 $\mu\text{mol TE/g fw}$), and Total Flavonoid (1083.52 mg KE/L fw) in environments with 40% compost rate and no mycorrhiza application. values were determined. As a result, it was concluded that as the compost ratios increase, the values increase, and the microorganisms are not effective in their phytochemical contents.

Kompost, Bakteri ve Mikoriza Uygulamalarının Yenilebilir Lale Petallerinin Fitokimyasal İçeriklerine Etkisi

Özet

Yenilebilir çiçekler eski zamanlardan beri insan diyetinde ve mutfak hazırlıklarında yerini almaktadır. Günümüzde ise, sağlığa faydaları ve besleyici etkileri sayesinde tüketiciler tarafından tercih edilmektedir. Bu sebeplerden dolayı, yenilebilir çiçekler, gıda sanayisinde, fonksiyonel gıda, diyet takviyelerinin tasarımı ve geliştirilmesinde yenilikçi ve gelecek vaat eden ürün olarak piyasa sunulmaktadır. Bu çalışmada, farklı oranlarda (%0-%20 ve %40) kompost içeren ortamlara bakteri ve mikoriza uygulamalarının etkilerine bakılmıştır. Çalışmada lale soğanları, 0.3 absorbans (Abs) değerine sahip bakteri süspansiyonlarına 30 dakika ve 5000 ppm mikoriza süspansiyonuna 10 saniye daldırıldıktan sonra 20 cm derinliğinde x 40 cm genişliğinde x 60 cm uzunluğundaki plastik kasalara dikimi yapılmıştır. Yetiştiricilik sonunda hasat edilen lale petallerindeki toplam fenol ($\mu\text{g GAE/g fw}$), TEAC ($\mu\text{mol TE/g fw}$) ve toplam flavonoid (mg KE/L fw) içerikleri incelenmiştir. Çalışma sonunda, sadece kompost uygulamaları kıyaslandığında, %40 oranında kompost uygulanan ortamlardan alınan lale petallerinde en yüksek TP (28682.63 $\mu\text{g GAE/g fw}$) ve Total Flavonoid (1011.96 mg KE/L fw) ölçülürken, kompost içermeyen ortamlarda (%0) ise en yüksek TEAC (9.46 $\mu\text{mol TE/g fw}$) değeri ölçülmüştür. Bakteri ve mikoriza uygulamalarında ise, mikroorganizma uygulaması yapılmayan ortamlar, uygulama yapılan ortamlara kıyasla daha iyi sonuçlar vermiştir. Farklı kompost oranları ile bakteri uygulamalarının kombinesi sonucunda, en yüksek TP (28833.42 $\mu\text{g GAE/g fw}$) ve Total Flavonoid (1014.07 mg KE/L fw) içerikleri %40 kompost uygulaması ve bakteri uygulaması yapılan ortamlardan alınan petallerde ölçülürken, en yüksek TEAC (9.80 $\mu\text{mol TE/g fw}$) %40 oranında kompost içeren ve bakteri bulunmayan ortamlardan alınan petallerde ölçülmüştür. Farklı kompost oranları ile mikoriza uygulamalarının etkileri kıyaslandığında, %40 kompost oranı ve mikoriza uygulamasının bulunmadığı ortamlarda en yüksek TP (29944.53 $\mu\text{g GAE/g fw}$), TEAC (10.13 $\mu\text{mol TE/g fw}$) ve Total Flavonoid (1083.52 mg KE/L fw) değerleri saptanmıştır. Sonuç olarak, kompost oranlarının arttıkça değerlerde artışların gerçekleştiği, mikroorganizmaların ise fitokimyasal içeriklerinde etkili olmadığı sonucuna varılmıştır.

The Effects of Some Herbal Additives Added to Ration on Calcium, Phosphorus, and Magnesium Levels in Serum of Broiler Breeding in Stocking Density

Recep Gümüş¹, Abdullah Özbilgin¹

¹Department of Animal Nutrition and Nutritional Diseases, Faculty of Veterinary Medicine, Sivas Cumhuriyet University, Sivas, Türkiye

Abstract

This study was carried out to determine the effects of different doses of curcumin (Cur) and resveratrol (Res) added in ration on serum calcium (Ca), phosphorus (P) and magnesium (Mg) levels of broilers exposed stocking density. A total number of 255 0-day-old male broiler chicks (Ross 308) were used in the study. The animals were divided into 5 groups; the control group was fed only basal diet but groups Cur250, Cur500, Res250 and Res500 had 250 mg/kg Cur, 500 mg/kg Cur, 250 mg/kg Res and 500 mg/kg Res, respectively, added to their ration. At the end of the study, 9 randomly selected animals from each group were slaughtered and blood was taken from the vena jugularis and used in the analysis. In the examinations, it was determined that serum Ca and Mg levels were statistically similar in all groups ($P > 0.05$). It was determined that the serum P level increased statistically significantly ($P < 0.05$) in the Cur250 group and was similar in the other groups. As a result, it was observed that the effects of the additives applied on serum mineral levels were limited according to the findings.

Key Words: Broiler, Calcium, Herbal Additives, Phosphorus

Yerleşim Sıklığı Uygulanan Broyler Rasyonuna İlave Edilen Bazı Bitkisel Katkıların Serumda Bazı Mineral Seviyeleri Üzerine Etkileri

Özet

Bu çalışma, yerleşim sıklığı uygulanan broylerlerin rasyonuna katılan farklı dozlardaki kurkumin (Kur) ve resveratrolun (Res) serumda kalsiyum (Ca), fosfor (P) ve magnezyum (Mg) seviyeleri üzerine etkilerini tespit etmek amacıyla yapıldı. Çalışmada 0 günlük yaşta toplam 255 adet erkek broyler civciv (Ross 308) kullanıldı. Çalışmada gruplandırma Kontrol, Kur250, Kur500, Res250 ve Res500 grupları olmak üzere 5 grup şeklinde dizayn edildi ve grupların bazal rasyonuna sırasıyla 0, 250 mg/kg Kur, 500 mg/kg Kur, 250 mg/kg Res ve 500 mg/kg Res katıldı. Çalışmanın sonunda her gruptan rastgele seçilen 9 adet hayvan kesilerek vena jugularisten kan alındı ve analizlerde kullanıldı. Yapılan incelemelerde serum Ca ve Mg seviyelerinin tüm gruplarda istatistiksel olarak bezer olduğu tespit edildi ($P > 0.05$). Serum P seviyesinin ise Kur250 grubundan istatistiksel olarak önemli oranda arttığı ($P < 0.05$), diğer gruplarda benzer olduğu belirlendi. Sonuç olarak elde edilen bulgulara göre uygulanan katkıların serum mineral seviyeleri üzerine etkisinin sınırlı olduğu görüldü.

Anahtar Kelimeler: Broyler, Kalsiyum, Bitkisel Katkılar, Fosfor

Giriş

Hayvansal üretimde, değişik yetiştirme koşullarına bağlı olarak meydana gelebilen stres düzeyi, hayvanların refah durumunu belirlemede kullanılan önemli ölçütlerden birisidir. Etçi piliç yetiştiriciliğinde yerleşim sıklığı, birim alanda yetiştirilen hayvan sayısı ya da üretim dönemi sonunda birim taban alanına düşen canlı ağırlık (kg/m^2) olarak tanımlanmaktadır. İşletmelerde karlılık için birim alanda yetiştirilen hayvan sayısı oldukça önemli bir kriterdir. Yerleşim sıklığının artırılması, birim alanda üretilen toplam canlı ağırlığı dolayısıyla işletmenin karlılığını artırdığından, günümüzde yapılan entansif yetiştiricilikte etlik piliçler oldukça yüksek yoğunlukta yetiştirilmektedir. Bununla birlikte, yerleşim sıklığının gereğinden fazla artırılmasının hayvan refahı ve bireysel verim özellikleri üzerinde olumsuz etkiye sahip olduğu da bilinen bir gerçektir (Meluzzi ve Sirri, 2009).

Serum metabolitleri, tüm canlılarda olduğu gibi broylerde de metabolizmanın ve belirli doku ve organlardaki değişikliklerin önemli göstergeleridir (Ghazi ve ark., 2015). Çevresel ve beslenmeye bağlı birçok faktör canlılarda strese yol açabilmektedir. Hızlı bir gelişim gösteren broylerler normal çevresel şartlar altında da strese girebilir ve stres vücutta başta karaciğer olmak üzere birçok organı etkileyerek serum biyokimyasal parametrelerini etkileyebilir (Chen ve ark., 2021; Gumus ve Özbilgin, 2022). Son zamanlarda dünya genelinde kullanılan kurkumin, resveratrol ve diğer birçok bitkisel katkıların sağlık üzerine olumlu etkilerinin olduğu belirtilmiştir (Umay ve ark., 2021).

Zerdeçal (*Curcuma longa*), tropik bölgelerde yetiştirilen *Zingiberaceae* familyasına bağlı bir bitki olup içerdiği, polifenolik bir bileşik olan curcumin, kanatlı endüstrisinde antikoksidial, antiinflamatuvar, immünomodülatör, antimikrobiyal, antioksidan ve büyüme performansını desteklemek için yaygın olarak kullanılmaktadır (Ashry ve ark., 2021). Resveratrol, başta kırmızı üzüm olmak üzere çok çeşitli gıdalarda bulunan aktif bir doğal polifenolik bileşik olup başta antioksidan olmak üzere antitümör, antiinflamatuvar, antiaging, anti-hiperlipidemik, kardiyoprotektif ve nöroprotektif özellikler gibi birçok biyolojik aktivitesi vardır (Alesci ve ark., 2022).

Broylerlerde yapılan çalışmada rasyona katılan resveratrolun serum Mg seviyesini üzerine olumlu etkisinin olduğu belirtilmiştir (Gumus ve Ozbilgin, 2022).

Bu çalışma, yerleşim sıklığı uygulanan broylerlerin rasyonuna katılan farklı dozlardaki resveratrol ve kurkuminin serumda biyokimyasal parametrelerden Ca, P ve Mg seviyeleri üzerine etkilerini tespit etmek amacıyla yapıldı.

Materyal ve Yöntem

Deneme dizaynı, Hayvan ve Yem

Bu çalışmada hayvanlar 28 gün süren besi denemesi boyunca Sivas Cumhuriyet Üniversitesi Veteriner Fakültesinde kapalı alanda üç katlı 120×60×80 cm ölçülerine sahip kafeslerde barındırıldı. Hayvan materyali olarak piyasadan temin edilen 0 günlük yaşta, toplam 255 adet erkek broyler civciv (Ross 308) kullanıldı ve hayvanlar eşit sayıda 5 gruba ayrıldı (her grup kendi içerisinde 17 adet broyler olacak şekilde 3 alt gruba ayrıldı). Çalışmada gruplandırma Kontrol, Kur250, Kur500, Res250 ve Res500 grupları olmak üzere 5 grup şeklinde dizayn edildi ve grupların bazal rasyonuna sırasıyla 0, 250 mg/kg Kur, 500 mg/kg Kur, 250 mg/kg Res ve 500 mg/kg Res ilave edildi. Çalışmanın 14. gününe kadar bütün hayvanlara konfor sıcaklığı (sıcaklık dereceli olarak 33 °C'den 22 °C'ye düşürüldü), 15. günden itibaren çalışmanın sonuna kadar (28. gün) tüm gruplara 22 °C sıcaklık uygulandı. Tüm gruplara 0-14. günler arası dönemde broyler başlangıç yemi (ham protein % 22.5 ve metabolik enerji 2960 kcal/kg), 14-28. günler arası broyler büyütme yemi (ham protein % 19.55 ve metabolik enerji 3150 kcal/kg) verildi. Yem ve su *ad libitum* olarak verildi. Çalışma süresince tüm hayvanlara günde 23 saat aydınlık, 1 saat karanlık uygulandı. Hayvanların rasyonları NRC (1994)'nin önerilerine göre formüle edildi.

Yem Katkıları

Resveratrol, 3,4',5-Trihydroxy-trans-stilbene, % 99.13 (HPLC), Katalog No:32060, Chem-Impex Int'l. Inc. USA. Kurkumin, % 95.11 (HPLC), Katalog No:22845, Chem-Impex Int'l. Inc. USA. Yem katkıları rasyona katılan gruplarda katıldığı miktar kadar mermer tozu miktarı azaltılmıştır.

Biyokimyasal Analizler İçin Kan Örneklerin Alınması ve Analizi

Çalışmanın son günü (28 günlük yaş) biyokimyasal analizlerde kullanılmak üzere her gruptan rastgele seçilen 9 adet (her alt gruptan 3 adet) broylerlerin vena jugularisinden kan alındı. Hayvanlardan antikoagülsüz tüplere (Becton Dickinson Co. USA) yaklaşık 5 cc kadar alınan kanlar soğutmalı santrifüjde (Hettich 38R, Hettich Zentrifugen, Tuttlingen Germany) +4 °C'de 4000 rpm'de 10 dk santrifüj edilerek elde edilen serumlar analiz edileceği güne kadar -80 °C'de saklandı.

Serum örneklerinde Ca, P ve Mg seviyeleri ticari test kitleri kullanılarak otomatik analizörde (Mindray BS-200, P.R. China) ölçüldü.

İstatistiksel Analizler

Elde edilen veriler SPSS istatistik paket programı kullanılarak değerlendirildi (SPSS, 2011). Gruplardan elde parametreler ile ilgili veriler arasında istatistiksel farklılığın olup olmadığını saptamak için tek yönlü ANOVA testi, hangi gruplar arasında farklılığın olduğunu belirlemek için Duncan testi uygulandı ($P < 0.05$).

Bulgular ve Tartışma

Broyler rasyonuna katılan farklı dozlardaki kurkumin ve resveratrolun serum Ca seviyesi üzerine etkileri Şekil 1'de, serum P seviyesi üzerine etkileri Şekil 2'de ve serum Mg seviyesi üzerine etkileri ise Şekil 3'te verildi. Şekil 1 ve Şekil 3'e bakıldığında rasyona katılan resveratrol ve kurkumin katkılarının tüm dozlarının serum Ca ve Mg seviyelerini etkilemediği tespit edildi ($P > 0.05$). Şekil 2'ye bakıldığında ise rasyona katılan 250 mg/kg kurkuminin serum P seviyesini istatistiksel olarak arttırdığı belirlendi ($P < 0.01$).

Canlıların serumdaki biyokimyasal parametrelerin değerleri metabolik durum hakkında oldukça önemlidir. Hastalık durumu, çeşitli çevresel faktöre bağlı stresler ve beslenme bu parametreleri oldukça etkileyebilmektedir (Gumus ve Ozbilgin, 2022). Kalsiyum, vücutta en çok bulunan mineral olup vücut ağırlığının yaklaşık %1.5-2'sini, fosfor da, kalsiyumdan sonra, vücutta en fazla bulunan ikinci element olup toplam vücut ağırlığının yaklaşık % 0.8-1.2'sini oluşturur (Gropper ve ark., 2009). Vücutta Ca ve P mineralleri birçok biyolojik fonksiyonda birlikte görev aldığı için kanatlı hayvanların kanındaki değerleride önemlidir (Qian ve ark., 1997). Bu nedenle, broylerler için Ca gereksinimlerin belirlenmesinde P gereksinimlerinde dikkate alınmalıdır. Yine kemik dokusunun gelişimi üzerine Ca ve P minerallerinin büyük etkisi olduğu bildirilmiştir (Waldenstedt, 2006). Bir diğer önemli mineral olan Mg biyolojik sistemler için gerekli olup, biyokimyasal olarak çeşitli enzimatik ve metabolik işlemlerde yer alır (Fischer ve Giroux, 1991).

Şekil 1. Broyler rasyonuna katılan kurkumin ve resveratrolün serum Ca seviyeleri üzerine etkileri. ($P > 0.05$).

Şekil 2. Broyler rasyonuna katılan kurkumin ve resveratrolün serum P seviyeleri üzerine etkileri. ($P < 0.01$).

Bu çalışmada da elde edilen sonuçlar incelendiğinde kullanılan farklı dozlardaki kurkumin ve resveratrol katkılarının serum Ca ve Mg seviyelerini etkilemediği görülürken, rasyonuna 250 mg/kg kurkuminin katılan grupta serum P seviyesinin önemli olarak arttığı belirlenmiştir. Broylerde yapılan bir çalışmada rasyona katılan resveratrol ve kurkumin katkılarının 42 günlük yaşta serum Ca ve P seviyelerini etkilemediği, serum Mg seviyesinin ise resveratrol katılan gruplarda arttığı belirtilmiştir (Gumus ve Ozbilgin, 2022). Yine benzer olarak sığırcılarda yapılan başka bir çalışmada içme suyuna 10 mg/kg dozunda resveratrol ilave edilen grubun serum Ca ve P seviyelerinin etkilenmediği, Mg seviyesinin ise arttığı bildirilmiştir (Arslangil ve Baltacı, 2015). Bıldırcınlarda yapılan bir çalışmada benzer etkilere sahip bitkisel bir katkı olan kekik uçucu yağının rasyona katılan 300 ve 450 mg/kg dozlarının serumda Mg seviyesini önemli oranda arttırdığı, serum Ca ve P seviyelerini ise etkilemediği bildirilmiştir (Gumus ve ark., 2017).

Sonuç olarak; yerleşim sıklığı uygulanan broylerlerin rasyonuna katılan resveratrol ve kurkumin katkılarının serum Ca ve Mg seviyelerini etkilemediği, serum P seviyesini ise 250 mg/kg kurkumin dozunun önemli oranda arttırdığı görüldü. Buna göre resveratrol ve kurkumin katkılarının serumda bakılan parametreler üzerine olumsuz etkilerinin olmaması ve içerdikleri diğer birçok olumlu özelliklerinden dolayıda broyler rasyonlarında kullanılmasının uygun olacağı düşünülmektedir.

Şekil 3. Broyler rasyonuna katılan kurkumin ve resveratrolün serum Mg seviyeleri üzerine etkileri. (P > 0.05).

Effects of Different Organic Source Materials on Growth, Flowering, and Yield in Zinnia Plant

Onur Sefa Alkaç¹, Esra Öndeş¹, Esat Tuncel¹, Rümeyza Temir¹

¹Bahçe Bitkileri Bölümü, Ziraat Fakültesi, Tokat Gaziosmanpaşa Üniversitesi, Tokat, Türkiye

Abstract

Zinnia (*Zinnia elegans*) is an ornamental plant of the Asteraceae family, originating from Central America and Mexico, which can also be used in landscape design, grown as potted or cut flowers with various colors. Organic fertilizers, on the other hand, are important plant food sources that increase the uptake of nutrients and minerals needed by the plant by the roots and have positive effects on growth, development, and yield. The study was carried out in a randomized plot design with three replications, with 4 pots in each replication and 3 plants in each pot. A total of 10 applications consisting of liquid compost (25%-50%), vermicompost (25%-50%), and humic acid (600-1200 ppm) and combining these applications were applied to Zinnia seedlings. The first application was applied as 400 mL per pot when the plants reached 20 cm in size. Applications were made 3 times with an interval of 7 days. When the plants are harvested, flower diameter (mm), stem thickness (mm), number of flowers (piece), stem length (cm), number of branches (pieces), the weight of branches (g), number of leaves (pieces), root length (cm), root fresh weight (g), root dry weight (g), vase life (days) parameters were examined. As a result of the study, the highest flower diameter (72.27 mm) and SPAD value (34.93) was 600 ppm humic acid application, the highest flower stem thickness (4.67) and flower stem length (45.56 cm) 25% liquid compost + 25% vermicompost application, the highest flower stem thickness (4.67). The number of flowers (6.17 pieces) and root wet weight (8.10 g) were found in 25% vermicompost application, the highest number of branches (7.25) in 1200 ppm humic acid application, the highest branch weight (30.76) in 50% vermicompost application. As a result, it was observed that in applications where 25% of vermicompost was used, it had positive effects on the number of leaves, flowering, and root parameters. In humic acid applications, it has been found to have a positive effect when used at low rates such as 600 ppm. It is stated in the results of the study that the doses used to give better results when applied at low rates.

Key Words: Humic acid, Vermicompost, Compost, Cut flower, Sustainable Agriculture

Farklı Organik Kaynaklı Materyallerin Zinnia Bitkisinde Büyüme, Çiçeklenme ve Verime Etkileri

Özet

Zinnia (*Zinnia elegans*), Asteraceae familyasına ait Orta Amerika ve Meksika kökenli olan, çeşitli renklere sahip olan saksılı veya kesme çiçek olarak yetiştirilen peyzaj tasarımında da kullanılabilen bir süs bitkisidir. Organik gübreler ise bitkinin ihtiyaç duyduğu besin elementlerinin ve minerallerin kökler tarafından alınımını artıran büyüme, gelişme ve verim üzerinde olumlu etkiler yapan önemli bitki besin kaynaklarıdır. Çalışma tesadüf parselleri deneme desenine göre üç tekerrürlü, her tekerrürde 4 saksı ve her saksıda 3 er bitki olacak şekilde yürütülmüştür. Zinnia fidelerine sıvı kompost (%25-%50), vermikompost (%25-%50), hümik asit (600-1200 ppm) ve bu uygulamaların kombine edilmesiyle oluşan toplam 10 uygulama yapılmıştır. İlk uygulama, bitkiler 20 cm boyuta gelince saksı başına 400 mL olacak şekilde uygulanmıştır. Uygulamalar 7 gün ara ile 3 kez yapılmıştır. Bitkiler hasada geldiğinde çiçek çapı (mm), çiçek sap kalınlığı (mm), çiçek sayısı (adet), çiçek sap uzunluğu (cm), dal sayısı (adet), dal ağırlığı (g), yaprak sayısı (adet), kök uzunluğu (cm), kök yaş ağırlığı (g), kök kuru ağırlığı (g), vazo ömrü (gün) parametrelerine bakılmıştır. Çalışma sonucunda en yüksek çiçek çapı (72.27 mm) ve SPAD değeri (34.93) 600 ppm hümik asit uygulamasında, en yüksek çiçek sap kalınlığı (4.67) ve çiçek sap uzunluğu (45.56 cm) %25 sıvı kompost + %25 vermikompost uygulamasında, en yüksek çiçek sayısı (6.17 adet) ve kök yaş ağırlığı (8.10 g) %25 vermikompost uygulamasında, en yüksek dal sayısı (7,25) 1200 ppm hümik asit uygulamasında, en yüksek dal ağırlığı (30,76) %50 vermikompost uygulamasında bulunmuştur. Sonuç olarak, vermikompostun %25 oranında kullanıldığı uygulamalarda yaprak sayısı, çiçeklenme ve kök parametrelerine üzerine olumlu etkiler yaptığı gözlemlenmiştir. Hümik asit uygulamalarında ise 600 ppm gibi düşük oranlarda kullanıldığında olumlu etki yaptığı saptanmıştır. Kullanılan dozlar düşük oranlarda uygulandığında daha iyi sonuçlar verdiği çalışmanın sonuçlarında yer almaktadır.

Artificial Neural Network Applications in Seafood

Ismail Yüksel Genç¹

¹ Fishing and Processing Technology Department, Eğirdir Fisheries Faculty, Isparta University of Applied Sciences, Isparta, Türkiye

Abstract

Seafood are perishable products and have limited shelf life due to their nutritional composition, pH value, water content, water activity and weak connective tissue. The quality of seafood could be determined by analyzing the microbiological, chemical and sensory changes during a particular storage time. Additionally, safety of seafood is another concern in terms of public health and also could be determined by the evaluation of microbiological and chemical indices. Conventional methods are used for analyzing the quality and safety of seafood. However, recently neural networks are gaining popularity in order to determine, categorize and prediction of the quality and safety of seafood. Artificial neural network (ANN) is one of the sub subjects of artificial intelligence. Additionally, ANN is one of the most effective approaches for deciding whether or not the product is suitable for the consumption or is used to categorize the product. Predictive models were developed for many food categories, particularly for perishable products such as seafood. In this context, ANN applications to determine the quality and safety of seafood were evaluated. Furthermore, critical statistical indices were emphasized for assessment of the developed model performance in this study.

Key Words: Artificial neural network, mathematical modeling, seafood, quality, safety

Yapay Sinir Ağlarının Su Ürünlerinde Uygulamaları

Özet

Su ürünleri çabuk bozulabilen gıdalardır ve besin içerikleri, pH değerleri, su içerikleri, su aktivitesi ve zayıf bağ dokusu nedeni ile sınırlı raf ömrüne sahiptirler. Su ürünlerinin kaliteleri belirli zaman aralığına sahip depolama koşullarında mikrobiyolojik, kimyasal ve duyuşal değişimlerin analizleri ile belirlenebilir. Buna ek olarak, su ürünlerinde güvenlik halk sağlığı açısından diğer bir konudur ve mikrobiyolojik ve kimyasal indislerin değerlendirilmesi ile belirlenebilmektedir. Su ürünlerinde kalite ve güvenliğin belirlenmesinde konvensiyonel metotlar kullanılabilir. Ancak, günümüzde sinir ağları su ürünlerinin kalite ve güvenliğinin belirlenmesinde, kategorize edilmesinde ve tahmininde popülerlik kazanmaktadır. Yapay Sinir Ağları (YSA) yapay zekanın alt konularından biridir. Bununla birlikte, YSA ürünün tüketilip tüketilemeyeceği veya ürünün kategorize edilmesinde oldukça etkili yaklaşımlardan biri olmaktadır. Tahmin modelleri özellikle su ürünlerinde olmak üzere birçok gıda ürününde geliştirilmiştir. Bu kapsamda, su ürünlerinde kalite ve güvenliğinin belirlenmesinde YSA uygulamaları değerlendirilmiştir. Dahası, bu çalışmada geliştirilen modellerin performans değerlendirilmesinde kullanılan istatistiki indisler vurgulanmıştır.

Anahtar Kelimeler: Yapay sinir ağları, matematiksel modelleme, su ürünleri, kalite, güvenlik

Giriş

Su ürünleri diğer ülkelerde olduğu gibi ülkemizde de ekonomik açıdan olduğu kadar insan tüketimi açısından da önemli bir yere sahiptir. Ülkemizdeki su ürünleri istatistikleri incelendiğinde yetiştiricilik üretiminin 2020 yılında 421 411,0 tondan 2021 yılında 476 686,0 tona çıktığı, bununla birlikte avlanan deniz balıkları miktarının 2020 yılında 291 910,0 ton ve 2021 yılında 262 289,7 tona ve son olarak avlanan tatlısu ürünlerinin miktarının 2020 yılında 33 119 tondan 2021 yılında 33 140,0 tona ulaştığı bildirilmiştir (TUİK, 2022). Bu kapsamda değerlendirildiğinde su ürünleri ülkemizde de tüketimin önemli bir kısmını oluşturduğu düşünülmektedir. İnsan diyetinin büyük bir kısmını oluşturmasının yanında kara hayvanlarında bulunmayan fonksiyonel bileşenleri içermesinden dolayı sağlıklı gıdalar arasında yer almaktadır. Su ürünlerinde bulunan fonksiyonel bileşenler bireyin ateroskleroz ve trombotik rahatsızlıklardan korunmasına yardımcı olan n-3-çoklu doymamış yağ asitlerini (eikosapentaenoik asit dokosahexaenoik asit) içermektedir (Hosomi ve ark 2012). Su ürünlerinin sağlıklı gıda olarak tüketilmesinin yanında besin içerikleri, pH değerleri, yüksek nem içeriği gibi özelliklerinden kaynaklı olarak çabuk bozulabilen gıdalar arasında yer aldığı bilinmektedir ve korumasız ve yetersiz depolama ve işleme uygulandığında çok hızlı bir şekilde bozulabildiği bilinmektedir (Gram, 2009). Su ürünlerinde kalite fizikokimyasal, tekstürel, duyuşal elektriksel metotlar ile belirlenebilmektedir ancak kullanılan bu metotlar zaman ve ekonomik açıdan değerlendirildiğinde oldukça maliyetli olmaktadır (Hassoun ve Karoui, 2017). Bu açıdan değerlendirildiğinde su ürünlerinde kalite ve güvenliğin belirlenmesinde matematiksel model tabanlı uygulamalar ön plana çıkmaktadır.

Yapay sinir ağları (YSA) biyolojik sinir ağlarına benzer olarak nöronlar ile birbirlerine bağlanan bir sistemi ifade eder ve bu sayede gelen verileri işleyerek eylem alınmasına olanak sağlar (Mishra ve Srivastava 2014). Dahası,

yapay sinir ağıları biyolojik sinir sisteminden esinlenerek oluşturulmuş matematiksel model tabanlı bir bilgi işleme sistemidir (Maind ve Wankar 2014). Yapay sinir ağıları nöron ismi verilen işleme birimlerinden oluşurlar. Nöronlar, girdi (input) ve çıktılardan (output) oluşurlar ve nöron fonksiyonu nöronu aktive eder ve bu sayede bilgi işlenerek çıktıya ulaşılır (Kukreja vd., 2016). Yapay sinir ağıları bu sayede gerçek hayat problemlerinin çözümünde birçok alanda kullanılmaya başlanmıştır ve fonksiyon yaklaşımı veya regresyon analizi, sınıflandırma, veri işleme, filtreleme, kategorize etme gibi birçok alanda uygulanmıştır (Shanmuganathan, 2016). Bu kapsamda değerlendirildiğinde su ürünleri insan tüketimine sunulmakta ve gıda kalite ve güvenliği açısından da değerlendirilmesi gerekmektedir. Bu çalışmada yapay sinir ağlarının su ürünleri uygulamaları incelenmiştir.

Yapay sinir ağlarının su ürünlerinde uygulamaları

Biyolojik faaliyetlerin kinetiklerin matematiksel modeller ile belirlenebilmektedir. Matematiksel modellerin birçok uygulama yöntemi olmakla birlikte YSA bu yöntemlerin uygulama alanlarından biri olarak sunulmaktadır. Genel olarak YSA'nın gıdalarda birçok uygulaması olmasına rağmen su ürünlerindeki uygulamaları göreceli olarak kısıtlıdır. Yapılan çalışmalarda optimizasyon ve tahmin modellerinin ağırlıklı olarak incelendiği görülmüştür. Bu kapsamda, Genç (2022) yapmış olduğu çalışmada su ürünlerinde depolama zamanının YSA tabanlı bir matematiksel model ile tahmin edilebilirliğini araştırmıştır. Çalışmada karides, yayın, çipura, gökkuşağı alabalıkları, sazan, tilapiya, sarıağzı balığı gibi farklı su ürünlerinde depolama zamanına bağlı olarak meydana gelen renk değişimleri giriş verisi olarak kullanılmıştır. İleri beslemeli geri yayılım algoritması Marquardt algoritması ile eğitilmiştir. Momentumlu kademeli azalma ve adaptif öğrenme oranlı geri yayılım fonksiyonu eğitim fonksiyonu olarak belirlenmiştir. Yapılan çalışmada su ürünlerinin depolama zamanının tahmin edilmesi için geliştirilen en uygun topolojinin 30 nöron içerdiği bildirilmiştir. Yapılan diğer bir çalışmada Kumar ve Kumar (2021) YSA tabanlı birleşik risk derecelendirme yaklaşımını incelemişlerdir. Araştırmacılar yapmış oldukları çalışmada Avrupa'da bulunan balık ve su ürünlerinde risk oluşturan kontaminantları süreklilik, biyoakümüleyasyon ve toksisite açısından değerlendirmişler ve herbir bileşik için YSA tabanlı kendi kendini düzenleyen harita yaklaşımını kullanarak bir tehlike indeksi oluşturmuşlardır. Araştırmacılar yapmış oldukları çalışma sonuçlarının öncelikli kontaminantları belirlediğini ve düzenleyici kararlarda, bilimsel panellerde ve güvenlik ölçümlerinde bu sonuçların kullanılabileceğini bildirmişlerdir. Lalabadi vd. (2020) yapmış oldukları çalışmada çok sınıflı yapay sinir ağıları ve destek vektör makineri kullanarak balıklarda göz ve solungaç rengine dayalı tazelik kategorizasyonunu araştırmışlardır. YSA sınıflandırmasında çok katmanlı algılayıcı ve destek vektör makineleri (DVM) sınıflandırmasında ise radial tabanlı işlev çekirdeği kullanılmıştır. Araştırma sonuçlarına göre YSA sınıflandırmasının DVM'ye göre daha hassas sonuçlar verdiği bildirilmiştir. Moosavi-Nasab vd. (2021) balık filetolarında toplam uçucu bazik azot (TVBN) miktarının derin öğrenme sinir ağı ile birleştirilen hiperspektral görüntüleme ve meta analizi ile değerlendirmiştir. Araştırmada doğrusal derin sinir ağı (DDSA) balık filetolarında TVBN içeriğini kabul edilebilir oranda tahmin edebildiği belirtilmiştir. Ancak en küçük kareler DVM algoritmasının diğer modellere göre daha hassas ve doğru sonuçlar verdiği araştırmacılar tarafından bildirilmiştir. Yapılan diğer bir çalışmada farklı balık türlerinin belirlenmesinde derin öğrenme tabanlı bilgisayarlı akıllı bir sistem geliştirilmesi amaçlanmıştır. Çalışmada derin öğrenme algoritması olarak evrişimli sinir ağı kullanılmıştır. Araştırma sonuçlarına göre geliştirilen modelin genel hassasiyetinin % 94 olduğu ve modelin F1-değerinin %98 olduğu barbun balığında güvenli olarak çalıştığı bildirilmiştir (Rasheed, 2021).

Sonuç

Su ürünlerinde YSA tabanlı geliştirilen modeller incelendiğinde risk değerlendirmede, sınıflandırmada, kategorizasyonda, optimizasyonda ve matematiksel tahmin gibi alanlarda kullanıldığı görülmektedir. Gelişen teknoloji de göz önünde bulundurulduğunda YSA tabanlı algoritmaların su ürünlerinde kalite ve güvenlik değerlendirilmesi amacı ile kullanılması hem zaman hem de maliyet açısından olumlu sonuçlar vereceği düşünülmektedir. Bununla birlikte su ürünlerinde YSA tabanlı uygulamaların geliştirilmesi yapılacak olan çalışmalarda da optimizasyon teknikleri ile birlikte hassas sonuçların elde edilmesine olanak sağlayacağı yapılan çalışmalar açısından değerlendirildiğinde de açıkça görülmektedir. Dahası, YSA tabanlı tahmin modellerin tahribatsız ve hızlı olması bununla birlikte geliştirildikten sonra üçüncül modeller gibi kullanımının kolay olması gibi avantajlarından dolayı tercih edilebilirliğinin yüksek olduğu düşünülmekte ve su ürünlerinde kullanımının artması bu alanda yapılacak olan çalışmalarda zaman ve ekonomik açıdan avantaj sağlayabileceği düşünülmektedir.

The relationship of antibacterial activity of *Origanum majorana* L. with its plant nutrient elements

Muazzez Gürkan¹, Sevinç Yeşilyurt²

¹Department of Biology, Tekirdağ Namık Kemal University, Tekirdağ, Turkey

²Department of Soil Science and Plant Nutrition, Tekirdağ Namık Kemal University, Tekirdağ, Turkey

Abstract

The importance and popularity of medicinal aromatic plants are on the rise all over the world, especially due to economic problems and resistance of bacteria towards antibiotics. These kinds of plants have been used in traditional medicine for centuries. The reduction of productivity of agricultural lands due to unconscious agricultural applications such as excess fertilizers or pesticides have major impact on the plant nutrient element concentrations in agricultural soils all over the world. This change may indeed affect the elemental composition of cultivated plants and may alter the biological activities of the crops. In this study the antibacterial activity of the ethanol extract of *Origanum majorana* L. belonging to Lamiaceae family on Gram-positive and Gram-negative bacteria was evaluated together with the correlations of macro and micro nutrient elements of this plant. Ethanol extract of the harvested aerial parts of *Origanum majorana* L. grown in the lab conditions on soil obtained from the experimental field of Faculty of Agriculture was tested on *E. coli*, *P. aeruginosa*, *S. aureus* and *E. faecalis*. Moreover, some macro (P, K, Ca, Mg) and micro (Fe, Cu, Zn, Mn, B and Ni) nutrient elemental concentrations were determined using ICP-OES. The results showed the antibacterial activity of the extracts on these bacteria, in the order of *S. aureus*, *P. aeruginosa*, *E. faecalis*, *E. coli* and their significant positive correlation with copper and nickel micro nutrient elements ($\rho=1$, $p=0.010$, for each). This means that as these elements increase in the plant, its antibacterial activity will increase, most probably up to a certain level. Therefore, soil analyses prior to fertilizer or pesticide applications are vital for cultivation of medicinal aromatic plants which are frequently used in traditional medicine.

Key Words: *Origanum majorana* L., macro and micro nutrient elements, antibacterial activity

***Origanum majorana* L. bitkisinin bitki besin elementleri ile antibakteriyel aktivitesinin ilişkisi**

Özet

Tıbbi aromatik bitkilerin popülaritesi tüm dünyada özellikle antibiyotik direnci ve ekonomik problemlerden dolayı gitgide artmaktadır. Bu tür bitkilerin yüzyıllardır geleneksel tıpta kullanıldığı bilinmektedir. Tarım alanlarında fazla gübre ya da pestisit kullanımı gibi bilinçsiz uygulamalar nedeniyle tarım topraklarının verimliliği azalmakta ve bitki besin elementi içerikleri gün geçtikçe azalmaktadır. Bu değişiklikler de tarımı yapılan bitkilerin içeriklerini ve biyolojik etkilerini de değiştirebilmektedir. Bu çalışmada Lamiaceae familyasına ait *Origanum majorana* L. bitkisinin etanolle elde edilmiş özütü Gram pozitif ve Gram negatif bakteriler üzerinde etkileri bitkinin makro ve mikro besin element içeriği ile birlikte değerlendirilmiştir. Tekirdağ Namık Kemal Üniversitesi Ziraat Fakültesi deneme alanı toprağı kullanılarak laboratuvar ortamında yetiştirilen *Origanum majorana* L. bitkisinin toprak üstü aksamının etanol özütü *E. coli*, *P. aeruginosa*, *S. aureus* ve *E. faecalis* üzerinde denenmiştir. Ayrıca bazı makro (P, K, Ca, Mg) ve bazı mikro (Fe, Cu, Zn, Mn, B ve Ni) besin elementleri içerikleri ICP-OES kullanılarak belirlenmiştir. Sonuçlar bu özütün antibakteriyel etki sıralamasının *S. aureus*, *P. aeruginosa*, *E. faecalis*, *E. coli* şeklinde olduğunu göstermiştir. Antibakteriyel etkinin bakır ve nikel ile belirgin pozitif korelasyonu olduğu da gösterilmiştir (her biri için $\rho=1$, $p=0.010$). Bu sonuç, bu elementlerin bitkideki miktarının muhtemelen belli bir miktara kadar arttıkça antibakteriyel etkilerinin de artacağı anlamına gelmektedir. Bu nedenle, pestisit ya da gübre uygulanmasından önce toprak analizlerinin yapılması özellikle geleneksel tıpta kullanılan bitkilerin yetiştiriciliğinde büyük önem arz etmektedir.

Anahtar Kelimeler: *Origanum majorana* L., makro ve mikro besin elementleri, antibakteriyel aktivite

Introduction

Origanum majorana L. is a member of Lamiaceae family. The genus *Origanum* have around nine hundred species and many of them are used in food industry as well as cosmetics. The fragrance of marjoram is preferred for being a spicy odor. Besides such uses, the plant has been used in traditional medicine for centuries and consumed as food (Pimple et al., 2012). Therefore, marjoram is also a medicinal aromatic plant. It is rich in proteins, carbohydrates, and Vitamin C (Hussain et al., 2010). The essential oils of medicinal aromatic plants are rich in phytochemical compounds such as polyphenols. Such bioactive chemicals make the plants have certain biological activities such as antibacterial, anti-fungal, anti-carcinogenic, anti-inflammatory and antioxidant effects (Amor et al., 2019; Lombrea et al., 2020). Moreover, it was found to have immunomodulatory effects (Wang et al., 2021). Essential oil of marjoram is indeed rich in alpha-terpinene., gamma-terpinene, beta terpineol and sabinene (El-Khateeb et

al., 2020; Kimera et al., 2021). Therefore, it has many biological activities. In a recent study, the essential oil of *O. Majorana* was used to produce a paper to be used as a protectant agent in food industry and it was tested on meat spoilage and was shown to be used as protectant agent in food industry (Yasar et al., 2022).

Macro and micro nutrient elements are vital for plant health and cultivation. The macro elements are elements such as N, P, K, Ca, and Mg which are required in large amounts for the growth and development of plants. On the other hand, micro elements such as Fe, Cu, Zn, Mn B, and Ni, are required in relatively lower amounts than macro elements but they are very crucial for the healthy metabolism of plants. They are vital for enzyme activities since they have roles as enzyme cofactors in plants. Their concentration in plants give an idea of plant health and also soil health, since plants absorb these elements from the soil during development. Their concentration in plants also give an idea of the requirement of fertilizers in agriculture. They are also very important for the formations of molecules in essential oils. In this study, we aimed to determine the nutrient elements of *O. majorana* and their correlations with the antibacterial activity of the ethanol extract of the plant.

Materials and Methods

The soil used in this study was obtained from the trial field of Faculty of Agriculture, Namık Kemal University, Tekirdag. The soil was sifted out and the pots of 4 L were filled with this soil. The seeds of *Origanum majorana* L. was bought from a local seed provider. The seeds were sown to viols filled with peat. After germination and formation of the seedlings, the seedlings were transferred to the pots filled with the trial soil. The seedlings were watered regularly. The plants were kept for 3 months after which they were harvested. The fresh weight of plants was recorded. They were dried and grinded. The macro and micro nutrient element concentration of plant were measured with ICP-OES in the central lab (NABILTEM) of Tekirdag Namık Kemal University. The dried plant material was also used to obtain extract with ethanol as solvent. Maceration technique was adopted for extraction with a 1:20 m/v dry weight/ethanol ratio. The plant material was kept for 48 hours at dark. The extract was tested on 4 bacteria: 2 Gram positive (*S. aureus* and *E. faecalis*) and two Gram negative (*E. coli* and *P. aeruginosa*). The bacteria were obtained from Middle East Technical University, Ankara, Turkey. Well diffusion method was adopted for antibiogram of majorana extract. Mueller Hinton agar plates were prepared and bacteria adjusted to 0.5 McFarland were spread on the agar plates under aseptic conditions. Using sterile pipette tips, wells of 8 mm diameter were formed and 100 µL of extract was added into the well. The plates were kept at 37°C for 24 hours after which the inhibition of bacterial growth was measured by the clearance around the wells. The experiment was replicated three times. The correlation between the antibacterial activity of the extract and the nutrient elements in marjoram plant was determined using Pearson correlation using Minitab software.

Results and Discussion

Origanum majorana L. was grown on the soil obtained from a trial field of the university. The study was a pot study. After the harvest, the macro and micro nutrient elements of the plant were detected by ICP-OES. The contents of macro and micro elements of marjoram grown in this study are given in Table 1.

Table 1. Macro and micro nutrient elements in *O. majorana*

		Control
Macro Nutrient Elements	N (%)	3.61±0.09
	P (%)	0.45±0.03
	K (%)	3.20±0.08
	Ca (%)	2.20±0.25
	Mg (%)	0.51±0.03
Micro Nutrient Elements	Fe (ppm)	359.77±37.59
	Cu (ppm)	6.16±0.25
	Zn (ppm)	62.33±3.91
	Mn (ppm)	81.57±9.33
	B (ppm)	75.37±5.84

Marjoram grown in this study contains sufficient amount of macro nutrients P, Ca, K compared to the contents given by USDA Handbook (Murphy et al., 1978). The iron content of the plant was high when compared to *Ocimum basilicum* grown on a similar soil we used in one of our previous studies; the iron content was around 125 in that study. Similarly, Zn and B contents are higher in marjoram, but manganese content is lower in marjoram compared to sweet basil, which is another medicinal aromatic plant (Gürkan Eser & Adiloğlu, 2020).

Table 1. Antibacterial effects of *O. majorana* on different bacteria

Bacteria	Inhibition zone (mm)
<i>E. coli</i>	-
<i>P. aeruginosa</i>	14.33 ± 0.33
<i>S. aureus</i>	21.3 ± 0.33
<i>E. faecalis</i>	12.33 ± 0.33

The effect of the extract on *E. coli* could not be observed (Figure 1). The effect of the extract was the highest on *S. aureus* in terms of bacterial growth inhibition (Table 1). The activity on the other Gram-positive bacterium *E. faecalis* was also significant. This shows that the marjoram extract was more effective on inhibiting Gram-positive bacterial growth. *S. aureus* is a normal member of the human microbiota but it became an important source of nosocomial infections and many antibiotic resistant strains of this bacterium are known to cause serious health problems. Similar to this bacterium, other bacteria used in this study are normal flora members but some pathogenic strains of them appear and cause different health problems. Bacterial ability to exchange chromosomal particles making them advantageous gave rise to antibiotic resistance which is an alarming health issue all over the world. Testing different natural or synthesized chemicals against bacterial growth is therefore very important. Here, we can suggest that ethanol extract of *O. majorana* has significant inhibiting effect for Gram positive bacteria, especially *S. aureus*.

Figure 1. Antibiogram of *O. majorana* extracts tested with different bacteria

After the antibacterial effect, the correlations of the antibacterial effect with the nutrient elements in marjoram were determined in this study. This is important for the cultivation medicinal aromatic plants because the nutrient elements can change depending on the soil they are growing on. The agricultural soils are getting polluted more and more all around the world. The pollutions in soil affect the plants' ability to uptake nutrient elements from soil and thus change the nutrient element concentrations in the plants. This in turn affect the biological activities of the extracts (Gürkan Eser & Adiloğlu, 2020; Gürkan & Adiloğlu, 2021). The correlations of the antibacterial activity of marjoram extract and the nutrient elements in the plant are found to be significantly positive for some nutrient elements. One of them is magnesium. The correlation between Mg and antibacterial activity against *S. aureus* was found to be significantly positive ($p=0.99$, $p=0.046$). This means that as Mg in the plant increases, the antibacterial activity will increase. This is the result of bacterial cell wall structure which can bind cations and if too many cations bind to the cell wall it may lead to the distortion of cell wall and to kill the bacterial cell. Copper has a strong positive correlation with bacterial growth inhibition ($p=1.00$, $p=0.01$). This is an expected result as copper has an antibacterial effect (Arendsen et al., 2019). The similar thing is valid for the nickel metal and its correlation with antibacterial activity was significantly positive ($p=0.99$, $p=0.024$). Nickel has an antibacterial activity and its nanoparticles can be used as an antibacterial agent in several applications (Vahedi et al., 2017).

Conclusion

Origanum majorana is a medicinal aromatic plant which has been used as food and source of essential oil for centuries. The essential oil of this plant is rich in bioactive chemicals which make the plant earn many biological activities such as antibacterial, antioxidant, and anticancer activities. The ethanol extract of this plant, which is easier to obtain in a traditional medicine aspect, was tested on different bacteria and found to be effective on inhibiting especially Gram-positive bacteria. Moreover, the concentrations of macro and micro nutrient elements of this plant were detected and their correlation with the antibacterial activity was tested. Significant positive correlation with copper and nickel with bacterial growth inhibition was determined. Increasing copper and nickel content in plant- which is very possible since pesticides containing these metals are frequently used in agricultural practices- would increase the antibacterial effect of the extracts, most probably up to certain point, which should be determined in the future. Such information is crucial for sustainable and healthy agriculture and will lead farmers to maintain better agricultural applications.

Abstract

Diabetes is a chronic glucose metabolism disease related with high premature mortality rates. More than 4 million people/year die from diabetes around the world and it is responsible from 11.3 % of all death causes. Changes in lifestyle and diet are the first recommendations to patients with diabetes, however, patients usually cannot stick with them and hence medications are prescribed to the patients in most cases. The side effects of the pharmaceuticals raise concerns among patients which lead them to search for alternative treatments. Functional foods are gaining attention at this point. Spirulina, a photosynthetic and edible algal microorganism living in water environments, is accepted as a functional food with its high nutritional content such as lipids, proteins, vitamins and minerals. Moreover, the bioactive chemicals such as phenolic compounds make them gain more attention in a medical view. The extracts of spirulina have antioxidant, antibacterial, anticarcinogenic and anti-inflammatory effects. Besides these health benefits, its utility for diabetic patients have been studied. For instance, the results of such a study revealed that administering spirulina to diabetes cases could lower blood glucose levels and also lipids in blood. This study aimed to summarize the researches on spirulina whose market continues to widen all over the world in a perspective to be used for diabetic patients.

Key Words: *Spirulina, Diabetes, Metabolism*

Spirulina diyabet hastalarını tedavi edebilir mi?

Özet

Diyabet yüksek erken ölüm oranıyla seyreden kronik bir glikoz metabolizması hastalığıdır. Her yıl dünyada 4 milyondan fazla insan diyabet ve ilişkili hastalıklardan yaşamını yitirmektedir ve bu tüm ölümlerin %11,3'ünü oluşturmaktadır. Diyabet hastalarına genellikle ilk olarak hayat tarzı değişikliği önerilmekte ancak hastalar buna uyamadığı için ilaç başlanmaktadır. Kullanılan ilaçların yan etkileri hastaları alternatif tedavi yöntemleri bulmaya yöneltmektedir. Fonksiyonel gıdalar bu noktada ilgi çekmektedir. Yenilebilir fotosentetik bir mikro alg türü olan Spirulina lipitler, proteinler, vitamin ve mineraller gibi yüksek besin içeriklerinden dolayı fonksiyonel bir gıda olarak kabul edilmektedir. Bunun yanında, fenolik bileşikler gibi biyoaktif kimyasallar da tıbbi açıdan önem kazanmasına yol açmaktadır. Spirulina ekstraktları antioksidan, antibakteriyel, anti karsinojenik ve anti enflamatuvar etkilere sahiptir. Sağlığa faydalarını yanında Spirulina diyabet hastalarında da araştırılmıştır. Örneğin, çalışmalardan birinin sonuçları diyabet hastalarına verilen Spirulina'nın kan lipid ve glikoz seviyelerini düşürdüğünü göstermiştir. Bu derleme, dünya çapında Pazar payı her geçen gün artan Spirulina'nın diyabet hastaları için kullanımı için yapılan çalışmaları özetlemektedir.

Anahtar Kelimeler: *Spirulina, diyabet, fonksiyonel gıda*

Introduction

Diabetes is a glucose metabolism disorder that affects millions of people all over the world. It was reported that around 382 million people suffer from diabetes in 2013 and this number is supposed to increase to 592 million by 2035. It is related with insulin secretion and/or irregular actions of enzymes playing role in oxidative stress which is caused by insulin metabolism. Therefore, it is known that people with diabetes have lower superoxide dismutase, catalase activities, and lower glutathione contents in renal and hepatic tissues (Bitam & Aissaoui, 2020). Since this disease is known to affect people for very long time, people have tried many alternative therapies, but usually ended up using drugs. Therefore, a natural therapeutic which can be applied into a pharmaceutical can help. Spirulina can be handy in this concept.

Spirulina is a microscopic blue green alga (cyanobacterium) rich in carbohydrates, proteins, amino acids, and especially phytopigments. The principal pigment of Spirulina is phycocyanin. Spirulina is rich in polyphenols, flavonoids, phycobiliproteins, carotenoids and chlorophyll (Bitam & Aissaoui, 2020). Spirulina is also as an enriched sources of bioactive secondary metabolites such as carbanilic acid, oxazolidin, piperidin, benzophenone. Such bioactive chemicals give Spirulina some biological characteristics such as antibacterial activity (Alshuniaber et al., 2021). Several researchers studied the anti-diabetic properties of Spirulina. For example, Spirulina was reported to increase the activities of catalase and superoxide dismutase enzymes (Bitam & Aissaoui, 2020). This suggests that consuming Spirulina can help the antioxidative metabolism in diabetes patients. When Spirulina was given to diabetic patients as 2g/day for 2 months, the fasting blood glucose level and postprandial blood glucose

significantly reduces. Moreover, HbA_{1c} significantly reduced which suggested improving long term glucose regulation (Parikh et al., 2001). In another study, 8g/day Spirulina consumption by diabetes patients without any other functional foods significantly reduced plasma triglycerides, malondialdehyde levels and blood pressure, and increased plasma adiponectin levels in 12 weeks (Lee et al., 2008). Spirulina was also found to decrease total cholesterol, LDL, VDL and increase HDL in blood (Hatami et al., 2021). Moreover, Spirulina was reported to increase volatile fatty acid producing bacteria in gut microbiome and improve the stability of microbiome, which is very important for general human health (He et al., 2022). Taking into account of the anti-diabetic health effects of Spirulina, in this study, we aimed to grow *Spirulina platensis* in lab scale and determined the growth kinetics, harvest efficiency and cell number to be able to produce this microalgal species in large scale.

Materials and Methods

Apart from having a high protein content, Spirulina is a blue-green alga with carbohydrates, other essential nutrients such as vitamins (A, C, E) and minerals such as iron, calcium, chromium, copper, magnesium, manganese, phosphorus, potassium, sodium and zinc (Gogna et al., 2022). Thus, it can be a promising food product for many diseases, especially cancer, obesity, heart diseases and diabetes. In this compilation study, a small-scale production profile of spirulina culture obtained from a private enterprise was revealed under laboratory conditions. First of all, the obtained culture was examined under a microscope to see if it was contaminated (Figure 1). After this process, the nutrients required for the growth of spirulina were added to the 5 plastic drums at the rates shown in Table 1.

Sevinç, Eser, Yağcılar, 2022

Figure 1. *Spirulina platensis* microscope view and mode of production.

Table 1. Composition of modified spirulina medium

Ingredient	To make 5 L of mix
Sodium Bicarbonate (NaHCO ₃)	80 g
Potassium Nitrate (KNO ₃)	10 g
Sea Salt (NaCl)	5 g
Ammonium Phosphate ((NH ₄) ₃ PO ₄)	0.5 g
Magnesium Sulfate (MgSO ₄)	0.5 g
Potassium Sulfate (K ₂ SO ₄)	2.5 g
Lime or Calcium Chloride (CaCl ₂)	0.5 g

When the ideal growing conditions of *Spirulina* are examined in many studies, it has been reported that the temperature is 25-35 °C and the best growth is 30 °C (Soni et al., 2019). Since light is important for photosynthesis, light intensity has been investigated in different studies and it has been stated that the light value of 3000 lux and 5000 lux is ideal (Pandey et al., 2011). The growth in the applied laboratory conditions was also kept similar to these values (Table 2).

Table 2. *Spirulina* growth conditions

<i>Spirulina platensis</i> harvest characteristics	Value
Temperature	32.86 °C
pH	10
TDS	15.85 ppm
Conductivity	19.94 ppm
Light Value	3967.66 lux
Ambient Temperature	32.33 °C
Ambient humidity	39.66 %

Cell counts were made every four days with the fuchs-Rosenthal counting chamber (Figure 2) from sowing the initial culture until harvest time. The Fuchs-Rosenthal Counting Chamber consists of 16 chambers of one square millimeter areas orientated by triple lines. It is generally recommended to count these 16 areas, preferably 8 in each chamber. In our study, 16 chambers were counted.

Figure 2. Fuchs-Rosenthal counting chamber

Harvest time was determined by observing the pH, cell number and color changes of the cell counted cultures (Figure 3A). Adult cells were collected in the gland with the help of a silk sieve cloth with a harvesting shape of 43 microns (Figure 3B). The wet product obtained was weighed and dried.

A. *Spirulina platensis* harvesting process

B. *Spirulina platensis* harvesting process

Sevinç, Eser, Yağcılar, 2022

Figure 3. *Spirulina platensis* harvesting process

A. *Spirulina platensis* drying process

B. *Spirulina platensis* drying process

Sevinç, Eser, Yağcılar, 2022

Figure 4. *Spirulina platensis* drying process

Finally, the harvest efficiency with the wet and dry weight values given in Table 3 was calculated with the help of the following formula.

$$\text{Harvest efficiency} = 100 * \text{Sample dry weight (g)} / \text{Sample wet weight (g)}$$

Table 3. Harvesting efficiency

	1.	2.	3.
Wet weight	35.2	34.6	36.8
Dry weight	3.23	3.32	3.41
Harvest Efficiency	% 9.17	% 9.59	% 9.26

Results and Discussion

The four-day cell growth numbers of spirulina grown and harvested under laboratory conditions at the 20-day harvest time are given in Table 4 and the growth curve is shown in the graphic below (Figure 5).

Table 4. Cell number of *Spirulina platensis* in ml water sample

Number of measurements / day	Total number of cells / ml
1.	2187
4.	3750
8.	7812
12.	11979
16.	18854
20.	23958

Figure 5. *Spirulina platensis* growth curve

Conclusion

In conclusion, there are studies in which *spirulina platensis* microalgae responds positively in diabetic patients and it is shown to be a promising agent as a functional food for diabetes. However, more studies are needed to increase the number of studies on this subject and to better understand the effects of spirulina.

Abstract

Fruits and vegetables are basic crops of mass consumption for human population to meet their food requirements. Recent advances in medicinal studies have revealed that different parts of fruits and vegetables are loaded with phytochemicals responsible for eliminating the risks of different diseases. Pumpkin (*Cucurbita maxima*) is one of the abundantly grown and consumed vegetable all around the world. Seeds of this vegetables are named as nutritional power houses due to their excellent nutrient profiles. In present study total antioxidant status (TAS), total oxidant status (TOS), oxidative stress index (OSI) and DPPH free radical scavenging activity, of pumpkin seeds extracts were determined. Extraction of pumpkin seeds was carried out in a Soxhlet apparatus using ethanol as extraction solvent. TAS and TOS were determined through Rel Assay Kits and free radical scavenging activity was measured through DPPH assay. TAS was found 4.18 ± 0.36 and TOS 14.68 ± 0.42 , whereas value of OSI was measured 0.35 ± 0.10 . DPPH free radical scavenging activity was observed increasing with increasing the concentration and maximum value $56.10 \pm 0.90\%$ was observed at 2 mg/mL concentration. From these results it was concluded that pumpkin seeds could be utilized as natural antioxidant source with potential to reduce oxidative stress and minimizing the risks of certain diseases.

Key Words: Pumpkin; Seeds; Antioxidant; Extracts; Free radicals

Introduction

Fruits and vegetables parts (peels, flesh, seeds) have been found involved in reducing the risks of many diseases due to presence of phytochemicals, responsible for different health promoting activities in humans. Pumpkin seeds due to presence of phenolic compounds, minerals, vitamins, carotenoids and essential oils, possess strong antioxidant potential and reduce oxidative stress in human body (Hussain *et al.*, 2022). Extracts of different herbs, fruits and vegetables have been found loaded with biologically active components and are a well alternative source of drugs. Due to insufficient health services in many developing and under developed countries the need of complementary medicines has been increased (Mohammed *et al.*, 2020). Expectations of public are very high from food producers in terms of healthy and nutritious food products, which can play both functional and medicinal role in the body and most economic and extraordinary sources of functional ingredients are waste by products of fruits and vegetables (Hussain *et al.*, 2022). Plants are natural sources of antioxidant compounds and extracts of these plants and their parts have been traditionally used in curing different ailments due to their antioxidant, antimicrobial, antiviral, anti-inflammatory, antiallergic, antihypertensive and anticarcinogenic properties (Uysal *et al.*, 2021).

Pumpkins are the members of family *Cucurbitaceae* and genus *Cucurbita* and their usage as a traditional food treating diseases is very common since ancient times. The excellent pharmacological properties of pumpkins are due to their phytochemical composition, which includes phenols, flavonoids, carotenoids and tocopherols. Among pumpkin parts, seeds are the most suitable component with respect to their chemical composition and their usage in different food products in different forms has gained very importance in recent times (Hussain *et al.*, 2022). Production of pumpkins, squashes and gourds in 2019 was estimated above 23 million tons cultivated all over the world comprising an area of 1.54 million hectare and in Pakistan 2.7 lac tons on 26515-hectare area (FAO, 2019). Plants especially fruits and vegetables produce secondary metabolites due to different metabolic reaction in their parts and these non-nutritive components have been reported involved in a range of biological activities in human bodies, when consumed in fresh or processed forms. Specially the antioxidant properties of different plant species and their parts like leaves, peels and seeds, are edge in lowering disease factors (Kina *et al.*, 2021). Consumption of pumpkin seeds on a regular basis could be beneficial for both healthy and diseased persons, due to the excellent nutritional profiles of these seeds. Nutrients present in pumpkin seeds play mediating role in oxidation related reactions resulting in the protection of body cells. So many biologically active components have been reported in pumpkin seeds, which are capable of scavenging free radicals in the human body (Hussain *et al.*, 2021). Ingredients used in the development of so many drugs drive their source from plants, fungi and animals. A variety of natural ingredients from extracts of plants are used in complementary medicines in different regions of the world.

Discovery of new plants, analysis of their different parts and extraction of active compounds is the need of time to overcome the need of modern drugs (Akgul *et al.*, 2022).

Oils extracted from raw pumpkin seeds due to its antioxidant potential, significantly reduced serum triglycerides, total cholesterol, LDL cholesterol, uric acid, creatinine, serum transaminases and urea in experimental animals, whereas serum HDL cholesterol were significantly increased, which was a clear indication of health promoting potential of pumpkin seeds (Nameni *et al.*, 2021). Investigations made by Majid *et al.* (2020) on humans by application of pumpkin seed oil, in controlled lifestyle, showed a significant reduction in endpoint LDL, significant increase in HDL cholesterol. Experiment results revealed pumpkin seed oil have potential of hypolipidemic and anti-hypertensive activity as it lowered LDL and increased HDL levels. Pumpkin seed oil extracts exhibited anti-oxidant, anti-bacterial and anti-inflammatory activities therefore, pumpkin seed oil could be a promising source of ingredients for pharmaceutical and food industries to develop pharma foods and supplements (Amin *et al.*, 2020). Experiments were conducted to check the antioxidant status of pumpkin seeds and results revealed that pumpkin seed oil retarded liver damage by inhibiting oxidative stress induced by sodium nitrate in adult rats (Rouag *et al.*, 2020). As pumpkin seeds are excellent source of nutrients that's why these are known as nutritional powerhouse. Pumpkin seeds have no side effects on human health so these can be consumed on regular basis to promote human health with minimum use of supplements (Maheshwari *et al.*, 2015).

In this context it is very important to investigate peels, flesh and seeds of different medicinal plants, especially fruits and vegetables for their health promoting activities. Antioxidant properties of different plant portions and the agents responsible for this are needed to be discovered for benefit of mankind. Present study was designed to investigate the extracts of pumpkin seeds for their total antioxidant status, total oxidant status, oxidative stress index and DPPH free radical scavenging activity in comparison with ascorbic acid.

Materials And Methods

Procurement and preparations of plant materials

Mature pumpkins were collected from the fields directly and specimen was submitted to Botanical research Centre for identification. Seeds were separated from pumpkins after cutting with knife. Seeds were cleaned from any adhering fibrous material. Seeds were dried in hot air microwave oven at 60°C till constant weight. Fine powder was obtained after grinding the dried seeds in common spice grinder.

Preparations of pumpkin seeds extracts

For preparation of pumpkin seeds extracts, 20 g of powder was taken in flask and 200 mL ethanol was added and extraction was carried out at 50°C for approximately 6 hours. The solvents of the prepared extracts were removed in the rotary evaporator.

Determination of total antioxidant status, oxidant status and oxidative stress index

Total antioxidant status (TAS) and total oxidant status (TOS) of pumpkin seeds ethanolic extracts were measured using Rel assay kits by following the guidelines provided by Erel (2005) with some modifications. Trolox was used as standard calibrator in determination of TAS, whereas hydrogen peroxide was used as standard calibrator in TOS analysis. Oxidative stress index (OSI) was calculated as proportion of TOS and TAS values as described by Sevindik (2019).

Determination of DPPH free radical scavenging activity

For determination of DPPH free radical scavenging activity of pumpkin seeds ethanolic extracts at different concentrations, stock solutions of extracts were prepared using dimethyl sulfoxide at 0.25, 0.5, 1 and 2 mg/mL concentrations. DPPH solution (0.039%) was taken 160 μ L in a cuvette and 50 μ L stock solution was added and mixture was incubated for 30 minutes before analysis and then absorbance was measured at 517 nm using spectrophotometer. Same process was repeatedly carried out for all selected concentrations of pumpkin seeds extracts by following the guidelines given by Shimada *et al.* (1992). Standard reference antioxidant in this study was used ascorbic acid.

Results And Discussion

Antioxidant status, oxidant status and oxidative stress index of pumpkin seeds extracts

Results of TAS, TOS and OSI have been presented in Table 1, from where it can be seen that TAS of pumpkin seeds ethanolic extracts was found 4.18 ± 0.36 mmol/L and TOS was found 14.68 ± 0.42 μ mol/L, which means that pumpkin seeds possess more antioxidant potential. OSI was calculated as ratio between TAS and TOS and value was noted as 0.35 ± 0.10 .

Production of free radicals in human body by different enzymatic and non-enzymatic processes is very common, which is caused by different factors including environmental and internal body reactions. As a result of these free radicals, oxidative stress is produced in the body cells and this oxidative stress results in advancement and occurrence of so many diseases including cancer, brain and heart diseases (Sevindik *et al.*, 2021). Natural body defense system works to reduce oxidative stress caused by free radicals, but in many cases this natural defense system does not work sufficient to protect body cells. Supplementary antioxidant agents from different plant sources are then added to complimentary medicines and foods to support scavenging of free radicals (Mohammed

et al., 2021). Antioxidant and oxidant status of a medicinal plant *Echium italicum* was determined by Uysal *et al.* (2021), and supportive results were found in terms of antioxidant capacity of plants and their parts. Similarly, Mohammed *et al.* (2020) collected plants from different regions of Iraq and determined their antioxidant status, oxidant status and oxidative stress index, and it was concluded that ethanolic extracts of plants have high antioxidant and low oxidant potential so these plants and their parts in different forms can be used as natural antioxidant agents.

Total antioxidant status value is an indicator of the antioxidant compounds provided by the plant materials. Greater the value of total antioxidant status means higher are the antioxidant compounds in plant extracts (Mohammed *et al.*, 2021). Hussain *et al.* (2021) made a comparison of phytochemicals present in peel, flesh and seeds of pumpkin (*Cucurbita maxima*), and concluded that pumpkin seeds are excellent sources of total phenolic, flavonoid, carotenoid and mineral contents and due to present of these biologically active components antioxidant status of pumpkin seeds is high as compared to peel and flesh portion. Makni *et al.* (2011) studied the effect of pumpkin and flax seeds mixtures on alloxan induced diabetic rats and found that diet supplemented with pumpkin seeds exhibited antioxidant activity in rats to control lipid oxidation related diseases. Similar to our results, data was present in the study of Akgul *et al.* (2022), where ethanolic extracts of plants exhibited strong antioxidant and low oxidant potential, encouraging the use of plants as natural antioxidant agents.

Total oxidant status of any plant material indicates the whole oxidant compounds produced by plant material due to metabolic reactions occurred in plant cells with variable speed and concentrations due to different environmental and structural factors (Mohammed *et al.*, 2021). Oxidative stress index value is an indication of endogenous oxidant compounds suppressed by endogenous antioxidant agents provided by the plant materials (Dogan *et al.*, 2014).

Table 1. Total antioxidant status, total oxidant status and oxidative stress index of pumpkin seeds ethanolic extracts

TAS, TOS and OSI of pumpkin seeds extracts			
Sample	TAS (mmol/L)	TOS (μmol/L)	OSI
Pumpkin seeds extracts	4.18±0.36	14.68±0.42	0.35±0.10

Values are presented as means of triplicate results ± standard deviation

DPPH free radical scavenging activity

Data of free radical scavenging activity of pumpkin seeds ethanolic extracts and ascorbic acid at different concentrations have been presented in Table 2. From the findings it was evident that by increasing the concentration of extracts the DPPH free radical scavenging was found increased as at 0.25mg/mL value of DPPH free radical scavenging activity of pumpkin seeds ethanolic extracts was found 22.96±1.56 and was significantly increased to 56.10±0.90 at 2 mg/mL concentration, while DPPH free radical scavenging activity of ascorbic acid at 0.25 mg/mL was 65.46±0.95, which was increased to 92.70±0.30 at 2 mg/mL.

Use of traditional herbal remedies as preventive measures and to cure certain diseases are very common in developing and develop countries due to their lesser side effects with fewer complications. The antioxidant potential of a plant or its part depends upon the presence of biological active ingredients capable of suppressing free radicals and reactive oxygen species in living body. Recent advances in medicinal sciences have revealed that peels and seeds of plants have antioxidant potential (Pandey *et al.*, 2019). DPPH free radical scavenging activity of pumpkin seeds 80% methanolic extracts was found 16.56 mg AAE/100 g, in a study conducted by Hussain *et al.* (2021), in which a comparison of antioxidant and antimicrobial activities of pumpkin peel, flesh and seeds was made. Asif *et al.* (2017) made research to investigate antioxidant status of different parts of pumpkin, by DPPH free radical scavenging activity of different types of extracts and concluded that pumpkins are capable of promising antioxidant activities. Dissanayake *et al.* (2018) used DPPH free radical scavenging assay to check the antioxidant potential of pumpkin different fractions by using three different solvents and came on result that all types of solvents provided good results for DPPH free radical scavenging activity of different pumpkin parts. Supportive results were also found in the study of Singh *et al.* (2016), in which different fruits of *Cucurbitaceae* family were analyzed for their antioxidant potential by using different solvents using DPPH free radical scavenging analysis and both methanolic and ethanolic extracts exhibited prominent antioxidant activities.

Tyan *et al.* (2018) determined antioxidant activity of three different plants extracts of *Cucurbitaceae* family by using DPPH free radical scavenging method and concluded that by increasing the concentration of extracts dose the free radical scavenging activity was increased. They suggested that pumpkin seeds due to their antioxidant potential could reduce the risk of oxidation related diseases such as cardiovascular diseases and cancer. Hussain *et al.* (2021) made a comparison of phytochemicals present in peel, flesh and seeds of pumpkin (*Cucurbita maxima*), and concluded that pumpkin seeds are excellent sources of total phenolic, flavonoid, carotenoid and mineral contents and these bio-actives are capable of scavenging free radicals. Phenolic compounds such as flavonoids, alkaloids, saponins and steroids present in pumpkin seeds have been reported good antioxidant agents by scavenging the free radicals in living bodies (Mala and Kurian, 2016). Results supporting to our study were

found in the research work of Akgul *et al.* (2022), when DPPH free radical scavenging activity of medicinal plants was compared with ascorbic acid at different concentrations and data obtained revealed that plants ethanolic extracts have potential of scavenging free radicals.

Table 2. DPPH free radical scavenging activity of pumpkin seeds extracts in comparison with ascorbic acid at different concentrations

DPPH free radical scavenging activity of pumpkin seeds extracts		
Concentration mg/mL	Ascorbic acid (%)	EtOH (%)
0.25	65.46±0.95	22.96±1.56
0.5	86.90±0.80	36.60±1.10
1	89.18±0.45	43.58±1.40
2	92.70±0.30	56.10±0.90

Values are presented as means of triplicate results ± standard deviation

Conclusion

Pumpkin is one among the most nutritious vegetable also used as a medicinal food due to its pharmacological potential. Consumption of pumpkin and its seeds have a very long history since ancient times to cure different remedies. Pumpkin seeds extracts TAS was found 4.18±0.36 and TOS 14.68±0.42, whereas value of OSI was measured 0.35±0.10. DPPH free radical scavenging activity was observed increasing with increasing the concentration and maximum value 56.10±0.90% was observed at 2 mg/mL concentration. Pumpkin seeds are excellent source of phytochemicals responsible for strong antioxidant potential, a future prospect for pharma foods industry.

Recommendations

Pumpkin is a versatile vegetable known for its excellent nutritional profile loaded with phytochemicals promoting human health in different ways. Modern and innovative technologies could be implemented to utilize pumpkin in different ways to extract bioactives from pumpkin for development of nutraceuticals and functional foods. Waste streams of pumpkin like peels and seeds can be utilized in efficient ways to develop powders and extracts and their incorporation in bakery, beverages and pharma food industry.

Aknowledgements

The authors are grateful to the Institute of Food Science and Nutrition, University of Sargodha, Pakistan and Institute of Chemistry, University of Sargodha, Pakistan for providing the necessary facilities for conduct of this research work.

Conflict Of Interest

The authors have declared no conflict of interest for this article.

Abstract

Medicinal aromatic plants are preferred as an alternative to medications all over the world. These plants have also beneficial industrial uses such as pharmaceutical, cosmetics, and food industry. Moreover, they can be used in agricultural applications as pesticides. The extracts of these plants are rich in phenolics because of which they are named as medicinal plants. The extraction method is crucial as different solvents dissolve make different compounds found in the plant materials. In this study, the antibacterial activities of the extracts of lavender (*Lavandula officinalis*), epicalyx (*Althaea officinalis*), St. John's wort (*Hypericum perforatum*), daphne (*Laurus nobilis*), green tea (*Camellia sinensis*), blackberry (*Rubus fruticosus*), olive leaf (*Olea europaea*) and parsley (*Petroselinum crispum*) obtained by different solvents were tested on *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Enterococcus faecalis*. The naturally dried plants were obtained from herbalist shops and their extracts were obtained using ethanol, distilled water, and hexane using Soxhlet extraction. Antibigram technique was applied with agar well diffusion method in triplicates. Green tea, St. John's wort, daphne leaf, olive leaf and epicalyx extracts were determined to have inhibition effect on bacteria when compared with the reference antibiotic. The most effective solvent for green tea was distilled water and ethanol was the best for the other plants; while hexane was not an appropriate solvent for the Soxhlet extraction.

Key Words: Antibacterial effect, Plant extracts, Soxhlet, Antibigram

Bazı Bitki Özütlerinin Antibakteriyel Etkilerinin Araştırılması

Özet

Günümüzde antibiyotik direnci ciddi bir sorun haline gelmiştir. Tıbbi aromatik bitkiler tüm dünyada ilaçlara alternatif olarak kullanılmaktadır. Bu bitkilerin aynı zamanda farmasötik, kozmetik ve gıda endüstrileri gibi farklı endüstrilerde de faydalı kullanım alanları vardır. Ayrıca, tarımda pestisitlere alternatif olarak da kullanılabilmektedirler. Tıbbi bitki ismini almalarını sağlayan şey bitkilerin fenoliklerce zengin ekstraktlarıdır. Bitkide bulunan farklı bileşiklerin çözülmesini sağlamak için kullanılan ekstraksiyon metodu çok önemlidir. Bu çalışmada, lavanta (*Lavandula officinalis*), hatmi (*Althaea officinalis*), kantaron (*Hypericum perforatum*), defne (*Laurus nobilis*), yeşil çay (*Camellia sinensis*), böğürtlen (*Rubus fruticosus*), zeytin yaprağı (*Olea europaea*) and maydanoz (*Petroselinum crispum*) bitkilerinin farklı çözücüler ile elde edilen ekstraktları *Escherichia coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, ve *Enterococcus faecalis* bakteri üzerinde denenmiştir. Aktarlardan alınan ve doğal olarak kurutulan bitkilerin ekstraktları etanol, distile su ve hekzan kullanılarak elde edilmiştir. Antibiyogram tekniği agar kuyu metodu ile üç tekrarlı olacak şekilde denenmiştir. Yeşil çay, kantaron, defne, zeytin yaprağı, ve hatminin bakteriler üzerinde antibakteriyel etkisi olduğu gösterilmiştir. Yeşil çay için en etkili çözücü distile su iken diğer bitkiler için etanol daha etkili olmuştur. Soxhlet ekstraksiyonunda bu bitkiler için hekzanın etkili bir çözücü olmadığı gözlenmiştir.

Anahtar Kelimeler: Antibakteriyel etki, bitki ekstraktları, Soxhlet, Antibiyogram

Abamectin, hexythiazox and spiromesifen resistance in populations of *Tetranychus urticae* Koch (Acari:Tetranychidae) collected from cucumber greenhouses in central district of Tokat province*

Tarık Balkan¹

¹ Department of Plant Protection, Faculty of Agriculture, Tokat Gaziosmanpasa University Tokat / Turkey.

* This study supported by Tokat Gaziosmanpasa University Scientific Research Unit, Grant Project No: 2021/48.

Abstract

The two-spotted spider mite, *Tetranychus urticae* Koch (Acari: Tetranychidae), which has rapidly developed high resistance to many classes of acaricides, is one of the most important pests in greenhouses. This study was carried out to determine the resistance levels of *T. urticae* populations collected on cucumber plants produced in the greenhouses of Gümenek village in the central district of Tokat province in the 2022 production season against abamectin, hexythiazox and spiromesifen. The LC₅₀ values of the collected populations were determined by spray tower-leaf disc method. The resistance rates were found by dividing the LC₅₀ values of the collected greenhouse populations to the LC₅₀ value of the susceptible population. The resistance levels of *T. urticae* were determined as between 1.88-2.14-folds against abamectin, 1.67-1.84 folds against hexythiazox and 1.77-2.09 folds against spiromesifen. According to these results, a low rate of resistance development was observed against the studied acaricides in *T. urticae* populations.

Key Words: *T. urticae*, Acaricide, Resistance, Cucumber, Greenhouse

Tokat ili merkez ilçesindeki hıyar seralarından toplanan *Tetranychus urticae* Koch (Acari: Tetranychidae) popülasyonlarının abamectin, hexythiazox ve spiromesifen'e karşı direnç düzeylerinin belirlenmesi*

Özet

Birçok akarisit sınıfına hızla yüksek direnç geliştirmiş olan iki noktalı örümcek *Tetranychus urticae* Koch (Acari: Tetranychidae), seralardaki en önemli zararlılardan biridir. Bu çalışma, 2022 üretim sezonunda Tokat ili Merkez ilçesi Gümenek köyü seralarında üretilen hıyar bitkileri üzerinden toplanan *T. urticae* popülasyonlarının abamectin, hexythiazox ve spiromesifen'e karşı direnç düzeylerinin belirlenmesi için yapılmıştır. Toplanan popülasyonların LC₅₀ değerleri ilaçlama kulesi kullanılarak yaprak disk metodu ile belirlenmiştir. Toplanan sera popülasyonlarının LC₅₀ değerleri hassas popülasyonun LC₅₀ değerine oranlanarak direnç oranları bulunmuştur. *T. urticae* popülasyonlarında abamectin'e karşı 1.88-2.14 kat; hexythiazox'a karşı 1.67-1.84 kat ve spiromesifen'e karşı 1.77- 2.09 kat arasında direnç oranı tespit edilmiştir. Bu sonuçlara göre *T. urticae* popülasyonlarında çalışılan akarisitlere karşı düşük oranda direnç gelişimi görülmüştür.

Anahtar Kelimeler: *T. urticae*, Akarisit, Direnç, Hıyar, Sera

Abstract

This study was carried out to determine the effects of plant growth promoting rhizobacteria and mycorrhiza applications on the plant growth of *Zinnia elegans* L. (Dirty Lady Flower) and *Dahlia variabilis* L. (Star Flower). In the study, Zesty variety purple dirty lady flower, Figari Violet variety star flower, 4 different rhizobacteria (*Enterobacter cloacae* (ZE-2), *Bacillus cereus* (ZE-7), *Pseudomonas putida* (ZE-12), *Acinetobacter calcoaceticus* (ZE-13)) and 'Endo Roots Soluble' (ERS) mycorrhizal fungi obtained from a private company were used. In the study, firstly a suspension was prepared from bacterial isolates developed for 24 hours at 26 °C. The prepared suspensions were adjusted to 0.3 absorbance (A 600: 0.3) at 600 nanometers in the spectrophotometer. Likewise, it was prepared at a concentration of 5000 ppm in mycorrhiza. Flower seedlings were dipped into the prepared suspensions and kept for 30 minutes. At the end of the period, flower seedlings were planted in pots with a mixture of peat and perlite. Seedlings without rhizobacteria and mycorrhiza treatments were used as the control group. The experiment was established with 3 replications and 10 plants per replication. In the evaluations made throughout the experiment, rhizobacteria and mycorrhiza applications increased plant height, number of leaves and flowers, branch thickness, and branch weight especially in *Z. elegans* compared to the control. Among the applications, ZE-12+ZE-13 combination application was the most effective. As a result, with this study, it has been revealed that rhizobacteria and mycorrhiza applications, which are of natural origin and do not harm the environment, have the potential to be used in ornamental plants cultivation, and that these applications should be expanded.

Key Words: Plant Growth Promoting Rhizobacteria, Mycorrhiza, *Zinnia elegans*, *Dahlia variabilis*

Bitki Gelişimini Teşvik Eden Rizobakteri ve Mikoriza Uygulamalarının *Zinnia elegans* L. ve *Dahlia variabilis* L.'in Bitki Gelişimine Etkisi

Özet

Bu çalışma, bitki gelişimini teşvik eden rizobakteri ve mikoriza uygulamalarının *Zinnia elegans* L. (Kırlı Hanım Çiçeği) ve *Dahlia variabilis* L. (Yıldız Çiçeği)'in gelişimleri üzerindeki etkisini belirlemek amacıyla yapılmıştır. Çalışmada Zesty çeşidi mor renkli kırlı hanım çiçeği, Figari Violet çeşidi yıldız çiçeği, 4 farklı rizobakteri (*Enterobacter cloacae* (ZE-2), *Bacillus cereus* (ZE-7), *Pseudomonas putida* (ZE-12), *Acinetobacter calcoaceticus* (ZE-13)) ve özel bir firmadan temin edilen 'Endo Roots Soluble' (ERS) mikoriza mantarları kullanılmıştır. Çalışmada ilk olarak 26 °C'de 24 saat süre ile geliştirilen bakteri izolatlarından süspansiyon hazırlanmıştır. Hazırlanan süspansiyonlar spektrofotometrede 600 nanometrede 0.3 absorbans (A 600: 0.3) değerine ayarlanmıştır. Aynı şekilde mikorizada 5000 ppm'lik konsantrasyonda hazırlanmıştır. Hazırlanan süspansiyonlar içerisine çiçek fideleri daldırılarak 30 dk bekletilmiştir. Süre bitiminde çiçek fideleri torf ve perlit karışımı bulunan saksılara dikilmiştir. Kontrol grubu olarak rizobakteri ve mikoriza uygulaması yapılmamış fideler kullanılmıştır. Deneme 3 tekerrürlü ve tekerrür başına 10'ar bitki olacak şekilde kurulmuştur. Deneme boyunca yapılan değerlendirmelerde kontrole kıyasla rizobakteri ve mikoriza uygulamaları özellikle *Z. elegans*'ta bitki boyu, yaprak ve çiçek sayısı, dal kalınlığı, dal ağırlığında artış sağlamıştır. Uygulamalar içerisinde en etkili ZE-12+ZE-13 kombinasyon uygulaması olmuştur. Sonuç olarak, bu çalışma ile süs bitkileri yetiştiriciliğinde doğal kökenli olan ve çevreye zararı olmayan rizobakteri ve mikoriza uygulamalarının kullanılabilme potansiyeline sahip olduğu, ayrıca bu uygulamaların yaygınlaştırılması gerektiği ortaya konulmuştur.

Anahtar kelimeler: Bitki Gelişimini Teşvik Eden Rizobakteri, Mikoriza, *Zinnia elegans*, *Dahlia variabilis*

Antibacterial Effect of *Salvia bracteata* ve *Tagetes erecta* Plant Extracts Against Some Plant Pathogen Bacteria

Kübra Eroglu¹, Sabriye Belguzar¹

¹Department of Plant Protection, Faculty of Agriculture, Tokat Gaziosmanpaşa University

Abstract

In this study, *Salvia bracteata* Banks&Sol. (Sage) and *Tagetes erecta* L. (Marigold) plants, methanol extracts of *Pseudomonas syringe* pv. *tomato* (*Pst*; Tomato bacterial spot disease agent), *Clavibacter michiganensis* subsp. *michiganensis* (*Cmm*; Tomato bacterial cancer and wilt disease agent) and *Xanthomonas euvesicatoria* (*Xe*; Pepper bacterial spot disease agent) were determined. In the study, the leaf part of *S. bracteata* and the leaf and flower parts of *T. erecta* were used. In order to prepare methanol extract from ground plant materials, 100 grams of plant material was weighed and placed in an erlenmeyer flask and 2000 ml of methanol was added and shaken at 150 rpm for 48 hours. At the end of the period, the material was filtered with the help of cheesecloth and the methanol was removed at 40 °C, so the extraction process was carried out. In the study carried out as a Petri experiment, different doses of extracts prepared from plant materials were prepared and placed in autoclaved media. After the media solidified, 100 µl of suspensions prepared from bacterial cultures at a density of 1x10⁶ cells/ml were taken and inoculated into the extracted media and smeared with sterile glass rod. Bacteria were cultivated on the media where the extracts were not added and used as a positive control. Bacteria densities were measured in the spectrophotometer (600 nm) 2 days after inoculation in petri dishes left to incubation at 26 °C. As a result of the experiment, the highest effect on pathogens was seen in the extract obtained from the flowers of *T. erecta*. In parallel with the dose increase, the effect ratio also increased. While all doses of flower extract except 250 ppm were effective on *Pst*, all doses on *Cmm* were effective, while 2000 and 3000 ppm doses were effective (100%) on *Xe*. While 3000 ppm dose of *S. bracteata* extract was effective on *Pst*, it did not affect other pathogens. The extract obtained from the leaves of *T. erecta* was only effective on *Cmm*. In conclusion, with this study, it was revealed that especially *T. erecta* has an antibacterial effect on pathogens.

Key Words: *Salvia bracteata*, *Tagetes erecta*, *Pseudomonas syringe* pv. *tomato*, *Clavibacter michiganensis* subsp. *michiganensis*, Antibacterial effect

***Salvia bracteata* ve *Tagetes erecta* Bitki Ekstraktlarının Bazı Bitki Patojeni Bakterilere Karşı Antibakteriyel Etkisi**

Özet

Bu çalışma ile *Salvia bracteata* Banks&Sol. (Adaçayı) ve *Tagetes erecta* L. (Kadife çiçeği) bitkilerinden elde edilen metanol ekstraktlarının *Pseudomonas syringe* pv. *tomato* (*Pst*; Domates bakteriyel benek hastalığı etmeni), *Clavibacter michiganensis* subsp. *michiganensis* (*Cmm*; Domates bakteriyel kanser ve solgunluk hastalığı etmeni) ve *Xanthomonas euvesicatoria* (*Xe*; Biber bakteriyel leke hastalığı etmeni)'ya karşı antibakteriyel etkileri belirlenmiştir. Çalışmada *S. bracteata*'nın yaprak kısmı, *T. erecta*'nın yaprak ve çiçek kısımları kullanılmıştır. Öğütülmüş bitki materyallerinden metanol ekstraktı hazırlamak için, 100'er gram bitki materyali tartılarak erlenmayer içerisine konulmuş ve üzerine 2000 ml metanol eklenerek 48 saat 150 rpm'de çalkanmıştır. Süre bitiminde tülbent yardımı ile materyal süzülerek 40 °C'de metanol uzaklaştırılmış, böylece ekstraksiyon işlemi gerçekleştirilmiştir. Petri denemesi şeklinde yürütülen çalışmada, bitki materyallerinden hazırlanan ekstraktlardan farklı dozlar hazırlanarak otoklav edilmiş besi yerlerine konulmuştur. Besi yerleri katılaştıktan sonra, bakteri kültürlerinden hazırlanan 1x10⁶ hücre/ml yoğunluğundaki süspansiyonlardan 100 µl alınarak ekstraktlı besi yerlerine inokule edilmiş ve steril cam çubuk ile yayma ekim yapılmıştır. Ekstraktların eklenmediği besi yerlerine bakteri ekimi yapılarak pozitif kontrol olarak kullanılmıştır. 26 °C'de inkübasyona bırakılan petrilerde inokulasyondan 2 gün sonra spektrofotometrede (600 nm) bakteri yoğunlukları ölçülmüştür. Deneme sonucunda patojenler üzerinde en yüksek etki *T. erecta*'nın çiçeklerinden elde edilen ekstraktta görülmüştür. Doz artışına paralel olarak etki oranı da artmıştır. *Pst* üzerinde çiçek ekstraktının 250 ppm dışındaki tüm dozları, aynı şekilde *Cmm* üzerinde bütün dozları etkili olurken, *Xe* üzerinde 2000 ve 3000 ppm dozları etkili (%100) olmuştur. *S. bracteata* ekstraktının 3000 ppm dozu *Pst* üzerinde etkili olurken diğer patojenler üzerinde etki göstermemiştir. *T. erecta*'nın yapraklarından elde edilen ekstrakt sadece *Cmm* üzerinde etkili olmuştur. Sonuç olarak yapılan bu çalışma ile özellikle *T. erecta*'nın patojenler üzerinde antibakteriyel etkiye sahip olduğu ortaya konulmuştur.

Anahtar Kelimeler: *Salvia bracteata*, *Tagetes erecta*, *Pseudomonas syringe* pv. *tomato*, *Clavibacter michiganensis* subsp. *michiganensis*, Antibakteriyel etki

Comparison of Israeli carp meat, scales, visceral organs and bone structures in terms of nutritional content

Koray Korkmaz¹

¹ Department of Fisheries Engineering Technology, Fatsa Faculty of Marine Sciences, Ordu University, Ordu, Turkey

Abstract

Recycling and use of food wastes have started to be promoted especially in developed countries. By-products formed during the processing of foods are released in varying amounts after the processes applied by the food industry. Many food wastes are a valuable source of nutrients with their protein, carbohydrate, and lipid contents. The evaluation of the by-products obtained in the food industry and the development of new functional products attract great attention in terms of providing a significant economic return at the industrial level. In this study, the use of meat, scales, viscera, and bone structures of Israeli carp (*Carassius gibelio*), which is one of the non-economic fish species of the Black Sea, was investigated as a functional product to increase nutritional value as an alternative protein and lipid source for human consumption and as animal feed. Its use as an alternative product for the proportional amounts of these structures among themselves was 46% as internal organs, 27% meat, 16% scales, and 11% bony structures. The use of other parts (63%) as an alternative is essential because of the low total meat ratio of 27% in Israeli carp, which is an invasive and non-economic species. Although the highest crude protein ratio was observed in the scales (21.31%), the lowest percentage was detected in the internal organs (1.08%). Considering the lipid ratio, the highest rate was observed in the internal organs (22.38%) and the lowest in the muscle tissue (1.43%). In terms of moisture content, the ratio decreased from fish meat to flakes. The highest rate was observed in muscle (80.59%), followed by internal organs (77.62%), bony structures (71.83%), and scales (67.31%). Ash ratios were also from highest to lowest scale (9.07%), bony structures (7.20%), internal organs (3.25%), and muscle (1.27%).

Key Words: *Israeli carp, waste assessment, alternative source, nutritional content.*

İsrail sazanı eti, pulu, iç organı ve kemiksi yapılarının besinsel içerikler açısından karşılaştırılması

Özet

Gıda atıklarının geri kazanımı ve kullanımı, özellikle gelişmiş ülkelerde teşvik edilmeye başlanmıştır. Gıdaların işlenmesi sırasında oluşan yan ürünler, gıda endüstrisi tarafından uygulanan işlemler sonrasında değişen miktarlarda açığa çıkmaktadır. Birçok gıda atığı, içermiş olduğu protein, karbonhidrat ve lipid içerikleri ile değerli bir besin kaynağı olarak karşımıza çıkmaktadır. Gıda endüstrisinde elde edilen yan ürünlerin değerlendirilmesi ve yeni fonksiyonel ürünlerin geliştirilmesi, endüstriyel boyutta önemli bir ekonomik getiri sağlaması açısından yoğun ilgi görmektedir. Bu çalışmada, Karadeniz'in ekonomik değere sahip olmayan balık türlerinden İsrail sazanı (*Carassius gibelio*)'nın et, pul, iç organ ve kemiksi yapılarının gerek insan tüketiminde alternatif protein ve lipid kaynağı olarak kullanımında gerekse hayvan yemi olarak besinsel değeri artırmada fonksiyonel ürün şeklinde kullanımı için alternatif ürün olarak kullanımı araştırılmıştır. Bu yapıların kendi aralarındaki oransal miktarları 46% ile iç organ, 27% et, 16% pul ve 11% kemiksi yapılar şeklinde olmuştur. İstilacı ve ekonomik olmayan bir tür olan İsrail sazanında total oransal açıdan 27% oranındaki etin düşük olması nedeniyle diğer kısımların (63%) alternatif olarak kullanımı önem arz etmektedir. En yüksek ham protein oranı pullarda (21.31%) görülmesine rağmen en düşük oran ise iç organlarda (1.08%) tespit edilmiştir. Lipid oranına bakıldığında ise en yüksek oran iç organlarda (22.38%) en düşük ise kas dokusunda (1.43%) gözlenmiştir. Nem içerikleri açısından oran balık etinden pullara doğru düşüş eğiliminde olmuştur. En yüksek oran kasta (80.59%) gözlenirken bunu iç organlar (77.62%), kemiksi yapılar (71.83%) ve pullar (67.31%) takip etmektedir. Kül oranları da en yüksekten en düşüğe doğru pul (9.07%), kemiksi yapılar (7.20%), iç organlar (3.25%) ve kas (1.27%) şeklinde olmuştur.

Anahtar Kelimeler: *İsrail sazanı, atık değerlendirmesi, alternatif kaynak, besinsel içerik.*

The influence of sweet potato peel extract on biogenic amine accumulation in amino acid decarboxylase broth by food-borne pathogens

Yılmaz Uçar¹, Mustafa Durmuş², Ali Rıza Köşker², Koray Korkmaz¹, Hatice Yazgan³

¹ Department of Fisheries Engineering Technology, Fatsa Faculty of Marine Sciences, Ordu University, Ordu, Türkiye

² Department of Seafood Processing Technology, Faculty of Fisheries, Cukurova University, Adana, Türkiye

³ Department of Food Hygiene and Technology, Faculty of Ceyhan Veterinary Medicine, Cukurova University, Adana, Türkiye

Abstract

Biogenic amines produced by bacteria can be toxic to humans and animals and cause a variety of illnesses. When seafood is improperly stored and handled, bacteria can rapidly grow and they decarboxylated free amino acids to produce biogenic amines. The growth of the bacterial cells in foods as well as the prevention of toxin production is of great importance for food processing technology. It has been reported that sweet potato peel extracts have antibacterial properties on food spoilage bacteria and pathogens. However, there are not sufficient research regarding to the effect of sweet potato peel extracts on biogenic amines production. Therefore, in this study, the impact of sweet potato peel extracts used at different doses (0.5 and 1 mL/100 mL) on biogenic amine (BAs) and ammonia (AMN) production by *Staphylococcus aureus*, *Escherichia coli*, *Klebsiella pneumoniae*, *Enterococcus faecalis*, *Pseudomonas aeruginosa*, *Aeromonas hydrophila* and *Salmonella enterica* serovar Paratyphi A) was investigated in both histidine decarboxylase broth (HDB) and tyrosine decarboxylase broth (TDB) separately. The results obtained from the current study showed that all pathogens have ability to decarboxylase amino acid (histidine or tyrosine) to produce biogenic amines. Significant differences ($P < 0.05$) were found in the production of AMN and BAs between members of the gram negative and gram-positive pathogens in both amino acid decarboxylase broths. These differences were observed depending on the concentration of extracts and the pathogens studied. Sweet potato peel extracts used at different doses in TDB showed significant increase compare to HDB under the same conditions. This results also showed that extract has higher inhibitory effect on AMN and BAs formation by food-borne pathogens in HDB than TDB.

Key Words: Sweet potato peel extracts, biogenic amines, bacterial growth, amino acid decarboxylase broth, foodborne pathogens

Tatlı patates kabuğu ekstresinin amino asit dekarboksilaz sıvısında gıda kaynaklı patojenler tarafından üretilen biyojenik amin üretimi üzerine etkisi

Özet

Bakteriler tarafından üretilen biyojenik aminler, insanlar ve hayvanlar için toksik olabilir ve çeşitli hastalıklara neden olabilir. Su ürünleri uygun şekilde depolanmadığında veya işlendiğinde, bakteriler hızla gelişebilir ve biyojenik aminler üretmek için serbest amino asitleri dekarboksile ederler. Gıdalardaki bakteri hücrelerinin gelişimi ve toksin üretiminin önlenmesi gıda işleme teknolojisi için büyük önem taşımaktadır. Tatlı patates kabuğu ekstraktlarının gıda bozucu bakteri ve patojenler üzerinde antibakteriyel özelliklere sahip olduğu bildirilmiştir. Ancak tatlı patates kabuğu ekstraktlarının biyojenik amin üretimi üzerindeki etkisine ilişkin yeterli araştırma bulunmamaktadır. Bu nedenle bu çalışmada, farklı dozlarda (0,5 ve 1 mL/100 mL) kullanılan tatlı patates kabuğu ekstraktlarının *Staphylococcus aureus*, *Escherichia coli*, *Klebsiella pneumoniae*, *Enterococcus faecalis*, *Pseudomonas aeruginosa*, *Aeromonas hydrophila* ve *Salmonella enterica* serovar Paratyphi A) tarafından biyojenik amin (BA'lar) ve amonyak (AMN) üretimine etkisi hem histidin dekarboksilaz sıvısı (HDB) hem de tirozin dekarboksilaz sıvısı (TDB) içinde ayrı ayrı incelenmiştir. Mevcut çalışmadan elde edilen sonuçlar, tüm patojenlerin biyojenik aminler üretmek için kullanılan amino asitleri (histidin veya tirozin) dekarboksile etme yeteneğine sahip olduğunu göstermiştir. Her iki amino asit dekarboksilaz sıvısında gram negatif ve gram pozitif patojen üyeleri arasında AMN ve BA üretiminde önemli farklılıklar ($P < 0.05$) gözlenmiştir. Bu farklılıklar, ekstraktların konsantrasyonuna ve kullanılan mikroorganizma türüne bağlı olmuştur. TDB'de farklı dozlarda kullanılan tatlı patates kabuğu ekstraktları, aynı koşullar altında HDB'ye göre önemli artış göstermiştir. Bu sonuçlar ayrıca ekstraktın HDB'de gıda kaynaklı patojenler tarafından TDB'ye göre AMN ve BA oluşumu üzerinde daha yüksek inhibitör etkiye sahip olduğunu göstermiştir.

Anahtar Kelimeler: Tatlı patates kabuğu ekstraktı, biyojenik aminler, bakteri gelişimi, amino asit dekarboksilaz sıvısı, gıda kaynaklı patojenler

Metal levels of commercially important *Saurida lessepsianus* from North-Eastern Mediterranean: Health risk estimation

Ali Rıza Köşker¹, Yılmaz Uçar², Mustafa Durmuş¹, Koray Korkmaz², Hatice Asuman Yılmaz¹

¹ Department of Seafood Processing Technology, Faculty of Fisheries, Cukurova University, Adana, Türkiye

² Department of Fisheries Engineering Technology, Fatsa Faculty of Marine Sciences, Ordu University, Ordu, Turkey

Abstract

The metal levels of a commercially important fish species (*Saurida lessepsianus*) of economic value in the northeastern Mediterranean were investigated. *S. lessepsianus* used in the study was investigated in Mersin Bay using commercial fishing boats. Sampling was done over four seasons (winter, spring, summer and autumn) between December 2018 and September 2019. Mg, P, K, Fe, Cu, Zn, Mn, Se, Al, Cr, As, Cd and Pb levels ($\mu\text{g/g}$, w/w) in fish species were measured seasonally. Min-max metal levels found in the studied fish species were as follows ($\mu\text{g/g}$, ww); Mg (149.27-361.37), P (960.66-2387.33), K (4322.83-5404.13), Fe (7.92-16.64), Cu (0.36-0.84), Zn (3.70-9.81), Mn (0.24-0.70), Se (0.61-2.27), Al (2.58-7.62), Cr (0.36-0.65), As (3.13-10.00), Cd (0.07-0.12) and Pb (0.36-0.65). In addition, to predict possible risks regarding consumer health that might arise from the consumption of these species, risk estimates were calculated for adults and children for consumption frequencies of once, thrice and seven times a week. For this, the estimated weekly intake (EWI), the target hazard quotient (THQ) and the lifetime cancer risk (CR) for the consumption of *S. lessepsianus* of economic value in the Northeastern Mediterranean were calculated. EWI values were found to be lower than the PTWI values determined by the European Food Safety Authority and FAO/WHO. For most samples examined, it was found that THQ<1. For the samples examined, it was determined that the CR values for consumers is low, except for heavy consumption cases.

Key Words: Seafood, risk assessment, estimated weekly intake, Target Hazard Quotient, lifetime cancer risk,

Kuzey-Doğu Akdeniz'den ticari olarak önemli *Saurida lessepsianus*'un metal seviyeleri: Sağlık riski tahmini

Özet

Kuzeydoğu Akdeniz'de ekonomik değeri olan ticari açıdan önemli bir balık türünün (*Saurida lessepsianus*) metal düzeyleri araştırılmıştır. Çalışmada kullanılan *S. lessepsianus* örnekleri, Mersin Körfezi'nde ticari balıkçı tekneleri kullanılarak temin edilmiştir. Örneklem Aralık 2018 ile Eylül 2019 arasında dört mevsim olarak (kış, ilkbahar, yaz ve sonbahar) yapılmıştır. Mg, P, K, Fe, Cu, Zn, Mn, Se, Al, Cr, As, Cd ve Pb seviyeleri ($\mu\text{g/g}$, w/w) mevsimsel olarak ölçülmüştür. İncelenen balık türünde bulunan min-max metal seviyeleri ($\mu\text{g/g}$, ww); Mg (149.27-361.37), P (960.66-2387.33), K (4322.83-5404.13), Fe (7.92-16.64), Cu (0.36-0.84), Zn (3.70-9.81), Mn (0.24-0.70), Se (0.61-2.27), Al (2.58-7.62), Cr (0.36-0.65), As (3.13-10.00), Cd (0.07-0.12) ve Pb (0.36-0.65) olarak belirlenmiştir. Ayrıca bu türün tüketiminden kaynaklanabilecek tüketici sağlığına ilişkin olası riskleri tahmin etmek için yetişkinler ve çocuklar için haftada bir, üç ve yedi kez tüketim sıklıkları için risk tahminleri hesaplanmıştır. Bunun için Kuzeydoğu Akdeniz'de ekonomik değeri olan *S. lessepsianus* tüketimi için tahmini haftalık alım miktarı (EWI), hedef tehlike katsayısı (THQ) ve yaşam boyu kanser riski (CR) hesaplanmıştır. EWI değerleri, Avrupa Gıda Güvenliği Otoritesi ve FAO/WHO tarafından belirlenen PTWI değerlerinden düşük bulunmuştur. İncelenen örneklerin çoğu için THQ<1 olduğu belirlenmiştir. İncelenen numuneler için yoğun tüketim durumları dışında tüketiciler için CR değerlerinin düşük olduğu tespit edilmiştir.

Anahtar Kelimeler: Su ürünleri, risk değerlendirmesi, tahmini haftalık alım, Hedef Tehlike Katsayısı, yaşam boyu kanser riski,

Express Determination Of Ecotoxicant Volume Substances In Waste Water Formed In The Process Of Hydrogen Purification Of Petroleum Oils

Huseynli Atlas

Baku State University, Ecological chemistry, Baku, Azerbaijan Republic, atlashuseynli@yahoo.com

The hydrogen treatment plant for petroleum distillates and other oil distillates at the Heydar Aliyev Oil Refinery is considered to be more environmentally and economically efficient than the old classical technological plants. As it is known, so far the complete reduction of emissions has not been achieved during the technological processes of oil refining in the developed countries of the world oil industry

One of the main directions of our research is the initial assessment of the environmental impact of wastewater generated at the facility. The following analyzes were performed for this purpose.

Spectral analysis of volatile ecotoxicants in water samples taken from wastewater formed during the hydrogenation of Autol 8 and Autol 15 oil distillates as catalysts as the main raw material was carried out in the above-mentioned facility [1-3].

We use gas chromatography-mass spectrometry method for the analysis of aromatic hydrocarbons in polystyrene wastewater; optical emission spectrometry method for metals; spectrometry method for phenols, dyes and fluorine; nephelometry method for turbidity; gravimetry method for common suspended particles.

The results obtained during laboratory measurements by taking water samples from the general wastewater outlet of the facility in accordance with the known methods are shown below (Table 1).

Table 1. Results of analysis of industrial wastewater

Assigned indicator	Amounts. mg/l
Polycyclic aromatic hydrocarbons	
Naphthalene	9.8
Acenaftilen	0.06
Acenaften	0.06
Fluoren	0.17
Fenantren	0.27
Anthracene	0.18
Fluorant	0.23
Pyrenees	0.36
Benz (a) anthracene	0.34
Krizen	0.53
Benz (b + j + k) fluorescent	0.30
Benz (a) pyrene	0.18
Inden (1,2,3-cd) pyrene	0.08
Benz (ghi) perilen	0.09
Dibenz (ah) anthracene	0.09
Σ 16 Polycyclic aromatic hydrocarbons	12.7

As can be seen from the results obtained from the tables, the reasons for the formation of all volatile organic and inorganic substances with all ecotoxicant properties in the water sample taken from the plant of the refinery can be explained as follows:

- Chemical transformations of hydrogen gas with Autol 8 and Autol 15 distillates due to the presence of sulfur, nitrogen, oxygen, phosphorus organic compounds, various mixtures of hydrocarbons and metal salts and catalysts, pressure and temperature up to 280-310°C. resulting in volatile ecotoxicants.
- Although the individual quantities of the refinery are less than normal, as can be seen from the table, their total amount is very high and toxic.

Evaluation of total antioxidant and oxidant status, oxidative stress index and DPPH free radical scavenging activities of pumpkin (*Cucurbita maxima*) seeds ethanolic extracts

Ashiq Hussain^{1*}

¹Institute of Food Science and Nutrition, University of Sargodha, Sargodha, Pakistan, *Corresponding author

Abstract

Fruits and vegetables are basic crops of mass consumption for human population to meet their food requirements. Recent advances in medicinal studies have revealed that different parts of fruits and vegetables are loaded with phytochemicals responsible for eliminating the risks of different diseases. Pumpkin (*Cucurbita maxima*) is one of the abundantly grown and consumed vegetable all around the world. Seeds of this vegetables are named as nutritional power houses due to their excellent nutrient profiles. In present study total antioxidant status (TAS), total oxidant status (TOS), oxidative stress index (OSI) and DPPH free radical scavenging activity, of pumpkin seeds extracts were determined. Extraction of pumpkin seeds was carried out in a Soxhlet apparatus using ethanol as extraction solvent. TAS and TOS were determined through Rel Assay Kits and free radical scavenging activity was measured through DPPH assay. TAS was found 4.18 ± 0.36 and TOS 14.68 ± 0.42 , whereas value of OSI was measured 0.35 ± 0.10 . DPPH free radical scavenging activity was observed increasing with increasing the concentration and maximum value $56.10 \pm 0.90\%$ was observed at 2 mg/mL concentration. From these results it was concluded that pumpkin seeds could be utilized as natural antioxidant source with potential to reduce oxidative stress and minimizing the risks of certain diseases.

Reactive Extraction of Lactic Acid Using Trioctylamine with Environmentally Friendly Solvents

Mehmet Yetisen¹, Cem Baltacıoğlu¹, Hasan Uslu¹

¹Food Engineering Department, Faculty of Engineering, Niğde Ömer Halisdemir University, Niğde, Turkey

Corresponding Author ✉: cembaltacioglu@ohu.edu.tr

Abstract

Today, carboxylic acids are used very frequently in fields such as medicine, food and cosmetics. The production of carboxylic acids by fermentation has gained importance with the increasing interest in environmentally friendly production types. However, separation of carboxylic acids from the fermentation medium is difficult. Many methods have been developed for the separation of these acids from the fermentation medium. Among these methods, separation by reactive extraction has recently come to the fore as an innovative method. Lactic acid is a small molecule organic acid that is used extensively in industry as both raw material and additive. Although the production methods of lactic acid are developed, there is a need for studies on the separation of lactic acid from the fermentation medium. In this study, the separation of lactic acid from aqueous solutions using trioctylamine (TOA) reactant and environmentally friendly solvents such as sunflower and rice bran oil was investigated, and it was aimed to contribute to the separation of lactic acid by reactive extraction. It is aimed to determine the most suitable reactant / solvent ratios with reactive extraction analyzes. As a result of the studies, the highest efficiency (72.91%) was achieved with the TOA reactant. An increase in yield occurred as a result of using both sunflower oil and rice bran oil (1:1) together. When the physical and reactive extraction results were examined, it was observed that the addition of TOA to the organic phase greatly increased the extraction efficiency in the recovery of carboxylic acids from aqueous solutions. While the physical extraction yield was 11.85%, the yield increased up to 72.91% in reactive extraction. An increase in yield was observed about 7 times. In general, it was understood from the results that the dispersion coefficient (from 0.13 to 2.69) values increased with the increasing extractant concentration, and the loading factor (from 1.79 to 0.69) values decreased. Considering the organic phase mixtures formed with extractant and diluent combinations, it has been determined that the most positive results in terms of extraction efficiency can be obtained when 3.62M TOA is used for lactic acid.

Key Words: *Reactive extraction, Physical extraction, Trioctylamine, Sunflower oil, Rice bran oil*

Çevre Dostu Çözücüler ile Trioktil Amin Kullanılarak Laktik Asitin Reaktif Ekstraksiyonu

Özet

Günümüzde karboksilik asitler ilaç, gıda, kozmetik gibi alanlarda çok sık kullanılmaktadır. Çevre dostu üretim çeşitlerine olan ilginin artması ile karboksilik asitlerin fermantasyon ile üretilmeleri önem kazanmıştır. Fakat karboksilik asitlerin fermantasyon ortamından ayrılması zor olmaktadır. Bu asitlerin fermantasyon ortamından ayrılmasına yönelik birçok yöntem geliştirilmiştir. Bu yöntemler arasında reaktif ekstraksiyon ile ayırma yenilikçi bir yöntem olarak son zamanlarda öne çıkmıştır. Laktik asit gerek hammadde gerekse katkı maddesi olarak endüstride yoğun bir şekilde kullanılan küçük molekülü organik asittir. Laktik asitin üretim metotları gelişmiş olmasına rağmen fermantasyon ortamından ayrılmasına yönelik çalışmalar yapılmasına ihtiyaç duyulmaktadır. Bu çalışmada, laktik asitin sulu çözeltilerinden trioktil amin (TOA) reaktanı ve ayçiçek ve pirinç kepek yağı gibi çevre dostu çözücüler kullanılarak ayrılması incelenmiş ve reaktif ekstraksiyon ile laktik asitin ayrılmasına katkı sağlayacağı amaçlanmıştır. Reaktif ekstraksiyon analizleri ile en uygun reaktant / çözücü oranlarını tespit etmek hedeflenmiştir. Çalışmalar sonucunda TOA reaktanı ile en yüksek verime (%72.91) ulaşılmıştır. Hem ayçiçek yağı hem de pirinç kepek yağının (1:1) birlikte kullanılması neticesinde verimde artış meydana gelmiştir. Yapılan fiziksel ve reaktif ekstraksiyon sonuçları incelendiğinde, karboksilik asitlerin sulu çözeltilerden geri kazanımında organik faza TOA eklemesinin ekstraksiyon etkinliğini büyük oranda arttırdığı görülmüştür. Fiziksel ekstraksiyonda verim %11.85 bulunurken, reaktif ekstraksiyonda verim %72,91'e kadar çıkmıştır. Yaklaşık 7 kat verimde artış gözlenmiştir. Genel itibariyle sonuçlardan artan ekstraktan konsantrasyonu ile birlikte dağılım katsayısı (0.13'dan 2.69'a) değerlerin de arttığı, yükleme faktörü (1.79'dan 0.69'a) değerlerinin azaldığı anlaşılmıştır. Ekstraktan ve seyreltici kombinasyonlarıyla oluşturulan organik faz karışımları göz önüne alındığında ekstraksiyon verimliliği açısından en olumlu sonuçların laktik asit için 3.62M TOA kullanıldığında elde edilebildiği tespit edilmiştir.

Anahtar Kelimeler: *Reaktif ekstraksiyon, Fiziksel ekstraksiyon, trioktil amin, Ayçiçek yağı, Pirinç kepek yağı*

Abstract

Although land-based pollution is expressed as the most important pollution factor in the pollution of the seas (80%), the rate of pollution originating from ships (approximately 20%) is not to be underestimated. The fact that marine pollution is caused almost exclusively by ships requires investigation of the measures to be taken against marine pollution from ships and their applicability. As a matter of fact, the most important cause of pollution caused by ships is ballast water, and it has been determined that over 7,000 marine organisms are transported between ports with ballast waters on a global scale every day.

Ballast water is used to maintain the balance of the ship on the water when the ships are not loaded. Considering that 90% of international trade is still provided by ships and 3-5 billion tons of ballast water is transported by approximately 85,000 ships every year with world maritime trade, the importance of pollution caused by ballast water becomes apparent. While ballast water is one of the elements that cause the transport of exotic marine and freshwater organisms between all seas of the world and cause pollution, the pollution in question is very effective especially in the aquaculture sector. Therefore, in this article, the connection of ballast water with fisheries management has been examined and solutions have been sought for the problems.

Key Words: *Fisheries Management, Balast Water, Pollution*

Balıkçılık Yönetimi İle Balast Suyu Yönetimi Sözleşmesi Bağlantısı (Bwm Convention, 2004)

Özet

Denizlerin kirlenmesinde kara kaynaklı kirlilik en önemli kirlilik unsuru olarak ifade edilse de (%80), gemilerden kaynaklanan kirliliğin oranı da (yaklaşık %20) azımsanmayacak orandadır. Deniz kaynaklı kirliliğe neredeyse sadece gemilerin neden olmasıysa gemi kaynaklı deniz kirliliğine karşı alınması gereken önlemlerin ve uygulanabilirliğinin araştırılmasını gerektirmektedir. Nitekim gemilerden kaynaklanan en önemli kirlilik nedeni balast suları olup, yapılan çalışmalarda küresel ölçekte her gün 7.000'in üzerinde deniz organizmasının balast suları ile birlikte limanlar arasında taşındığı tespit edilmiştir.

Balast suyu, gemilerin yükü olmadığı zamanlarda geminin su üzerinde dengesini sağlamak amacıyla kullanılmaktadır. Halen Uluslararası ticaretin %90'ının gemilerle sağlandığı ve dünya deniz ticareti ile her yıl yaklaşık 85.000 gemi tarafından 3-5 milyar ton balast suyunun taşınımının gerçekleştiği dikkate alındığında balast suyundan kaynaklanan kirliliğin önemi ortaya çıkmaktadır. Balast suyu, egzotik deniz ve tatlı su organizmalarının tüm dünya denizleri arasında taşınımını sağlayan ve kirliliğe neden olan unsurlardan biri iken, söz konusu kirlilik özellikle su ürünleri sektöründe oldukça etkili olmaktadır. Bu nedenle bu makalede balast suyunun balıkçılık yönetimi ile bağlantısı irdelenmiş, sorunlara çözüm aranmaya çalışılmıştır.

Anahtar Kelimeler: *Balıkçılık Yönetimi, Balast Suyu, Kirlilik*

The Coenzyme Q10 (CoQ10) in Fish

Semra Küçük

Adnan Menderes University, Faculty of Agriculture, Department of Aquacultural Engineering, South Campus, 09100, Aydın/Turkey, skucuk@adu.edu.tr

Abstract

Total fisheries and aquaculture production has been increasing on the World and it has reached to almost 214 million in 2020. Global fishery consumption will be increased from 20 kg to 22 kg per capita. Foods with protein are very important for a human being healthy and fit. Aquatic products contains many essential elements in their biochemical structures. The enzymes are the proteins that act to accelerate biochemical reactions as a catalyser and catalyze more than 5.000 reactions. The enzymes react with substrates and the reactions convert to products. Enzymes are classified in two groups (amino acid sequences, enzymatic reactions) such as lactase, DNA polymerase, and alcohol dehydrogenase. But some enzymes need organic or inorganic cofactors. Enzymes with cofactors structure are called holoenzymes. On the other hands, cofactors from enzyme act in transportation of some chemical groups (NADHP, ATP, FMN, FAD, TPP, THF) to another enzyme. Coenzyme Q10 (CoQ10) is a cofactor and found a high amount in the mitochondria of cells in order to produce energy by oxidative phosphorylation. This activity is common in the some tissues (heart, brain, liver and kidney). Cofactor has a role on the electron transport chain. In this study, it is going to be given more detail information about the definition, mechanism, functions and indicating the previous studies being done on the coenzyme Q10 in fish.

Key Words: Aquatic products, Coenzyme Q10, Aquaculture

Balıklarda Coenzim Q10

Özet

Toplam balıkçılık ve su ürünleri üretimi dünya da yükselmektedir ve 2020 yılında 214 milyon ton ulaşmıştır. Global su ürünleri tüketimi kişi başına 20 kg dan 22 kg'a yükselmiştir. Sağlıklı ve formda bir insan için proteinli gıdalar çok önemlidir. Akuatik ürünler biyokimyasal yapılarında birçok esansiyel elementi içerirler. Enzimler, biyokimyasal reaksiyonlarda bir katalizator olarak hızlanmasında görev yapan proteinlerdir ve 5,000 den fazla reaksiyonu katalize eder. Enzimler substratlar ile reaksiyona girerler ve reaksiyonlar ürünlere dönüşür. Enzimler iki grupta (aminoasit dizisi ve enzimatik reaksiyon) sınıflandırılır, örneğin laktaz, DNA polimeraz ve alkol dehidrogenaz. Fakat bazı enzimler organik veya inorganik kofaktörleri ihtiyaç duyarlar. Kofaktörle enzimin oluşturduğu yapı holoenzim olarak isimlendirilir. Diğer taraftan, kofaktörlerin bir enzimden diğer enzime bazı kimyasal grupları (NADHP, ATP, FMN, FAD, TPP, THF) transport edilmesinde görev yaparlar. Koenzim Q10 (koQ10) bir kofaktördür ve hücrelerin mitokondrilerinde oksidatif fosforilasyon ile enerji üretmek için yüksek miktarda bulunur. Bu aktivite bazı dokularda yaygındır (kalp, beyin, karaciğer ve böbrek). Kofaktör elektron transport zincirinde görev yapar. Bu çalışmada, kofaktörlerin tanımı, mekanizması ve fonksiyonları ve balıklar için kofaktörler hakkında şimdiye kadar yapılmış çalışmalar üzerine detaylı bilgiler verilecektir.

Anahtar Kelimeler: Akuatik ürünler, Koenzim Q10, Akvakültür

New Trends in Functional Beverages Nowadays

Asiye Özcan Tarım¹, Cem Baltacıoğlu¹

¹Food Engineering Department, Faculty of Engineering, Niğde Ömer Halisdemir University, Niğde, Türkiye
Corresponding Author ✉: cembaltacioglu@ohu.edu.tr

Abstract

The word functional food is the name given to the foods that are produced by adding bioactive substances obtained from natural foods to the foods we consume in daily life and that do not have synthetic properties. The difficulty in accessing healthy foods financially and physically is the basis of the increasing difficulty of quality and healthy nutrition. Although the healthy food market continues to spread today, ready-to-eat foods continue to be foods that are easily accessible to everyone and continue to be at the forefront of our society's consumption preferences. The most important point that distinguishes healthy foods from ready-made foods is that apart from the basic food components (carbohydrate, protein, fat, minerals) that provide our daily nutritional needs, there are components that have positive effects on human health. The awareness of healthy nutrition, which has become increasingly widespread in societies in recent years, and the decrease in consumption and health expenses due to the positive effects they have on health, although the production costs of these products are higher than those of normal food products, the interest of manufacturers in functional foods is increasing day by day. The beverage market also plays an important role in functional foods. However, studies have examined the positive effects of functional fruit and vegetable juice on health. Fruits and vegetables are considered as functional foods due to their positive effects on health due to the antioxidant and phenolic compounds they naturally contain, due to their antioxidant and antimicrobial effects. In this study, studies on functional fruit and vegetable juices were examined. The functional beverage market in our country is advancing and reaching more consumers. In addition, different techniques are used in probiotic products to keep cell viability at the maximum level, and cell growth can be supported by enriching product formulations with various components. Thanks to future studies, it will be possible to increase product diversity by using probiotics in different product groups.

Key Words: *Functional food, functional fruit juice, Healthy Food, Nutrition, New Foods, Probiotic bacteria, Probiotic juice*

Günümüzde Fonksiyonel İçeceklerde Yeni Eğilimleri

Özet

Fonksiyonel gıda kelimesi, doğal besinlerden elde edilen biyoaktif özellikteki maddelerin, günlük yaşamda tükettiğimiz gıdalara eklenmesi ile ortaya çıkan ve sentetik özellik taşımayan gıdalara verilen isimdir. Kaliteli ve sağlıklı beslenmenin giderek zorlaşmasının temelinde sağlıklı gıdalara maddi ve fiziki anlamda ulaşmanın güçlüğü bulunmaktadır. Günümüzde sağlıklı gıda pazarı yaygınlaşmayı sürdürse de, hazır gıdalar herkesin rahatlıkla ulaşabileceği besinler olmaya ve toplumumuzun tüketim tercihlerinin başında gelmeye devam etmektedir. Sağlıklı gıdalar ile hazır gıdaları birbirinden ayıran en önemli nokta günlük besin ihtiyacımızı sağlayan temel gıda bileşenleri (karbonhidrat, protein, yağ, mineraller) dışında insan sağlığına olumlu etkileri olan bileşenler olduğuna dikkat çekmektedir. Toplamların son yıllarda giderek yaygınlaşan sağlıklı beslenme bilinci, bu ürünlerin üretim maliyetlerinin normal gıda ürünlerinininkinden yüksek olmasına rağmen, sağlığa yaptıkları olumlu etkileri nedeniyle tüketim ve sağlık giderlerinin azalması, üretici firmaların fonksiyonel gıdalara olan ilgisini gün geçtikçe arttırmaktadır. Fonksiyonel gıdalarda içecek pazarı da önemli rol almaktadır. Bununla birlikte yapılan çalışmalarda fonksiyonel meyve ve sebze suyunun sağlık üzerindeki olumlu etkileri incelenmiştir. Meyve ve sebzeler, doğal olarak içerdikleri antioksidan ve fenolik bileşiklerin, antioksidatif ve antimikrobiyel etkilerine bağlı olarak sağlık üzerine olumlu etkilerinden dolayı fonksiyonel gıda olarak değerlendirilmektedir. Bu çalışmada fonksiyonel meyve ve sebze suları ile ilgili yapılan araştırmalar incelenmiştir. Ülkemizde fonksiyonel içecek pazarı ilerlemektedir ve daha çok tüketiciye ulaşmaktadır. Ayrıca probiyotik ürünlerde hücre canlılığını maksimum seviyede tutmak adına farklı tekniklerden yararlanılmakta, ayrıca ürün formülasyonları çeşitli bileşenlerle zenginleştirilerek hücre gelişimi desteklenebilmektedir. İleride yapılacak çalışmalar sayesinde probiyotiklerin farklı ürün gruplarında kullanımı ile ürün çeşitliliğinin artırılması mümkün olabilecektir.

Anahtar Kelimeler: *Fonksiyonel gıda, fonksiyonel meyve suyu, Sağlıklı Gıda, Beslenme, Yeni Gıdalar, Probiyotik bakteriler, Probiyotik meyve suyu*

1. Giriş

1.1 Fonksiyonel Gıda

Fonksiyonel gıdalar besleyici değerlerine ek olarak fiziksel performansta, zihinsel aktivitede, hastalıkların tedavisinde ve kontrolünde rol oynayan, fizyolojik fonksiyonları düzeltilmiş gıda ve gıda bileşenleridir (Farr, 1997; Belem, 1999; Hardy, 2000; Roberfroid, 2000). Başka bir tanım ise normal bir diyetin parçası olarak tüketilmesi amaçlanan, ancak basit besin gereksinimlerinin sağlanmasının ötesinde fizyolojik rollere hizmet edecek şekilde modifiye edilmiş ve temel beslenmenin ötesinde sağlık yararları sağlayabilen geleneksel gıdalara benzer görünüşte gıdalar olarak tanımlanabilir (Bech-Larsen ve Grunert, 2003; Labrecque ve ark. 2006).

Fonksiyonel gıda ürünleri, her zamankinden daha fazla sağlık bilincine sahip tüketicilerin beklentilerini karşılamak için yaratılmış, katma değeri olan yeni bir ürün kategorisini temsil etmektedir. Fonksiyonel gıdaların çoğunda belirtilen fonksiyonellik, kalp / damar sistemi, sinir sistemi ve sanayileşmiş ülkelerde yaygın olarak görülen bazı kanser türleri gibi hastalıkların önlenmesine yardımcı olmaktır (Labrecque et al., 2006).

Fonksiyonel gıda bilimi, beslenme biliminde yeni araştırma alanları bulmak ve yeni fonksiyonel gıdalar geliştirmek için bu alanları kullanmak anlamına gelir. Fonksiyonel gıda geliştirme bilimsel bir sorundur ve bilimsel bilgiye dayanmalıdır. Hedef, fonksiyonlara ve bunların gıda bileşenleri tarafından olası iyileştirmelerine odaklanır. Fonksiyonel gıda biliminin amaçları şunlardır;

- Bir gıda içindeki fonksiyonel bileşen ile vücuttaki hedef fonksiyonlar arasındaki faydalı etkileşimleri belirlemek
- Bu işlevlerle ilgili belirteçleri ve bunların gıda bileşenleri tarafından modülasyonlarını tanımlamak ve onaylamak
- Fonksiyonellik için ihtiyaç duyulan yiyecek miktarının veya bileşenlerinin güvenliğini değerlendirmek
- Belirtilen gıda bileşenlerinin ilgili alımını kanıtlamak için insan müdahalesi denemelerinde test edilecek hipotezleri formüle etmek, bir veya daha fazla hedef fonksiyonla ilişkilidir (Diplock, 1999).

2. Fonksiyonel Gıdanın Tarihçesi

Fonksiyonel gıdalarla ilgili ilk çalışmalar Japonya’da 1984 yılında başlamış olup, 1986 yılında yine Japonya’da fonksiyonel gıdalar yoluyla halk sağlığının korunması amacıyla altı uzmandan oluşan “fonksiyonel gıda forumu” kurulmuştur. Söz konusu komitenin raporu doğrultusunda Japonya Sağlık Bakanlığı “sağlık kullanımı için spesifik gıda” teriminin (FOSHU-Food for Specific Health Use) kullanılmasının uygun olacağı sonucuna varmıştır (Farr, 1997).

Lifli gıdalar (dietary fibres) piyasaya sürülen ilk ticari fonksiyonel gıda bileşenleridir. 1980’lerin sonlarında lif içeriği yüksek içeceklerle olan ilginin artması, hem Japonya ve hem de tüm dünyada fonksiyonel gıda pazarının oluşmasına katkıda bulunmuştur. 1988’de Japonya’da Fibre-mini olarak adlandırılan ve yumuşak bir içecek olan ilk fonksiyonel gıda üretilmiştir. Bu içekte suda çözünebilen polidekstroz kullanılmış ve mide-bağırsak düzenleyicisi olarak satışa sunulmuştur (Sheey ve Morrissey, 1998).

3. Fonksiyonel Gıda Çeşitleri Ve Bileşenlerinin Sağlığa Etkileri

Herhangi bir gıdanın fonksiyonel gıda olarak tanımlanması için taşıması gereken özellikler aşağıda sıralanmaktadır (Farr, 1997; Hardy, 2000; Roberfroid, 2000; Colmenero ve ark., 2001).

- Söz konusu gıda sağlığın devamını sağlayıcı veya iyileştirici olmalı; aynı zamanda diyetin gelişmesine de katkıda bulunmalıdır.
- Gıda veya bileşenlerinin yararları nutrisyonel veya medikal temellere dayanmalıdır.
- Gıda veya bileşenlerinin tüketilen miktarları nutrisyonel veya medikal bilgilerle tespit edilebilmelidir.
- Gıda veya bileşenleri güvenli olmalıdır.
- Gıda bileşenlerinin fiziko-kimyasal özellikleri iyi tanımlanmalı, bu bileşenler kalitatif ve kantitatif metodlarla tespit edilebilmelidir.
- Benzer gıdalarla karşılaştırıldığında bu gıdaların kompozisyonunun zararlı bir etkisi gözlenmemelidir.
- Bu gıdalar sıradan diyetlerde bulunabilmelidir.
- Bu ürünler sıradan gıdaların bileşiminde bulunmalıdır.
- Bu gıdalar veya bileşenleri ilaç olarak kullanılmamalıdır.

Tablo 1. Ülkemizde yapılan akademik çalışmalar da fonksiyonel gıda çeşitleri ve bileşenleri bu şekildedir; Raghuveer C. (2009)

FONKSİYONEL GIDA ÇEŞİTLERİ

Değiştirilmiş Gıdalar	İstenmeyen Zararlı Bazı Besin Bileşenlerinin Çıkarılıp Ya da Azaltılıp, Faydalı Özellikleri Bulunan Bir Bileşenlerle Değiştirilen Gıdalar		
Değiştirilmemiş Gıdalar	Normal Kendi Besin İçeriğinde Herhangi Bir Farklılık Olmayan Gıdalar		
Geliştirilmiş Gıdalar	Genetik Modifikasyonla Besin İçeriği Değiştirilmiş Veya Zenginleştirilmiş Gıdalar		

Gıdalardaki Fonksiyonel Bileşenler	✓ Beta-Karotenler	Sağğa Etkileri	✓ Kalp ve damar sağlığının iyileştirilmesi
	✓ Şeker Alkoller		✓ Onkolojik risklerin azaltılması
	✓ Vitamin Ve Mineraller		✓ Diyabet ve tansiyon riskinin azaltılması
	✓ Diyet Lifleri		✓ Duyusal özelliklerin gelişmesi
	✓ Oligosakkaritler		✓ Obezite ve kilo alamama gibi sorunlara iyi gelmesi
	✓ Antioksidanlar		✓ Ürolojik ve gastrolojik rahatsızlıkların giderilmesi
	✓ Fenoller		✓ Kemik ve kan rahatsızlıklarında destekleyici olması
	✓ Laktobakteriler		✓ Mikrobiyolojik etkilerden vücudu koruması
	✓ Doymamış Yağ Asitleri		
	✓ Antioksidanlar		
	✓ Glikosidler, İsoprenoidler		
	✓ Peptidler Ve Proteinler		
	✓ Prebiyotik Ve Probiyotikler		
	✓ Konjuge Linoleik Asitler		

4. Fonksiyonel Gıdaların Ülkemizdeki Kullanım Amaçları Ve Çeşitleri

Son on yılda; küreselleşme, ticarileşme, nüfus artışı ve kentleşme gibi nedenlerle değişen üretim ve tüketim motifleri sonucu tüketicilerin gıda ürünlerine yönelik taleplerinde dikkate değer değişimler meydana gelmiştir. Ülkemizde fonksiyonel gıdalar daha çok şu amaçlarla kullanılmaktadır:

- İlaç tedavisine alternatif olarak tedaviyi destekleyici ürün olarak kullanmak
- Besin yetersizliğini gidermek ve gıdayı besinsel olarak daha zengin hale getirmek
- Çölyak hastaları gibi bazı hastalıklar için gıda kullanımı
- Lif içeriği artırılmış ürünlerin diyet ürünü olarak kullanılması
- Sporcular için beslenmeyi ve sağlığı iyileştirmek
- Bazı maddelere karşı duyarlı kişilere uygun ürün olarak kullanmak
- Özellikle bayanlarda fonksiyonel gıdaların vücut bakım ürünü olarak kullanımı
- Sağlığı korumak veya daha iyi hale getirmek (Raghuveer, 2009).

5. Fonksiyonel Gıdaların Ülkemizdeki Durumu

Diyabetik ve Fonksiyonel gıda derneğinin açıklamasına göre, ülkemizde diyet ve fonksiyonel gıda pazarının büyüklüğü yaklaşık 420 milyon TL ye ulaşmıştır. Beslenmeden kaynaklı rahatsızlıkların artması sebebiyle fonksiyonel gıda pazarına artan ilgi günden güne artmaktadır. Bu pazar ürünlerinin kullanım sebeplerine baktığımızda ise, herhangi bir katkı içermemeleri, tansiyon, diyabet, kolesterol gibi rahatsızlıkların tedavisine yardımcı rol oynamaktadır. Ülkemiz insanların bilinç ve ekonomik durumunun iyileşmesiyle fonksiyonel gıdalar gibi sağlığa yardımcı ürünlere olan ilgileri artmıştır. Ülkemizde 330 milyon TL lik bu pazarın hane başına tüketim oranına baktığımızda %43 tür. Tüketilen bu ürünlerin dağılımı ise şöyledir; %39.1 ile maden suları birinci, %15.5 le margarin üçüncü, %12.6 le çay, %6.4 le bisküvi, %6.2 meyve suyu ve bu şekilde ürünler devam etmektedir. Bu pazarın 90.7 milyon TL lik kısmını diyet ürünler oluşturmaktadır.

Ülkemizde fonksiyonel gıda pazarı yerli ve yabancı şirketlerin her geçen gün ilgisini çekmektedir. Bu ilginin sebebine baktığımızda ülkemizin tarımsal açıdan zengin olması, fonksiyonel gıdalara olan ilginin yüksek olması, genç ve yetişmiş insan gücüyle büyük bir potansiyel barındırması yatırım yapmış ya da yapacak olan firmaları cezbetmiştir. Ve bu gibi yeni ürünleri benimsemekte zorlamayıp hızlı bir şekilde kabullenmesi yatırım yapacak olan firmalar için büyük bir pazar olarak görülmektedir (Ekşi, 2005).

Günümüzde fonksiyonel gıda piyasasının dünyada ulaştığı pazarın büyüklüğü yaklaşık 80 milyar USD, global ölçekli fonksiyonel gıda pazarının bir önceki yıla göre büyüme oranı ise %10-15 olarak belirlenmiştir. Bu büyüme oranının altında yatan sebeplere baktığımızda sağlığa olan harcamamaların azaltılması, sağlığın korunmasına yardımcı olunması ve doğal ürünlere olan ilginin yüksek olması temel sebeplerdendir. Küresel ölçekte fonksiyonel gıda pazarının %38.1 süt, %22.7 tahıl ve tahıl ürünleri, %12.5 içecekler, %8.1 katı ve sıvı yağlar, %7.4 et, balık ve yumurta, %5.8 soya ürünleri ve %5,7 ise diğer fonksiyonel gıdalar olmak üzere bu oranlarda bulunmaktadır (Krystallis, A., Maglaras, G. And Mamalis, S., 2008).

Tablo 2. Türkiye'de fonksiyonel gıda sağlığı beyanı örnekler

MARKA	ÜRÜN	SAĞLIK ETKİSİ
Yovita	Prebiyotik yoğurt	"Sindirim sisteminin düzenlenmesine ve prebiyotik lifli bağırsıklık sisteminin desteklenmesine yardımcı olur"
Becel Pro-aktiv	Margarin	Bitki stenolü kolesterol seviyesini düşürmeye yardımcı olur" "Kötü kolesterolü 2-3 hafta içinde düşürdüğünü kanıtladı"
Keskinoğlu	Omega 3 Yumurta	Fiziksel ve zihinsel gelişime yardımcı olur
Dimes Life	Ayva Suyu	Yüksek lif içerir. Lif, sindirim sisteminin düzgün çalışmasına yardımcı olur"

Türkiye 80 milyon nüfusu ile Avrupa'daki en kalabalık ülkelerden biridir. Önde gelen ülkelerle kıyaslandığında fonksiyonel gıda tüketimi oldukça düşüktür. Türkiye'de 2012 - 2017 yılları arasında fonksiyonel gıda büyüme hızı %52 olarak ölçülmüştür Bu oran diğer ülkelerden daha yüksektir. Türkiye'de artan büyüme hızı tüketicilerin tutumlarında pozitif anlamda bir değişim olduğunu göstermektedir. Ancak Amerika, Japonya ve Avrupa ülkeleri ile karşılaştırıldığında Türkiye'de fonksiyonel gıda pazarı hala az gelişim göstermektedir ve desteğe ihtiyaç duyulmaktadır.

Türkiye'de fonksiyonel gıda çeşitliliği oldukça azdır. Süt ürünleri sunulan tüm çeşitleriyle en çok tüketilen ürünlerdir. Türkiye'de süt ürünleri, kahvaltıda akşam yemeğine kadar ve aynı zamanda bazı yemeklerin ana maddesi olarak da kullanılan ürünlerdir. Dünya Pazar araştırması prebiyotiklerin fonksiyonel gıdalar arasında en fazla gelişim gösteren sektör olduğunu göstermektedir (Gök ve Ulu, 2018). Toplumun genel tüketim alışkanlıklarına yakın olmaları süt ürünleri ile üretilen fonksiyonel gıdalar olan prebiyotiklerin diğer fonksiyonel ürünlere göre daha çabuk benimsenmesine ve tüketiminin yüksek olmasına sebep olmuştur. En çok tüketilen süt ürünleri yoğurt, ayran, peynir ve kefir ve bunlar probiyotik kaynağıdır.

6. Fonksiyonel Gıdalarda İçecek Pazarı

Son on yılda, yaşam koşullarının değişmesiyle fonksiyonel gıda tüketim eğilimi yüksek bir büyüme oranı göstermiştir (Verbeke, 2005). Euromonitor International'a (2007) göre küresel fonksiyonel/zenginleştirilmiş yiyecek ve içecek pazar büyüklüğü 152,2 milyar ABD doları, meyve/sebze suyu pazarı ise 11 milyar ABD doları olmuştur (Tablo 3). Güçlendirilmiş/fonksiyonel meyve/sebze suyu küresel pazar büyüklüğünün büyümesi 2004 yılında %8,1, 2007 yılında ise %8,3 oranında artmıştır. Küresel fonksiyonel pazarın sürekli arttığı aşikardır.

Tablo 3. Güçlendirilmiş/fonksiyonel yiyecek ve içeceklerin küresel pazar büyüklüğü (milyon ABD doları) (Euromonitor International, 2007)

	2004	2005	2006	2007
Güçlendirilmiş/fonksiyonel yiyecek ve içecekler	118.687,00	128.760,00	137.934,90	152.152,50
Güçlendirilmiş/fonksiyonel içecekler	39.752,40	45.137,20	50.311,40	56.214,70
Güçlendirilmiş/fonksiyonel meyve/sebze suyu	8.823,50	9.538,90	10.321,40	11.178,50

Öte yandan, Resim 2'de verildiği gibi, her tür fonksiyonel gıdanın pazar büyüklüğü de sürekli artmaktadır (Euromonitor International, 2007). Ayrıca içecek pazar büyüklüğünün toplam kuvvetlendirilmiş/fonksiyonel yiyecek ve içeceklerden biraz daha büyük olduğu görülmektedir.

Şekil 1. Fonksiyonel/güçlendirilmiş yiyecek ve içeceklerin (içecekler hariç) küresel pazar büyüklüğü (Euromonitor International, 2007)

Tablo 4'te verildiği gibi, Birleşik Krallık, Avrupa ülkelerinin fonksiyonel içecek pazar büyüklüğünde 2,82 milyar ABD doları büyüklüğü ile ilk sırada yer almaktadır. Fransa 340,6 milyon ABD doları ile 7. sırada yer alırken, Türkiye 156,6 milyon ABD doları pazar büyüklüğüne sahip ve 14. sırada yer alıyor. Türkiye'nin kişi başına düşen fonksiyonel içecek tüketiminin Fransa'dan daha düşük olduğu açıktır (Euromonitor International, 2008). Türkiye'de fonksiyonel yiyecek ve içecek tüketimi hala düşüktür. 2011 yılı sonuna kadar fonksiyonel gıda pazar büyüklüğünün yaklaşık 130 milyar ABD doları olacağı tahmin edilmektedir (Euromonitor International, 2008).

Tablo 4. 2007 yılında Avrupa'da ülkelere göre fonksiyonel içecekler piyasa değeri (milyon ABD doları) (Euromonitor International, 2008)

Europe	8.686,5
United Kingdom	2.816,8
Germany	1.327,3
Italy	636,1
Spain	618,2
Austria	455,0
Netherlands	432,4
France	340,6
Russia	290,5
Belgium	289,4
Ireland	263,0
Sweden	204,0
Switzerland	169,1
Finland	158,2
Turkey	156,6

7. Fonksiyonel Meyve Suyu Pazarındaki Yeni Eğilimler

Global meyve suyu pazarı, son yıllarda tüketicilerin giderek artan sağlık bilinci ve endişeleri ile gelişmekte olan ülkelerde harcanabilir kişisel gelir oranının artması gibi faktörlerden büyük oranda etkilenmektedir. Günümüzde tüketiciler, gazlı içecekler yerine, ilave şeker ve yapay tatlandırıcı ile koruyucu içermeyen organik içecekleri tercih etmektedirler. Yakın geçmişte, ilave şeker içerikleri nedeni ile tercih edilmeyen meyve suyu ürünleri, son yıllarda, fonksiyonel özellikleri ile öne çıkan yeni ürünlerin geliştirilmesi ve yeni üretim tekniklerinin uygulanması gibi olumlu gelişmeler sayesinde tekrar tüketicilerin dietlerinde yer almaya başlamıştır (Global Fruit Juice Market Outlook 2024, 2017).

Meyve suyu pazarına son on yıllarda giriş yapmış olan taze sıkılmış ve “direkt (konsantreden üretilmeyen; NFC (not from concentrate))” meyve suyu ürünleri önemli bir gelişme kaydetmişlerdir (Ashurst, 2009). Yeni geliştirilen meyve suyu ürünleri, “0”, “doğal”, “organik”, “vitamin ve minerallerce zenginleştirilmiş”, “ilave şeker ve koruyucu içermez” gibi özellikleri vurgulanarak fonksiyonel içecekler arasında yerlerini almıştır (Abate, 2005). Birçoğu sağlık üzerine olumlu antioksidan etkileri ile iyi bilinen vitaminler, mineraller ve fenolik bileşenler için önemli birer kaynak olan meyve suları (Granato ve diğ., 2010a), her yaş grubu için hoş giden lezzet özellikleri ile birlikte sağlıklı ürünler kategorisinde konumlandırılmaktadır. Meyve-bazlı içecekler, global gıda endüstrisinde en hızlı büyüyen alanlardan biri olarak gösterilmekte olup, meyve suyu tüketim oranının yetişkinlerde %60 oranlarında olduğu rapor edilmiştir (Hughes, 2001).

8. Meyve Suyu-Bazlı Fonksiyonel Yeni İçecek Grupları

➤ Taze Meyve Suları

Taze meyve suyu grubu, taze sıkılmış meyve suları ile direkt (veya konsantreden üretilmeyen; NFC (not from concentrate)) meyve sularından oluşmaktadır. Taze sıkılmış meyve suları, son tüketiciye en yakın noktada, kabuk ve diğer atıkları uzaklaştırılarak, üretilen ve tek kişilik porsiyonlar halinde paketlenerek 2-3°C'ye soğutulan ve başka bir prosesten geçirilmeyen ürünlerdir (Ashurst, 2009). Minimal düzeyde ısıtılardan geçirildikten sonra soğuk zincir ile taşınarak soğukta saklanan direkt (NFC) meyve suyu ürünlerinin, tüketime hazır yüksek kaliteli meyve suları olarak, popülaritesi her geçen gün artmaktadır. Turuncu meyve suları, tropikal meyve suyu ve nar suyu karışımları bu tür ürünler arasında yer almaktadır.

➤ Yoğun Kıvamlı Meyve Suyu-Bazlı İçecekler – “Smoothie”ler

Smoothie içecekleri, saf içecek kategorisine dahil olup, bu gruptaki ürünler, bilinen meyve suyu veya meyve suyu karışımlarına oranla daha yoğun kıvama sahip ürünlerdir. Smoothie üretiminde, meyve ve/veya sebzeler, meyve/sebze suyu, posa ve püre eldesi için proses edilmekte ve karıştırılmaktadır (Morales-de la Pena ve diğ., 2016). Örneğin; yüksek C vitamini içeriğine sahip portakal suyu ile β -karotene zengin havuç suyunu karıştırarak antioksidan zengin bir içecek (Torregrosa ve diğ. 2006), kaju elması suyu ile hindistan cevizi suyunun karıştırılmasıyla yüksek C vitamini ve sodyum, potasyum, fosfor, klorür ve magnezyum içeriği olan içecek (De Carvalho ve diğ., 2007) ve kaju elması, papaya, guava, acerola meyvesi (Barbados kirazı) ve çarkıfelek meyvesi karışımıyla mikrobiyal bozulmaya dayanıklı, C vitamini açısından zengin ve istenen duyuşal özelliklere sahip ürün (De Sousa ve diğ., 2010) literatürde yer almaktadır.

➤ Meyve Suyu-Süt ve Meyve Suyu-Soya Sütü Karışımları

Fonksiyonel içecek sektöründe öne çıkan yeni ürünler arasında, meyve suyuna süt veya soya sütü ilavesiyle elde edilen, farklı duyuşal özelliklere ve biyoaktif bileşen içeriğine sahip karışımlar gösterilmektedir (Morales-de la Pena ve diğ., 2016). Bu tür karışımlarda, soya sütünün acı ve kekremsi tadı, meyve suyu ile maskelenebilmektedir (Zulueta ve diğ., 2007). Kalsiyum ve konjuge linoleik asitin temel kaynağı olan süt, protein ve yağda çözünen vitaminler açısından da zengin bir gıda ürünüdür (Morales-de la Pena ve diğ., 2016).

Yaban mersini suyu ile soya protein izolatının (%2,8) karıştırılmasıyla, stabil yapıda ve önemli miktarda antosiyanin içeren bir içecek geliştirilmiştir (Potter ve diğ., 2007). Benzer bir çalışmada, portakal, kivi ve ananas suyundan oluşan karışıma (%50) pastörize soya sütü (%42,5) ilavesiyle elde edilen içeceğin C vitamini, fenolik bileşenler ve izoflavonlar açısından zengin bir kaynak olduğu ve yüksek antioksidan aktivite gösterdiği belirlenmiştir (Morales-de la Pena ve diğ., 2010a ve b).

➤ Probiyotik ve Prebiyotiklerle Zenginleştirilmiş Meyve Suları

Süt ürünleri-bazlı olmayan probiyotik içeceklerin geliştirilmesinde, meyve suları ideal bir substrat olarak önerilmektedir. Meyve suları, sağlık için faydalı bileşenlerinin yanı sıra, probiyotik mikroorganizmaların gelişimi ve canlılığını koruması için de birçok avantaj sağlamaktadır (Granato ve diğ., 2010; Kandyliş ve diğ., 2016). Bu avantajlar arasında; probiyotiklerin gelişimi için gerekli olan şeker ve diğer besin bileşenlerinin meyve sularında yüksek oranlarda bulunması, meyve suyunun, midenin asidik ortamından hızlı geçişi sayesinde probiyotiklerin yüksek oranda canlılığını koruyabilmesi sayılabilmektedir (Vijaya ve diğ., 2015). Bunların yanı sıra, meyve

suyunun, lezzet özellikleri ile, her yaş grubundan tüketicilere hitap etmesi de meyve suyu-bazlı probiyotik içeceklerin geliştirilmesi konusunda araştırmacıların ilgisini çekmektedir (Kandylis ve diğ., 2016). Renuka ve diğ. (2009), ananas, mango ve portakal sularını fruktooligosakkaritler ile zenginleştirmiş ve zenginleştirilmiş meyve sularının fizikokimyasal ve duyu özellikleri açısından oda sıcaklığında 4 ay, buzdolabı sıcaklığında ise 6 ay stabilitelerini koruduklarını belirlemiştir. Bir başka çalışmada, elma suyuna %20 oranında β -glukan içeren yulaf unu ilavesinin buzdolabı sıcaklığında depolama sırasında *Lactobacillus rhamnosus* probiyotik bakterisi üzerinde koruyucu etki gösterdiği tespit edilmiştir (Saarela ve diğ., 2006).

9. Gıdalarda Fonksiyonel Meyve Ve Sebze Suları Üzerine Yapılan Çalışmalar

➤ Elma Sirkesinden Yapılan İçeceklerin Fizikokimyasal Ve Duyusal Özelliklerin Araştırılması

Bu çalışmada, farklı baharat ekstraktları, elma sirkesi ve çeşitli tatlandırıcıların kullanımı ile -kakule, tarçın, karanfil ve karabiber baharatları ile elma sirkesi materyal olarak kullanılarak farklı formlarda sirke içeceği üretimi yapılmıştır. Sirke içeceği üretiminde sakkaroz, stevia ve aspartam ile asesülfam-K ilave edilerek üç farklı uygulama yapılmıştır. Çeşitli baharatların farklı formlarıyla elde edilen sirke içeceği, baharatların soğuk çay formatı dışında kullanılmasına da olanak sağlamaktadır. Sirke içeceği, sirke tüketimine yeni bir bakış açısı getirerek günlük alınması gereken sirke miktarının içecek şeklinde sunulmasına alternatif bir tüketim şekli ortaya koymuştur. Bununla birlikte, farklı tatlandırıcılar kullanılarak şeker oranının düşürülmesi ile tüketiciye sakkaroz içeren ürünlere kıyasla daha düşük kalorili ürünler sunulmuştur. Bu çalışma ile diyabet hastaları için alternatif ürünler oluşturulmuştur (Terakye,2019).

➤ Antosiyaninlerce Zengin Meyve Ve Sebze Suyu Eklenmiş Kefirlerin Kalite Özelliklerinin Belirlenmesi Ve Kefir Kültürü ile Siyah Havuç Suyundan Fermente İçecek Üretimi

Daha lezzetli kefir üretimi için, sade kefire (SK) çilek (ÇS), karadut (KDS), nar (NS) ve siyah havuç (SHS) suyu %10 ve 25 (w/w) konsantrasyonunda ilave edilmiştir.

Şekil 2. %10 oranında çilek ve nar suyu içeren kefir üretimi akış şeması (Kabakçı,2019).
Yapılan bu araştırmada şu sonuçlara ulaşılmıştır;

- En yüksek antosiyanin stabilitesinin, sırasıyla, karadut, nar, çilek ve siyah havuç suyu ilaveli kefirlerde olduğu bulunmuştur.
- Gerek kefirin tadını iyileştirerek kefirin tüketimini kolaylaştırması, gerekse de yüksek antioksidan aktiviteye sahip olması nedeniyle, %25 çilek ve karadut suyu ilavesi önerilmektedir.
- %25 konsantrasyonunda nar suyu ilavesinin kefirin raf ömrünü azaltması (5 hafta) ve %10 nar suyu ilaveli kefirlerin mikrobiyel olarak daha stabil olması (8–11 hafta) nedeniyle, kefire %10 nar suyu ilavesi önerilmektedir.
- 7) Kefir kültürü ile fermentasyonla hem siyah havuç suyunun pH'sı düşürülerek tadı iyileştirilmiş, hem de probiyotik mikroorganizmalarca ve antosiyanince zengin yeni fermente içecekler elde edilmiştir (Kabakçı,2019).

Şekil 3. Siyah havuç ham suyundan fermente içecek üretimi (Kabakçı,2019).

➤ Yeni Bir İzotonik İçecek Olarak; Nar, Kızılçık Ve Karadut Suları İle Zenginleştirilmiş Elma Suyu Üretim Olanakları

Bu çalışmada ülkemizde yaygın olarak kullanılan nar, kızılçık ve karadut gibi yüksek oranda fenolik ve antioksidan madde içeren meyvelerin suları elma suyuna katılarak besin değeri artırılmış yeni bir izotonik içecek elde edilmiş ve elde edilen ürünün bazı özellikleri incelenmiştir. Toplam fenolik değeri en yüksek nar-elma içeceğinde 50.49-101.10 mg gallik asit/g aralığında belirlenmiştir. Yapılan analizler ve duyu değerlendirmeler sonucunda içeceklerin oda sıcaklığında kolaylıkla depolanabileceği ve böyle bir ürünün tüketiciler tarafından talep göreceği belirlenmiştir(Toğrul ve Hayoğlu,2020).

Tablo 5. İzotonik içeceklerinde bulunan temel bileşenler ve oranları (Toğrul ve Hayoğlu,2020).

1.Örnek Sample 1	2. Örnek Sample 2	3. Örnek Sample 3	4. Örnek Sample 4
Elma suyu (%100)	Elma suyu (%80)	Elma suyu (%80)	Elma suyu (%80)
.....	Nar suyu (%20)	Kızılçık suyu (%20)	Karadut suyu (%20)
NaCl 20 mg/100mL	NaCl 20 mg/100mL	NaCl 20 mg/100mL	NaCl 20 mg/100mL
K-Sorbate 1.0mg/100mL	K-Sorbate 1.0mg/100mL	K-Sorbate 1.0mg/100mL	K-Sorbate 1.0mg/100mL

Şekil 4. Farklı oranlarda hazırlanan izotonik içeceklerin üretim akış şeması (Toğrul ve Hayoğlu,2020).

Çalışma sonucunda;

- Elma suyuna diğer meyve sularının özellikle nar ve kıvılcık sularının eklenmesiyle fenolik ve antioksidan aktivite bakımından önemli derecede artış olduğu görülmüştür. İzotonik içeceklerin toplam fenolik madde içeriği ile antioksidan kapasitesi arasında doğrusal ve pozitif korelasyonun olduğu görülmüştür.
- Kırmızı meyvelerle zenginleştirilmiş elma suyunun, sağlık üzerinde besleyici bir işlevi olan yeni içeceklerin tasarımında potansiyel olarak ilgi çekici olabileceğini göstermiştir. İzotonik içecekler, görünüş, tat, koku ve genel kabul edilebilirlik gibi özellikler bakımından değerlendirildiklerinde elma suyunun panelistler tarafından çoğunlukla daha çok beğenildiği anlaşılmıştır.
- Diğer meyve suları ile zenginleştirilmiş izotonik elma sularının tüketiciler tarafından tercih edilebileceği, özellikle antreman esnasında susuzluğu gidermek, kaybolan elektrolitleri geri kazanmak ve açlık hissini engellemek için kullanılabileceği, yapısında fenolik ve antioksidan maddelerce zengin olduğu; doğal bir ürün olan böyle bir içeceğin gıda sanayisinde rahatlıkla kullanılabileceği tahmin edilmektedir.

➤ Echinacea Purpurea (Ekinezya) Ekstraktı Kullanımı İle Fonksiyonel Meyve Suyu Ve Nektarlarının Geliştirilmesi

Bu çalışmada, süperkritik akışkan ekstraksiyonu ile farklı ekstraksiyon parametreleri (basınç (100, 200 ve 300 bar), sıcaklık (40, 50 ve 60°C) ve co-solvent oranı (%0, %5 MeOH ve %10 MeOH)) kullanılarak Echinacea purpurea ekstraktları elde edilmiş ve uygun ekstrakt parametreleri belirlenerek fonksiyonel nitelikte meyve suyu ve nektarları geliştirilmiştir. Kurutulmuş Echinacea purpurea bitkisinin topraküstü kısımları öğütüldükten sonra, süperkritik akışkan ekstraksiyonu ve konvansiyonel ekstraksiyon olmak üzere iki farklı ekstraksiyon işlemine tabi tutulmuş, elde edilen ekstraktlar bileşenleri bakımından LC/MS/MS de incelenmiş ve antioksidan aktiviteleri belirlenmiştir. Buradan elde edilen sonuçlara bakılarak en uygun ekstraksiyon parametresi belirlenmiş ve fonksiyonel meyve suları üretilmiş, bileşenleri ve antioksidan aktivite bakımından incelenmiştir. Fonksiyonel nitelikli elma suyunun duyuşal özelliklerinin ortanın üzerinde, fonksiyonel nitelikli kayısı nektarının tat değeri kötü-orta arasında, diğer duyuşal özelliklerinin ise ortanın üzerinde olduğu belirlenmiştir.

Yapılan kromatografik analiz sonucu elma suyunda belirlenmesi planlanan 6 adet biyoaktif bileşikten 5 tanesi (caftaric acid, cichoric acid, chlorogenic acid, cynarin ve rutin) belirlenebilmiştir. Fonksiyonel nitelikteki elma suyundaki biyoaktif bileşiklerin, klasik elma suyuna göre daha fazla olduğu belirlenmiştir. Klasik elma suyundaki belirlenen biyoaktif bileşik toplamı 2.38 ± 0.05 ppm iken, fonksiyonel elma suyundaki belirlenen biyoaktif bileşik toplamı 11.01 ± 0.15 ppm'dir. Elde edilen bu sonuca göre; elma suyuna bitki ekstraktı eklenerek elde edilen fonksiyonel elma suyunun biyoaktif bileşikçe zenginleştirildiği söylenebilir.

Klasik kayısı nektarındaki belirlenen biyoaktif bileşik toplamı 1.35 ± 0.20 ppm iken, fonksiyonel kayısı nektarındaki belirlenen biyoaktif bileşik toplamı 4.48 ± 0.65 ppm'dir. Elde edilen bu sonuca göre; kayısı nektarına bitki ekstraktı eklenerek elde edilen fonksiyonel kayısı nektarının biyoaktif bileşikçe zenginleştirildiği söylenebilir (Dalabasmaz,2013).

Tablo 6. LC/MS/MS kullanılarak meyve sularında belirlenen biyoaktif bileşiklerin miktarları (Dalabasmaz, 2013).

Bileşen adı	Klasik elma suyu (ppm)	Fonksiyonel elma suyu (ppm)	Klasik kayısı nektarı (ppm)	Fonksiyonel kayısı nektarı (ppm)
Caftaric acid	0.054 ± 0.001	0.31 ± 0.02	N.P	0.016
Cichoric acid	0.52 ± 0.02	0.73 ± 0.02	0.08 ± 0.004	0.14 ± 0.03
Chlorogenic acid	1.76 ± 0.05	9.89 ± 0.15	1.03 ± 0.18	3.86 ± 0.6
Cynarin	0.04 ± 0.01	0.06 ± 0.01	N.P	N.P
Rutin	0.015 ± 0.002	0.021 ± 0.02	0.23 ± 0.01	0.47 ± 0.02
Toplam	2.38 ± 0.05	11.01 ± 0.15	1.35 ± 0.20	4.48 ± 0.65

(N.P: Pik gözlenmemiştir; no peak)

Yapılan antioksidan aktivite tayininde klasik elma suyu EC₅₀ değeri 127.32 ± 1.47 µL, fonksiyonel nitelikteki elma suyu ise 114.33 ± 0.88 µL olarak belirlenmiştir. EC₅₀ değerindeki bu düşüş antioksidan aktivitede %11.35 oranında bir artış olarak hesaplanmıştır. Klasik kayısı nektarında EC₅₀ değeri 336.77 ± 1.81 µL, fonksiyonel nitelikteki klasik kayısı nektarında ise 228.34 ± 2.50 µL olarak belirlenmiştir. EC₅₀ değerindeki bu düşüş antioksidan aktivitede %47.48 oranında bir artış olarak hesaplanmıştır.

Tablo 7. Meyve suyu ve nektarlarından elde edilen EC₅₀ değerleri (Dalabasmaz,2013).

Örnek	EC ₅₀ değeri (µL)
Klasik elma suyu	127.32 ± 1.47
Fonksiyonel elma suyu	114.33 ± 0.88
Klasik kayısı nektarı	336.77 ± 1.81
Fonksiyonel kayısı nektarı	228.34 ± 2.50

Tüm bu sonuçlar toparlandığında; E.purpurea bitkisinin biyoaktif bileşiklerce zengin olduğu ve antioksidan aktivite gösterdiği sonucuna, literatürdeki diğer çalışmalarda olduğu gibi, ulaşılmıştır. Bu çalışmada, süperkritik akışkan ekstraksiyonla elde edilmiş ekinezya ekstraktlarının fonksiyonel meyve suyu ve nektarı üretiminde kullanılmasıyla, meyve sularına ve fonksiyonel ürünlere yeni bir bakış açısı kazandıracağına inanılmaktadır. Ayrıca, süperkritik akışkan ekstraksiyonunun çevre ile dost olarak nitelendirilmiş bir teknoloji olması ve soxhlet gibi klasik ekstraksiyon yöntemlerinin tersine kimyasal çözgen kullanılmadan, bitki ekstraktının elde edilmesi nedeniyle doğal bir ürün elde edilmiştir. Bu da tüketici algısını etkileyecek önemli etmenlerden biridir.

➤ Fonksiyonel Bir Ürün: Peyniraltı Suyu İlave Edilerek Üretilen Nar Suyu İçeceği

Bu çalışmada farklı oranlarda (%20, 30, 40 ve 50) peyniraltı suyu ilavesi ile üretilen Nar suyu içeceklerinin bazı fizikokimyasal ve duyuşsal özellikleri araştırılmıştır. Bu şekilde üretilen içecekler su banyosunda 65 °C'de 30 dakika süreyle pastörize edilmiştir. Pastörizasyon sonrası nar suyu içecekleri, +4 °C'de muhafaza edilmiştir.

Tablo 8. Nar suyu içeceğinin bazı duyuşsal parametrelerine ait ortalama değerler (Çelik vd.,2018).

Parametre	Deneme Örnekleri					Standart hata
	Kontrol (Nar suyu)	%20 PAS'lı içecek	%30 PAS'lı içecek	%40 PAS'lı içecek	%50 PAS'lı içecek	
Renk	2.902 ^a	2.724 ^b	2.577 ^c	2.406 ^d	2.165 ^e	0.210
Bulanıklık	2.859 ^a	2.715 ^{ab}	2.592 ^{bc}	2.397 ^c	2.106 ^d	0.385
PAS kokusu	2.776 ^a	2.417 ^{ab}	2.257 ^{bc}	2.131 ^{bc}	1.867 ^c	0.606
PAS tadı	2.882 ^a	2.557 ^b	2.348 ^b	2.000 ^c	1.676 ^d	0.344
Burukluk	2.784 ^a	2.368 ^b	2.160 ^{bc}	1.926 ^c	1.647 ^d	0.360
Ekşilik	2.150	2.226	2.218	2.393	2.365	0.515
Tatlılık	1.971	2.088	2.269	2.318	2.360	0.551
Aroma	2.693 ^a	2.433 ^{ab}	2.222 ^b	1.915 ^c	1.701 ^c	0.406
Ağızda Bıraktığı Tat	2.741 ^a	2.471 ^b	2.312 ^b	1.999 ^c	1.758 ^d	0.310
Genel Kabul Edilebilirlik	2.759 ^a	2.493 ^b	2.318 ^{bc}	2.093 ^c	1.677 ^d	0.375

*Farklı harfler ile gösterilen ortalamalar arasındaki fark istatistiksel olarak P<0.05 düzeyinde önemlidir.

Yapılan değerlendirmeler sonucunda, PAS (peyniraltı suyu) ilave oranının artışına paralel olarak nar suyu içeceklerinin KM ve çözünür KM oranlarının düştüğü, renk değerlerinin ise nar suyuna oranla, rakamsal olarak arttığı tespit edilmiştir. PAS katkılı nar suyu içeceğinin protein, laktoz ve mineral maddeler açısından zengin bir içecek olacağı; %20 peyniraltı suyu ilave edilen nar suyu içeceğinin tüketiciler tarafından daha fazla beğenileceği ve tüketilebileceği sonucuna varılmıştır (Çelik vd.,2018).

➤ Mikro Yeşil Ve Meyve Bazlı Fonksiyonel İçecek İçin Bir Prosesin Optimizasyonu

Bu çalışmada Fenugreek (çemen otu) (*Trigonella foenum-graecum*), kinnow mandarin (*Citrus reticulata*) ve aloe vera (*Aloe brobadensis*) içeren mikrogreen bazlı fonksiyonel meyve suyu karışımları incelenmiştir. Bu fonksiyonel içecek yüksek protein, mineraller (sodyum ve potasyum) ve vitamin (C vitamini) içeriğinin yanı sıra iyi kaynak beta-karoten, fenoller ve antioksidanlara sahiptir. Antioksidan, oksidatif stresi azaltarak ve reaktif oksijen türlerine karşı koruyucu etkilerinden dolayı diyabetik komplikasyonların azaltılmasına yardımcı olmuştur (Sharma vd., 2020).

Mikro yeşil bitkiler canlı renklere, dokuya ve yoğun tatlara sahiptir ve bu nedenle yenilebilir bir garnitür olarak kullanılır. Bitkisel besinlerin konsantrasyonu olgun yapraklardan daha yüksektir. Böylece mikrogreenler "fonksiyonel gıdalar" olarak sınıflandırılabilir. Bununla birlikte, ortam koşullarında depolandıklarında 1-2 günlük kısa bir ömüre sahiptirler (Xiao ve ark. 2012, 2014). Yüksek besleyici değeri, sağlığı teşvik etmesi ve hastalıkları önleyen özellikleri nedeniyle "fonksiyonel bir gıda" olarak kabul edilir.

Fenugreek (*Trigonella foenum graecum*), yaygın olarak çemen otu olarak bilinir. Fabaceae ailesine ait yıllık bir üründür ve güçlü baharatlı lezzeti nedeniyle bir mutfak baharatı olarak Kuzey Hindistan'a özgüdür (Olaiya & Soetan 2014). Fenugreek, kan şekeri seviyesini düşürmeye yardımcı olan 4 Hidroksisoleucin ve trigonellin gibi anti-diyabetik bileşikler içerir (Dutta ve ark. 2014).

Aloe vera özellikle kan şekeri seviyesini düşürmeye yardımcı olur (Rajasekaran vd. 2005). Biyoaktif bileşikleri anti-diyabetik, anti-ülser, antiseptik, anti-bakteriyel, antienflamatuar, anti-oksidan ve antikanser ajanlar olarak kullanılmaktadır. Bu çalışmada fenugreek mikrogren ve meyve tabanı kullanarak içmeye hazır bir içecek hazırlamak ve fenugreek mikrogreninin diyetle kabul edilebilirliğini artırmak için hedeflenmektedir.

➤ Kuşburnu Meyvesinin Geleneksel Yöntemle Meyve Suyuna İşlenmesi Aşamalarında Antioksidan Kapasite Değişiminin İncelenmesi

Antioksidanlarca zengin olan kuşburnunun ürünlere işlenmesi sırasında doğal antioksidan bileşikler ve antioksidan aktivitede değişim olduğu bilinmektedir. Bu çalışma son yıllarda kullanımı artmakta olan kuşburnu meyvesinin geleneksel olarak meyve suyuna işlenmesi sırasında antioksidan kapasitesindeki değişimi incelemeyi amaçlamıştır. Analizler sonucu askorbik asit, fenolik madde ve antioksidan özelliklerin değişimi istatistiksel olarak önemli bulunmuştur (Altan,2014).

Kuşburnu meyvesi yıkama işlemini takiben sap, çöp ve bozuk olan meyvelerinden arındırılmıştır. Kuşburnu meyvesi 1 kısım ürüne 2 kısım su eklenerek 70-80°C'de 4 dakika ön ısıtma işlemi uygulanmıştır. Ön ısıtma işlemi uygulanan meyveler palperden geçirilerek pulp elde edilmiş, 1'e 3 oranında su ilave edilerek meyve suyu elde edilmiştir. 100 °C 'de 15 dakika pastörizasyon işlemi uygulanmıştır. Pastörize edilen meyve suyu sıcak dolum yöntemiyle kavanozlara doldurularak 30 °C 'ye kadar soğutulmuştur.

Tablo 9. Hammadde, ön ısıtma işlem, pulp ve meyve suyuna işleme aşamalarında TFMM değerleri (Altan,2014).

İŞLEM AŞAMALARI	TFMM(mg/kg)
Hammadde	6147,5
Ön Isıl İşlem	7598,3
Pulp	9772
Meyve Suyu	15290
Min:	6147,5
Max:	15290
Ort:	9701,95

Kuşburnu meyve suyuna işlenirken işleme basamaklarında toplam fenolik madde miktarına artış meydana gelmiştir. II. aşamadaki artışın hem ısıtma işlem uygulamasından hem de çekirdekte fenolik madde geçişinden kaynaklanma olduğu düşünülmüştür. Kuşburnunun kendine has buruk bir tadı olduğundan dolayı şekerli meyve suyu tüketiminde uygun değildir. En ideal meyve suyunun %20-%30 şeker konsantrasyonu arasında üretilabileceği düşünülmektedir (Altan,2014).

➤ **Hint İnciri (*Opuntia Ficus-Indica*) Meyvesinden Meyve Suyu Eldesi Kimyasal Ve Antioksidan Özelliklerinin İncelenmesi**

Bu çalışma, hint incirinin meyve suyu olarak kullanılma potansiyelini değerlendirmek amacıyla tasarlanmış ve depolanan meyvelerden taze olarak sıkılmış meyve suyu ile -18°C’de meyve suyu halinde bir ürün olarak 4 hafta boyunca depolanan meyve suyunun, depolama periyodu boyunca bazı fiziksel ve kimyasal özellikleri ile antioksidan kapasitesindeki değişimleri incelemeyi amaçlamıştır. Ayrıca çalışma ülkemizde yetişmekte olan, ticari ürün olarak kullanılmayan, besleyici değeri bir hayli yüksek bu meyvenin meyve suyu gibi bir çok ürüne işlenerek kullanılabileceğini göstermesi ve bu konu ile ilgilenecekler için kaynak ve gıda endüstrisi için yol gösterici olması açısından önem taşımaktadır. 1309 gram tartılan meyveden, 670 ml meyve suyu elde edilmiştir. Yüzde verim(%v/w) %51.18 olarak tespit edilmiştir. Hint inciri meyve suyunun *E.coli*, *S.aureus* ve *Candida* spp. üzerindeki antimikrobiyal etkisi araştırılmış ve yapılan analizler sonucunda zone oluşumuna dolayısıyla antimikrobiyal etkiye rastlanmamıştır (Dengiz, 2016).

Şekil 5. 18° C’deki meyve suyu Şekil 2: Taze olarak sıkılmış meyve suyu (Dengiz, 2016).

Hint inciri meyve suyuna soğuk sıkım tekniği kullanılarak vitamin, mineral gibi besin içerikleri korunarak tüketiciye kaliteli bir ürün sunulmasına yardımcı olunabilir. Hint inciri meyvesinin Akdeniz bölgesinde fazla miktarda yetişmesi ve besin içeriği zengin olan bu meyvenin ülkemizde ticari bir ürüne işlenmemesi nedeniyle bu meyve ilgi ilgili araştırmaların detaylı olarak yapılması önem taşımaktadır.

➤ **Bazı Sebzelerden Fermente Sebze Suyu Üretimi Ve Fermentasyonun Sebze Sularının Antioksidan Aktivitesi Üzerine Etkisi**

Bu çalışmada *L. plantarum* kültürü inoküle edilerek havuç, siyah havuç, kırmızı lahana ve pancar sularının laktik asit fermentasyonu gerçekleştirilmiş olup, elde edilen fermente sebze sularının 4 °C’ de 5 haftalık depolanması boyunca fiziksel, kimyasal, mikrobiyolojik ve duyuşal özelliklerindeki değişimler incelenmiştir.

Bu çalışmada, havuç, siyah havuç, kırmızı lahana ve pancar sebzelerinden elde edilen sebze sularına *L. plantarum* kültürü inoküle edilerek laktik asit fermentasyonu gerçekleştirilmiş, fermente edilen sebze suları 4 °C’ de 5 hafta depolanmıştır. Depolama boyunca yedi günlük periyotta pH, toplam asitlik, indirgen şeker, toplam fenolik madde, toplam monomerik antosiyanin, toplam antioksidan kapasite ve duyuşal özellik gibi kalite parametreleri belirlenmiştir. Depolama başı ve sonunda da laktik asit, toplam aerobik mezofilik canlı bakteri ve maya-küf sayımları yapılarak fermente sebze sularındaki değişimleri belirlenmiştir.

Şekil 6. *L. plantarum* kültürü inoküle edilerek havuç, siyah havuç, kırmızı lahana ve pancar suyu (Türker,2019).

- ✓ Fermente sebze sularından havuç suyunda en düşük düzeyde, siyah havuç suyunda en yüksek düzeyde toplam fenolik madde saptanmıştır. Toplam monomerik antosiyanin miktarı fermente siyah havuç suyunda 395,76 mg/L, kırmızı lahana suyunda 350,70 mg/L' dir. Troloks eşdeğer antioksidan kapasite değeri fermente siyah havuç suyunda en yüksek, fermente havuç suyunda en düşüktür. Depolama sonunda tüm fermente sebze sularının toplam fenolik madde içeriğinde azalma, monomerik antosiyanin ve antioksidan aktivite değerlerinde ise artış olmuştur.
- ✓ Fermente sebze sularından havuç suyunun en düşük düzeyde (119,18 mg gallik asit/L), siyah havuç suyunun ise en yüksek düzeyde (1235,70 mg gallik asit/L) toplam fenolik madde içerdiği saptanmıştır.
- ✓ Troloks eşdeğer antioksidan kapasite değeri (TEAC) en yüksek fermente sebze suyu siyah havuç olup (16,69 µmol troloks /mL), en düşük olan fermente sebze suyu havuç olarak belirlenmiştir (1,30 µmol troloks /mL).
- ✓ *L. plantarum* ile fermente edilen havuç ve siyah havuç suyunda 4 °C' de 5 haftalık depolama süresince küf-maya sayısı artarken, kırmızı lahana ve pancar sularında depolama başı ve sonunda tespit edilmemiştir.
- ✓ *L. plantarum* kültürü, laktik asit fermentasyonu sonucunda sebze sularının asitliğini düşürerek sebze sularına içilebilir bir lezzet vermiştir. Fermente sebze sularının duyuşal özellikleri ve tüketici beğeni testi değerlendirmelerinden de anlaşılacağı gibi, fermente sebze sularının, özellikle siyah havuç ve kırmızı pancar sularının raf ömrü üzerine detaylı çalışmalar yapıldıktan sonra piyasaya yeni bir ürün olarak kazandırabileceği düşünülmektedir (Türker,2019).

➤ **Bazı Probiyotik Bakterilerin Mikroenkapsülasyonu Ve Meyve Suyunda Kullanımının Araştırılması**

Bu çalışmada bazı probiyotik mikroorganizmaların mikroenkapsülasyonu gerçekleştirilmiş olup, elde edilen mikrokapsüllerin %100 portakal suyu ve %100 elma şeftali suyunda kullanımı araştırılmıştır. Bu aşamanın sonucunda elde edilen veriler ve meyve sularının özellikleri göz önünde bulundurularak, meyve suyuna eklenmek için en uygun mikrokapsüller seçilmiştir. Probiyotik mikrokapsülleri meyve suyuna eklenmiş ve örnekler 35 gün boyunca 4 °C'de depolanmıştır. Depolama süresince meyve suyu örneklerinde bulunan probiyotik canlılıklarındaki değişim belirlenmiştir. Ayrıca, elde edilen probiyotik meyve suyu örneklerinin kalite analizleri ve duyuşal analizleri gerçekleştirilmiştir.

Bu çalışmada ki amaç, insan bağırsağındaki mikrobiyal dengeleri iyileştirebilir nitelikte probiyotik bakteriler kullanarak meyve suyu üretimi için mikroenkapsülasyon yönteminin etkisinin araştırılmasıdır. Bu amaçla, öncelikle probiyotiklerin asit toleransı yüksek polimerler kullanılarak mikroenkapsülasyonunu gerçekleştirmek; sindirim sistemi simülasyonunda ve meyve suyunda depolama süresince probiyotik canlılığının etkin bir şekilde korunmasını sağlamak, ayrıca elde edilen meyve suyu örneklerinin tüketim bakımından kabul edilebilirliğini ortaya koymak hedeflenmektedir. Enkapsülasyon işleminin probiyotiklerin sindirim sistemi simülasyonunda canlı kalma yüzdelerini artırdığı belirlenmiştir.

Meyve sularının probiyotik gıda olarak adlandırılabilmesi için canlı probiyotik bakteri sayısının 106 kob/g olması gerekmektedir. *Lactocaseibacillus rhamnosus* içeren tüm meyve suyu örneklerinde canlı mikroorganizma sayısının 35 günlük depolama süresi boyunca bu değerin üzerinde olduğu belirlenmiştir. EcN (*Escherichia coli* Nissle) içeren örneklerde ise 35. günde 106 kob/mL değerinin altına düştüğü gözlenmiştir. EcN içeren ticari meyve suyu üretimi yapılması durumunda depolama süresi 14 gün olarak belirlenmelidir.

➤ **Probiyotiklerin Meyve ve Sebze Bazlı İçeceklerde Kullanımı**

Modern, sağlık bilincine sahip tüketiciler, refahı iyileştirebilecek ve hastalık riskini azaltabilecek gıdalar için artan bir istek gösterdiğinden, küresel fonksiyonel içecek pazarı gıda endüstrisinin büyüyen bir sektörüdür. Fonksiyonel gıda pazarının en hızlı büyüyen sektör olduğu ve 2008'de gıda endüstrisi için %2 ila %3'lük beklenen yıllık büyüme ile karşılaştırıldığında %10'luk bir büyüme olduğu bildirildi (Corbo vd., 2014). Bu ürünler, laktoz intoleransının daha yaygın olması ve düşük kolesterol ürünlerinin tercih edilmesi bağlamında önemli hale geldi ve tüketicilerin süt içeceklerinden kaçınmasına neden olmaktadır (Marsh vd., 2013). Ayrıca, meyvenin laktik fermentasyon için substratlar olarak uygulanması, tüketiciler tarafından takdir edilen, farklı duyuşal ve fizikokimyasal özelliklere sahip ürünlerle sonuçlanan, her meyve tipine özgü tatlar ve besinlerin dahil edilmesi avantajına sahiptir. Peynir altı suyu eklenmiş veya eklenmemiş, farklı fermente Brezilya meyvelerinden yapılan içecek formülasyonlarının karşılaştırılması, süt bileşenlerinin eklenmesinin istenmediğini ve tüketicilerin tercihinin laktoz içermeyen fermente meyve suları olduğunu göstermektedir (Maldonado vd.,2017). Laktik asitle fermente edilmiş meyve veya sebze sularının geliştirilmesine yönelik son araştırmalar, özellikle LAB büyümesine ve sağlıkla ilgili özellikler üzerindeki etkisine odaklanmıştır (Tablo 10).

Tablo 10. Laktik asitle fermente edilmiş meyve veya sebze suları (Maldonado vd.,2017).

Hammadde	Ön Fermentatif Anama	Mikroorganizma	Beslenme Etkisi
Nar	Isl işlem 80 °C 5 dk	<i>L. plantarum</i> , <i>L. acidophilus</i> , <i>L. paracasei</i> , <i>L. delbrueckii</i>	DPPH radikal süpürme aktivitesinde artış; azalma antosiyanin içeriği; antioksidan aktivitede daha fazla artış <i>L. plantarum</i> 'dan ziyade <i>L. acidophilus</i> ile işaretlenmiştir
Nar	Filtrasyon 0,22 µm	<i>L. plantarum</i>	Toplam fenolik bileşik konsantrasyonu ve serbest radikal süpürme aktivitesi fermente edilmiş ürünlerde daha iyi korunmuştur. koralden daha meyve suyu, fermente edilmiş meyve suyu modüle edilmiş bağışıklık araçlarının periferik kanda sentezi mononükleer hücreler
Nar	-	<i>L. acidophilus</i> , <i>L. plantarum</i> , <i>B. longum</i> subsp. <i>infantis</i> , <i>B. bifidum</i>	Fermente ürünlerde kateşin ve α-punkalagin tanımlanması meyve suları; antioksidan aktivite ve konsantrasyonda artış simüle edilmiş gastrointestinal sırasında fenolik türlerin fermente meyve sularının sindirimi; fermentasyon arttı fenolik bileşiklerin biyoerişilebilirliği
Nar	Isl işlem 70 °C 5 dk	<i>L. plantarum</i> , <i>L. acidophilus</i> , <i>L. delbrueckii</i>	Daha yüksek antioksidan aktivite ve toplam fenolik bileşikler kıyasla <i>L. plantarum</i> ile fermente edilmiş meyve sularında fermente edilmiştir
roni	Isl işlem 121 °C 15 dk	<i>L. casei</i> subsp. <i>casei</i> , <i>B. longum</i> , <i>L. plantarum</i>	<i>B. longum</i> ile fermente edilmiş meyve suyunun antioksidan aktivitesi diğer türler göre daha iyi korunmuştur ve ilk fermente edilmemiş meyve suyunu benzer kaldı
Kiraz, domates, böğürtlen, kuru erik, beyaz üzüm meyve suyu ve aloe vera Kivi, rezene, ıspanak, papaya, beyaz üzüm meyve suyu ve aloe vera	Isl işlem 80 °C 10 dk	<i>L. plantarum</i> , <i>L. pentosus</i> , <i>Lactobacillus</i> sp.	Radikal süpürücü aktivitenin ve toplamı daha iyi korunması başlatılmış meyve sularında fenolik bileşik konsantrasyonu
Armut	-	<i>acidophilus</i>	Çoğu için α-glukozidaz inhibisyonunda önemli artış fermente meyve suyu örnekleri
Vişne suyu ve brokoli püresi	Vişne suyu ısl işlem görmüş 121 °C 10 dakika	<i>L. plantarum</i>	Fermente vişne suyu ve brokoli püresi zenginleştirildi yüksek insan biyoyararlanımına sahip fenolik türlerde ve biyolojik aktivite
Hindistan cevizi suyu	-	<i>L. plantarum</i> , <i>B. Animalis</i> subsp. <i>lactis</i>	-

LAB, organik asitlerin üretiminin yanı sıra, fermentasyon yoluyla birçok önemli biyoaktif bileşimin üretimine de katkıda bulunma yeteneğine sahiptir. Meyve ve sebze suları, güçlü bir sağlık çekiciliğine paralel olarak LAB için uygun bir büyüme substratı sağlayan vitaminler, mineraller ve antioksidan moleküller açısından değerli kaynaklardır. LAB'nin çeşitli suşları ile içecek fermentasyonunun, bazen toplam fenol ve flavonoid içeriğinde bir artışla birlikte antioksidan aktiviteyi büyük ölçüde arttırdığı rapor edilmiştir (Garcia vd.,2020). Meyve ve sebze suları, laktik asit fermentasyonu için uygun substratlar veya probiyotik bakteriler için vektörler olarak uygundur. Aktif LAB'nin meyve ve sebze özellikleri ile kombinasyonu sunarsayısız beslenme avantajı. Ayrıca, LAB metabolizmasından kaynaklanan sinerjik etkiler beklenebilir. Kombinasyonun avantajları laktozsuz içecekler, spesifik tat, EPS üretimi, şeker içeriğinde azalma ve biyoaktif bileşiklerin üretimini kapsar. LAB tüketimi, bağırsak sistemi sağlığını iyileştirebilir, bağışıklık sistemini güçlendirebilir, besinlerin biyoyararlanımını sentezleyebilir ve geliştirebilir ve belirli kanser ve kardiyovasküler hastalık riskini azaltabilir. LAB fermente meyve ve sebze içecekleri, metabolik hastalık yönetimi için yeni bir varlık sağlayabilir.

Probiyotik taşıyıcıları olarak meyve ve sebzelerin kullanılması ile fonksiyonel özellikleri artırılmış daha sağlıklı ürünler elde edilebilmektedir. Farklı tekniklerle üretilen meyve ve sebze bazlı probiyotik içeceklerin geliştirilmesi amacıyla hammadde olarak sıklıkla elma, portakal, ananas, havuç ve pancar, probiyotik kültür olarak ise genellikle *Lactobacillus acidophilus*, *L. casei*, *L. plantarum*, *L. rhamnosus*, *Leuconostoc mesenteroides* ve *Bifidobacterium lactis* kullanılmaktadır. Bu çalışmada, probiyotik meyve ve sebze bazlı içeceklerin geliştirildiği güncel çalışmalar derlenmiştir.

Tablo 11. Ticari olarak üretilen çeşitli meyve ve sebze bazlı probiyotik içecekler (Corbo vd., 2014).

Ürün İçeriği	Probiyotik Suş	Marka	Üretici / Ülke
Portakal	<i>L. reuteri</i>	"R"	Ingman/İsveç
Portakal ve Mango	<i>L. rhamnosus</i> GG	Biola	Tine BA/Norveç
Şeftali ve Muz	<i>B. lactis</i>	It's Alive	Birleşik Krallık
Ananas, Havuç, β-karoten ve Kalsiyum	<i>L. rhamnosus</i> GG	Gefilus/Gfilac	Valio, İsveç/Finlandiya
Ahududu, Siyah Frenk Üzümü ve Üzüm	<i>L. plantarum</i> 299v	SHOT	Skanemejerier/İsveç
Portakal, Şeftali, Prebiyotik ve C vitamini	<i>L. rhamnosus</i> GG	Gefilus/Gfilac	Valio, İsveç/Finlandiya
Havuç, Zencefil ve Şeker Kamışı	<i>L. plantarum</i> 299v	GoodBelly	ABD
Zencefil, Frenk Üzümü, Yaban Mersini ve 19 Farklı Aromatik Bitki Ekstraktı	<i>L. acidophilus</i> , <i>L. rhamnosus</i> , <i>L. casei</i> , <i>L. lactis</i> , <i>L. salivarius</i> , <i>B. lactis</i> , <i>B. longum</i> ,	Vita Biosa	Danimarka
Çilek, Siyah Frenk Üzümü, Mango, Muz ve Oligosakkarit	<i>B. lactis</i>	Tropicana	ABD
Erik, Üzüm ve Portakal	<i>L. paracasei</i>	Malee Enterprise Company	Tayland

Bu kapsamda fonksiyonel gıdaların büyük bölümünü oluşturan probiyotik ürünlere yönelik talep oldukça fazladır. Süt bazlı probiyotik gıdalar dünya genelinde en yaygın üretilen probiyotik ürünler olmasına rağmen laktoz intolerans, vejetaryen beslenme ve süt proteini alerjisi gibi çeşitli sınırlayıcı faktörler nedeniyle yeni gıda matrislerinin araştırılması hız kazanmıştır. Meyve ve sebzelerin içerdiği sağlığa faydalı bileşenlerin yanı sıra üretim, depolama ve tüketim gibi birçok aşama açısından probiyotik taşıyıcıları olarak kullanımları dikkat çekmektedir. Buna ek olarak, geleneksel fermente içeceklerden elde edilen potansiyel probiyotik suşlar ve farklı tekniklerle üretilen meyve ve sebze bazlı probiyotik içeceklerle yönelik çalışmalar her geçen gün artmaya devam etmektedir. Bu tip ürünlerin geliştirilmesinde ortamın pH değeri, çeşitli antimikrobiyel bileşenlerin varlığı, oksijen düzeyi, raf ömrü ve tüketim sırasındaki canlı ve aktif probiyotik sayısı gibi çeşitli faktörler kritik rol oynamaktadır. Probiyotik ürünlerde hücre canlılığını maksimum seviyede tutmak adına farklı tekniklerden yararlanılmakta, ayrıca ürün formülasyonları çeşitli bileşenlerle zenginleştirilerek hücre gelişimi desteklenebilmektedir. İleride yapılacak çalışmalar sayesinde probiyotiklerin farklı ürün gruplarında kullanımı ile ürün çeşitliliğinin artırılması mümkün olabilecektir.

10. Sonuç

Meyve suyu-bazlı fonksiyonel içecek grupları, son yıllarda, tüketicilerin sağlıklı gıda konusunda artan farkındalık ve talepleri doğrultusunda hızla büyüyen fonksiyonel gıda pazarında önemli bir yere sahiptir. Bu kapsamda geliştirilen yeni içecekler, temel besin bileşenlerinin yanı sıra, sağlığı destekleyici ve kronik hastalıklara yakalanma riskini azaltıcı etkileri ile bilinen fonksiyonel özellikteki bileşenler için de zengin birer gıda kaynağı olarak ilgi çekmektedir. Bununla birlikte, gıda üreticileri, yeni geliştirilen ürünlerde, yüksek miktarda biyoaktif madde içeriği, yüksek antioksidan kapasite ve yüksek duyu kalite özelliklerinin hepsinin birarada bulunması hedefi ile optimum karışımların oluşturulması için çaba sarfetmelidir. Bu ürünlerin, sağlık üzerine olumlu etkilerinin detaylı bir şekilde araştırılması ve ortaya konması, tüketiciler tarafından daha yüksek oranda kabul görmelerinde kilit rolü oynamaktadır.

Teşekkür

Önüme çıkan her sorunun aşılmasında bilgi, birikim ve değerli tecrübeleri ile bana yol gösteren, kıymetli vaktini ayırarak yardımlarını esirgemeyen değerli hocam Sayın Doç. Dr. Hande BALTACIOĞLU' na teşekkür ederim.

Productivity, forage quality and capacity of *Thymuseta-Vicaetum-Festucosum* formation in the mountain part of Talish

Sanubar Aslanova

Azerbaijan State Pedagogical University, Baku, Azerbaijan, aslanova17.02@mail.ru

The vegetation cover of the formation was recorded in the "Turksoba" summer (non-grazed) pasture field No. 8 in the territory of Astara region in the mountain-brown soils that have come out from under the forest. The average annual temperature of the air typical of the climate of this region is 10-14°C, and the annual amount of precipitation reaches 1400-1600 mm. The research shows that the vegetation of this formation belongs to the class of diverse herbaceous- Fabaceae- Poaceae formation. The productivity of this formation class of *Thymuseta-Vicaetum-Festucosum* formation varies between 19.5-29.6 s/ha in wet mass and 7.8-12.9 s/ha in dry mass (table 1) in the summer of 2019-2020-2021. According to calculations, the coefficient of conversion of wet mass to dry mass of productivity corresponds to 2.3 - 2.5. As can be seen from table No. 1, the average annual productivity of the *thymuseta-vicaetum-festucosum* formation is variable for botanical groups. So, in the summer of 2019 (in dry mass) - 7.8 s/ha, Poaceae 3.6 s/ha (46.1%), Fabaceae 2.7 s/ha (34.7%), HerboSeta, 1.5 s/ha (19.2 %) has fluctuated; In 2020 (summer) 10.2 s/ha - Poaceae 6.1 s/ha (59.8%), Fabaceae 2.5 s/ha (24.5%), HerboSeta 1.6 s/ha (15.7%) and 12.9 s/ha in 2021 - Poaceae 6.7 s/ha (51.9%), Fabaceae 3.8 s/ha (29.5%), and HerboSeta 2.4 s/ha (18.6%).

Table 1 The average annual productivity of the *Thymuseta-Vicaetum-Festucosum* formation spread in the summer pasture area No. 8 "Turkasoba" of Astara region

Years and months	Botanical plant groups	Wet mass		Dry edible mass	
		With s/ha	With %	With s/ha	With %
2019 (July 10-20)	Poaceae	9,0	46,1	3,6	46,1
	Fabaceae	6,8	34,9	2,7	34,7
	HerboSeta	3,7	19,0	1,5	19,2
	Average annual productivity	19,5	100,0	7,8	100,0
2020 (July 20-25)	Poaceae	15,2	59,6	6,1	59,8
	Fabaceae	6,3	24,7	2,5	24,5
	HerboSeta	4,0	15,7	1,6	15,7
	Average annual productivity	25,5	100,0	10,2	100,0
2021 (July 25-30)	Poaceae	16,6	56,1	6,7	51,9
	Fabaceae	7,3	24,7	3,8	29,5
	herboSeta	5,7	19,2	2,4	18,6
	Average annual productivity	29,6	100,0	12,9	100,0

As can be seen in table 2, the three-year average productivity of the *Thymuseta-Vicaetum-Festucosum* formation (10.1 s/ha), 3.0 head of cattle per hectare, and the grazing capacity (270 heads of small horned cattle can be grazed) was determined in the total area (90 ha) taking into account the fodder unit in 100 kg of dry feed (45.8 kg), shelf life of phytocenosis (120 days), the daily feed rate of cattle (sheep-goats) (1.3 feed units).

Table 2. Duration of use of phytocenoses, average productivity, feed quality and pasture capacity in the summer season of 2019-2020-2021 in some plant formations

s/s	Formations	D	AY	in 100 kg of fodder		NH	Area (in hectares)	Pasture capacity
				FU	AP			
1.	<i>Thymuseta-stipa festucosum</i>	120	8,1	44,7	4,9	2,3	333	766
2.	<i>Trifolium -thymuseta-festucosum</i>	120	10,9	55,3	5,6	3,9	296	1154
3.	<i>thymuseta-vicaetum-festucosum</i>	120	10,1	45,8	4,6	3,0	90	270

D: Duration (in days); AY: Average yield (in edible dry mass); FU: Fodder unit; AP: Absorbed protein; NH: Number (load) of small horned cattle that can be grazed per hectare

Thus, from our multi-year studies on biodiversity productivity, feed quality and grazing capacity in the mountainous ecosystem of Lankaran, we come to the conclusion that 35-40% of summer pastures in Yardimli, Lerik and Astara regions have decreased productivity due to inefficient use and overgrazing and phytodiversity has been degraded. Therefore, it is appropriate to implement measures to protect, efficiently (correctly) use and improve phytocenoses in natural summer pastures of the region.

Structural Characterization Antioxidant, Hemolytic And Antimicrobial Activities Of *Gymnema Sylvestre*

Muhammad Tjammal Rehman^{1*}, Iqra Saleem¹, Arslan Rasool¹, Muhammad Shahid¹

¹University of Agriculture, Faisalabad, Pakistan

Abstract

Traditional medicine is based on a variety of herbs since old age for treating several diseases and maintaining health. *Gymnema sylvestre*, often known as "Gurmar", is a perennial, woody climbing plant native to the tropical woods of southern and central India. It belongs to the Apocynaceae family and the genus *Gymnema*. *Gymnema sylvestre* has great medicinal importance due to their anti-inflammatory, antioxidant, antidiabetic, antihypertensive, antioxidant, antithrombotic, antiseptic and hepatoprotective activities. In this study ethyl acetate, methanolic and aqueous extract of plant were prepared. Fourier Transformed Infrared Spectroscopy (FTIR) and high-performance liquid chromatography (HPLC) was used to characterize and identify the functional groups. Extract was further processed to assess antioxidant and antimicrobial hemolytic activity of *Gymnema sylvestre*. Ethyl acetate exhibited the highest TPC (67.954 ± 0.79 g gallic acid equivalent/g dry weight) and highest TFC (113.02 ± 3.20 g catechin equivalent/ g dry weight) was noted in aqueous extract. Antioxidant activity was assessed by DPPH scavenging assay in which methanol extract had the highest DPPH scavenging activity (75%), antimicrobial activity was measured by agar well diffusion method and the maximum zone of inhibition was of methanol fraction against *Staphylococcus aureus* (12.55 mm) and *E. coli* (7.73 mm), biofilm formation inhibition assay was performed by microtiter plate method. The maximum hemolytic activity of ethyl acetate is 151.2 ± 3.71 . One way ANOVA and Tuckey test was used to find significant difference between means of different samples which revealed all the results are significant.

Characterization And Evaluation Of Pharmacological Potential Of *Crocus Sativus* Stigma Extract

Arslan Rasool^{1*}, Hamna Mazhar¹, Muhammad Tjammal Rehman¹, Muhammad Shahid¹,

¹University of Agriculture, Faisalabad, Pakistan

Abstract

Saffron is one of the most beneficial plants in the world belongs to the member of Iridaceae family which is also known as saffron. The present study was designed to evaluate the biological potential and toxicological studies of the *Crocus sativus*. Ethanol, n-hexane and distilled water extracts of *Crocus sativus* was used to evaluate their antioxidant, antimicrobial, and hemolytic activity. The *Crocus sativus* extracts were characterized by FTIR. Fourier Transformed Infrared Spectroscopy (FTIR) was used to determine the functional groups present in *Crocus sativus* stigma extracts. The antioxidant activity of the *Crocus sativus* stigma extracts were measured by DPPH scavenging assay, TPC and TFC. In the DPPH assay, distilled water extract (47.04 ± 0.76) exhibited highest DPPH scavenging activity followed by n-hexane (28.76 ± 0.94) and ethanol (4.0 ± 0.3) extracts. Ethanol extract exhibited the highest TPC (595 ± 0.84 g gallic acid equivalent /g dry weight) and TFC (32.7 ± 0.26 g catechin equivalent /g dry weight) as compared to n-hexane and distilled water extracts. The antibacterial activity was performed through well diffusion method and the maximum zone of inhibition (mm) was of ethanol fraction of *Crocus sativus* stigma extract against *E.coli* (23.5 mm) and *Staphylococcus aureus* (19 mm). *Crocus sativus* showed the biofilm inhibition against the both positive strain (*S. aureus*) and negative strain (*E. coli*) of bacteria. Cytotoxicity Assay by hemolytic activity indicates that all three extracts of *Crocus sativus* were nontoxic and safe for human use. All the extracts of *Crocus sativus* stigma showed significant anti-inflammatory activity. One way ANOVA and Tuckey test was used to find significant difference between means of different sample extracts which showed that results are significant. Results of this study showed that *Crocus sativus* stigma extract can be used for medicinal purposes.

Keywords: *Crocus sativus*, Antioxidant potential, Antibacterial, hemolytic assay, Saffron

Sterilization effect of 0.1 HgCl₂ on the invitro germination of papaya (*Carica papaya* Linn) seeds to produce disease-free plants

Muhammad Mudassir Iqbal, Attif Ramzan, Anees Ur Rehman

Abstract

The famous fruit plant papaya (*Carica papaya* L.) due its nutritive value belongs to the family Caricaceae. There are many species of papaya among them only 32 are dioecious, two trioecious and one monoecious. The first and only species of the genus *Carica* is the papaya, which is also the most popular and economically significant member of the family. It is a prominent fruit crop grown in tropical and subtropical regions of the world. Papaya plant facing pathogenic issues during germination of the seeds in the field. This research was conducted to minimize this problem in the papaya seed nursery development industry by taken seeds to invitro conditions, to avoid the contamination problems this research laid under Complete randomized design. It included the concentrations of 0.1 HgCl₂ with different time intervals 3mint, 5mint and 7mint. Rinsed the seed 2-3 times with double sterilized water and soaked in the solution of 0.1% HgCl₂ and add 2 drops of tween twenty. The results revealed that the seeds treated with 0.1 HgCl₂ for 5mints gave higher germination % (96%) results and lower contamination (fungal or bacterial) growth on seeds as compared to the other treatments.

Key words: *Carica papaya* L.; 0.1 HgCl₂, Contamination (fungal or bacterial) or pathogenic, Sterilization

Interrelation Of Humic Substances With Chemical Substances And Pollutants

Aliyeva Tarana¹, Abdullayev Rizvan¹, Melikova Afak²

¹Baku State University, Ecological chemistry

²Azerbaijan State University of Oil and Industry, Ecological chemistry, Baku, Azerbaijan Republic

Humus to some extent interacts with the mineral components of the solid phase of the soil, forming its sorption properties. In this regard, any compound entering the soil from outside interacts with both the solid phase and the organic matter of the soil solution.

Soil organic matter plays an important role in the transformation of mineral fertilizers, chemical ameliorants, pesticides and individual components of various soil pollutants. The presence of organic substances in the interaction of agrochemicals and pollutants with soil is manifested in the following:

promotes the separation of mineral nutrients from sparingly soluble fertilizers in acidic soils, for example, accelerates the separation of phosphorus from phosphorus flour or the dissolution of lime or the hydrological decomposition of some pesticides, etc.;

sorbed phosphates pass into the soil solution, replacing them in the soil absorbing complex;

Participates in the exchange and non-exchange absorption of mineral fertilizers and chemical ameliorants, pesticides, radionuclides, cations contained in heavy metals. In turn, sorbed humus reduces the scale of strong binding of phosphates and some cations, preventing the interaction of agrochemical and toxic substances with the mineral part of the soil;

Reduces the transition of phosphates into sparingly soluble forms due to active interaction with cations (Fe^{3+} , Al^{3+} , Ca^{2+} , etc.) involved in the precipitation of phosphates in fertilizers;

In some soils, the possibility of the formation of complex, sparingly soluble mineral-humus compounds containing Fe and Al, as well as phosphorus has been established. Such compounds are capable of active migration;

In some cases, cations of mineral fertilizers, such as potash fertilizers in alkaline soils or alkaline fertilizers containing ammonium (liquid ammonia, ammonia water), can form soluble humates in the soil.

Soluble humus can also interact with heavy metal cations as well as artificial radionuclides. These reactions are due to the formation and behavior of simple and complex hetero polar salts and affect the migration, accumulation and entry of toxic substances into plants.

To regulate the behavior of pesticides in the soil, it is important to study the interaction of these substances with various active soil components, primarily organic substances. However, information on this issue is insufficient and sometimes contradictory. A number of studies have shown a very important effect of humus on the degradation, migration and entry of pesticides into plants. It is known that the amount of herbicides needed to kill weeds can vary by a factor of 20 depending on the nature of the interaction of the soil with humus (F. Stevenson). The interaction of various structural and functional groups of soil humus with simazine, atrazine, 2,4-D and other herbicides has been experimentally proven. It is known that clay-humus complexes adsorb pesticides better than pure humic acids. Fulvic acids, on the other hand, act as carriers for a number of sparingly soluble pesticides.

Cadmium And Zinc In The Environment

Aliyeva Tarana¹, Samedova Ayten¹, Hajiyeve Hadiyya¹, Melikova Afak²

¹ Baku State University, Ecological chemistry

² Azerbaijan State University of Oil and Industry, Ecological chemistry, Baku, Azerbaijan Republic

Cadmium, zinc and copper are the most important metals in the study of pollution problems, as they are widely distributed in the world and have toxic properties. Cadmium and zinc (as well as lead and mercury) are found mainly in sulfide sediments. As a result of atmospheric processes, these elements easily enter the oceans. Soils contain approximately $4.5 \times 10^{-4}\%$. Vegetation contains varying amounts of both elements, but the content of zinc in plant ash is relatively high – 0.14%, since this element plays an essential role in plant nutrition.

About 1 million kg of cadmium enters the atmosphere annually as a result of the activities of plants for its smelting, which is about 45% of the total pollution by this element. 52% of pollution comes from the combustion or processing of products containing cadmium. Cadmium has a relatively high volatility, so it easily diffuses into the atmosphere. The sources of air pollution with zinc are the same as with cadmium.

The entry of cadmium into natural waters occurs as a result of its use in galvanic processes and technology. The most serious sources of water pollution with zinc are zinc smelters and electroplating plants.

Fertilizers are a potential source of cadmium contamination. In this case, cadmium is introduced into plants that are used by humans for food, and at the end of the chain they pass into the human body. Cadmium and zinc readily enter seawater and the ocean through a network of surface and groundwater. Cadmium and zinc accumulate in certain organs of animals (especially in the liver and kidneys).

Zinc is the least toxic of all the heavy metals listed above. However, all elements become toxic if found in excess; zinc is no exception. The physiological effect of zinc is its action as an enzyme activator. In large quantities, it causes vomiting, this dose is approximately 150 mg for an adult.

Cadmium is much more toxic than zinc. He and his compounds belong to the I class of danger. It penetrates the human body over a long period. Breathing air for 8 hours at a cadmium concentration of 5 mg/m³ can cause death. In chronic cadmium poisoning, protein appears in the urine, and blood pressure rises.

When examining the presence of cadmium in food, it was found that human excretions rarely contain as much cadmium as was absorbed. There is currently no consensus on the acceptable safe content of cadmium in food.

One effective way to prevent cadmium and zinc from being released as pollution is to control the content of these metals in emissions from smelters and other industries.

ID: 660

Soil Contamination With Protein And Vitamin Preservatives

¹Alieva Tarana, ¹Hajiyeva Hadiyya, ¹Samedova Ayten, ²Malikova Afag

¹ Baku State University, Ecological chemistry

²Azerbaijan State University of Oil and Industry, Ecological chemistry, Baku, Azerbaijan Republic

In the last 10 years, compound feeds (feed mixtures prepared from different feeds) obtained with the use of protein-vitamin concentrates (PVC) for cattle in the 80s of the twentieth century, which manifested themselves in animal husbandry due to environmental problems, have been widely developed.

The energy use of the human body is mainly associated with the consumption of animal meat. Proteins, fats and carbohydrates in meat, milk and eggs are absorbed by people by 90-98%, and in potatoes and vegetables by 70-95%. Accordingly, for animal nutrition, it is necessary to develop foods rich in protein and vitamins.

Such substances are found in microorganisms synthesized from carbohydrate-containing raw materials. On their basis, protein-vitamin concentrates are made. However, their end products, as it turned out later, are not harmless. First, during production, they cause allergies, dermatitis, bronchial asthma and, in some cases, cancer in workers. The second is the accumulation in the body of an animal of substances harmful to human health.

As a result of feeding protein-vitamin concentrates to animals, eosinophilia develops in the intestinal mucosa, granulomatosis in the liver.

It has also been proven that protein-vitamin concentrates contain 12-15 times more nucleic acids than feed. It is known that these biological polymers provide the transfer of genetic information. So it affects the genetic code of animals, birds and ultimately humans. The basis of nucleic acid in protein-vitamin concentrates is ribonucleic acid (RNA). RNA causes an increase in uric acid in the urine and blood in the human body. Leads to diseases that contain a lot of RNA.

Excessive feeding of animals with protein and vitamin concentrates leads to the accumulation of fat in the liver, increased cholesterol levels, and metabolic disorders. In this regard, protein-vitamin concentrates can be added to feed for cattle 20%, and poultry 15%.

Currently, science is trying to study the unknown properties of protein-vitamin concentrates. Therefore, it is very important to comply with the norm when added to animal feed, so as not to endanger human health.

Evaluation Of Environmentally Harmful Mineral Fertilizer Standards In Irrigated Gray Brown Soils In Samukh District

Adigozalov Parviz

Ganja State University, Environmental protection, Ganja, Azerbaijan Republic

Rye is one of the cereal plants cultivated as food and fodder in our republic. Rye grain contains 9.0-18.6% protein, 51.8-62.6% non-extractable nitrogenous substances, 1.6-1.9% fat, 2.3-2.5% depending on the characteristics of the variety and cultivation conditions, cellulose and 1.9-2.0% ash. Grain can contain up to 82% carbohydrates, most of which is starch. Starch has a positive effect on the preparation and composition of bread. Rye flour contains 3.1-4.5% gluten. The increase in gluten greatly improves its baking quality.

Ecological evaluation of lands and landscape complexes of the republic and individual regions has been studied by many authors.

In Ganja-Gazakh region, we began to study autumn rye in 2018.

If the application of agrochemical and chemical means in crop cultivation is not carried out correctly, if the given norms are not expected, it creates consequences for the environment and human health. From this point of view, optimizing the application of mineral fertilizers in crop cultivation, providing scientifically based "ecological" norms and ecological (agroecological) evaluation of soils can play an important role in preventing negative processes that may arise for the environment and human health.

The main goal of the research is to determine the ecologically harmless mineral fertilizer norms that ensure high and quality harvest from the autumn rye plant in irrigated gray-brown (chestnut) soils under the conditions of the Ganja-Gazakh region, and to determine the ecological value of these soils. It is evidence of logical evaluation.

Researches were conducted in 2018-2020 with the "Mirbashir-46" variety of winter rye on irrigated gray-brown (chestnut) soils at the Ganja Regional Agrarian Science and Innovation Center of the Ministry of Agriculture, located in the Samukh district.

The following price indicators were used during the ecological evaluation of the lands of Ganja-Gazakh region: bonity scores obtained on the basis of the internal properties of the soils (humus, nitrogen, phosphorus, potassium, UAC) during the comparative evaluation (bonitirotn) of the soils; Ecological scores obtained on the basis of special evaluation scales according to the degree of manifestation of individual characteristics of soils (pH, water-resistant aggregates, dry residue).

In the third stage of our research, the final ecological scores of dark gray-brown (chestnut), ordinary gray-brown (chestnut) and light gray-brown (chestnut) soils under ryegrass were found using "cultivation-ecological coefficients". The following formula was used for this:

$$E_{m-e} = E_b \times T_{m-e}$$

Here, E_{m-e} – is the final acculturation-ecological score of soils; E_b – soil ecological score and T_{m-e} -culturalization - ecological correction coefficient.

As a result, the environmental scores of the lands used under rye crops were calculated by applying the main credit scores.

Alternatives to antibiotics in the poultry diet regarding one health concept

Muhammad Umair Asghar^{1,2*}, Mariusz Korczyński¹, Sibel Canoğulları Doğan², Sema Yaman²

¹ Department of Animal and Feed Sciences, Faculty of Animal Science and Fisheries, Wrocław University of Environmental and Life Sciences, Wrocław, Poland

² Department of Animal Production and Tech., Faculty of Agricultural Sciences and Tech., Niğde Ömer Halisdemir University, Niğde, Turkey,

Abstract

In poultry industry, antibiotic substances have been widely used as growth promoters causing serious health problems regarding one health concept. Antimicrobial resistance developed due to imprudent usage of these antibiotics as growth promoters. To overcome this problem, employing biotic or natural items as antibiotic replacements, phytochemicals, organic acids, probiotics, prebiotics, bacteriophages, in-feed enzymes and others such as phytobiotics (phytogenics or botanicals), has gained a lot of interest. Phytobiotics or its components are a new class of natural herbs that have acquired appeal and acceptance among the poultry sector. The use of a variety of phytobiotic additions in chicken feed has demonstrated their capacity to improve the productivity of both broilers and layers. Furthermore, phytobiotics shown high efficiency in combating pathogenic microorganisms in the intestine while preserving the community of typical resident useful microbiota. Moreover, substances like thymol, carvacrol, cinnamaldehyde and curcumin found in thyme, peppermint and turmeric exert significant support of the innate immunity as well as antioxidant action. Phytobiotics have been found to have an immunostimulatory impact on both humoral and cellular immunity, along with antioxidant qualities. As a result, the purpose of this review paper was to focus on the use of various types of phytobiotics as chicken dietary supplements to boost productivity, decrease infectious intestinal flora, and augment the immunological response, particularly after vaccination. However, the phytochemical mechanisms of the growth promotion and action on microflora are still unclear and need further investigation to achieve the maximal effectiveness.

Abstract

Today, the use of pesticides has become a routine for most of the population. Pesticides can be purchased very easily, without a recommendation from a specialist, at an affordable price and guaranteeing the desired effect against pests, which can be represented by insects, mollusks, rodents, fish, plants, etc. Moreover, lately there is a growing interest in understanding the relevance of pesticide exposure in most of the neuropsychiatric disorders. We are describing here the current state of knowledge regarding the influence of some pesticides (and especially rotenone) in some neuropsychiatric manifestations, focusing mostly on the neurological and psychiatric characteristics of Parkinson's disease. Also, we are giving a lot of interest to the zebrafish model in the aforementioned context.

Alternative Raw Material Source for Gluten-Free Products: Cauliflower Powder

Pınar Küçük

Food Engineering, Engineering Faculty, Manisa Celal Bayar University, Manisa, Turkey

Abstract

Gluten-free products prepared from commercial starches and gluten-free grains are thought to have low amounts of dietary fiber. For this reason, the gluten-free diet, food choices and dietary habits of celiac patients cause long-term concerns. Recent studies on this diet style; revealed that insufficient protein, carbohydrate, fat intake and unbalanced protein intake occur. For this, it is aimed to produce foodstuffs to increase dietary fiber intake with various studies. Fruits and vegetables are good sources of dietary fiber to compensate for nutritional deficiencies in gluten-free products (Arslan et al., 2018). Dietary fiber from vegetables has more nutritional value. Therefore, it is recommended to supplement the dietary fiber source with increasing vegetable intake in celiac disease.

Due to this deficiency, it is aimed to improve and enrich the foods by making use of the high dietary fiber in vegetables in gluten-free cereal products. Among the pumpkin, cabbage, broccoli, sugar beet and carrot vegetables, cauliflower can be used as the main product for enriching gluten-free bread in terms of having higher dietary fiber. Thus, cauliflower, which is very valuable as a waste product, will be used in powder form and the deficiency in nutrition will be eliminated with vegetables with high dietary fiber. Cauliflower, one of the Brassica vegetables, has been added to the bread structure, which is the main nutritional product due to its high secondary metabolite and dietary fiber feature. Bread making caused some reduction in SPMs. But Klopsch et al.2019 developed a promising, innovative and healthy product to increase bioactive consumption with high fiber content by adding fresh cauliflower and leaves to bread in their study (Lin and Zhou 2018; Świeca, Sęczyk, Gawlik-Dziki, Dzik, 2014).

Key Words: *gluten, cauliflower, bread, celiac*

Glutensiz Ürünlerde Alternatif Hammadde Kaynağı: Karnabahar Tozu

Özet

Ticari nişastalardan ve glutensiz tahıllardan hazırlanan glutensiz ürünlerinin düşük miktarda diyet lifine sahip olduğu düşünülmektedir. Bu nedenle çölyak hastalarının glutensiz diyet yapmaları, bu yöndeki gıda seçimleri ve beslenme alışkanlıkları uzun vadeli endişelere yol açmaktadır. Bu beslenme tarzı üzerine son zamanlarda yapılan çalışmalar; yetersiz protein, karbonhidrat, yağ alımı ile dengesiz protein alımı oluştuğunu ortaya koymuştur. Bunun için çeşitli çalışmalar ile diyet lifi alımını arttırmaya yönelik gıda maddeleri üretilmesi hedeflenmektedir. Meyve ve sebzeler glutensiz ürünlerdeki beslenme eksikliklerini telafi etmek için iyi bir diyet lifi kaynağıdır (Arslan ve ark., 2018). Sebzelerden elde edilen diyet lifleri daha fazla besin değerine sahiptir. Bundan dolayı çölyak hastalığında diyet lifi kaynağının sebze alımının artırılması ile desteklenmesi önerilmektedir.

Bu eksiklikten dolayı glutensiz tahıl ürünlerinde sebzelerdeki yüksek diyet lifinden faydalanılarak gıdaları iyileştirmek, zenginleştirmek hedeflenmektedir. Bal kabağı, lahanası, brokoli, şeker pancarı, havuç sebzeleri arasında karnabahar daha yüksek diyet lifine sahip olması açısından esas ürün alınarak glutensiz ekmek zenginleştirilmesinde kullanılabilmektedir. Böylelikle hem atık ürün olarak çok kıymetli olan karnabahar, toz şeklinde kullanılacak hem de diyet lifi yüksek sebze ile beslenmedeki eksikliğin giderilmesi sağlanacaktır. Brassica sebzelerinden olan karnabahar yüksek sekonder metabolit ve diyet lifi özelliğinden dolayı temel beslenme ürünü olan ekmek yapısına ilave edilmiştir. Ekmek yapımı SPM'lerin bir miktar azalmasına neden olmuştur. Ama Klopsch ve ark.2019, yaptığı çalışmada taze karnabahar ve yapraklarının ekmeğe ilave ederek lif oranı yüksek, biyoaktif tüketimini artırmak için umut verici, yenilikçi ve sağlıklı bir ürün geliştirmiştir (Lin ve Zhou 2018; Świeca, Sęczyk, Gawlik-Dziki, Dzik, 2014).

² Tokat Gaziosmanpaşa University, Faculty of Agriculture, Department of Biosystem Engineering

Abstract

The risks posed by natural, economic and social factors adversely affect the sustainability of agricultural production. It is aimed to reduce these risks by developing systems that will meet the food needs of the increasing population, use water resources efficiently and reduce the workload of the soil. In the modernizing world, the use of agriculture integrating with the developing technology has allowed the emergence of alternative farming methods. The advantages of the Aeroponic system, which is one of the alternative farming methods, compared to traditional farming methods are increasing the popularity of the system. Aeroponic system; It is a sustainable cultivation technology that integrates plant nutrition and agricultural automation. In this developed method, the water and nutrient concentration is circulated and given to the plant roots suspended in the air in the form of fogging. It can be installed as a single-storey system or as a multi-storey system. The water needed for aeroponic systems is 98% less than other traditional methods thanks to water recycling and uses less pesticides. In addition, since the roots are more exposed to oxygen, it has higher efficiency than other soilless methods. Aeroponic systems are generally used as a plant growing medium today. Aeroponic rooting unit was established for the rooting of wood and semi-wood cuttings within the scope of the project prepared by Tokat Gaziosmanpaşa University Faculty of Agriculture and carried out with the support of Tübitak. The project is in effect and the system installation has been completed. It is thought that the system, which has goals such as higher yield per unit area, disease and pest-free seedlings, rooting of plants that are difficult to root, and economic production, will make significant contributions to the nursery sector.

Keywords: *Aeroponic, Rooting, Wood Cutting, Semi-Wood Cutting*

Türkiye ve Dünyada Aeroponic Yetiştiricilik

Özet

Doğal, ekonomik ve sosyal faktörlerin oluşturduğu riskler tarımsal üretimde sürdürülebilirliği olumsuz yönde etkilemektedir. Artan nüfusun gıda ihtiyacını giderecek, su kaynaklarının verimli şekilde kullanılacağı ve toprağın iş yükünü azaltacak sistemler geliştirilerek bu risklerin azaltılması hedeflenmektedir. Modernleşen dünyada tarımın gelişen teknoloji ile entegre edilerek kullanılması Alternatif tarım yöntemlerinin ortaya çıkmasına olanak sağlamıştır. Alternatif tarım yöntemlerinden biri olan Aeroponic sistemin, geleneksel tarım yöntemlerine kıyasla avantajlarının fazla olması, sistemin popülaritesini giderek daha da artırmaktadır. Aeroponic sistem; bitki besleme ve tarımsal otomasyonu entegre eden sürdürülebilir yetiştirme teknolojisidir. Geliştirilen bu yöntemde su ve besin konsantrasyonu, sirküle edilerek havada asılı halde duran bitki köklerine sisleme şeklinde verilmektedir. Tek katlı sistem olarak kurulabildiği gibi çok katlı sistem şeklinde de kurulabilmektedir. Aeroponik sistemler için ihtiyaç duyulan su, suyun geri dönüşümü sayesinde diğer geleneksel yöntemlere göre %98 daha azdır ve daha az pestisit kullanır. Ayrıca kökler oksijene fazla maruz kaldığı için diğer topraksız yöntemlere göre daha yüksek verime sahiptir.

Aeroponic sistemler günümüzde genellikle bitki yetiştirme ortamı olarak kullanılmaktadır. Tokat Gaziosmanpaşa Üniversitesi Ziraat Fakültesi tarafından hazırlanan ve Tübitak desteği ile yürütülen proje kapsamında odun ve yarı odun çeliklerinin köklendirilmesi amacıyla Aeroponic köklendirme ünitesi kurulmuştur. Proje yürürlükte olup sistem kurulumu tamamlanmıştır. Birim alandan daha yüksek verim, hastalık ve zararlılardan arı fidan, köklenmesi zor olan bitkilerin köklendirilmesi, ekonomik üretim gibi hedefleri olan sistemin fidancılık sektörüne önemli katkılar sağlayacağı düşünülmektedir.

Anahtar Kelimeler: *Aeroponic, Köklendirme, Odun çeliği, Yarı Odun Çeliği*

Prevalence And Frequency of Diabetic autonomic neuropathy (DAN) and their Related Risk Factors in Type 1 Diabetic Patients of Hyderabad and Jamshoro.

Tahira Jabeen Ursani, Fahmida Channa

Department of Zoology, University of Sindh, Jamshoro- 76080 Pakistan

Corresponding author: Dr. Tahira Jabeen: tjchandio65@gmail.com

Abstract

Diabetic autonomic neuropathy (DAN) is an insidious complication of diabetes mellitus (DM) that develops slowly over several years and slowly robs diabetics (DM) of their ability to feel when they develop hyper/hypoglycaemia or myocardial infarction. event.. Skin exposure and appearance to any organ, the gastrointestinal (GI) tract is associated with a significant risk of death in patients with diabetes mellitus (DM). Factors commonly associated with DAN in DM patients include chronic DM duration, hyperglycemia, hypertension, and elevated LDL cholesterol levels. Tight glycaemic control is important to prevent the onset and slow the progression of diabetic autonomic neuropathy (DAN). The 5-year mortality rate in patients with diabetic autonomic neuropathy (DAN) is three times higher than in patients with diabetes mellitus (DM), excluding autonomic involvement. Causes of death in diabetic patients with symptomatic or asymptomatic autonomic neuropathy include cardiovascular disease (CVD); and nephropathy. Urinary albumin excretion (UAE) is associated with autonomic neuropathy in patients with diabetes mellitus (DM). The objective of the research was to examine the prevalence, frequency of diabetic autonomic neuropathy(DAN) and its severity in type 1 diabetic(T1DM) patients of Jamshoro and Hyderabad .It is furnished by the result found that 410 patients of T1DM were observed in this study. From the perusal of T1DM patients, it has been observed that DN 105 patients 45(43%) patients were DAN. Out of 45 DAN patients, 25 males (55.5%) were suffered and 20 (44.5%) females. Hence, the proportion of males suffering from DAN is nearly similar to that of the females.40% patients age group was 20-25 & 60% was 26-30 years. Out of 45 DAN patients 60% have positive family history and 40% patients have negative family history .Out of 45 DAN had 18% good glycemic control and 82% patients had poor glycemic control. Out of 45 DAN patients 85%were hypertensive (BP>145/95mmHG) and 15% were Normotensive (BP <145/90mmHG).Out of 25 male DAN patients 20%were smokers.. Whereas a the patients are largely come under the suffering from muscles weakness (95%). Around 85% patients suffered from the constipation or diarrhea (85%). Whereas a the patients are come under the suffering from urinary incontinence also (62%).

The Effect of Post-Harvest Calcium Chloride Applications on the Shelf Life Quality of Strawberry

Osman Nuri Öcalan¹, Fatmanur Çezik¹, Ala Asi Mohammed Al-Salihi¹, Muhammet Rahmetullah Çiğdem¹, Kenan Yıldız¹

¹Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

The aim of this study was to examine the effects of postharvest calcium chloride applications at different doses on quality changes in Monterey cv. strawberry fruits kept on the shelf after being stored for different periods. The trial was conducted during 2021-2022. In the study; fruit skin color parameters, fruit flesh firmness and soluble solid matter (SSC) ratios, as well as total acidity, total phenolic substance, total monomeric anthocyanin amounts and total antioxidant capacity were determined. After the fruits were harvested, they were immersed in three different doses (0-2-4%) of calcium chloride (CaCl₂) solution for 5 minutes. The fruits removed from the solution were kept to dry. The fruits were stored for 14 days in a cold store with a temperature of 1-2 °C and a relative humidity of 90±5%. Before the storage and on the 7th and 14th days of storage, the fruits samples were taken and kept on the shelves in the rooms with a temperature of 21±1 oC and a relative humidity of 60±5% for 3 days. Measurements and analyzes of fruit quality parameters were made in the samples taken from the fruits that were kept on the shelf for three days. As a result of the study, it was determined that 4% CaCl₂ application was effective in maintaining fruit flesh firmness. In fruits kept on the shelf for 3 days after 14 days of storage, SSC of 4% CaCl₂ treatment was found to be higher than the control treatment. Compared to the control, 4% CaCl₂ caused a significant increase in the total phenol content. The highest total monomeric anthocyanin content and total antioxidant capacity was determined in the control treatment. While there were no significant changes in L* values between treatments, a* and b* values were found to be higher in 2% CaCl₂ treatment. In the light of the data obtained, it was concluded that 4% CaCl₂ application had a positive effect on the shelf life of strawberry fruits.

Key Words: Color, Phytochemical, Anthocyanin, Antioxidant, CaCl₂

Hasat Sonrası Kalsiyum Klorür Uygulamalarının Çileğin Raf Ömrü Kalitesine Etkisi

Özet

Bu çalışmada, hasat sonrası farklı dozlarda kalsiyum klorür uygulamalarının, belli sürelerle depolandıktan sonra rafta bekletilen Monterey çeşidi çilek meyvelerinde ortaya çıkan kalite değişimleri üzerine etkilerini incelemek amaçlanmıştır. Deneme, 2021 ve 2022 yıllarında yürütülmüştür. Çalışmada; meyve kabuğu renk parametreleri, meyve eti sertliği ve suda çözünür kuru madde (ŞÇKM) oranları yanında toplam asitlik, toplam fenolik madde, toplam monomerik antosiyanin miktarları ve toplam antioksidan kapasite belirlenmiştir. Meyveler hasat edildikten sonra, üç farklı dozda (%0-2-4) kalsiyum klorür (CaCl₂) çözeltisi içerisine 5 dakika boyunca daldırılmıştır. Daldırma işleminden sonra meyveler kurumaya bırakılmıştır. Meyveler, sıcaklık 1-2 °C, bağıl nemi %90±5 olan soğuk hava deposunda 14 gün süreyle muhafaza edilmiştir. Depolama öncesinde ve depolamanın 7 ve 14. günlerde alınan meyve örnekleri, sıcaklığı 21±1 °C ve bağıl nemi %60±5 olan odalardaki raflarda 3 gün bekletilmiştir. Üç gün rafta bekletilen meyvelerden alınan örneklerde meyve kalite parametrelerine ait ölçüm ve analizler yapılmıştır. Çalışma sonucunda, %4 CaCl₂ uygulamasının meyve eti sertliğinin korunmasında etkili sonuç verdiği belirlenmiştir. 14 gün depolamanın ardından 3 gün rafta bekletilen meyvelerde, %4 CaCl₂ uygulamasının ŞÇKM içeriği kontrol uygulamasından daha yüksek bulunmuştur. Kontrole kıyasla %4 CaCl₂ toplam fenol içeriğinde belirgin bir artışa neden olmuştur. En yüksek toplam monomerik antosiyanin içeriği ve toplam antioksidan kapasite kontrol uygulamasında tespit edilmiştir. L* değerlerinde önemli değişiklikler olmazken, a* ve b* değerleri %2 CaCl₂ uygulamasında daha yüksek bulunmuştur. Elde edilen veriler ışığında, %4 CaCl₂ uygulaması ile çilek meyvelerinin raf ömürlerinin uzatılabileceği görülmüştür.

Anahtar Kelimeler: Renk, Fitokimyasal, Antosiyanin, Antioksidan, CaCl₂

Giriş

Çilek, *Fragaria* × *ananassa* Duch., *Rosales* takımı, *Rosaceae* familyası, *Fragaria* cinsi içerisinde yer alan (Hancock 1999), çeşitli bölgelere ve kültürel sistemlere uyarlanabilen çok yönlü bir üzümü meyvedir (Chandler ve ark., 2012). Türkiye’de yetiştiriciliği 1970’li yıllarda yapılmaya başlanmıştır (Tarım ve Orman Bakanlığı [TOB], 2020). Çilek, değişik iklim ve toprak şartlarında yetiştirilebilen, adaptasyon kabiliyeti yüksek bir bitkidir ve bu sayede her mevsim üretimi yapılabilmektedir (Erenoğlu ve ark., 2000). 2020 yılında dünyada çilek üretimi 8 861 381 ton, Türkiye’de ise 546 525 ton olarak gerçekleşmiştir (FAO, 2020). Dünya çilek üretiminde %36.2 ile Çin birinci, %11.5 ile ABD ikinci, %9.7 ile Meksika üçüncü, %5.5 ile Türkiye dördüncü ve %5.2 ile Mısır beşinci sırada yer almaktadır (TOB, 2020). 2021 yılına gelindiğinde Türkiye’de çilek üretimi biraz daha artarak 669 195

tona çıkmıştır (TÜİK, 2021). Türkiye’de en çok çilek üretimi yapılan yerler; Mersin (%37.4), Aydın (%12.9), Konya (%9.3), Antalya (%9.3), Bursa (%9.3), Çanakkale (%5.5), Manisa (%5), Hatay (%2.1), Elazığ (%1.8) ve Sakarya (%1.3) illeridir (TOB, 2020). Çilek yetiştiriciliğinin bir diğer önemli tarafı, diğer tarımsal ürünlerle karşılaştırıldığında birim alandan elde edilen gelirin yüksekliği ve yapılan yatırımın kısa sürede dönüş yapması ile küçük aile işletmeciliğine uygun olmasıdır (Ağaoğlu, 1986; Aybak, 2000). Tüm bunlara ek olarak taze tüketiminin yanında işlenerek de (reçel, marmelat, dondurma ve pasta) tüketimi yapılmaktadır (Özdemir, 1999; Erenoğlu ve ark., 2000; Kılıçel, 2005). Çilek üretiminin avantajları olduğu gibi dezavantajları da vardır. Çilek, bir üzüm suyu meyvedir ve hassas dokuları sebebi ile hasat sonrası çok çabuk bozulabilmekte ve bunun sonucunda üreticiden tüketiciye ulaşıncaya kadar meyvelerde büyük kayıplar yaşanabilmektedir. Yaşanan kayıpların önüne geçebilmek için yapılması gerekenlerin başında fizyolojik bozuklukların kontrolü gelmektedir. Bu noktada kalsiyum (Ca), temel bir makro besin maddesi olarak, bitkilerin temel fizyolojik süreçlerinin düzenlenmesine katkıda bulunur. Kalsiyum, meyvenin kalitesini ve depolanabilirliğini korumada önemli bir rol oynar ve hücre zarlarının bütünlüğünü koruduğu ve zar geçirgenliğini azalttığı ifade edilmektedir (Kou ve ark., 2015; Bhat ve ark., 2012). Kalsiyum laktat ve kalsiyum klorür gibi farklı kalsiyum tuzları ile hasat öncesi ve sonrası yapılan uygulamalar meyve ve sebzelerin fizyolojik bozukluklarının azaltılmasında etkili olmuştur (Tulin ve Eryol, 2019; Naser ve ark., 2018). Bu çalışmada, farklı dozlarda $CaCl_2$ uygulamaları ile depolamanın ardından rafta bekletilen çilek meyvelerinin kalite kayıplarını azaltmak amaçlanmıştır.

Materyal ve Yöntem

Çalışmada kullanılan meyveler 2021 yılının Mayıs ayında sabah erken saatlerde hasat edilerek Tokat Gaziosmanpaşa Üniversitesi Ziraat Fakültesi Bahçe Bitkileri Bölümü Meyvecilik Laboratuvarı’na getirilerek bir gün boyunca 1-2°C ve %90±5 bağıl nemde ön soğutma işlemine tabi tutulmuştur. Sonrasında meyveler üç farklı dozda (%0 (kontrol), %2 ve %4) kalsiyum klorür ($CaCl_2$) çözeltisi içerisinde 5 dakika boyunca daldırılmıştır. Uygulama sonrası meyveler kurumaya bırakılmıştır. Daha sonra meyveler 3 tekerrürlü ve her tekerrürde 500 gram meyve olacak şekilde şalelere yerleştirilmiştir. Meyveler 1-2 °C’de ve %90±5 bağıl nemde 14 gün süreyle soğuk hava deposunda tutulmuştur. Hasat döneminin yanı sıra meyveler 7 ve 14. günlerde soğuk hava deposundan çıkarılmış ve 3 gün boyunca 21±1 °C ve %60±5 bağıl nemde bekletilmiştir. 0+3, 7+3 ve 14+3 günlerde meyvelerde fiziksel ve kimyasal ölçümler yapılmıştır.

Meyvelerde Yapılan Ölçümler

Meyve Dış Rengi

Çilek meyvelerinin renk tayini Minolta renk ölçer cihazı (CR-400 model) ile yapılmıştır. Ölçüm yapılmadan önce renk ölçer, beyaz standart bir plakada kalibre edildikten sonra Hunter renk ölçüm parametreleri olan L, a ve b değerleri ile meyvelerin dış rengi ölçülerek belirlenmiştir. L, parlaklığı ifade eder ve 0 ile 100 arasında değerler alır. L değeri, parlaklık artarsa 100’e yaklaşır, parlaklık azalırsa 0’a yaklaşır. a, kırmızı ve yeşil renkleri temsil eder: a’nın pozitif değeri kırmızı ve tonlarını, negatif değeri yeşil ve tonlarını. b ise sarı ve mavi renkleri temsil eder: b’nin pozitif değeri sarı ve tonlarını, negatif değeri mavi ve tonlarını. Ölçümler her bir tekerrürden tesadüfen seçilen 10 meyve ile yapılarak, her meyvenin meyve dış rengi dikine iki yanından birer değer olacak şekilde yapılmıştır.

Meyve Eti Sertliği

Meyve eti sertliğini belirlemek için her tekerrüründen tesadüfen seçilen 10 meyvenin iki yanından olacak şekilde dijital sertlik test cihazı ile (Agrosta® 100, Fransa) ölçüm gerçekleştirilmiştir. Cihaz ölçüm aralığı sertlik değerleri 0-100 arasında değişmektedir.

Toplam asitlik (TA, %)

Meyvelerin toplam asitliğini belirlemek için püre haline getirilmiş meyvelerden 5 g tartılıp üzerine 95 ml saf su ilave edilmiştir. Çözelti pH’ı sabitlendikten sonra 0.1 N NaOH (sodyum hidroksit) solüsyonu pH 8.1 oluncaya kadar eklenmiştir. Tüketilen NaOH miktarına göre titrasyon asitliği, sitrik asit cinsinden formül ile hesaplanarak % olarak ifade edilmiştir.

Suda Çözünabilir Kuru Madde (SÇKM, %)

Meyveler homojenizatörde püre haline getirildikten sonra santifüj yapılarak meyve suları çıkartılmıştır. Sonrasında saf suya göre kalibre edilmiş dijital refraktometrede (Atago PAL-1, USA) okumalar yapılmış ve değerler % olarak ifade edilmiştir.

Toplam Fenolik Madde

Toplam fenol tayini Singleton ve Rossi (1965)’nin tarif ettiği şekilde Folin-Ciocalteu’s kimyasalı kullanılarak yapılmıştır. Homojenizatörde püre haline getirilmiş meyve örneklerinden 2 g tartılıp üzerine aseton, su ve asetik asit (70:29.5:0.5) çözeltisi eklenerek 24 saat süresince ekstraksiyon işlemi uygulanmıştır. Sonraki gün dolaptan çıkarılan örneklerden 0.5 mL alınıp üzerine 0.5 mL Folin-Ciocalteu’s kimyasalı ve 9 mL saf su eklenmiştir. 8 dk sonra ise 2.5 mL %7’lik sodyum karbonat ilave edilmiştir. İki saat inkübasyondan sonra mavimsi bir renk alan çözelti spektrofotometrede 750 nm dalga boyunda okuması yapılmıştır. Elde edilen değerler galik asit cinsinden µg galik asit eşdeğer/g taze ağırlık (ta) olarak hesaplanmıştır.

Toplam Antioksidan Kapasite

Meyvelerin toplam antioksidan kapasitesi Özgen ve ark. (2006) göre TEAC (Trolox eşdeğer antioksidan kapasitesi) metodu kullanılarak yapılmıştır. TEAC için 7 mM ABTS (2,2'-Azino-bis 3-ethylbenzothiazoline-6-sulfonic acid) 2,45 mM potasyumbisülfat ile karıştırılarak +4 °C'de karanlıkta 12-16 saat bekletilmiştir. Daha sonra bu solüsyon 20 mM sodyum asetat (pH 4.5) bafırı ile spektrofotometrede 734 nm dalga boyunda 0,700±0,01 absorbans olacak şekilde sadeleştirilmiştir. Sonunda 30 µL örneğin üzerine 2.97 mL hazırlanan TEAC çözeltisi eklenerek 10 dakika inkubasyon süresi sonunda spektrofotometrede 734 nm dalga boyunda okumalar yapılmıştır. Ölçüm sonrası absorbans değerleri Trolox (10–100 µmol/L) standart eğim çizelgesi ile hesaplanarak µmol Trolox eşdeğeri/g yaş ağırlık olarak sunulmuştur.

Toplam Monomerik Antosiyanin

Meyvelerdeki toplam monomerik antosiyanin tayini pH diferansiyel farkı yöntemiyle belirlenmiştir (Giusti ve ark., 1999). 0.3 mL örneklerin üzerine ayrı ayrı toplam hacim 3 mL olacak şekilde pH 1,0 ve pH 4,5 bafırları eklenerek, 15 dk sonra spektrofotometrede 520 ve 700 nm dalga boylarında okumaları yapılmıştır. Toplam antosiyanin miktarı, absorbanslar [pH 1,0 (A520–A700) - pH 4,5 (A520–A700)] µg pelargonidin-3-glucoside/g taze meyve olarak hesaplanmıştır (pelargonidin-3- glucoside: molekül ağırlığı 433.2, molar sönmülleme katsayısı 22 400) .

İstatistiksel Analizler

Deneme her bir uygulamadaki her bir analiz dönemi için 3 tekerrürlü ve her tekerrürde 1 şale olacak şekilde kurulmuştur. Deneme neticesinde elde edilen veriler SAS paket programı kullanılarak varyans analizine tabii tutulduktan sonra uygulama ortalamaları arasındaki farkın önemli olup olmadığı Tukey çoklu karşılaştırma testi yapılarak belirlenmiştir.

Bulgular ve Tartışma

Meyve dış Rengi

Meyve dış rengine ait L*, a* ve b* değerleri Çizelge 1'de verilmiştir. L* değerlerinde sadece 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde depolama süresi ve CaCl₂ uygulamalarından kaynaklanan önemli bir değişim gözlemlenmiştir. % 4 CaCl₂ uygulamasında, yedi günlük depolamanın ardından 3 gün rafta bekletilen meyvelerin L* değeri diğer ölçüm dönemlerinde belirlenen L* değerlerinden daha düşük çıkmıştır. Hem kontrol hem de CaCl₂ uygulamalarında, ilk 3 günlük raf ömrü sonunda ölçülen a değerinin depolama süresine bağlı olarak azalma eğilimi gösterdiği tespit edilmiştir. 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde, %2 CaCl₂ uygulanan meyvelerin kabuk rengi a değeri diğer uygulamalardan daha yüksek bulunmuştur. Uygulamaların b değeri üzerine etkisi depolama süresine bağlı olarak farklılık göstermiştir. 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde her iki CaCl₂ uygulaması da b* değerinde azalmaya neden olmuştur. 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde ise %2 CaCl₂ uygulamasının b* değeri kontrol ve %4 CaCl₂ uygulamasının b* değerlerinden daha yüksek çıkmıştır.

Çizelge 1. Çilek meyvelerinde farklı CaCl₂ dozlarının raf ömrü boyunca meyve dış rengi (L* a*b*) üzerine etkileri

Uygulama (%CaCl ₂)	L*		
	0+3	7+3	14+3
Kontrol	34,17 Aa	33,01 Aa	32,94 Aa
2	34,17 Aa	32,93 Aa	32,85 Aa
4	34,17 Aa	31,70 Ba	33,53 Aa
	a*		
	0+3	7+3	14+3
Kontrol	29,44 Aa	28,00 ABa	26,66 Bb
2	29,44 Aa	27,44 Ba	28,24 ABa
4	29,44 Aa	27,07 Ba	25,77 Bb
	b*		
	0+3	7+3	14+3
Kontrol	13,02 Aa	11,86 Aa	8,87 Bb
2	13,02 Aa	10,25 Ba	12,69 Aa
4	13,02 Aa	10,25 Ba	9,45 Bb

*Aynı satırda aynı büyük harfle gösterilen raf ömrü ortalamaları arasında ve aynı sütunda aynı küçük harfle gösterilen uygulama ortalamaları arasındaki farklar önemli değildir (P<0.05).

Benzer konuda daha önce yapılan çalışmalardan birinde (Demir 2014), CaCl₂ ve lysophosphatidylethanolamine uygulamalarının çileğin dış rengi (L, a, b, C, H^o) parametrelerinde önemli bir değişim neden olmadığı ifade edilmiştir. Bu çalışmada da benzer şekilde L değerinde CaCl₂ uygulamalarından kaynaklanan önemli bir değişim gözlenmemiş ancak a ve b değerlerinde bazı önemli farklılıkların ortaya çıktığı tespit edilmiştir. Bu tür farklı

sonuçlar, kullanılan çeşitlerin farklılığından kaynaklanmış olabilir. Depolama ve raf ömrü süresinde renk gelişimi üzerinde yapılan çalışmalarda farklı sonuçlar rapor edilmiştir. Akın, (2014) 12 gün modifiye atmosferde depoladıktan sonra 2 gün rafta beklettiği çilek meyvelerindeki renk parametrelerini ölçmüş ve muhafaza başlangıcına göre renk değerlerinde azalmaların olduğunu bildirmiştir. Diğer taraftan Öz ve Kafkas (2015) çilekte yapmış oldukları bir çalışmada, 12 günlük muhafaza süresi boyunca ölçülen L*, a* ve b* renk parametrelerinin başlangıç değerlerine yakın bulunduğunu ve istatistiksel açıdan önemli bir farkın olmadığını belirtmiştir. Bu çalışmada, depolama süresi depolamanın ardından rafta bekletilen meyvelerin L değerinde önemli bir değişime neden olmazken, a ve b değerlerinde bir miktar düşüşe neden olmuştur. Bu tür farklı sonuçlar depolama koşulları ve çalışmalarda kullanılan çeşitlerin farklılığı yanında hasat önceki gelişme döneminde uygulanan kültürel işlemlerin farklılığından da kaynaklanmış olabilir.

Meyve Eti Sertliği, Titre Edilebilir Asitlik, SÇKM

Çizelge 2’de meyve eti sertliği, titre edilebilir asitlik ve SÇKM değerleri verilmiştir.

Meyve eti sertliği değerlerinde, depolama süresi ve CaCl₂ uygulamalarından kaynaklanan önemli farklılıklar görülmüştür. 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerin meyve eti sertliği değerleri % 4 CaCl₂ uygulamasında, diğer ölçüm dönemlerinde belirlenen değerlerden daha yüksek çıkmıştır. Son ölçüm tarihine gelindiğinde (14+3) tüm uygulamalarda meyve eti sertliği azalmış, en yüksek değer yine % 4 CaCl₂ uygulamasından elde edilmiştir.

Titre edilebilir asit (TA, %) değerleri depolama süresi ve CaCl₂ uygulamaları sonucunda önemli değişikliklere uğramıştır. 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde uygulamalara bağlı olarak değişiklik meydana gelmiştir: Kontrol ve %2 CaCl₂ uygulamalarına kıyasla %4 CaCl₂ uygulaması TA değerinde azalmaya neden olmuştur. 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde ise TA değerlerinde düşüş yaşanmıştır. Burada en yüksek TA değerine %4 CaCl₂ uygulamasından ulaşılmıştır.

SÇKM değerlerinde depolama süresi ve CaCl₂ uygulamaları sonucunda önemli değişiklikler meydana gelmiştir. Uygulamaların SÇKM değeri üzerine etkisi depolama süresine bağlı olarak farklılık göstermiştir. 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde SÇKM değerleri düşmüş, her iki CaCl₂ uygulamasına kıyasla kontrol uygulamasında SÇKM değeri daha düşük çıkmıştır. 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerde ise %4 CaCl₂ uygulamasının SÇKM değeri diğer uygulamalarından daha yüksek çıkmıştır.

Çizelge 2. Çilek meyvelerinde farklı CaCl₂ dozlarının raf ömrü boyunca meyve eti sertliği, toplam asitlik (%), sçkm (%) üzerine etkileri

Uygulama (%CaCl ₂)	Meyve Eti Sertliği

*Aynı satırda aynı büyük harfle gösterilen raf ömrü ortalamaları arasında ve aynı sütunda aynı küçük harfle gösterilen uygulama ortalamaları arasındaki farklar önemli değildir (P<0.05).

Meyve eti sertliği açısından literatür incelenirse, Öz ve Kafkas, (2015) yaptıkları çalışmada, 12 gün boyunca 5 °C’de ve %85-90 bağıl nemde polivenilpropilen kutularda tutulan ‘Festival’ çilek çeşidi meyvelerin muhafaza süresinin sonunda meyve eti sertliklerinin düştüğünü belirtmiştir. Benzer sonuçlar Rahimi ve ark., (2018) tarafından da ifade edilmiştir: CaCl₂ ve kitosan uygulamaları sonucunda çileklerin meyve eti sertlikleri muhafaza süresi boyunca azalmıştır. Elde ettiğimiz sonuçlar bu iki çalışma ile uyum içerisinde olmuştur. Nguyen ve ark., (2020) tarafından yapılan başka bir çalışmada, hasat sonrası çileklere nano-kitosan kaplama ve CaCl₂ uygulaması yapılarak meyveler 4 °C’de 15 gün boyunca muhafaza edilmiştir. Muhafaza süresince meyvelerin sertliği ilk başlarda azalırken 3. günden sonra meyve sertliklerinin arttığı belirtilmiş ve bu artışta özellikle %3 ve %4’lük CaCl₂ uygulamalarının daha etkili olduğu rapor edilmiştir. Bizim çalışmamızda da %4 CaCl₂ uygulaması meyve eti sertliğini daha iyi muhafaza etmiştir.

Daha önce yapılan çalışmalarda, çileklerin toplam asit içeriklerinin muhafaza süresi sonunda azaldığı rapor edilmiştir (Rahimi ve ark., 2018; Akın, 2014). Yapılan bu çalışmada da çileklerin toplam asit içeriği raf ömrü süreleri boyunca azalmış ve yapılan uygulamalar sonucunda değişiklik göstermiştir. %2 CaCl₂ ve kontrol uygulamalarına kıyasla %4 CaCl₂ uygulamasında toplam asit içeriği daha iyi muhafaza edilmiştir.

Olgunlaşma olayı sırasında meyvelerin solunum sürecinde organik asitlerin tüketildiği ve bunun TA'nın azalmasına ve SÇKM değerlerinin artmasına neden olduğu bildirilmektedir (Hosseinifarahi ve ark., 2020). Yaptığımız çalışma sonucunda, TA değerlerinde azalma meydana gelmiştir fakat, SÇKM değerlerinde de azalma meydana gelmiştir. Öz ve Kafkas, (2015) ve Korkut, (2019) da yaptıkları çalışma sonucunda SÇKM değerlerinin azaldığını bildirmiştir. Bu konuda Öz ve Kafkas, (2015) SÇKM değerlerindeki düşüşlerin, çilek meyvelerinde artan solunum hızından kaynaklanabileceğini ifade etmiştir.

Toplam Fenolik Madde, Toplam Antioksidan Kapasite, Toplam Monomerik Antosiyanin

Çizelge 3.de toplam fenolik madde, toplam antioksidan ve toplam monomerik antosiyanin değerleri verilmiştir.

Toplam fenolik madde değerleri, depolama süresi ve uygulamalardan kaynaklı önemli değişikliklere uğramıştır. İlk 3 günlük raf ömrü sonunda ölçülen toplam fenol değerlerinin 7+3 dönemine kadar artma eğilimi gösterdiği tespit edilmiştir. 7 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerin, kontrol ve %2 CaCl₂ uygulamalarına kıyasla %4 CaCl₂ uygulaması sonucunda toplam fenol değeri daha yüksek çıkmıştır. 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerin toplam fenol içeriğinde düşüşler görülmüştür. Burada yine %4 CaCl₂ uygulamasında toplam fenol içeriği daha yüksek bulunmuştur.

Toplam antioksidan kapasite değerlerinde, kontrol uygulaması hariç, depolama sürelerinden kaynaklı önemli farklılıklar bulunmuştur. İlk 3 günlük raf ömrü sonunda ölçülen toplam fenol değerinin %4 CaCl₂ uygulaması sonucunda 7+3 dönemine kadar artma eğilimi gösterdiği tespit edilmiştir. 7+3 döneminden sonra CaCl₂ uygulamalarında, toplam antioksidan kapasite değerleri düşüşe geçmiştir. Nitekim, 14 günlük depolamanın ardından 3 gün rafta bekletilen meyvelerin en yüksek toplam antioksidan kapasite değeri kontrol uygulamasından elde edilmiştir.

Toplam monomerik antosiyanin değerlerinde, depolama süresi ve uygulamalardan kaynaklı önemli farklılıklar meydana gelmiştir. Tüm uygulamalarda, ilk 3 günlük raf ömrü sonunda ölçülen antosiyanin değerleri, 7+3 dönemine kadar artış göstermiştir. Burada en yüksek toplam monomerik antosiyanin değerine %4 CaCl₂ uygulamasından ulaşılmıştır. 7+3 döneminden sonra kontrol hariç CaCl₂ uygulamalarında, meyvelerin antosiyanin içeriğinde düşüşler görülmüştür. 14 günlük depolamanın sonuna gelindiğinde 3 gün rafta bekletilen meyvelerde en yüksek toplam monomerik antosiyanin değeri kontrol uygulamasından elde edilmiştir.

Çizelge 3. Çilek meyvelerinde farklı CaCl₂ dozlarının raf ömrü boyunca toplam fenolik madde, toplam antioksidan ve toplam monomerik antosiyanin üzerine etkileri

Uygulama (%CaCl ₂)	Toplam Fenolik Madde (µg GAE/g ta)		
	0+3	7+3	14+3
Kontrol	2760,56 ABa	2818,89 Ab	2573,89 Bb
2	2760,56 Aa	2802,22 Ab	2499,72 Bb
4	2760,56 Ca	3529,72 Aa	3246,39 Ba
	Toplam Antioksidan Kapasite (µmol TE/g ta)		
	0+3	7+3	14+3
Kontrol	17,42 Aa	17,71 Aa	16,95 Aa
2	17,42 Aa	17,94 Aa	15,27 Bb
4	17,42 Ba	19,14 Aa	16,36 Bab
	Toplam Monomerik Antosiyanin (µg cy-3-glu/g ta)		
	0+3	7+3	14+3
Kontrol	178,39 Ba	232,75 Aab	219,05 Aa

4	178,39 Ba	241,09 Aa	182,90 Bb

*Aynı satırda aynı büyük harfle gösterilen raf ömrü ortalamaları arasında ve aynı sütunda aynı küçük harfle gösterilen uygulama ortalamaları arasındaki farklar önemli değildir (P<0.05).

Üzümsü meyveler, antioksidan aktiviteye sahip çok çeşitli flavonoidler (flavan-3-oller, flavonoller, antosiyaninler, prosiyanidinler) ve fenolik asit türevleri (hidroksisinnamik, ellajik) bakımından zengindir (González-Aguilar ve ark., 2008; Heinonen ve ark., 1998). Meyvelerde bulunan bu fitokimyasallar ve sahip oldukları antioksidan aktiviteleri; çeşide, agronomik koşullara, büyüme mevsimine, hasat olgunluğuna, ışığa ve depolama koşullarına göre değişiklik gösterebilmektedir (Kalt ve ark., 2008; Howard ve ark., 2003; Connor ve ark., 2002; Wang ve Stretch, 2001; Wang ve Lin, 2000). Nitekim çalışmamız sonucunda da, raf ömrü süresi boyunca, çileklerin fitokimyasal içeriğinde değişimler meydana gelmiştir. Raf ömrünün son gününde, toplam fenolik madde içeriği; kontrol ve %2 CaCl₂ uygulamaları sonucunda azalırken, %4 CaCl₂ uygulamasında artmıştır. Daha önce yapılan bir çalışmada, çileklerin muhafaza süresi boyunca toplam fenol içeriklerinin azaldığı rapor edilmiştir (Çeler ve ark.,

2019). Başka bir çalışmada ise, erik meyvelerinin muhafaza süresi boyunca toplam fenol içeriklerinde dalgalanmaların olduğu, en iyi sonuçların 20.günde ultrasound+CaCl₂ uygulamasında görüldüğü bildirilmiştir (Bal, 2016). Yaptığımız çalışma, literatürde ifade edilenlerle uyum içerisinde olmuştur.

Raf ömrünün sonunda, çileklerin toplam antioksidan kapasiteleri %2 CaCl₂ uygulamasında azalırken, kontrol ve %4 CaCl₂ uygulamasında önemli bir değişikliğe uğramamıştır (Çizelge 3.). Bu konuda literatüre bakıldığında, Korkut (2019) yaptığı çalışmada, raf ömrü süresi sonunda (15+2) çileklerin toplam antioksidan kapasitelerinin azaldığını belirtmiştir. Benzer sonuçlar Nguyen ve ark. (2020) tarafından da bildirilmiştir.

Çalışmamızda, çileklerin toplam monomerik antosiyanin içerikleri 7+3. günde tüm uygulamalarda artmış, 14+3. günde ise kontrol uygulaması hariç CaCl₂ içeren uygulamalarda azalmıştır. Çilek üzerine yapılan önceki bir çalışmada Rahimi ve ark. (2018), üç gün muhafaza edilen meyvelerde, farklı dozlarda CaCl₂ ve kitosan uygulamaları sonucunda, antosiyanin miktarının arttığını belirtmiştir. Bu sonuç, çalışmamızın 7+3 döneminde yapılan ölçümleri ile paralellik göstermektedir. Korkut (2019) ise yaptığı çalışmada, çileklerin muhafaza (15 gün) ve raf ömrü (15+2 gün) sonunda toplam monomerik antosiyanin içeriğinde düşüşler olduğunu bildirmiştir. Bu ise çalışmamızın 14+3 döneminde yapılan ölçümler ile benzerlik göstermektedir.

Sonuç

Hasat sonrası CaCl₂ uygulamalarının çileğin raf ömrüne etkisinin incelendiği bu çalışmada, kalsiyum klorürün herhangi bir olumsuz etkisine rastlanmamakla birlikte olumlu etkileri görülmüştür. Raf ömrü sonunda, L* değerlerinde önemli değişiklikler olmamıştır. En yüksek a* ve b* değerleri, kontrol ve %4 CaCl₂ uygulamalarına kıyasla %2 CaCl₂ uygulamasında görülmüştür. Meyve eti sertliği, toplam asit içeriği, SÇKM ve toplam fenolik madde içeriği %4 CaCl₂ uygulamasında daha yüksek bulunmuştur. En yüksek toplam antioksidan kapasite ve toplam monomerik antosiyanin içeriği ise kontrol uygulamasında tespit edilmiştir. Elde edilen veriler ışığında, %4 CaCl₂'un Monterey çeşidi çilek meyvelerinin kalite özelliklerini muhafaza etmesi açısından en iyi doz olduğu belirlenmiştir.

Rooting Performances of Promising Black Mulberry (*Morus nigra* L.) Genotypes Determined in Tokat Province under Same Environmental Conditions

Emircan Dinçer¹, Onur Saraçoğlu¹, Osman Nuri Öcalan¹

¹ Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

In this study, it was aimed to examine the rooting performance of hardwood cuttings taken from the promising black mulberry genotypes Kemalpaşa, Yelpe, Merkez 3, Merkez 6, Kocacık, Çamdere and Merkez 7 determined in the province of Tokat under the same environmental conditions. All cuttings were immersed in 6000 ppm IBA solution for 5 seconds before planting and planted on heated bottom tables. The cuttings, which were kept in rooting units for about 3 months, were then removed and measurements were made on them. As a result of the study, statistically differences were found in root length, root diameter, root number, callus formation rate and rooting rates in the parameters examined. There was no statistically significant difference between genotypes in decay rates. Decay rates of genotypes are between 12.96% - 41.67%, callus formation rates are between 70.83% - 95.39%, rooting rates are between 60.41% - 92.64%, root lengths are between 5.85 - 7.52 cm, root diameters are between 1.42 - 1.75 mm, and root numbers are between 7.87 - 12.67 root/cutting has taken values. In the light of the information obtained as a result of the study, it was determined that Yelpe, Çamdere and Merkez 6 genotypes showed high rooting success. These results are important in terms of shedding light on the researches to be done in order to determine the variety studies and the performance of the saplings. It is also a determining factor for enterprises producing saplings.

Key Words: IBA, Callus, Decay, Hardwood cutting

Tokat İlinde Belirlenen Ümitvar Kara Dut (*Morus nigra* L.) Genotiplerinin Aynı Ortam Koşullarındaki Köklenme Performansları

Özet

Bu çalışmada, Tokat ilinde belirlenmiş Kemalpaşa, Yelpe, Merkez 3, Merkez 6, Kocacık, Çamdere ve Merkez 7 ümit var kara dut genotiplerinden alınan odun çeliklerinin aynı ortam koşullarında köklenme performanslarının incelenmesi amaçlanmıştır. Bütün çelikler dikim öncesi 5 saniye süresince 6000 ppm IBA çözeltisine batırılıp alttan ısıtmalı masalara dikilmiştir. Yaklaşık 3 ay köklendirme ünitelerinde bekletilen çelikler daha sonra çıkarılıp üzerlerinde ölçümler yapılmıştır. Çalışma sonucunda, incelenen parametrelerde kök uzunluğu, kök çapı, kök sayısı, kallus oluşum oranı ve köklenme oranlarında istatistiki açıdan farklar tespit edilmiştir. Çürüme oranlarında ise genotipler arasında istatistiki açıdan önemli bir fark bulunmamıştır. Genotiplerin çürüme oranı %12.96 - %41.67, kallus oluşturma oranları %70.83 - %95.39, köklenme oranları %60.41 - %92.64, kök uzunlukları 5.85 - 7.52 cm, kök çapları 1.42 - 1.75 mm ve kök sayıları 7.87 - 12.67 kök/çelik arasında değerler almıştır. Çalışma sonucunda elde edilen bilgiler ışığında Yelpe, Çamdere ve Merkez 6 genotiplerinin yüksek köklenme başarısı gösterdiği tespit edilmiştir. Bu sonuçlar çeşit çalışmaları ve fidan performanslarının belirlenmesi amacıyla yapılacak araştırmalara ışık tutması açısından önem arz etmektedir. Ayrıca fidan üretimi yapan işletmeler için de belirleyici nitelik taşımaktadır.

Anahtar Kelimeler: IBA, Kallus, Çürüme, Odun çeliği

Giriş

Dut (*Morus spp.*) *Moraceae* familyasına ait olup başta Afrika ve Güney Amerika'nın kuzeybatısı olmak üzere dünyanın birçok bölgesine yaygın olarak dağılmıştır. Anadolu'da yetiştiriciliği önceden beri bilinmektedir (Özbek, 1977). Dolayısıyla Türkiye'de önemli bir genetik dut varyasyonu vardır. Yetiştiriciliği yoğun yapılan dut türleri ise Beyaz dut (*Morus alba*), Kırmızı dut (*Morus rubra*) ve Karadut (*Morus nigra*)'tur. Ülkemiz meyveciliği açısından önemli bir yere sahip olan dut, zengin besin içeriği ve birçok kullanım alanından faydalanılması sebebiyle giderek önemi artmıştır. Dut bitkisinin yapraklarının ipek böceği yetiştiriciliğinde ve gövde kabuğunun idrar yolu hastalıklarının tedavisinde kullanıldığı bilinmektedir. Dut meyvesinin ise taze tüketiminin yanında şurup, reçel ve farmakoloji gibi birçok alanda kullanımı mevcuttur. Halk arasında özellikle karadutun ağız yaralarına iyi geldiği ve kalp rahatsızlıkları yaşayan kişilerin taze meyvesini tükettikleri bilinmektedir. Besin içeriği üzerine yapılan çalışmalarda araştırmacılar karadutun kayda değer antosiyanin ve antioksidan içeriğine sahip olduklarını belirtmişlerdir (Wang ve ark., 1997; Stintzing ve ark., 2002; Özgen ve ark., 2009). Bununla birlikte karadut her geçen gün kullanım alanının artmasına ve pazar talebinin yükselmesiyle aranan bir meyve olmuştur. Ancak karadutta bu olumlu gelişmelerle birlikte çözülmesi gereken bazı önemli sorunlar da vardır. Bu sorunların başında fidan üretiminde yaşanan sorunlar gelmektedir. Fidan üretiminde karşılaşılan sorunlar ise aşırıyla çoğaltmada başarı oranının düşük olması ve karadut bitkisinin kök oluşumunda yaşanan sıkıntılardır. Fidan üretiminde çeşitli vejetatif

çoğaltma metotları kullanılmaktadır. Bu metotlar; doku kültürü, aşılama, daldırma ve çelikle çoğaltmadır (Yıldız ve ark., 2009). Karadut ağaçlarının sürgünleri kesildiğinde süt salgılar (Güneş, 2013; Saraçoğlu ve ark., 2016). Bu süt salgısı aşılama, aşı bölgesinin deformasyona uğramasına neden olmaktadır. Bu da aşıyla üretimde zorluklar meydana getirmektedir. Çelikle çoğaltma karadut gibi bitkilerde pratik ve ucuz bir yöntemdir. Çelikle çoğaltmadaki en büyük sorunlardan biri ise köklenme sorunudur. Köklenme sorunu yaşayan çeliklerde büyüme düzenleyiciler güçlü kök sistemi ve köklenme hızını artırabilmektedir (Kumlay ve Eryiğit, 2011). Oksin grubu büyüme düzenleyiciler tarımda kullanılan en yaygın hormonlardır (Halloran ve Kasım, 2002; Kumlay ve Eryiğit, 2011). Oksin grubundan olan IBA (Indol-3-Bütirik Asit) çeliklerin köklenmesinde en çok kullanılan hormondur (Kaynak ve Ersoy, 1997). IBA'nın köklenmeyi teşvik edip kök sayısı ve kalitesini artırmasının yanında etki süresi de daha uzundur. Karadutta köklenme üzerine yapılan çalışmalarda farklı sonuçlar ortaya çıkmıştır. Yapılan bazı çalışmalarda düşük köklenme oranları bulunurken (Ayfer ve ark., 1986; Ünal ve ark., 1992; Koyuncu ve Şenel, 2003; Karadeniz ve Şişman 2004; Koyuncu ve ark., 2004; Yıldız ve ark., 2009), bazı çalışmalarda ise yüksek köklenme oranlarına ulaşılmıştır (Yıldız ve Koyuncu, 2016; Erdoğan ve Aygün, 2006). Karadut çalışmalarında henüz tescilli bir çeşit olmamasından dolayı yapılan araştırmalarda bölgedeki karadut ağaçları kullanılmaktadır. Çalışmamızda kullandığımız karadut genotipleri daha önce Dinçer ve Saraçoğlu (2020) 'nın Tokat bölgesinde fenolojik, morfolojik ve pomolojik özelliklerini inceledikleri karadut genotiplerinden ümitvar olan 7 genotip kullanılmıştır. Bu çalışmada, seçilmiş ümitvar genotiplerin aynı ortam şartlarında 6000 ppm IBA' ya daldırılıp köklenme performanslarının belirlenmesi amaçlanmıştır.

Materyal ve Yöntem

Çalışma 2020-2021 yıllarında Tokat Gaziosmanpaşa Üniversitesi Tarımsal Araştırma ve Uygulama Merkezinde'ki köklenme serasında yürütülmüştür. Çalışmada daha önceden belirlenen 7 farklı genotiplerden alınan odun çelikleri 15 cm kesilerek her genotipten 15 adet çelik olacak şekilde ve üç tekerrür halinde dizayn edilmiştir. Dikime hazırlanan çelikler dikim öncesi 6000 ppm IBA çözeltisine batırılıp yaklaşık 5 saniye beklendikten sonra perlit ile doldurulmuş sıcaklık kontrollü (22 ± 2 °C) masalara dikimi gerçekleştirilmiştir. Yaklaşık 3 ay köklendirme ünitelerinde bekletilen çelikler daha sonra sökülüp gerekli ölçümler yapılmıştır. Deneme tam şansa bağlı deneme desenine göre 3 tekerrürlü olacak şekilde kurulmuş ve her tekerrürde 15 çelik kullanılmıştır.

Araştırmada İncelenen Özellikler

Kallus oluşum oranı (%): Yara dokusu oluşturan çeliklerin sayısının toplam çelik sayısına oranı (%) olarak ifade edilmiştir.

Köklenme oranı (%): Adventif kök oluşturan çeliklerin sayısının toplam çelik sayısına oranı (%) olarak ifade edilmiştir.

Çürüme oranı (%): Kök bölgesinde çürüme (köklerin yumuşaması ve kararması) gösteren çeliklerin sayısının toplam çelik sayısına oranı (%) olarak ifade edilmiştir.

Kök sayısı(adet): Her tekerrürde çeliklerde oluşan kökler sayılıp ortalamaları alınmıştır.

Kök uzunluğu(mm): Köklenmiş çeliklerin kök uzunlukları bir cetvel yardımıyla ölçülerek ortalamaları cm olarak ifade edilmiştir.

Kök çapı(mm): Köklenmiş çeliklerin kök çapları dijital kumpasla ölçülerek ortalamaları mm olarak ifade edilmiştir.

İstatistiksel Analiz: Deneme neticesinde elde edilen veriler SAS paket programı kullanılarak varyans analizine tabii tutulduktan sonra uygulamaların ortalamaları arasındaki farkların önemli olup olmadığı Duncan çoklu karşılaştırma testi ($P < 0.05$) yapılarak belirlenmiştir.

Bulgular ve Tartışma

Çürüme oranı, kallus oranı, köklenme oranı

Yapılan bu çalışmada Dinçer ve Saraçoğlu'nun (2020) önceki çalışmasında belirlenen ümitvar genotiplerin köklenme performansları değerlendirilmiştir. Karadut çeliklerinin çürüme oranı, kallus oranı ve köklenme oranları Çizelge 1'de verilmiştir. Çürüme oranları açısından genotipler arasında farklılık oluşmasına rağmen bu farklılıklar istatistiksel olarak önemli bulunmamıştır. Çürüme oranları Merkez 7 genotipinde %41.67, Merkez 6 genotipinde ise %12.96 olarak tespit edilmiştir. Bu değerler arasında istatistiki açıdan bir farklılık oluşmamıştır. Konuyla ilgili benzer çalışmalara bakıldığında, Macit, (2019) karadut çelikleri ile yapmış olduğu çalışmasında, çeliklerdeki en yüksek çürüme oranlarını sırasıyla %37.07 ve %31.68, en düşük çürüme oranlarını ise sırasıyla %15.57 ve %21.10 olarak bulduğunu bildirmiştir. Altuncu, (2019) ise farklı pH dozlarında IBA uygulamasının karadut köklenmesi üzerine etkilerini incelemiş ve en yüksek çürüme oranını %34.11, en düşük çürüme oranını %27.55 olarak bulduğunu rapor etmiştir. Macit, (2019) ve Altuncu, (2019)'nun bildirmiş oldukları değerler çalışmamızdaki çürüme oranıyla benzerlik göstermektedir. Çeliklerde meydana gelen çürümelerin köklenme ortamındaki aşırı nemlilikten kaynaklandığı düşünülmektedir. Köklenme ortamının hava alma kapasitesinin artırılması koşuluyla aşırı nemliliğin azalacağı dolayısıyla da çürüme oranlarının azalacağı beklenmektedir.

Bitkilerde meydana gelen yaralanmaların onarılması için yaralı bölgedeki hücrelerin farklılaşmasıyla yara dokusu meydana gelerek kallus oluşumu gerçekleşir. Çalışmadaki genotiplerin kallus oranı incelendiğinde en yüksek değer Çamdere genotipinde (%95.39) elde edilirken, en düşük kallus oluşumu Merkez 7 (%70.83) genotipinde tespit edilip bu iki genotip arasında istatistiki açıdan fark bulunmuştur. Çalışmamızda genotipler %70'in üzerinde kallus oluşumu gerçekleştirmiştir. Literatürde, kallus oluşumunun köklenme ile ilgili direk etkisinin olmadığı ancak çürüme oranını azalttığı ve çeliğin canlılık süresini uzattığına dair bilgiler mevcuttur. Bu yargıyı doğrular nitelikte çalışmamızda Merkez 7 genotipi en yüksek çürüme oranına sahipken aynı zamanda en düşük kallus oluşumuna sahiptir. Öte yandan diğer araştırmacılar çalışmamıza yakın yüksek kalluslenme değerleri tespit ettiklerini bildirmişlerdir (Saraçoğlu ve ark., 2016; Yıldız ve Koyuncu, 2016; Ekizoğlu, 2010).

Genotipler arasında en düşük köklenme oranı %60.41 ile Merkez 7 genotipinde tespit edilip diğer genotipler ile arasında istatistiksel açıdan fark bulunmuştur. İstatistiksel açıdan farkın olmadığı genotipler arasında ise köklenme oranı %79.49 ile %92.64 arasında değerler almıştır. Bugüne kadar birçok araştırmacı karadut çeliklerinin köklenmesi üzerine yapmış oldukları çalışmalarda köklenme oranları açısından farklı sonuçlara ulaşmıştır. Yapılan çalışmalarda %60'ın üzerinde köklenme başarısına ulaşmış olan çalışmalar mevcuttur (Yıldız ve Koyuncu, 2016; Sezgin, 2009; Ekizoğlu, 2010; Erdoğan ve Aygün, 2006; Macit, 2019; Yağlıoğlu, 2015; Altuncu, 2019; Saraçoğlu ve ark., 2016; Zenginbal ve Demir, 2018). Diğer araştırmacılar ise %60'ın altında köklenme değerlerine ulaşmıştır (Ünal ve ark., 1992; Karadeniz ve Şişman, 2004; Koyuncu ve ark., 2004; Yıldız ve ark., 2009; Özkan ve Arslan., 1996). Yapılan çalışmalar arasında köklenme üzerine bu denli farkın oluşmasına neden olacak birçok unsur vardır. Yıldız ve ark., (2009) yapmış oldukları çalışmada bu konuya değinip olabilecek sebepler arasında; genotipik farklılık, çelik alma zamanı, çelik alınan ağacın lokasyon ve beslenme durumu aynı zamanda ağaç yaşı ve uygulama farklılıklarının etki edebileceğini bildirmişlerdir. Yaptığımız çalışmada da meydana gelen farklılıklar sayılan bu sebeplerden kaynaklanmış olabilir.

Çizelge. 1 Karadut genotiplerinin çürüme oranı, kallus oranı ve köklenme oranı

Lokasyon	Çürüme Oranı (%) ^{öd}	Kallus Oranı (%)	Köklenme Oranı (%)
Kemalpaşa	13,33 ± 6,67	86,66 ± 7,70 AB	84,44 ± 4,44 A
Yelpe	22,34 ± 11,53	76,13 ± 9,52 AB	92,64 ± 4,46 A
Merkez 3	21,06 ± 2,04	82,27 ± 4,34 AB	79,49 ± 6,84 A
Merkez 6	12,96 ± 6,86	91,84 ± 4,13 AB	89,62 ± 1,96 A
Kocacık	36,39 ± 16,22	89,30 ± 5,57 AB	82,77 ± 3,89 A
Çamdere	21,56 ± 11,31	95,39 ± 2,31 A	90,63 ± 6,33 A
Merkez 7	41,67 ± 4,17	70,83 ± 8,33 B	60,41 ± 9,08 B

^{öd}: 0.05 seviyesinde ortalamalar arasındaki fark önemli değildir. Aynı harflerle gösterilen değerler istatistiki açıdan önemsizdir.

Kök uzunluğu, kök çapı ve kök sayısı

Karadut çeliklerinin kök uzunluğu, kök çapı ve kök sayısına ait değerler Çizelge 2'de verilmiştir. Genotiplerin kök uzunluğu değerlerinde istatistiki açıdan farklılıklar oluşmuştur. Kök uzunluğu 5.85 ve 7.52 cm arasında değerler almıştır. En yüksek kök uzunluğu değeri Merkez 3 genotipinde, en düşük ise Yelpe genotipinde tespit edilmiştir. Yapılan diğer çalışmalarda Zenginbal ve Demir (2018) 2.75 – 8.57 cm arasında, Sezgin (2009) ise 2.5- 6.16 cm arasında değerler bulunduğunu bildirmiştir. Çalışmamızda bulmuş olduğumuz değerler literatürle uyum içerisinde olmuştur. Saraçoğlu ve ark., (2016) yaptıkları çalışmada, kök uzunluklarını 0 – 4.34 cm arasında bulmuştur. Bu değerler çalışmamıza kıyasla daha düşük kalmıştır. Yıldız ve Koyuncu, (2016) yaptıkları çalışmada kök uzunluğu değerlerinin 7.9 – 12.2 cm arasında bulunduğunu bildirmiştir. Bu değerler ise çalışmamıza kıyasla daha yüksek bulunmuştur.

Kök çapı açısından genotipler değerlendirildiğinde en yüksek değer 1.75 mm ile Kocacık genotipinde tespit edilmiştir. En düşük kök çapı değeri ise 1.42 mm ile Merkez 6 genotipinde belirlenmiştir. Literatürdeki yapılan diğer çalışmalarda Yıldız ve ark., (2009) 0 – 2.03 mm, Yağlıoğlu, (2015) 0.9 – 1.5 mm, Altuncu, (2019) 0.92 – 0.98 mm arasında değerler bulmuştur. Literatürde belirtilen bu sonuçlar, çalışmamızda elde ettiğimiz sonuçlarla uyum içerisinde olmuştur. Farklılık gösteren değerler ise yapılan uygulama ve çelik alma zamanı gibi kriterlerden kaynaklanmış olabilir.

Kök sayısı açısından bakıldığında, Merkez 3 genotipi Yelpe, Kocacık ve Çamdere genotiplerine kıyasla daha yüksek değerlere ulaşmıştır. Kök sayısı değerleri 7.87– 12.67 adet/çelik arasında değişiklik göstermiştir. Zenginbal (2018) yapmış olduğu çalışmada kök sayısı değerlerini 2.05 – 9.79 arasında bularak çalışmamıza nispeten yakın değerlere ulaşmıştır. Yapılan diğer çalışmalarda, Saraçoğlu ve ark., (2016) 0 – 2.97 arasında, Yıldız ve ark., (2009) 0 – 3.5 arasında, Yıldız ve Koyuncu, (2016) 1.9 – 5.9 arasında değerler bulduklarını bildirmiştir. Çalışmamıza kıyasla bu bulunan değerler düşük kalmıştır.

Çizelge 2 Karadut Genotiplerinin Kök Uzunluğu, Kök Çapı ve Kök Sayısı

Lokasyon	Kök Uzunluğu(cm)	Kök Çapı(mm)	Kök Sayısı (adet/çelik)
Kemalpaşa	7,01 ± 0,39 AB	1,72 ± 0,05 A	8,95 ± 0,95 AB
Yelpe	5,85 ± 0,42 B	1,68 ± 0,06 A	8,00 ± 0,96 B
Merkez 3	7,52 ± 0,34 A	1,54 ± 0,06 AB	12,67 ± 1,95 A
Merkez 6	6,03 ± 0,34 B	1,42 ± 0,04 B	11,46 ± 1,46 AB
Kocacık	6,60 ± 0,30 AB	1,75 ± 0,05 A	8,12 ± 1,03 B
Çamdere	6,98 ± 0,31 AB	1,62 ± 0,04 AB	7,87 ± 0,69 B
Merkez 7	6,05 ± 0,35 B	1,65 ± 0,05 A	9,17 ± 1,33 AB

Aynı harflerle gösterilen değerler istatistiki açıdan önemsizdir ($p < 0,05$).

Sonuç

Yapılan bu çalışmada Dinçer ve Saraçoğlu (2020) ‘nun Tokat bölgesinde belirlemiş oldukları karadut genotipleri kullanılarak onların çelikle köklenme performansları incelenmiştir. Karadut üzerine yapılan bazı çalışmalara kıyasla yoğun köklenme oranı, kök sayısı ve kök uzunluğunda yüksek değerlere ulaşılmıştır. Bu yüksek değerlerin daha önceden belirlenmiş karadut genotiplerinin ön seleksiyonla seçilmiş olmasından kaynaklandığı düşünülmektedir. Elde edilen sonuçlarla birlikte ilerleyen zamanlarda, çalışmada kullanılan Kemalpaşa, Yelpe, Merkez 3, Merkez 6, Kocacık, Çamdere ve Merkez 7 karadut genotipleri üzerine çalışmaların devam etmesi ve sonunda bir çeşit ıslahına gidilecek yol haritası çizilmesi gerektiği düşünülmektedir. Ayrıca sonuçlar ticari fidan üretimi yapan firmalara önem arz etmektedir.

Investigation of Antibacterial Activity of Aromatized Kombucha

Duygu Sevinç¹, Muazzez Gürkan¹

¹Department of Biology, Tekirdağ Namık Kemal University, Tekirdağ, Turkey

Abstract

Kombucha (Kombu tea) is the beverage obtained from fermentation of black or green tea with sugar via the kombucha scoby. Its market is on the rise all over the world. This is the result of the health benefits of kombucha raised by the polyphenols and probiotic bacteria in the beverage. Polyphenols make the beverage have antibacterial, anti-inflammatory and anticarcinogenic features, while probiotic bacteria make the beverage a functional drink because of its benefits for the gut flora. In this study, the kombucha was aromatized after the end of fermentation by addition of either lavender, sage, clove, or bay leaf and kept at the refrigerator for 24 hours. This was followed by the analysis of antibacterial activity of kombucha on *E. coli*, *P. aeruginosa*, *S. aureus*, and *S. mutans*. Moreover, a few dominant bacterial species were determined. The results showed that kombucha had antibacterial activity especially on *S. aureus* and this activity reduced by the addition of aromatizers.

Key Words: Kombucha, antibacterial activity, aromatic plants

Kombu Çayının Aromalandırılmasının Antibakteriyel Aktivitesi Üzerine Etkilerinin İncelenmesi

Özet

Kombuça (Kombu çayı) bakteri ve mayalardan oluşan bir çay mantarı tarafından siyah çay veya yeşil çayın ve şekerin fermente edilmesinden elde edilen içeceğe verilen addır. Dünya piyasasında payı giderek artan ve tüketimi gittikçe artan bir içecektir. Bunun nedeni içeriğindeki polifenoller ve probiyotik bakterilerdir. Polifenoller içeceğe antibakteriyel, anti karsinojen, anti enflamatuvar özellik kazandırırken, içeriğindeki probiyotikler de özellikle bağırsak florasına olan katkıları sebebiyle kombu çayının fonksiyonel bir içecek olmasını sağlamaktadır. Bu çalışmada probiyotik değerli bir içecek olan Kombuçanın fermentasyondan sonra lavanta, adaçayı, karanfil, defne yaprağı ile 24 saat buzdolabında bekletilmesi ile aromalandırılmasının kombuçanın antibakteriyel etkisi üzerinde etkisi *E. coli*, *P. aeruginosa*, *S. aureus*, ve *S. mutans* bakterileri üzerinde denenmiştir. Ayrıca hazırlanan kombuçalardaki baskın olan bakteri türü de tespit edilmiştir. Sonuçlar kombuçanın özellikle *S. aureus* üzerinde antibakteriyel etki gösterdiğini ve bu etkinin eklenen tıbbi aromatik bitkiler ile azaldığını göstermiştir.

Anahtar Kelimeler: Kombuç, antibakteriyel aktivite, aromatik bitkiler

Introduction

Kombucha is beverage formed by the fermentation of tea and sugar by a combination of yeasts and bacteria. The history of this drink goes back to ancient China, and nowadays a preferable drink worldwide, especially in Europe and USA. In 2020, the global kombucha market worth approximately 2.2 billion US dollars. Kombucha may contain a low concentration of alcohol (1-3%), but usually considered to be a non-alcoholic beverage. The microorganism combination that ferments tea and sugar is called SCOBY (Symbiotic Colony of Bacteria and Yeast) (Figure 1). The microorganisms which consist of yeast, acetic acid bacteria and lactic acid bacteria from a biofilm which results in the formation of this SCOBY pellicle on top of the liquid during the fermentation of tea and sugar, since the microorganisms are aerobic. The SCOBY gets thicker through the fermentation process and it can be reused for next fermentation processes. First, the brewed tea is mixed with table sugar (5-25%) and let to cool to room temperature. Then SCOBY from the previous process is placed on top of the liquid solution and the jar (usually glass) is covered with a porous clean cloth. The yeasts in the SCOBY metabolize sugar in the mix to ethanol which is the substrate for bacteria which form acetic acid as a result. At the end of 7-10 days of fermentation, SCOBY is removed and the beverage is ready to consume. The end product has a pH of 2.5-4.2. Lower or higher pH values are undesirable. The beverage is full of probiotic microorganisms which are very healthy and beneficial for human gut microbiota. This property makes the beverage more and more preferable in recent times and it is accepted as a functional beverage (Coelho et al., 2020; de Filippis et al., 2018).

The examples of acetic acid bacteria found in the SCOBY are *Acetobacter nitrogenifigens*, *Acetobacter aceti*, *Lactococcus species*, *Leuconostoc species*, *Lactobacillus brevis*, *Lactobacillus kefiranoferiens*, etc. The examples of yeast found in SCOBY are *S. cerevisiae*, *Brettanomyces bruxellensi*, *Zygosaccharomyces kombuchaensis*, *Hanseniaspora vineae*, etc. (Antolak et al., 2021).

The polyphenols are the bioactive chemicals found in kombucha which comes from the tea. Different tea types can result in different concentrations and types of polyphenols. Such bioactive chemicals are responsible for the health benefits of kombucha as well as the probiotic bacteria. They make kombucha have anti-carcinogenic, antibacterial, anti-diabetic features. In order to diversify the bioactive chemicals, different plant infusions and medicinal aromatic plants can be added to kombucha (Jakubczyk et al., 2020; Vázquez-Cabral et al., 2017). The

combination of polyphenols from different sources can hence make the beverage healthier. However, plant infusions or medicinal aromatic plants can themselves have antibacterial and anti-fungal effects which can decrease the bacterial number and diversity in kombucha. In this study we investigated the change of antibacterial activity of kombucha mixed with different plants after the end of fermentation process.

Materials and Methods

Black tea obtained from market was brewed with boiling drinking water. Table sugar (was added to the tea and let the solution cool down to room temperature. A SCOBY from a previous fermentation was washed with drinking water and placed into the tea-sugar solution. The head of jar was covered with a clean cloth (Figure 1). The preparations were done following hygiene rules. The jar was placed into a dark cupboard and let for 10 days for the fermentation to take place.

The dry medicinal aromatic plants used in this study (clove, lavender, sage, bay leaf) were bought from a market. After the fermentation was over and the SCOBY was removed, kombucha was aliquoted. The dry plants were added to the kombucha aliquots and they were kept at the refrigerator (4°C) for 24 hours.

Figure 1. Kombucha fermentation jar with the SCOBY on top of the solution (Original photo)

The bacteria used in the antibiogram test (*E. coli*, *P. aeruginosa*, *S. aureus*, and *S. mutans*) were obtained from Middle East Technical University, Ankara, Turkey. The bacteria were grown on blood agar and adjusted to be 0.5 McFarland. The bacteria were spread on Mueller Hinton agar plates and wells of 8mm diameter were formed with a sterile pipette tip. 100 µL kombucha mix were added to the wells. The plates were kept at 37°C for 24 h. The antibacterial activity of kombucha was evaluated by the measurement of clearance around the wells.

The pH of the samples was measured using a pH meter. The McFarland turbidity of the samples was measured using a densitometer. The statistics of the measurements were determined using Minitab 13. The results were analyzed with one-way and two-way ANOVA with the same software. The dominant bacterial species in kombucha samples was determined by spreading the sample on TSA agar followed by determination of three colonies using VITEK system. Each experiment was carried out in duplicate.

Results and Discussion

In this study, the fermented beverage kombucha prepared from black tea was aromatized with different medicinal aromatic plants. The antibacterial activities of each kombucha were tested against two Gram-positive and two Gram-negative bacteria. The clearance around the wells on the agar plates were measured to evaluate the antibacterial activity of each kombucha. The results of the well diffusion test are given in Table 1.

Table 1. Diameter of antibacterial activity around the wells. Values are given as mean ± SEM

	<i>E. coli</i>	<i>P. aeruginosa</i>	<i>S. aureus</i>	<i>S. mutans</i>
Control	11.0±0.00	10.0±0.00	15±1.41	8.0±0.00
Lavender	12.75±1.06	11.75±2.47	13.5±0.71	11.0±0.00
Sage	13.25±1.06	9.5±2.12	12.0±0.00	8.0±0.00
Clove	12.50.71	11.5±0.71	12.0±0.00	12.5±0.71
Bayleaf	12.5±0.71	11.0±2.83	13.25±0.35	13.25±0.35

The highest antibacterial activity of kombucha was seen against *S. aureus* in the control group where no aromatizer was added (p=0.039). Kombucha with sage had the lowest activity against the same bacterium. Also decrease of

antibacterial activity of the kombucha with sage was obvious against *P. aeruginosa* and *S. mutans*, too. This suggests that the antibacterial activity of kombucha decreases with aromatization with sage. Bay leaf usage in kombucha increased antibacterial activity compared to sage against *S. aureus*, *P. aeruginosa*, and *S. mutans*. The difference can be explained by the different cell wall structures of Gram positive and Gram-negative bacteria, as well as the polyphenols that can come with the plant aromatizers. Two-way ANOVA results revealed that the type of aromatic plant significantly affected the antibacterial activity ($p=0.014$). Moreover, interaction of bacterial species tested in this study and the plant species is significant ($p=0.007$).

Table 2. pH and McFarland turbidity values of kombucha samples. Values are given as mean $\pm$ SEM. * means significant difference ($p<0.05$).

	pH	McFarland Turbidity
Control	3.45 $\pm$ 0.005	2.405 $\pm$ 0.005
Lavender	3.65 $\pm$ 0.145	2.45 $\pm$ 0.05
Sage	4.10 $\pm$ 0.03*	2.55 $\pm$ 0.15
Clove	3.56 $\pm$ 0.03	2.45 $\pm$ 0.05
Bayleaf	3.51 $\pm$ 0.00*	2.30 $\pm$ 0.1

The pH of each kombucha was determined after 24 hours of aromatization. The results are given in Table 2. Moreover, the microorganism density in kombucha samples were measured as the McFarland turbidity. It is clear that the highest pH value was obtained in the kombucha aromatized with sage ($p=0.006$), and the lowest is in the control. Moreover, kombucha with sage added has the highest turbidity (Table 2). For kombucha, the lowest pH acceptable is 3 and it should not be over 5. The bacterial combination and density would change the pH of the kombucha, as seen in this study. This can also be related to the decreased antibacterial activity as different pH values would support different types of bacteria in the mixture. Therefore, in order to detect the reason well, microbial analyses should be carried out to determine the bacterial and fungal flora in kombucha. In this study, only 3 bacterial species which were observed to be dominant were detected. They were *Staphylococcus hominis*, *Pasteurella pneumotropica* and *Leuconostoc mesenteroides*. The agar plates where the colonies were picked are given in Figure 2. *S. hominis* is a Gram positive, commensal bacterium normally found on human skin. It is known for its aerobic thioalcohol production. *Pasteurella pneumotropica* is a Gram-negative bacterium with both oxidative and fermentative metabolism. It can produce acid from glucose (Public Health England, 2015). Therefore, this bacterium is one of the acid producing bacteria in the SCOBY. *L. mesenteroides* is a lactic acid bacterium used in the fermentation of vegetables (Zubaidah et al., 2020). Therefore, this bacterium is one of the many bacteria responsible for the fermentation process in kombucha making.

Figure 2. Agar plates with kombucha samples spread after dilution.

Conclusion

The probiotic beverage Kombucha is gaining attention day by day with an increased market value. The beverage is prepared by the fermentation of black or green tea and the resulting flavor is sometimes tried to be enriched together with the polyphenol ingredients of the beverage by adding different medicinal aromatic plants which are sources of polyphenols. Although, the polyphenols and bioactive chemicals can be enriched in the beverage, the plant additives can lower the diversity and number of probiotic bacteria in the beverage, since the bioactive compounds can themselves be antibacterial agents. Therefore, the aromatization of kombucha should be carried out by the consideration of lowered probiotic content. The consumers should be informed by this fact together with the enrichment of anti-carcinogenic, anti-inflammatory, anti-bacterial bioactive chemicals.

Nutritional strategies particularly Lactic acid bacteria to reduce methane production in ruminants

Muhammad Umair Asghar^{1*}, Mariusz Korczyński¹, Martyna Wilk¹, Barbara Król¹, Maja Słupczyńska¹, Sibel Canoğulları Doğan², Sema Yaman²

¹ Department of Animal and Feed Sciences, Faculty of Animal Science and Fisheries, Wrocław University of Environmental and Life Sciences, Wrocław, Poland

² Department of Animal Production and Tech., Faculty of Agricultural Sciences and Tech., Niğde Ömer Halisdemir University, Niğde, Turkey,

Abstract

Ruminant enteric fermentation is the single greatest anthropogenic source of agricultural methane and contributes significantly to global warming. As a result, creative ways to minimize methane emissions from cattle farms are essential to maintain long-term food production sustainability. Lactic acid bacteria (LAB), Gram positive bacteria that create lactic acid as a primary end product of carbohydrate fermentation, are one viable strategy. LAB are natural occupants of animals' intestines and are one of the most important families of bacteria employed in food fermentations. LAB are easily extracted from ruminant animals and are now employed as direct-fed microbials (DFMs) and silage inoculants on farms. While it has been hypothesized that LAB can be utilized to reduce methane generation in ruminant animals, research has been limited thus far, and compelling animal data to back up the hypothesis is absent. This study critically examined the existing research and offered a thorough analysis and overview of the possible usage and mechanisms of LAB as a methane mitigation method. Although some encouraging findings have been obtained, additional study is required to determine if the use of LAB may be an effective methane mitigation solution for ruminant animals.

Key Words: *Direct fed microbes, Lactic acid bacteria, Methane mitigation, Ruminants, Silage*

Investigation of Stray Dogs Problem in Sivas Province Animal Shelter Example

Yusuf Ziya Oğrak¹, Şahin Alıcı²

¹Sivas Cumhuriyet University, Faculty of Veterinary, Department of Animal Breeding and Husbandry, Sivas, Türkiye

²Sivas Municipality Veterinary Affairs Directorate, Sivas, Türkiye

Abstract

Parallel to the increasing number of pet breeding in Turkey, the increase in the number of dogs abandoned to the street or shelter creates significant problems both for the loyal friendly dogs of people and for the society. With this study, which is expected to serve to solve this increasing problem, the dog traffic in the animal shelter in Sivas province was investigated together with the reasons for abandonment. For this purpose, in this study, dog traffic in the animal shelter of Sivas province was investigated both quantitatively on the basis of years and the reasons for abandonment, as well as the attitudes and behaviors of the animal owners. In the study, besides the dog traffic records of the stray animal rehabilitation center operated by Sivas Municipality, the survey data made with the owners who left their dogs there were analyzed. According to the four-year records covering the years 2019-2022, the average number of dogs staying in the Sivas Municipality Animal Shelter is 1058 (963-1150), while the average number of dogs collected from the street per month is 50.7, the average number of spayed female and male dogs per month is 17.33 and 33.44, respectively. The average number of adopted female and male dogs was 2.8 and 4.3 respectively. The average number of dog deaths per month in the shelter was 21.9. Every month, an average of 15 dogs were released back to the point where they were taken after the spayed and treated at the animal shelter. In addition, a face-to-face survey was conducted with a total of 50 people (49 men, 1 women) who left their dogs in the shelter and 15 questions were asked to the participants, including the reasons for adopting/abandonment and form of care-feeding. While there was no statistically significant effect of marital status in the answers given by the participants to the questions, it was observed that their educational status had an effect on dog breeding due to dog ownership. Again, a relationship was found between the age of the dog owners and the level of vaccination of their dogs, and between the occupation of the dog owners and the reasons for dog abandonment. In addition, it has been understood that the dog owners' living in a province, district or village is also a determining factor in their dog breed preferences. As a result, it can be said that it would be beneficial to deal with the process in many different provinces with more detailed studies in terms of the ever-increasing number of dog acquisitions in the society and the prevention of their abandonment.

Key Words: Dog, Stray Dog, Animal Shelter, Abandoned Dog, Sivas.

Sokak Köpekleri Sorununun Sivas İli Hayvan Barınağı Örneğinde Araştırılması

Özet

Türkiye’de her geçen gün artan pet yetiştiriciliğine paralel olarak, sokağa veya barınağa terk edilen köpeklerin sayısındaki artış, hem insanların vefalı dostu köpekler için hem de toplum nezdinde önemli sorunlar yaratmaktadır. Bu olumsuz gidişin bir an önce önlenmesi, mevcut durumun iyi anlaşılıp tahlil edilmesiyle mümkün görünmektedir. İşte bu amaçla yapılan bu çalışmada, Sivas İli hayvan barınağındaki köpek trafiği, hem yıllar bazında nicel olarak hem de terkedilme nedenleri ile birlikte hayvan sahiplerinin tutum ve davranışları açısından araştırılmıştır. Çalışmada, Sivas Belediyesi tarafından işletilen sokak hayvanları rehabilitasyon merkezinin köpek trafiği kayıtları yanında, buraya köpeğini bırakan sahipleriyle yapılan anket verileri analiz edilmiştir. 2019-2022 yıllarını kapsayan dört yıllık kayıtlara göre Sivas Belediyesi Hayvan Barınağında konaklayan köpek sayısı ortalama 1058 (963-1150) olurken, aylık sokaktan toplanan köpek sayısı ortalama 50,7, aylık kısırlaştırılan dişi ve erkek köpek sayısı ortalamaları sırasıyla 17,33 ve 33,44, aylık sahiplendirilen dişi ve erkek köpek sayıları ortalama 2,8 ve 4,3 barınakta her ay görülen ortalama köpek ölümü sayısı da 21,9 olmuştur. Her ay barınakta kısırlaştırılıp tedavisi tamamlanan ortalama 15 köpek de alındıkları noktaya geri bırakılmıştır. Ayrıca barınağa köpeklerini terk eden toplam 50 kişiyle (49 bay, 1 bayan) yüz yüze anket yapılmış ve katılımcılara sahiplenme, bakım-besleme ve terk etme nedenlerini de içeren 15 soru yöneltilmiştir. Katılımcıların sorulara verdikleri cevaplarda istatistiki olarak medeni durumlarının bir etkisi görülmezken, eğitim durumlarının köpek edinme nedeni ile köpek besleme üzerine etkili olduğu görülmüştür. Yine köpek sahiplerinin yaşı ile köpeklerine aşı yaptırma düzeyleri arasında, köpek sahiplerinin mesleği ile köpek terk etme nedenleri arasında da ilişki bulunmuştur. Ayrıca köpek sahiplerinin il, ilçe veya köyde yaşamasının da köpek ırklarını tercihlerinde belirleyici olduğu anlaşılmıştır. Sonuç olarak, toplumda sürekli artan köpek edinme ve sonrasında terk etmelerinin önlenmesi açısından sürecin birçok farklı ilde her yönüyle daha ayrıntılı çalışmalarla ele alınmasının yararlı olacağı söylenebilir.

The Role of E-commerce in the Daily Food Sector

Usman M. Khan^{1*}, Mesut Selamoglu²

¹University of Massachusetts, Amherst, MA, 01003, USA

²Osmaniye Korkut Ata University, Bahce Vocational School, Department of Management and Organization, Logistics Programme, Bahce, Osmaniye, Turkey

Abstract

New commerce ecosystems such as social media platforms and all-in-one apps are also becoming incredibly powerful ways to connect to and engage with consumers. E-commerce sales have been rising yearly and during Covid-19 more consumers began shopping online in greater numbers and frequency. Food Industry professionals also believe that this is a permanent change. In this presentation, we focus on the use of electronic commerce for quality control and cost cutting efficiencies by the food and agricultural industries such as daily food products in the world.

The Testosterone Role In Adolescent Males From Hospital Of Hyderabad And Jamshoro

Muhammad Junaid Khilji, Tahira Jabeen Ursani and Jawaaid Ahmed Khokhar

Department of Zoology, University of Sindh, Jamshoro- 76080 Pakistan

Abstract

Testosterone is a principal sex hormone needed for the normal physiological processes during all life stages. In males, testosterone is essential for the development and maintenance of secondary sexual traits. Testosterone also influences bone mass, muscle strength, mood, and intellectual capacity. Testosterone imbalances lead to reproductive dysfunction during multiple life stages in human males. Low testosterone levels are related to reduce semen quality in men, increased genital malformations, and changes in the time of onset or progression of puberty. In the recent study of adolescent males, a clear positive relationship between testosterone level and energy relationship and muscle tone in adolescent males. The partakers were 120 adolescent males 15-17 years old with median age of 16. Level of testosterone obtained during present study ranging from 270ng/dl to 720ng/dl with mean testosterone level during adolescent males is 495ng/dl. Adolescent males with normal testosterone show 70% well muscle tone while 30% show weak muscle tone. 27% males with normal testosterone feel tired while 73% don't show tiredness. 56 % Adolescent males with normal testosterone follows biorhythms & having normal energy and well muscle tone while 44% males with low testosterone don't follows biorhythms and having low energy and weak muscle tone.

Investigation of Genetic Structure of Dogs in Sivas Animal Shelter with Nuclear and Mitochondrial DNA Markers

Yusuf Ziya Oğrak¹, Sevgi Durna Daştan², Taner Daştan³

¹Sivas Cumhuriyet University, Faculty of Veterinary, Department of Animal Breeding and Husbandry, Sivas, Türkiye,

²Sivas Cumhuriyet University, Faculty of Science, Department of Biology, Division of Molecular Biology, Sivas, Türkiye

³Sivas Cumhuriyet University, Faculty of Science, Department of Biochemistry, Sivas, Türkiye

Abstract

The aim of this study was to investigate the genetic structure of dogs in Sivas Municipality shelter and compare them with the known dog breeds using mitochondrial and nuclear gene information. DNA isolation was performed with commercially available spin column kits. Using total genomic DNA, different microsatellite gene regions and the COI gene region of mtDNA were amplified by Polymerase Chain Reaction (PCR). Gene sequencing analysis were made on this gene regions and in this way, differences in DNA were investigated. Molecular genetic markers are used to identify, and differentiate the characteristics of both plants and animals. By revealing morphological characters, roughly a classification or description of organisms can be made. However, since genetic markers based on genetic material are less affected by environmental factors such as physiological conditions and age of organisms, they can be more effective in revealing the kinship relationships of living things and comparing differences and similarities. This study is important to determine the gene polymorphisms of a group of stray dogs in Sivas province and to reveal their genetic similarities and differences with some known dog breeds. Indeed, in this study a wide geography like Türkiye as well as for the proper identification and naming of the dog breeds found, as well as correctly identified dog breeds to maintain their own characteristics, will serve to protect.

Key words: DNA, Gene polymorphisms, Genetics diversity, Stray Dog, Sivas.

Sivas Hayvan Barınağındaki Köpeklerin Genetik Yapısının Nükleer ve Mitokondriyal DNA Belirteçleri ile Araştırılması

Özet

Bu çalışmada, Sivas İli Belediye barınağında bulunan köpeklerin genetik yapılarının, mitokondriyal ve nükleer DNA gen bölgesi bilgileri kullanılarak araştırılması ve bilindik köpek ırklarıyla karşılaştırılması amaçlanmıştır. DNA izolasyonu, ticari olarak satılan spin kolon kitleriyle gerçekleştirilmiştir. Total genomik DNA kullanılarak, farklı mikrosatellit gen bölgeleri ve mtDNA'ya ait COI gen bölgesi Polimeraz Zincir Reaksiyonu (PCR) yöntemi ile çoğaltılmıştır. Bu şekilde mitokondriyal DNA üzerindeki farklılıklar araştırılmıştır. Moleküler genetik belirteçler hem bitki hem de hayvanların özelliklerinin belirlenmesi, tanımlanmaları ve farklılıklarının çıkarılması için kullanılmaktadır. Morfolojik karakterlerin ortaya konulmasıyla kabaca bir sınıflama veya organizmaların tanımlaması yapılabilir. Fakat genetik materyal esaslı belirteçler fizyolojik şartlar ve organizmaların yaşı gibi çevresel faktörlerden çok az etkilendiği için canlıların akrabalık ilişkilerinin ortaya konulmasında, farklılıkların ve benzerliklerin karşılaştırılmasında daha etkili olabilmektedir. Bu çalışma, Sivas ilindeki sahipsiz bir grup köpeğin gen polimorfizmlerinin belirlenmesi ve sahipli -bilinen bazı köpek ırklarıyla genetik benzerlik ve farklılıklarının ortaya konulması için önemlidir. Nitekim bu çalışma Türkiye gibi geniş bir coğrafyada bulunan köpek ırklarının doğru şekilde tanımlanması ve adlandırılması için önemli olduğu kadar, doğru bir şekilde belirlenmiş köpek ırklarının kendi özelliklerini muhafaza edecek şekilde yetiştirilip, korunmalarına da hizmet edecektir.

Anahtar kelimeler: DNA, Gen polimorfizmleri, Genetik çeşitlilik, Sokak Köpeği, Sivas.

Giriş

Sorumluluk sahibi gerçek hayvan severler tarafından evlerin bir ferdi gibi yetiştirilen köpekler, ilk evcilleştirilen hayvan türü olarak binlerce yıldır insanlarla birlikte dirler (Oğrak, 2009). Ancak, sorumsuz kişilerce sokağa terk edilen veya kaybolan köpeklerin hızlı üremelerine bağlı olarak bugün dünyada 600 milyon sokak köpeği bulunduğu tahmin edilmektedir ki bu ciddi sorunları beraberinde getirmektedir (Anonim, 2022a). Her yıl binlerce insanın köpek saldırısı/ısırtığı ve kuduzdan hayatını kaybetmesi nedeniyle Dünya Sağlık Örgütü, sokak köpekleri sorununa yönelik çalışmalar yürüterek, 2030 yılına kadar “Sıfır Kuduz” hedefiyle, “Tek Sağlık” hizmetinin güçlendirilmesini benimsemiştir (Anonim, 2022b).

Moleküler genetik belirteçler hem bitki hem de hayvanların özelliklerinin belirlenmesi, tanımlanmaları ve farklılıkların açığa çıkarılması için kullanılmaktadır. Morfolojik karakterlerin ortaya konulmasıyla kabaca bir sınıflama, organizmaların tanımlaması yapılabilir ve hatta klasik olarak morfolojik karakterlerin iyi gözlenmesi, düzenli kayıtların tutulması ve referans karakterlerin iyi belirlenmesi ile organizma ırklarının ıslah edilmesi, belirli özellikler yönünden kültüre edilmiş ırkların yoğun bir şekilde üretiminin yapılması mümkündür. Fakat bitkisel veya hayvansal organizmalarda genetik materyal esaslı belirteçler fizyolojik şartlar ve organizmanın yaşı gibi

çevresel faktörlerden çok az etkilendiği için, canlıların akrabalık ilişkilerinin ortaya konulmasında, farklılıkların ve benzerliklerin karşılaştırılmasında, verim özelliklerinin belirlenmesinde, belirli bir hastalığa yatkınlıkların belirlenmesinde veya çeşitli dirençlilik-duyarlılık niteliklerinin belirlenmesinde daha etkili olabilmektedir (Durna, 2006). Ayrıca tür veya ırk kategorilerinde tanımlama, sınıflama ve çeşitli verimsel karakter özelliklerinin belirlenmesinde genetik belirteçlerin kullanılması zaman bakımından da avantaj oluşturmaktadır, nitekim canlının tam olarak ırkın morfolojik ve üreme olgunluğu dönemine gelmesini beklemeden, doğar doğmaz ve hatta embriyonik gelişimlerinin erken safhalarında bile genetik olarak tanımlanması, özelliklerinin belirlenmesi kolayca yapılabilmektedir. Bunlara ilaveten morfometrik ölçümlere dayalı yöntemler, özellikle fenotipik benzerliklerin söz konusu olduğu ırkların ayrımlarında yetersiz kalmaktadır. Bu yüzden son yıllarda genetik bilimindeki gelişmelerin sayesinde genotipik çalışmalar, benzerliklerin ve ayrımların yapılmasında sıkça başvurulan, güvenilir bir yöntem olarak kullanılmaktadır. Bu sebeple, tür altı kategoriler olan ırk ve/ya varyete gibi alt gruplar arasında Single Nükleotid Polimorfizmi analizlerinin yapılması, tüm genomu kapayacak karşılaştırmalı çalışmaların yapılması, mitokondri gibi organel gnomlarının veya mikrosatellit lokuslarının karşılaştırılarak gruplar arasındaki akrabalığın ortaya konulması ciddi olarak ele alınmaktadır. Diğer taraftan genetik analizler, miktarı az olan örneklerin analizi için uygundur ve çok yakınlık gösteren varyetelerin, ırkların tespit edilmesinde de başarıyla kullanılmaktadır (Durna, 2006). Bir türün popülasyonları gibi evrimsel olarak yakın canlı grupların karşılaştırmalı olarak çalışılacağı ya da popülasyonlarda yakın zamanda oluşmuş olan bir olayın sebep ve tarihlerinin aranacağı bir durumda en çok kullanılan genetik işaretlerden biri de genom üzerinde çeşitli bölgelerin PCR yöntemiyle çoğaltılıp karşılaştırılmasıdır (Togan ve ark. 2003). Genomik materyal, hem çekirdekte bulunan DNA molekülü hem de organellerde bulunan DNA ve RNA moleküllerinden oluşmaktadır. Her bir organizma için sayıları binlerce milyona kadar erişen gen bölgeleri ve bunlar arasındaki intron denilen DNA alanların olması nedeniyle, genomda şifrelenen bilgi birikimi çok fazladır. Genetik belirteç olarak hem nükleer DNA gen bölgeleri hem de organel DNA'ları kullanılabilir (Brown et al., 2011; Bruford et al., 2003). Mitokondriyal DNA (mtDNA), genel olarak maternal kökenli olup, zigotun oluşumu sırasında yumurta hücresinde bulunan mitokondrilerdeki DNA'nın kalıtımı ile yeni jenerasyonlara aktarılmaktadır (Watson, 2004; Durna, 2006). Bu özelliğiyle mtDNA canlıların filogenetik analizlerinin yapılmasında, popülasyon yapısının değerlendirilmesinde, popülasyon genomiği, filogenetik ve filocoğrafik çalışmalarda kullanılan moleküler belirteçlerden biridir (Watson, 2004; Durna, 2006). Mitokondriyal DNA, türlerin ayrılma zamanı, coğrafik olarak dağılımları, türlerin yayılışı ve tarihi süreçteki dağılımları hakkında bilgiler verir, genomik DNA'ya oranla daha hızlı evrimleşir ve maternal kalıtıma sahip olduğu için canlıların moleküler saati ve anasal atasının bilgisi mitokondriyal DNA çalışmalarından elde edilebilir (Anderson ve ark., 1982; Avise ve ark., 1987; Bradley ve ark., 1996; Troy ve ark., 2001; Watson, 2004; Durna, 2006). İnsanoğlu teknolojik gelişmelere bağlı olarak genetik teknolojileri alanlarında da çok hızlı gelişmeler kaydetmiştir. Ancak ulaştığımız nokta itibarıyla hala araştırmamız gereken çok konu ve soru bulunmaktadır. Bu çalışma kapsamında mitokondriyal DNA ve nükleer DNA gen bölgeleri kullanılarak Sivas Hayvan Barınağındaki köpeklerin genetik çeşitliliğin tespit edilmesi amaçlanmıştır. Sivas İli Belediye barınağında bulunan köpeklerin DNA gen bölgeleri kullanılarak, genetik yapılarının araştırılması ve bilindik köpek ırklarıyla karşılaştırılması amaçlanmıştır.

Materyal ve Metot

Örneklerin Toplanması:

Hayvan materyalinin bulunduğu Sivas Belediyesi Hayvan Bakımevi ilk olarak 2007 yılında kurulmuş, daha sonra 2018 yılında köpek kapasitesi artırılarak Seyfebeli mevkiinde bulunan yeni binalarına taşınmıştır. Bu barınakta, 2004 yılında yayınlanan 5199 Sayılı "Hayvanları Koruma Kanunu" gereği, sokak hayvanlarının rehabilitasyon hizmeti, Sivas Belediyesi tarafından yürütülmektedir. İlgili mevzuatlarda belirtildiği gibi sokaklardaki sahihsiz köpekler, bakımevine getirilip, kısırlaştırma, aşılama ve küpeleme hizmetinden sonra ya barınakta tutulmakta ya da alındıkları bölgeye geri bırakılmaktadır.

Çalışmada, Sivas Belediye Hayvan Bakımevinde bulunan saf/melez çeşitli ırklardan 45 köpeğin vena brachialislerinden 2cc miktardaki kan, holder yardımı ile içerisinde antikoagulant (EDTA) bulunan vakumlu tüplere alınarak, tüplerin üzerine köpeğin adı ve alındığı yer yazılarak numaralandırıldı. Genetik analizler yapılncaya kadar, K₃-EDTA'lı tüplerdeki kanlar -20 °C'de saklandı.

DNA izolasyon prosedürü:

Uygun şekilde saklanan kan örneklerinden, ticari olarak satılan spin kolon esaslı kandan DNA izolasyon kitleri kullanılarak (GeneAll) DNA saflaştırma işlemi yapıldı. Elde edilen DNA'ların saflık ve miktarlarının belirlenmesine yönelik kalitatif ve kantitatif değerlendirmeler, % 1 lik agaroz jel elektroforezi ile UV görüntüleme esaslı olarak ve 260/280 nm UV absorbanlarına bakılmak suretiyle nanodrop spektrofotometre (deNovix cihazı)'de ölçülerek gerçekleştirildi. Tüm örneklerde standart miktarda ve kalitede DNA molekülü elde edilmesine çalışıldı. Stok DNA solüsyonları sulandırılarak, her bir örnek için 50 ng/µl yoğunluğunda standart DNA çözeltileri oluşturuldu.

Polimeraz Zincir Reaksiyonu:

Genomik DNA çözeltileri kullanılarak, literatüre göre köpeklere spesifik yapılmış başka çalışmalarda kullanılan sitokrom oksidaz bölgesini çoğaltmaya uygun primer dizileri de kullanılarak, mtDNA üzerindeki korunumu yüksek olan gen bölgelerine ilişkin genotipik farklılıklarda belirlenmeye çalışıldı. Bu işlem için ilk olarak uygun primerlerin seçilip sentezlettilmesinden sonra, standart PCR reaksiyonu yapıldı ve gen bölgeleri amplifiye edildi. Uygun PCR içeriği ve sıcaklık koşullarının belirlenmesi için gradient PCR uygulamasına başvuruldu. Kullanılan primerlerin listesi aşağıda verilmiştir:

COIF: 5'CCG GAC ATG GCA TTC CCC CG-3' (Kim ve ark., 1998).

COIR: 5' GGCGGACGTAAAGTACGCTCGTG-3' (Kim ve ark., 1998).

LCO1490: 5'-GGT CAA CAA ATC ATA AAG ATA TTG G-3' (Folmer ve ark., 1994).

HC02198: 5'-TAA ACT TCA GGG TGA CCA AAA AAT CA-3' (Folmer ve ark., 1994).

PCR Koşulları: PCR karışımı 25µl'lik son reaksiyon hacminin içeriğine; ddH₂O, 2.5 µl 10X reaksiyon tamponu (KCL tampon), 1.25 µl (1.5 mM/µl) MgCl₂, primerlerin her birinden 10pmol, 0.5 µl (0.2 mM) dNTPs, 5 U Taq DNA polimeraz (Fermantas) ve 1 µl (50 ng/µl) kalıp DNA eklenerek optimize edildi. PCR reaksiyonları "Applied Biosystems" marka termal cycler cihazında aşağıdaki koşullar altında gerçekleştirildi.

Başlangıç denatürasyonu	94°C	2 dk	35 döngü
Denatürasyon	94°C	30 sn	
Primer bağlanma (Annealing)	51-53°C	1 dk	
Uzama- Sentez (Extension)	72°C	1 dk	
Son Uzama (Final Extension)	72°C	10dk	

Sonraki basamakta da agaroz jel elektroforezi yapılarak fragment farklılıkları araştırıldı. Çoğaltılan gen bölgeleri agaroz jel elektroforezinde yürütülerek, görünür hale getirildi.

Agaroz jel elektroforezi:

Elde edilen PCR ürünlerinden 10 µl alınarak, 3 µl yükleme tamponu (6x Fermantas Loading dye: %50 gliserol, 0.1 M EDTA, %1 SDS, %0.1 Bromfenol mavisi, %0.1 Ksilen siyanol) ile karıştırıldı. Tris-Borik asit-EDTA (TBE) tamponu (10x Stok Tampon: 0.089 M Tris, 0.089 M Borik asit ve 0.011 M EDTA, pH: 8.3) içerisinde hazırlanan %1'lik agaroz jelde (1 g agaroz, 100 ml 1xTBE tamponu) yürütülerek saflaştırılan DNA örnekleri ve PCR ürünleri ayrıştırıldı. Elektroforez işlemi, 80 mA'de 2 saat süresince yapıldı (Agagel maxi Biometra). PCR işlemi sonucunda elde edilen ve elektroforez ile ayrıştırılan PCR ürünlerine ait bant modelleri, her bir örnek için 100 bç'lik DNA standartlarıyla (DNA ladder, Fermantas) kıyaslanarak kaydedildi ve Etidyum Bromid boyası ile hazırlanmış jel görüntüleri UV ışık altında incelenerek fotoğrafları çekildi.

Mikrosatellit Bölgelerinin Çoğaltılması:

Köpeklerde yüksek çeşitlilik gösteren önemli mikrosatellit bölgeleri mevcut literatürün incelenmesiyle belirlendi (Eichman et al., 2005; Irion et al., 2003; 2005; Kim et al., 2001; Leigh et al., 2004; Oishi et al., 2005; Richman et al., 2001; Sargan et al., 2007). 5 mikrosatellit bölgesinin PCR yöntemiyle ile çoğaltılması gerçekleştirildi. Seçilen 5 mikrosatellit bölgesinin isimleri ve bu bölgelerinin çoğaltılması için tasarlanan primer dizileri tablo 1'de gösterildi. Primer tasarımı esnasında, multipleks PCR yöntemi uygulanacağı için primerlerin T_m sıcaklıklarının yakın olmasına, primerlerin hairpin yapısı oluşturmamasına ve sadece ilgili bölgeyi çoğaltan tasarımın yapılmasına dikkat edildi.

Tablo 1. Kullanılan mikrosatellit belirteçler (Eichman et al., 2005; Irion et al., 2003; 2005; Kim et al., 2001; Leigh et al., 2004; Oishi et al., 2005; Richman et al., 2001; Sargan et al., 2007).

Primer Adı	Floresan İşaret	Kromozom	Primer Sekansı
FH2309-F	FAM	1	ACTGAGTTCCTTCAGCACAGTGT
FH2309-R		1	AAGAAATGCAGGGGTGCCT
FH2010-F	TAMRA	24	TCCTCCTATTAACAATGTCAGACTCTCA
FH2010-R		24	TGGATGCTTCTGGAGAGATCCA
FH2107-F	FAM	3	TGGATCATGTTGCACATACAATGAATCA
FH2107-R		3	TTGTTTGAGATTCTTCGTCCCCT
FH2054-F	HEX	12	ACTACCTCCGCTGTGATCACAT
FH2054-R		12	TCATTACACTGTAACACTGGCCTCA
FH2001-F	TAMRA	23	TGGCAGTATCCTCGACTGTAACA
FH2001-R		23	ATGAAGCAGTTGCATTCTTCTTGCA

Bütün primer alikotları 5µM Forward ve 5µM Reverse olacak şekilde hazırlandı ve PCR aşamasında KCl Buffer ve Thermo Taq Polymerase enzimi kullanıldı. Singlepleks PCR aşamasında kullanılan protokol 95 °C de 5 dakika, 40 döngü olmak üzere 95 °C' de 30 s, 56 °C'de 20s ve 72 °C'de 30 saniyedir. Genetik Analizör cihazı kullanılarak

fragman analizi kapiler elektroforez yöntemi kullanılarak gerçekleştirildi. Forward primerlerin floresan işaretli olması sayesinde, çoğaltılan ampikonlar da floresan işaretli olarak oluşturuldu.

Bulgular ve Tartışma

Total genomik DNA'nın saflaştırılmasından sonra kalite ve kantitesinin belirlenmesi amacıyla yapılan elektroforez sonucu Resim 1' de; mitokondriyal Sitokrom oksidaz I gen bölgesinin amplifikasyonunun görüntülenmesi ise Resim 2' de görülmektedir. Elektroforez işlemi sonucunda Singlepleks olarak çoğaltılan mikrosatellit bölgelerinin jel görüntüsü Resim 3'te gösterilmiştir.

Resim 1. Saflaştırılan DNA örneklerinin agaroz jel görüntüsü.

Resim 2. Köpek örneklerinden, spesifik primerler ile çoğaltılan mitokondriyal Sitokrom oksidaz I gen bölgesinin Led Görüntüleme sisteminden elde edilen agaroz jel görüntüsü.

Resim 3. Elektroforez işlemi sonucunda Singlepleks olarak çoğaltılan bazı mikrosatellit bölgelerinin jel görüntüsü.

Multipleks fragman analizi sonucunda 45 DNA örneğinden sadece B14, B42, B43, B44 ve B46 kodlu örnekler hariç 40 örneğin 5 mikrosatellit bölgesine göre sonuçları oluşturulmuştur. Cervus 3.0.6 programı kullanarak her mikrosatellit bölgesi için frekans analizi ve heterozigotluk/homozigotluk analizi yapılmıştır (Tablo 2). Barınak köpekleri (40 adet) ile kangal örnekleri karşılaştırılmıştır. Elde edilen sonuçlarda barınak köpeklerinde düşük frekansta olması sebebi ile kayda değer olmayan bazı alleller tespit edilmiş olmasına rağmen örnek sayısının düşüklüğünden kaynaklı ayırt edici alleller olarak isimlendirilmemiştir. Bunlar dışında bazı allellerin barınak köpekleri ve kangal köpekleri arasında ortak olduğu görülmüştür.

Tablo 2: Mikrosatellit belirteçlerin adları ve frekansları.

Sonuç

Çalışmada farklı ırkları ayırmada kullanılacak genetik belirteç bölgelerinin seçilmesi amacına uygun olarak çalışmanın ilk ayağını oluşturmuş ve bunun mümkün olabileceğini göstermiştir. Irkları ayırmak ya da sınıflandırmak için nükleer veya mitokondriyal çeşitli genetik bölgelerin seçilmesi olasıdır. Ancak çok sayıda örnek ile çalışma yapılmasıyla birlikte çok sayıda gen bölgesinin de analiz edilmesi gerekir. Daha kapsamlı benzer çalışmalarla, barınak köpeklerinin sahiplendirilmesinde, mikrosatellit veya mitokondriyal gen sonuçlarının bir sertifika gibi kullanılabilmesi mümkün olabilir. Barınak köpeklerinin de cins köpek ırklarıyla çeşitli gen düzeylerinde benzerliklerine vurgu yapılarak onların sahiplendirilmesi boyutunda kullanılabilir. Ancak genetik analizler şu anki geldiğimiz noktada rutin işlemlerde kullanılamayacak kadar maliyetlidir ve uzman kişiler tarafından analizlerin yapılması gerekli olup uygulanması kolay değildir.

Teşekkürler

Bu araştırma, Sivas Cumhuriyet Üniversitesi Bilimsel Araştırma Projeleri tarafından V-69 ve V-30 projeleri kapsamında desteklenmiştir.

Evaluation Of Diabetic Foot Complications In Outdoor Patients At Different Hospitals From District Naushahro Feroze Sindh

Aijazan Parveen Lakhari, Tahira Jabeen Ursani and Jawaid Ahmed Khokhar

Department of Zoology, University of Sindh, Jamshoro- 76080 Pakistan

Abstract

Diabetic foot is a global epidemic of 21st century and it is a major health problem. Foot complication in patients with diabetes mellitus (DM) is a major health problem and account for 20% annual diabetes related hospital admissions. This study was made in order to evaluate diabetic foot complications in out door patients (OPD) at different hospitals from district Naushahro Feroze Sindh. This cross-sectional descriptive study was carried out from June – November 2021. It aims to find out the prevalence and causes of foot complications in type I and type II diabetes mellitus patients and to find out the commonest complication in the area. The data was collected from the predesigned proforma and frequency, percentage, mean were analysis and culculated statistically. During research period total 74 patients of type I and type II diabetes mellitus patients were evaluated for diabetic foot complications. Out of 74 patients 42 (56.7%) were male patients and 32 (43.3%) were female patients. Male to female ratio was 1.3:1. 10 patients (13.5%) were suffered with type I DM and 64 (86.5%) patients were suffered with type II DM. The ratio of type I and type II DM was 1:6.4. The commonest age group of patients was between 31- 45 years. The mean age of male patients was 47.11 years and of females was 49.8 years. Mean weight of male patients was 83.1kg (ranged from 65-105) and female patients was 74.5kg (ranged from 65-95). Majority of the patients 54 patients (32 male and 22 female) were moderate build, 10 patients were thin build (6 male and 4 females) and 10 patients were obese (4 male and 6 female) patients. The literacy rate is very poor in district Naushahro feroze, 44 (59.4%) patients were educated (hardly five to seven or eight class) out of 44 educated patients 34 (80.9%) were male and 10 (31.25%) were female patients. 30 (40.54%) patients were uneducated (8 “19.04%” patients were male and 22 “68.75” were female patients) During my study most common foot complication found was diabetic foot ulcer/wound infection. 25 (33.7%) patients were effected in diabetic foot ulcer/wound infection, 20 patients (27.03%) were effected in diabetic foot gangrene, 18 patients (24.32%) were have peripheral neuropathy, 8 patients (10.81%) presented abscess and 3 (4.05%) patients were presented with cellulitis of foot or leg. Out of 10 patients of type-I DM, 7 patients (70%) have peripheral neuropathy, 2 patient (20%) were infected with diabetic foot ulcer/ wound infection and 1 patient (10%) presented with gangrene. Out of 64 (86.5%) patients of type-II DM 23 patients (35.93%) presented with diabetic foot ulcer/ wound infection, 19 (29.68%) patients presented with foot gangrene, 11 patients (17.8%) suffered with peripheral neuropathy 8 (12.5%) patient presented with foot abscess and 3 (4.68%) patients presented with cellulitis. Out of 74 patients 20 patients (29.7%) were on insulin injection and 54 patients (70.3%) were taking oral hypoglycaemic drugs. 35 patients (47.2%) came with history of hereditary (genetics) and 39 (52.7%) patients have history of acquired disease. People educated/uneducated in District Naushahro feroze are unaware of DM and its complications Therefore public (patients) awareness about DM, foot complications and foot care is strongly needed in District Naushahro feroze Sindh.

The Hepato-Therapeutique Effect Of Honey-Sidr From The Algerian Sahara On The Pathology Of Alzheimer Disease Study In Mice

Khadidja Hammou¹ And Nouredine Djebli¹

¹Pharmacognosy & Api-phytotherapy laboratory, Abdelhamid Ibn Badis University of -Mostaganel-27000, ALGERIA.

Abstract

The objective of this study is to determine the hepato-therapeutic effect of Honey-Sidr from the Algerian Sahara on mice caused by Alzheimer's disease whose liver damage could be one of the several pathologies caused by this disease providing more of the key lipids needed by the brain.

Experimental animal models make it possible to demonstrate the hépato-pathology effects of honey on this disease, females mices were given by the oral route of AlCl₃ at 100mg/kg/d, and D-galactose intraperitoneally at 120mg / kg / day for 45 days, after this period we proceeded to treatment with three doses of honey (100mg/kg/j, 200mg/kg/d and 300mg/kg/d) what were administrated by oral route for 45 days.

An analysis of the biochemical parameters (cholesterol, TGO, TGP, gamma GT) was carried out before and after treatment with Miel-Sidr.

The results of this analysis show a significant decrease in cholesterol levels in mice treated with the three doses of Honey, these values are at (0.9g/L, 0.78g/L, 0.6g/L) compared to mice affected by the disease Alzheimer's which is at 1.4g/L and the control which is at 0.6g/L and, this means that Honey has both anti-stress and anti-cholesterolemia activity, regarding the values of (TGO, TGP, gamma GT) are at (680IU/L, 100IU/L, -160IU/L) for mice affected by Alzheimer's disease, these values are very high compared to those treated with Honey which are at (300UI/L, 80UI/L, -190UI/L), these enzymes are found in the cells, their levels can be modified in the event of hepatic cell damage, these results show a decrease in the high rate of these enzymes, this confirms the effect of Honey on the hepatic balance which contributes to the proper functioning of the liver.

Abstract

Pseudomonas is most important member of Plant growth promoting rhizobacteria that improves the plant growth and yield under different stresses. *Pseudomonas moraviensis* and its indole acetic acid (IAA) deficient mutants were examined on chick pea as bio-inoculant under salinity stress and foliar spray of tryptophan. Inoculum of wild type and mutants of *P. moraviensis* were applied on the chickpea seeds. Salinity stress and foliar application of tryptophan was applied after 10 days of germination and after that plants were after one week of applying the treatments. The germination percentage was significantly greater in seeds that were inoculated with wild type but germination percentage was reduced significantly in seeds that were inoculated with mutants. Tryptophan application enhanced the chlorophyll contents and fresh weight of shoots and roots. However, protein contents were significantly higher in plants inoculated with mutants. Tryptophan application further improved proline and protein contents of the *P. moraviensis* and its mutants. Foliar application of tryptophan significantly reduced the effect of salinity in both wild type and mutants. Thus, it can be concluded that IAA have significant role in the growth and development of plants and tryptophan enhanced the IAA production ultimately improve the growth and yield of crops.

The Effect of Hesperidin Added to Japanese Quail Rations on Some Nutrient Contents of Egg

Abdullah Özbilgin¹, Recep Gümüş¹, Kübra Çınar Topçu²

¹Department of Animal Nutrition and Nutritional Diseases, Faculty of Veterinary Medicine, Sivas Cumhuriyet University, Sivas, Türkiye

²Department of Food Processing, Aydıntepe Vocational School, Bayburt University, Bayburt, Türkiye

Abstract

The present study was carried out to determine whether hesperidin, a citrus extract, has an effect on the nutrient content and pH of layer quails. In the study, 225 Japanese (*Coturnix coturnix japonica*) quails at 6 weeks of age with an average live weight of 165-178 g were used as animal material. The study was created in 3 groups. The Control group was fed only with basal ration. Hesperidin (group I and group II) was added to the basal ration at the levels of 1 g/kg and 2 g/kg, respectively, to the experimental groups. It was determined that egg white pH was statistically higher in the experimental groups compared to the control group due to hesperidin supplementation ($P < 0.05$). Egg yolk pH; in general moisture, crude ash and crude protein parameters in the whole egg were found to be similar in the groups ($P > 0.05$). As a result, it is thought that hesperidin supplement can be added to poultry rations as a result of the findings obtained in this study.

Key Words: Quail, Crude ash, Crude protein, Egg white, Hesperidin

Japon Bildircını Rasyonlarına Katılan Hesperidin'in Yumurtada Bazı Besin Madde İçerikleri Üzerine Etkisi

Özet

Mevcut çalışma yumurtacı bildircınlarda turuncgil ekstraktı olan hesperidin'in yumurtada besin madde içeriği ve pH üzerine etkisini belirlemek amacıyla yapılmıştır. Araştırmada hayvan materyali olarak 225 adet 6 haftalık yaşta 165-178 g ortalama canlı ağırlığında Japon cinsi (*Coturnix coturnix japonica*) bildircınlar kullanıldı. Çalışma kapsamında 3 grup oluşturuldu. Kontrol grubu sadece bazal rasyon ile beslendi. Deneme gruplarına (grup I ve grup II) bazal rasyona hesperidin sırasıyla 1 g/kg ve 2 g/kg düzeylerinde ilave edilmiştir. Yumurta akı pH'sının hesperidin takviyesine bağlı olarak Kontrol grubuna göre deneme gruplarında istatistiksel olarak yüksek olduğu belirlendi ($P < 0.05$). Yumurta sarısı pH'sı, genel olarak tüm yumurtada ise nem, ham kül ve ham protein parametrelerinin gruplarda benzer olduğu tespit edildi ($P > 0.05$). Sonuç olarak ise hesperidin takviyesinin bu çalışmada elde edilen bulgular neticesinde kanatlı rasyonlarına katılabileceği düşünülmektedir

Anahtar Kelimeler: Bildircın, Ham kül, Ham protein, Hesperidin, Yumurta akı

Bursa ve Aydın'da Çevre Koşulları Benzer İki İşletmede Yetiştirilen Siyah Alaca Sığırların Performanslarının Karşılaştırılması

Serdar Duru¹, Süleyman Can Baycan¹

¹Zootekni Bölümü, Ziraat Fakültesi, Bursa Uludağ Üniversitesi, Bursa, Türkiye

Özet

Bu araştırma Bursa ve Aydında süt sığırcılığı yapan iki işletmenin süt verimi ve üreme performansını karşılaştırmak için yapılmıştır. Araştırmada toplam 125 ineğin laktasyon ve 154 ineğin döl verimi kaydı değerlendirilmiştir. Sürüler arasındaki farkı belirlemek için varyans analizi yapılmıştır. Buzağılama yılı, buzağılama mevsimi ve laktasyon sayısı analizde kullanılan diğer fixed faktörlerdir. İşletmenin gebelik başına tohumlama sayısına (GBTS), buzağılama aralığına (BA), kuruda kalma süresi (KKS) ve 305 gün süt verimine (305 GSV) etkisi önemli bulunmasına rağmen diğer özelliklere etkisi önemsizdir. GBTS, BİTAS, SP ve BA için Aydın ve Bursa'da bulunan ortalamalar 1.3, 1.8 tohumlama, 91.4, 101.2 gün, 120.6, 132.0 gün, 384.1, 407.7 gün, LS, KKS, 305 GSV için 325.4, 318.7 gün, 75.6, 96.3 gün ve 6636 ve 7214 kg'dır. İşletmeler arasındaki farkta hayvanların genetik düzeyleri kadar işletmede hayvanlara sağlanan çevre şartları da etkilidir. İşletmelerin verimliliğini sadece süt verimi değil aynı zamanda döl verimi de etkiler. Hayvanların genotiplerine uygun çevre koşullarında bulunması başarılı bir sürü yönetimiyle birleşince karlılığı artırılabilir. Aydındaki işletmede özellikle süt verimini artırıcı önlemler alınması, Bursa'daki işletme için ise süt verimini artırmanın yanında döl verimini iyileştirici çalışmalar yapılması gerekir.

Anahtar Kelimeler: *Siyah Alaca, süt verimi, döl verimi, çevre faktörleri*

Comparison of Performance of Holstein Cattle Raised in Two Farms with Similar Environmental Conditions in Bursa and Aydın

Abstract

This research was conducted to compare the milk yield and reproductive performance of two dairy farms in Bursa and Aydın. In the research, lactation records of 125 cows and reproduction records of 154 cows were evaluated. Analysis of variance was performed to determine the difference between herds. Calving year, calving season and lactation number are other fixed factors used in the analysis. Although the effect of herd on the number of inseminations per pregnancy (GBTS), calving interval (BA), dry period (KKS) and 305 day milk yield (305 GSV) was found to be significant, its effect on other characteristics was insignificant. The averages found in Aydın and Bursa for GBTS, BİTAS, SP and BA were 1.3, 1.8 insemination, 91.4, 101.2 days, 120.6, 132.0 days, 384.1, 407.7 days, for LS, KKS, 305 GSV 325.4, 318.7 days, 75.6, 96.3 days and 6636 and 7214 kg. The environmental conditions provided to the animals in the herd are as effective as the genetic levels of the animals in the difference between the herds. The productivity of the farms affects not only the milk yield, but also the fertility. The profitability of the animals can be increased when the environmental conditions suitable for their genotypes are combined with a successful herd management. It is necessary to take measures to increase milk yield in the herd in Aydın, and to increase the milk yield for the herd in Bursa, as well as to improve the fertility of the herd.

Key Words: *Holstein, milk yield, reproductive performance, environmental factors*

Giriş

Dünyada birçok bölgede bulunan Holstein sığırları Türkiye'de de yaygın bir şekilde yetiştirilmektedir. Tüm sığırlar içinde sayıca en yüksek olan Holstein ve melezlerinin dişileri damızlık olarak süt üretiminde kullanılırken, erkekleri ise et üretimi için kullanılmaktadır. Türkiye'de Holstein sığırlarının genetik kapasitelerini tam olarak yansıttığı söylenemez. İyi genotipin iyi çevre isteği gerçeğine karşın, olumsuz çevre koşulları adaptasyonu yüksek olmasına rağmen Holstein sığırlarında istenilen performansın ortaya çıkmasını engellemektedir.

Türkiye'de sığırcılık için önemli iki il Bursa ve Aydın'dır. Bursa ve Aydın Damızlık Sığır Yetiştiricileri Birliği 1995 yılında kurulmuştur. 2022 yılı başında Aydında işletme sayısı 29107 toplam sığır sayısı 423071 baştır. Buna karşın Bursa'da 11045 işletme ve 186503 sığır bulunmaktadır (Anonim, 2022). Türkiye'de sığır sayısı en fazla olan iller Konya, İzmir, Erzurum, Balıkesir, Kars'tır. Aydın ve Bursa'nın Türkiye sığır varlığındaki payları sırasıyla %2.8 ve %1.33'tür. Her iki ilde de kültür ırkı ve melezlerinin payı %90'ın üzerindedir. Bursa ve Aydın'da sırasıyla Siyah Alaca ve melezleri %49, %54, Simmental ve melezleri %35, %14, Esmer ve melezleri %9, %17 oranında bulunmaktadır (Anonim, 2021). Bursa ve Aydın için uzun yıllar ortalama sıcaklığı 14.6 °C, 17.7 °C, ortalama yağış 708 mm, 653 mm'dir (Anonim, 2021).

Süt sığırı yetiştiriciliğinde sürü yönetiminin temeli kayıt tutmaya dayanır. Tutulan kayıtların sürü yönetiminde ve damızlık seçiminde kullanılması, işletmenin hem bugün hem de gelecekte olumlu sonuçlar almasını sağlar. Ayrıca kayıtlardan elde edilecek bazı bilgiler işletmenin genel durumunu ortaya koyarak, izlenecek politikanın

belirlenmesinde kullanılır. Türkiye’de süt sığırcılığı işletmelerinde sürü yönetimi genellikle somut olarak değerlendirilmez. Sürü yönetimini değerlendirmenin en etkili yolu teknik analiz yapmaktır. Bunun için sürüdeki kayıtlar zaman zaman incelenmeli ve süt ve döl verimi özellikleri açısından sürünün durumu değerlendirilmelidir. İnceleme sonrası varsa ideal değerlerden sapmalar ve bu sapmaların nedenleri ortaya konmalıdır. Bu araştırmada benzer büyüklükteki iki işletmede yetiştirilen Holstein sığırların yetiştirici koşullarındaki performansı karşılaştırılmıştır.

Materyal ve Yöntem

İşletmeler Bursa’nın Mustafakemalpaşa (Bursa) ve Aydın’ın Köşk (Aydın) ilçelerinde bulunmaktadır ve Damızlık Sığır Yetiştiricileri Birliği üyesidirler. Araştırma 2019 yılı Mart-Haziran ayları arasında yürütülmüştür. Söz konusu dönemde her iki işletme kayıtları değerlendirilmiştir. Araştırma sırasında Bursa’daki işletmede 26 inek, Aydındaki işletmede 23 inek bulunmakla birlikte Bursa’daki işletmede sürüden çıkan hayvanların bilgilerine de ulaşılmıştır. İşletmelerin karşılaştırılması için bazı döl ve süt verimi özellikleri değerlendirilmiştir.

Ön incelemede hemen her özellik için biyolojik sınırların dışında aşırı (uç) değerler olduğu gözlenmiştir. Bu tip çalışmalarda verilerin normal dağılımını sağlamak için bu uç değerler değerlendirme dışı tutulmaktadır. Bu çalışmada da gebelik başına tohumlama sayısı (GBTS) 7 ve üzeri, buzağılama ilk tohumlama arası süre (BİTAS) 30 günden kısa 300 günden uzun, servis periyodu (SP) 30 günden kısa 330 günden uzun, buzağılama aralığı (BA) 310 günden kısa 600 günden uzun, laktasyon süresi (LS) 220 günden kısa 550 günden uzun, kuruda kalma süresi (KKS) 20 günden kısa 200 günden uzun olanlar değerlendirilmemiştir. Söz konusu aşırı değerlerin bazı tohumlama ve buzağılamaların kayıt edilmemesi sonucu oluştuğu düşünülebilir. Ancak bazı ineklerin gerçekten çok uzun süre gebe kalamaması ve sağılması hatta neredeyse iki yılda bir buzağılamış olması da kuvvetle muhtemeldir.

Sığırlarda söz konusu özellikleri etkileyen faktörler genellikle; buzağılama yılı, buzağılama mevsimi ve laktasyon sayısıdır. Aşağıda görüldüğü gibi verilerin değerlendirilmesinde kullanılan istatistiksel modele bu faktörlerin yanı sıra işletme faktörü de dahil edilmiştir. Faktörlerin alt gruplarında çok fazla veri olmadığı için interaksiyonlar dikkate alınmamıştır.

$$Y_{ijklm} = \mu + a_i + b_j + c_k + d_l + e_{ijklm}$$

Y_{ijklm} : Herhangi bir özellik için fenotipi

μ : Bir özellik için beklenen ortalamayı

a_i : i. buzağılama yılının etkisini (+2008,2009 ... 2019)

b_j : j. buzağılama mevsiminin etkisini (ilkbahar, yaz, sonbahar, kış),

c_k : k. laktasyon sayısının etkisini (1, 2, 3, 4, 5+)

d_l : l. işletmenin etkisini (Bursa, Aydın)

e_{ijklm} : hata etkisini göstermektedir.

Elde edilen veriler MsExcel ile düzenlenmiş, faktörler arasında fark olup olmadığı varyans analizi ile alt gruplar arası karşılaştırmalar ise Fisher’in LSD testiyle yapılmıştır (Minitab, 2020).

Sonuçlar ve Tartışma

Araştırmada döl ve süt verimi özelliklerine etkisi araştırılan faktörlerden işletme dışında kalanlara ait ortalama ve standart hatalar verilmemiş sadece önemlilikleri hakkında bilgi verilmekle yetinilmiştir.

Buzağılama yılının gebelik başına tohumlama sayısına (GBTS) etkisi önemlidir ($P<0.05$). Buzağılama mevsiminin buzağılama ilk tohumlama arası süre (BİTAS), servis periyodu (SP) ve buzağılama aralığına (BA) etkisi önemlidir ($P<0.01$). Laktasyon sayısının döl verimi özelliklerine etkisi önemli değildir.

İşletmenin GBTS ($P<0.01$) BA’ya etkisi önemlidir ($P<0.05$) (Tablo 1). Döl verimi özelliklerinden GBTS ve BA bakımından Aydındaki işletmenin, Bursa’daki işletmeden genel olarak daha başarılı olduğu söylenebilir. Bursa’da gebelik için daha fazla tohumlama yapıldığı görülmektedir. GBTS’nin artmasının doğal sonuçlarından birisi SP’yi diğeri de BA’yı artırmaktır. Nitekim Bursa’da SP Aydın’a göre 12 gün daha uzun ve 132 gün, BA 23 gün daha uzun ve 407.7 gün olarak hesaplanmıştır. Aydın ve Bursa’da BİTAS sırasıyla 91.4 ve 101.2 gün, SP 120.6 ve 132 gün bulunmuştur. Her ne kadar bu iki özellik bakımından her iki işletme arasında yaklaşık 10 günlük bir fark olsa da istatistiki olarak önemli değildir. Her iki işletmede SP ideal değer olarak kabul edilebilecek 85 günden 1-1.5 ay daha uzundur.

Table 1. Differences between Aydın farm and Bursa farm for reproductive performance

Özellik	İşletme	n	Ortalama	Standart Hata	Minimum	Maksimum	P
GBTS	Aydın	68	1.3	0.13	1	3	0.000
	Bursa	271	1.8	0.07	1	5	
BİTAS	Aydın	59	91.4	7.8	32	290	0.256
	Bursa	228	101.2	4.2	39	299	
SP	Aydın	60	120.6	9.1	32	313	0.262
	Bursa	215	132.0	5.0	39	322	
BA	Aydın	58	384.1	8.5	312	576	0.016
	Bursa	182	407.7	4.9	320	572	

GBTS: gebelik başına tohumlama sayısı, GS: gebelik süresi, BİTAS: buzağılama ilk tohumlama arası süre, SP: servis periyodu, BA: buzağılama aralığı

Aydındaki işletmede bulunan 1.3 adet tohumlama ortalaması bazı araştırmalarda bulunan 1.42 – 1.47 arasındaki tohumlama sonuçlarına yakındır (Erdem ve ark., 2007; Bayrıl ve Yılmaz, 2010; Şahin ve Ulutaş, 2011; Cura, 2016). Bursa'daki işletmede bulunan 1.8 tohumlama değeri Güngör (2019) 1.8, E-İslah (2015) 1.9 değerlerine benzerdir. Buna karşın Kaygısız (1997) tarafından bildirilen 2.2 ve Alkoyak (2016) tarafından bildirilen 2.7 tohumlama her iki işletmede bulunan değerlerden oldukça yüksektir.

BİTAS için her iki işletmede hesaplanan 91 ve 101 günlük ortalamalar Alkoyak (2016) tarafından bu özellik için bildirilen 84 günden uzundur.

SP için Aydın'da bulunan değer (120 gün) bazı araştırma sonuçlarına benzer (Erdem ve ark. (2007) 122, Akkaş ve Şahin (2008) 124, Özçakır ve Bakır (2010) 120, Gürses ve Bayraktar (2012) 127, bazılarında yüksek (Kaygısız (1997) 108, Bayrıl ve Yılmaz (2010) 99, Cura (2016) 92) bazılarında ise düşüktür (Şahin ve Ulutaş (2010, 2011) 135, Alkoyak (2016) 162 gün).

Bu araştırmada BA için bulunan değerler (384 ve 407 gün) bazı araştırma sonuçlarında 379 – 404 gün arasında bildirilen değerlere benzer (Kaygısız, 1997; Erdem ve ark., 2007; Akkaş ve Şahin, 2008; Şahin ve Ulutaş, 2011; Bayrıl ve Yılmaz, 2010; Özçakır ve Bakır, 2010; Gürses ve Bayraktar, 2012; Güngör, 2019), 411 – 422 gün arasında bildiren bazılarında düşüktür (Şahin ve Ulutaş, 2010; Cura, 2016; E-İslah, 2015; Alkoyak, 2016).

Buzağılama yılının etkisi LS'ye $P < 0.05$ diğer süt verimi özelliklerine $P < 0.01$ düzeyinde önemlidir. Buzağılama mevsiminin KKS'ye etkisi önemli ($P < 0.05$) diğer özelliklere etkisi önemsizdir. Laktasyon sayısının LS ve 305 gün süt verimine (305 GSV) etkisi önemli ($P < 0.01$), KKS'ye etkisi önemsizdir.

İşletme faktörünün LS'ne etkisi önemsiz bulunmasına karşın KKS ve 305GSV'ye etkisi önemlidir ($P < 0.01$) (Tablo 2). Araştırmada LS Aydın ve Bursa'da 325.4 ve 318.7 gün bulunmuştur. Bulunan bu değerler ideal değerden yüksek olsa bile, LS'ni 343-364 gün arasında bildiren bazı araştırma sonuçlarından oldukça düşüktür (Türkyılmaz ve ark., 2005; Bakır ve Kaygısız, 2009; Boğokşayan ve Bakır, 2013; Genç, 2014; Keser, 2016; Cura, 2016). Bazı araştırmalarda bildirilen 312-331 günlük değerlere benzerdir (Koçak ve ark., 2007; Bakır ve ark., 2009; Şahin, 2009; Tekerli ve Koçak, 2009; Şahin ve Ulutaş, 2010; Keskin ve Boztepe, 2011; Şahin ve Ulutaş, 2011; Sarar ve Tapkı, 2017. Buna karşın Erdem ve ark., (2007)'nin bildirdikleri 301 günlük değerden büyük bulunmuştur.

Table 2. Differences between Aydın farm and Bursa farm for milk yield traits

Özellik	İşletme	n	Ortalama	Standart Hata	Minimum	Maksimum	P
LS	Aydın	64	325.4	9.2	222	520	0.256
	Bursa	216	318.7	4.5	220	533	
KKS	Aydın	58	75.6	4.9	21	200	0.000
	Bursa	161	96.3	2.5	23	186	
305GSV	Aydın	78	6636	48	5530	7453	0.000
	Bursa	265	7214	100	3823	11336	

KKS Aydın ve Bursa'da sırasıyla 75.6 ve 96.3 gün olarak bulunmuştur. Bursa'da KKS yaklaşık 20 gün daha uzun olmasına karşın LS 7 gün daha kısadır. Her iki işletmede de ineklerin kuruya çıkarılmasında bir sorun olduğu söylenebilir. Özellikle Bursa'daki işletmede bu konuda daha dikkatli olunması gerektiği açıktır.

Araştırmada bulunan değerler Karaağaç ve Genç, (2019) 62,5 gün, Genç (2014) 61 gün, Tuna (2017) 61 gün, Türkyılmaz ve ark. (2005) 48 gün, Cura (2016) 56 gün, Keser (2016) 57 gün ve Sarar ve Tapkı (2017) 67 gün olarak bildirdikleri değerlerden oldukça yüksektir. Buna karşın Bilgiç ve Alıç (2005) 79 gün, Erdem ve ark. (2007) 82 gün, Koçak ve ark. (2007) 86 gün, Bakır ve ark. (2009) 79 gün, Şahin (2009) 86 gün, Şahin ve Ulutaş (2010) 82 gün, Şahin ve Ulutaş (2011) 85 gün ve olarak bildirdikleri değerlere benzerdir.

Süt sığırcılığında kuruda kalma süresi üzerinde önemle durulması gereken bir özelliktir. Bu sürenin uzun olması sürüde üreme problemlerinin yaşandığını gösterirken, kısa olması doğacak buzağının yeterince gelişmemesine ve

hayvanın süt veriminde azalmaya yol açabilir (Akman ve Kumlu (2004), Duru ve Tuncel (2004), Genç ve Soysal (2019).

Bu araştırmada Aydın ve Bursa'daki işletmelerde 305 GSV ortalamaları 6636 ve 7214 kg'dır. 2020'de Aydında 305 GSV ortalaması 29823 laktasyonda 6204 kg, Bursa'da 15822 laktasyonda 7880 kg olarak bildirilmiştir (Anonim, 2022). Aydındaki işletme il ortalamasından daha yüksek süt verimine sahipken Bursa'daki işletme il ortalamasından düşüktür. Ancak her iki işletmede Türkiye ortalamasından yüksek süt verimine sahiptir. Bursa'da 305 gün süt verim ortalaması Aydın'dan yaklaşık 1600 kg daha fazlaysen işletmeler arası fark 600 kg'dır. Türkiye'de kayıtlı sürülerdeki Siyah Alaca sığırlarda 3.8 milyon laktasyonda LS'nin 371 gün ve 305 GSV'nin 6041 kg olduğu bildirilmektedir (E-İslah 2018).

Araştırmada Aydında 305 GSV için bulunan sonuç, Türkyılmaz ve ark. (2005) 6491 kg, Erdem ve ark. (2007) 6467 kg, Bakır ve Kaygısız (2009) 6798 kg, Şahin (2009) 6589 kg, Bakır ve ark. (2009) 6810 kg; Duru ve ark. (2012) 6010 kg, Sarar ve Tapkı (2017)'nin 6588 kg olarak buldukları değerlere yakın bulunmuştur. Bununla birlikte Tekerli ve Koçak (2009) 5620 kg, Keskin ve Boztepe (2011) 5997 kg, Galiç ve Kumlu (2012) 6100 kg, Katok ve Yanar (2012) 3408 kg, Boğokşayan ve Bakır (2013) 5673 kg, Kaygısız (2013) 5319 kg, Genç (2014) 6010 kg, Keser (2016) 5630 kg ve Cura (2016) 5755 kg olarak belirledikleri değerlerden yüksek olduğu saptanmıştır. Buna karşın Koçak ve ark. (2007) 7704 kg ve Tuna (2017) 9816 kg olarak bildirdikleri değerlerden düşük bulunmuştur.

Sonuç olarak, döl ve süt verimi özellikleri için işletmeler arasındaki farkta tohumlama, bakım-besleme, organizasyon, pazarlama, kayıt tutma ve değerlendirme gibi sürü yönetim konularının etkileri söz konusudur. Süt veriminin düşmesinin yanı sıra döl veriminin gerilemesi verimliliği önemli ölçüde düşürür. Hayvanlara genotiplerine uygun çevre koşullarının sağlanması ve başarılı bir sürü yönetimiyle döl veriminin yanında süt verimi de arttırılabilir. Aydındaki işletmede özellikle süt verimini artırıcı önlemler alınması, Bursa'daki işletme için ise süt verimini artırmanın yanında döl verimini iyileştirici çalışmalar yapılması gerekir. Her iki işletmede sürü yönetiminin daha başarılı olması birim başına geliri arttıracaktır.

Turkey's Foreign Trade Competitiveness in Quince

Burak Uzun¹, F. İlknur Unuvar², İlkey Dellal²

¹Mısır Araştırma Enstitüsü Müdürlüğü, Sakarya, Turkey

²Tarım Ekonomisi Bölümü, Ziraat Fakültesi, Ankara Üniversitesi Ankara, Turkey

Abstract

Turkey is the leading country in the world quince production and exports. Turkey as of 2021 in terms of the total amount of exports in the world has realized quince alone was 36% and in the first place. The main objective of this study is to demonstrate the competitiveness of the quince in foreign trade and to emphasize the importance of the quince in terms of agricultural production as an important export potential and the need to be careful on the subject. In the study, battery analysis was widely used to measure competitiveness. According to the results of the study, Turkey is the country with the highest share in the export value of quince (40 %). When the RCA index values of Turkey for 2010-2020 were examined, it was understood that although 2015 was relatively low compared to other years, quince was very competitive in all of the periods examined. However, although Turkey is below the export of quince quince is able to produce the first in the world, though only 11% of exports and quince average unit price in the world.

Türkiye'nin Ayva Dış Ticaretinde Rekabet Gücü

Özet

Türkiye, ayva üretim ve ihracatında dünyada lider ülkedir. Türkiye 2021 yılı itibarıyla dünyada toplam ayva ihracatını miktar bakımından %45'ini tek başına gerçekleştirmiş ve ilk sırada yer almıştır. Ayvanın dış ticarete rekabet gücünü ortaya koymak, tarımsal üretim bakımından ayvanın önemli bir ihracat potansiyeline sahip olduğunu ve konunun üzerinde dikkatli bir şekilde durulması gerekliliği bu çalışmanın temel amacını oluşturmaktadır. Çalışmada rekabet gücünün ölçülmesinde AKÜ analizi yaygın olarak kullanılmıştır. Araştırma sonuçlarına göre Ayva ihracat değerlerinde en yüksek paya sahip olan ülke Türkiye'dir (%36). Türkiye'nin 2010-2020 yılları AKÜ indeks değerleri incelendiğinde 2015 yılı nispeten diğer yıllara göre düşük seyrde olsa da incelenen dönemlerin hepsinde ayvada rekabet gücünde çok yüksek olduğu anlaşılmıştır. Fakat Türkiye her ne kadar ayva ihracatında dünyada birinci olsa da ürettiği ayvanın sadece %11'ini ihraç edebilmekte ve ayva birim fiyat olarak dünya ortalamasının altındadır.

Abstract

African eggplants are highly valued constituents of the Nigerian food. However, their nutritional potentials have not been fully tapped due to inadequate information on their nutritional and anti-nutritional qualities. This present study investigated the proximate, minerals, anti-nutrient contents as well as the estimation of mineral ratios and Mineral Safety Index of four selected edible solanum species namely, *Solanum anguivi*, *S. gilo*, *S. menalogen*a and *S. aethiopicum*. The proximate contents (%) ranged from 4.19-5.46 (moisture content), 1.71-2.49 (crude fat), 4.57-5.45 (crude ash), 3.76-4.93 (crude protein), 5.20-6.30 (crude fiber) and 77.14-78.58 (carbohydrate). The solanum species were good sources of energy with total metabolizable energy of 1.458MJ-1.484MJ. The four solanum species contained high K, Ca, Mg, low Fe, Mn, Zn and Cu, while amount of Cd, Ni and Pb were very low. The mineral ratios of K/Na, Ca/Mg, Ca/K, Zn/Cu and [K/(Ca+Mg)] were below the minimum good ratios levels of 1.0, 4.17, 4.0, 8.0 and 2.2 respectively which are good for man. The anti-nutrient contents revealed low phytate, oxalate and cyanide levels. The calculated Phytate/Zn, Phytate/Ca and Oxalate/Ca were lower than the threshold levels and would support absorption and bioavailability of Zn and Ca in the samples while that of Phytate/Fe was above the critical value and this indicates unavailability of iron in these eggplant fruits. The mineral differences observed showed that *S. menalogen*a and *S. aethiopicum* had greater minerals while the Mineral Safety Index results revealed that the body could not be overloaded with any of the minerals investigated. The eggplants are rich in fiber, ash, carbohydrate and minerals with moderate protein. The low level of the anti-nutrient is good and poses no deleterious effect when consumed. The eggplants have nutritional health benefits; hence, their consumption should be encouraged to address food insecurity in Nigeria

Effect of sweetening type on the quality and acceptability of Roselle tea

Jerry Ampofo-Asiama¹, Nazir Kizzie-Hayford¹, Salifu Seidu-Larry¹

¹Department of Biochemistry, School of Biological Sciences, University of Cape Coast, Ghana

Abstract

Roselle tea, also known as Bissap, is prepared as a hot infusion extract of dried Roselle leaves and marketed as a health drink. The tea, however, is usually consumed after adding sweeteners to milden the sour, sharp and sometimes tart tones of the leaf extract. In this study, sucrose, caramel, honey and sucralose were assessed for the potential to be used as sweeteners in the production of Bissap by determining their effect on physicochemical (pH, Brix, colour, non-enzymatic browning and cloud value), phytochemical (ascorbate level, phenolic content, flavonoid content and antioxidant capacity), sensory acceptability and storage quality. Using sucralose did not have an effect on physicochemical quality, although using caramel and honey increased the occurrence of non-enzymatic browning and cloud value. Additionally, using honey enhanced ascorbate levels, phenolic and flavonoid contents and antioxidant capacity. Sensory analysis revealed almost equal scores for beverages prepared using sucrose and sucralose, however, using caramel and honey resulted in lower scores for taste, aroma, aftertaste and overall acceptability. In addition, using these sweeteners did not have an effect on the physicochemical and phytochemical quality of Bissap during storage at 4°C for 18days.

Interrelation Of Humic Substances With Chemical Substances And Pollutants

Aliyeva Tarana¹, Abdullayev Rizvan¹, Melikova Afak²

¹Baku State University, Ecological chemistry, Azerbaijan

²Azerbaijan State University of Oil and Industry, Ecological chemistry, Azerbaijan

Abstract

Humus to some extent interacts with the mineral components of the solid phase of the soil, forming its sorption properties. In this regard, any compound entering the soil from outside interacts with both the solid phase and the organic matter of the soil solution.

Soil organic matter plays an important role in the transformation of mineral fertilizers, chemical ameliorants, pesticides and individual components of various soil pollutants. The presence of organic substances in the interaction of agrochemicals and pollutants with soil is manifested in the following:

promotes the separation of mineral nutrients from sparingly soluble fertilizers in acidic soils, for example, accelerates the separation of phosphorus from phosphorus flour or the dissolution of lime or the hydrological decomposition of some pesticides, etc.;

sorbed phosphates pass into the soil solution, replacing them in the soil absorbing complex;

Participates in the exchange and non-exchange absorption of mineral fertilizers and chemical ameliorants, pesticides, radionuclides, cations contained in heavy metals. In turn, sorbed humus reduces the scale of strong binding of phosphates and some cations, preventing the interaction of agrochemical and toxic substances with the mineral part of the soil;

Reduces the transition of phosphates into sparingly soluble forms due to active interaction with cations (Fe^{3+} , Al^{3+} , Ca^{2+} , etc.) involved in the precipitation of phosphates in fertilizers;

In some soils, the possibility of the formation of complex, sparingly soluble mineral-humus compounds containing Fe and Al, as well as phosphorus has been established. Such compounds are capable of active migration;

In some cases, cations of mineral fertilizers, such as potash fertilizers in alkaline soils or alkaline fertilizers containing ammonium (liquid ammonia, ammonia water), can form soluble humates in the soil.

Soluble humus can also interact with heavy metal cations as well as artificial radionuclides. These reactions are due to the formation and behavior of simple and complex hetero polar salts and affect the migration, accumulation and entry of toxic substances into plants.

To regulate the behavior of pesticides in the soil, it is important to study the interaction of these substances with various active soil components, primarily organic substances. However, information on this issue is insufficient and sometimes contradictory. A number of studies have shown a very important effect of humus on the degradation, migration and entry of pesticides into plants. It is known that the amount of herbicides needed to kill weeds can vary by a factor of 20 depending on the nature of the interaction of the soil with humus (F. Stevenson). The interaction of various structural and functional groups of soil humus with simazine, atrazine, 2,4-D and other herbicides has been experimentally proven. It is known that clay-humus complexes adsorb pesticides better than pure humic acids. Fulvic acids, on the other hand, act as carriers for a number of sparingly soluble pesticides.

A Study on the Taxonomy of *Gentiana lutea* (Gentianaceae)

Ece Gökçe Çakır – Dindar¹

¹ Biology, Faculty of Arts and Sciences, Kütahya Dumlupınar University, Kütahya, Turkey

Abstract

Gentiana lutea, which has a natural distribution in Turkey, Albania, Austria, Bosnia and Herzegovina, Bulgaria, Croatia, France, Germany, Greece, Italy, Portugal, Romania, Serbia, Slovenia, Spain, Switzerland, Ukraine, is has medical and economic importance in the world and is forbidden to collect from nature. According to the literature records, there are two subspecies in Turkey and *G. lutea* subsp. *symphyandra* is spreaded in Sinop, Bursa, Bilecik, İzmir and Kütahya; *G. lutea* subsp. *lutea* is spreaded in İzmir. In 2019, a species action plan was prepared for this species, which is located within the provincial border of Kütahya, under the responsibility of the Republic of Türkiye Ministry of Agriculture and Forestry 5. Regional Directorate Kütahya Provincial Branch Office. Field trips and herbarium samples belonging to other provinces was examined, the presence of *G. lutea* subsp. *symphyandra* could not be detected. It has been determined that the plant samples were *G. lutea* subsp. *lutea*. With this study, it is aimed to contribute to the taxonomy of the *G. lutea*

***Gentiana lutea* (Gentianaceae) Taksonomisi Üzerine Bir Çalışma**

Özet

Türkiye, Arnavutluk, Avusturya, Bosna Hersek, Bulgaristan, Hırvatistan, Fransa, Almanya, Yunanistan, İtalya, Portekiz, Romanya, Sırbistan, Slovenya, İspanya, İsviçre, Ukrayna’ da doğal yayılış gösteren *Gentiana lutea* Dünya’da tıbbi ve ekonomik önemi olan ve doğadan toplanması yasak bir bitki türüdür. Literatür kayıtlarına göre Türkiye’de iki alttürü mevcut olup *G. lutea* subsp. *symphyandra* Sinop, Bursa, Bilecik, İzmir ve Kütahya’da; *G. lutea* subsp. *lutea* ise İzmir’de doğal yayılış gösterdiği belirtilmektedir. 2019 yılında Tarım ve Orman Bakanlığı 5. Bölge Müdürlüğü Kütahya İl Şube Müdürlüğü sorumluluğunda Kütahya il sınırı içerisinde yer alan bu tür için tür eylem planı hazırlanmıştır. Arazi çalışmaları sırasında ve diğer illere ait bitki örnekleri incelendiğinde *G. lutea* subsp. *symphyandra*’nın varlığı tespit edilememiştir. Bitki örneklerinin *G. lutea* subsp. *lutea* olduğu belirlenmiştir. Bu çalışma ile *G. lutea* türünün taksonomisine katkı sağlanması amaçlanmıştır.

Anahtar Kelimeler: Bitki sistematigi, *Gentiana*, Kütahya

Giriş

Gentianaceae familyası dünyada yaklaşık 86 cins, 1665 tür içermektedir (Struwe and Albert, 2002). *Gentiana* L. cinsi dünyada 15 seksiyona bölünmüş olup yaklaşık 362 tür içermektedir. Çoğu türü Asya, Avrupa, Kuzey Amerika’da küçük bir kısmı Güney Amerika’daki And Dağları, Orta Amerika, Doğu Avustralya, Kuzeybatı Afrika’da yayılış gösterir (Ho and Pringle, 2001; Shabir, 2018; Struwe and Albert, 2002). Türkiye’de Gentianaceae familyası 8 cins, 36 tür ve tür altı takson ile temsil edilir (Güner ve ark., 2012). Ülkemizde *Gentiana* cinsi 14 tür ve türaltı seviyesinde takson içermektedir. Bunlardan sadece *Gentiana boissieri* Schott & Kotschy ex Boiss. endemiktir (Çiçek, 2012; Ekim ve ark., 2000).

Gentianaceae ailesinden *Gentiana* cinsi içerisinde yer alan ve çalışmanın konusu olan *Gentiana lutea* L. taksonu ülkemizde halk arasında Güşadotu, Kürşat, Cimtiyen, Cimtiyane, Defneyezit, Sarı censiyan, Sivri kök, Büyük kantaron, Kantaron-u kebir, Sarı ot, Sarı kök ve Acı kök olarak bilinmektedir (Pritchard, 1978, Davis, 1988; Özer ve ark. 2011). *G. lutea* endemik bir tür değildir. Avrupa-Sibirya elementi olan bu bitki Türkiye dışında Arnavutluk, Avusturya, Bosna Hersek, Bulgaristan, Hırvatistan, Fransa, Almanya, Yunanistan, İtalya, Portekiz, Romanya, Sırbistan, Slovenya, İspanya, İsviçre, Ukrayna’ da doğal olarak yayılış göstermektedir (IUCN Red list, 2022). Ülkemizde ise Ayancık, Zindan, Handere Dağı (Sinop); Ödemiş, Bozdağ (İzmir); Bozdağ, Birgi’nin kuzeyi (İzmir); Uludağ (Bursa); Bozüyük Kömürsü Dağı (Bilecik)’nda bulunduğu literatürlerde yer almaktadır (Pritchard, 1978, Davis, 1988). Flora of Turkey and the East Aegean Islands’ da kaydı bulunmayan ancak sonraki yıllarda yapılan çalışmalar ile Kütahya ilinin Daritepe Yangın Kulesi ve çevresi, Üçtepeler Yangın Kulesi ve çevresi, Domuzkertiği Mevkii, Acısu- Çiçekli Yayla Mevkii (Domaniç), Gümüş Dağı- Radar Mevkii (Merkez)’nde tespit edilmiştir (Köse, 2019).

G. lutea çeşitli mevzuatlarla doğadan toplanması yasak bir bitki olup tıbbi bir bitkidir (Erken, 2016; Özer ve ark., 2011). Kökleri Avrupa Farmakopesi, Hint Ayurvedik Farmakope, Alman Farmakopesi, Komisyon E Monografileri, European Scientific Cooperative on Phytotherapy (ESCOP) Monografileri ve FFD Monografileri gibi farmakope ve monografilerde kayıtlıdır. Bitkinin kök ve rizomları antinflamatuar, enflamasyon ve yara iyi edici etkileri yanı sıra karın ağrısı, mide yanması, gastrit, diyare ve kusma gibi gastrointestinal rahatsızlıkların geleneksel tedavisinde kullanılmaktadır. Bitki eskiden ülkemizde ateş düşürücü olarak da kullanılmıştır. Antalya,

Aydın, Sakarya ve Bursa’da mesane iltihaplarında kullanıldığı kayıt edilmiştir (Başer, 1986; The European Pharmacopoeia Commission, 1996). Ayrıca yapılan çalışmalarda alyuvarları arttırıcı, antioksidan özellikte olduğu, koleretik, hepatoprotektif ve antifungal etkisinin olduğu saptanmıştır. Bitkinin köklerinin anoreksiada kullanılışı olduğu gibi gastrik asit sekresyonunu stimüle ettiği ve iştah açıcı özelliği olduğu da bilinmektedir (Baytop, 1999; Demirezer ve ark, 2011).

Bu çalışma ile tıbbi önemi olan *G. lutea* türünün periyodik olarak yapılan arazi çalışmaları ve diğer illere ait örnekler incelenmesi sonucunda lokasyonları güncellenmiş, populasyon durumları hakkında bilgi sahibi olunmuş ve taksonomik olarak değerlendirilmiştir.

Materyal ve Yöntem

2019 yılında vejetasyon döneminde periyodik olarak Kütahya il sınırları içerisinde arazi çalışması yapılmıştır. Arazi çalışması sırasında bitki örnekleri toplanmış ve herbaryum tekniklerine uygun olarak preslenmiştir. Ülkemizde Kütahya ili haricindeki diğer illerde ise arazide bitkiler gözlenmiş olup bitki örnekleri incelenmiştir. Bitki teşhisi için Flora of Turkey and the East Aegean Islands vol. 6, Flora of Turkey and the East Aegean Islands (suppl. 1) vol. 10 kullanılmıştır (Pritchard, 1978; Davis, 1988). Bitkinin tehlike kategorisinin belirlenmesi için Türkiye Bitkileri Kırmızı Kitabı (Ekim, Koyuncu vd., 2000) ve Guidelines for Using the IUCN Red List Categories and Criteria (Standards and Petitions Subcommittee of the IUCN Species Survival Commission, 2019) kaynaklarından yararlanılmıştır.

Bulgular ve Tartışma

Gentiana lutea türünün ülkemizde iki alttürü mevcuttur. Bu iki alttürün farkları Tablo 1’de verilmiştir. (Pritchard, 1978; Davis, 1988).

Tablo 1. *G. lutea* subsp. *lutea* ve *G. lutea* subsp. *symphyandra* morfolojik olarak karşılaştırılması

	Stigma	Anter
<i>G. lutea</i> subsp. <i>lutea</i>	spiral şekilde kıvrık	serbest
<i>G. lutea</i> subsp. <i>symphyandra</i>	spiral şekilde kıvrık değil	Tüp şeklinde birleşik

Şekil 1. *Gentiana lutea* subsp. *lutea* alttürüne ait çiçek durumu ve çiçek görüntüsü

Arazi çalışmaları ve bitki örnekleri (Şekil 1) tarafımızca incelendiğinde *G. lutea* L. subsp. *symphyandra* (Murb.) Hayek’ in varlığı tespit edilememiştir. Bitki örneklerinin hepsinin *G. lutea* L. subsp. *lutea* olduğu belirlenmiştir (Sinop örneği hariç, bitki örneğine rastlanamamıştır).

Çalışma sonucunda; *G. lutea* subsp. *lutea* çoğunlukla orman sınırının sonunda ve subalpin kuşakta, nadiren de orman açıklıklarında yaklaşık 1650-1850 m arasında yayılış gösterdiği gözlenmiştir. Mayıs ayında rozet yaprakları gözlenmiştir (Şekil 2a). Haziran ayında ise birçok bireyin uzadığı ve çiçeklerin tomurcukta olduğu belirlenmiştir (Şekil 2b). Temmuz ayında yapılan arazi çalışması sonucunda ise türün çiçeklendiği (Şekil 2c-d); Ağustos ve Eylül aylarında ise olgun meyveler (Şekil 2e-f) gözlenmiştir.

Şekil 2. Bitkinin farklı zamanlardaki görünüşleri

G. lutea subsp. *lutea* literatür kayıtlarına göre ülkemizde Ayancık, Zindan, Handere Dağı (Sinop); Ödemiş, Bozdağ (İzmir); Uludağ (Bursa); Bozüyük Kömürsü Dağı (Bilecik); Domaniç, Darıtepe Yangın Kulesi ve çevresi (Kütahya); Domaniç, Üçtepeler Yangın Kulesi ve çevresi (Kütahya); Domaniç, Domuzkertliği Mevkii (Kütahya); Domaniç, Acısu- Çiçekli Yayla Mevkii (Kütahya); Merkez, Gümüş Dağı- Radar Mevkii (Kütahya)' da yayılış gösterdiği bilinmektedir (Pritchard, 1978; Davis, 1988; Köse, 2019). Literatür kayıtlarındaki lokasyonlara ait - Sinop hariç- bitki örnekleri incelenmiştir. Sinop iline ait bitki örneği ve lokasyonda bitki kaydına ulaşılamamıştır. Yapmış olduğumuz arazi çalışmaları sırasında Kütahya Orman Bölge Müdürlüğü, Domaniç İşletme Müdürlüğü,

Gürgenyayla Şefliği sınırları içerisinde bulunan Karagöz Alanı Mevkii'nde de bitkinin varlığı tespit edilmiştir. Türün doğal olarak yayılış gösterdiği lokalitelerin tamamı doğal bir alandır.

Arazide yapılan saha gözlemleri ve bitki örnekleri incelendiğinde;

1. Bursa (Uludağ) populasyonları turizm faaliyetleri ve otlatmadan dolayı tehdit altında olduğu,
2. İzmir (Bozdağ) populasyonları kayak merkezi civarında bulunduğu, burada 50'den az birey yetişmekte olduğu ve tür, bu alanda yok olma tehlikesi ile karşı karşıya olduğu,
3. Bilecik (Bozüyük, Kömürsu Yaylası) populasyonları ise Kutahya (Domaniç, Acısu-Çiçekli Yayla) populasyonlarının yakınında ve yaklaşık 200 bireyle temsil edildiği,
4. Türkiye Florasına göre türün Sinop (Ayancık) ilinde de kaydı olsa da bu türe ait bitki örneğine rastlanmadığı
5. Kutahya lokalitelerinde ise yaklaşık 5400 birey tespit edildiği, bu sayı *G. lutea*'nın ülkemizde en fazla populasyonunun Kutahya ilinde olduğu sonucu çıkarılmıştır.

Kutahya ili içerisinde türün yetiştiği lokasyonlardaki yaşamlarını tehdit eden veya edebilecek unsurlar;

1. Kutahya şehir merkezinden Radar Bölgesi olarak bilinen ve bölgenin hemen yanında bulunan askeri bölgeye ve TV vericisine asfalt bir yol ile ulaşılmaktadır. Bu yol üzerinde halk tarafından rekreasyonel faaliyetler amacıyla kullanılan bir alan dikkati çekmektedir. Fakat bu faaliyetlerin türün doğal yayılışına herhangi bir etkisi bulunmamaktadır. Radar Bölgesi'nin askeri bir bölge olması ve türünde bu alan etrafında yayılış göstermesinden dolayı ilk bakışta tür üzerinde herhangi bir tehdit görülmemekle birlikte, bölgede hayvancılık faaliyetlerinin yapıldığı gözlenmiştir. Gelecekte askeri bölgenin taşınması veya küçülmesi gibi sebeplerin olması halinde tür üzerindeki tehditlerin artması da kuvvetle muhtemeldir.

2. Türün yayılış gösterdiği diğer lokasyonlara (Darıtepe Yangın Kulesi ve çevresi, Karagöz Alanı Mevkii, Üçtepeler Yangın Kulesi ve çevresi, Acısu-Çiçekli Yayla Mevkii ve Domuzkertliği Mevkii) ulaşım orman yollarından sağlanmaktadır. Bu lokasyonlarda hayvancılık faaliyetleri, orman yangınları, antropojenik faktörler ve doğadan toplama tehdit olarak tespit edilmiştir.

Endemik olmayıp ülkemiz sınırları dışında da doğal olarak yayılış gösteren *G. lutea* IUCN'e göre tehlike kategorisi LC yani en az endişe vericidir, ancak türün ergin bireylerinin populasyonların da bir azalma söz konusudur (IUCN Red list, 2022). Türkiye Bitkileri Kırmızı Kitabı'nda (Ekim ve ark. 2000) endemik bitkilerin yanı sıra muhakkak korunması gerektiğine inanılan ve ülkemizde çok lokal yayılış gösteren bazı endemik olmayan bitkiler ile ilgili liste hazırlanmıştır. Bu listelere ekonomik değere sahip olan türler de dahil edilmiştir. Bu kapsamda ekonomik değere sahip *G. lutea* subsp. *lutea* tehlike kategorisi "EN (Endangered/Tehlikede)" olarak değerlendirilmiştir. Tüm bu veriler ışığında *G. lutea* subsp. *lutea*'nın ülkemizde yayılış gösterdiği tüm lokaliteler göz önünde bulundurulduğunda yayılış alanının 20000 km²'den az olduğu, ancak yaşam alanının 10 km²'den az olması ve yayılış gösterdiği alanlarda otlatma, turizm faaliyetleri, doğadan toplama ve yangın gibi türü tehdit eden faktörlerinde olması nedeniyle IUCN (2019)'in Kritik (CR) ölçütlerini sağlamasından dolayı tehlike kategorisi ülkemiz için CR (Critically Endangered/ Kritik) olarak önerilmiştir.

Bu çalışma daha sonraki çalışmalar için örnek teşkil etmekte olup, tarafımızca bitki örneği bulunamayan ancak literatüre göre kaydı olan Sinop ilindeki örneğin varlığı hakkında detaylıca çalışma yapılması gerekmektedir.

Teşekkür

Bu araştırma T.C. Tarım ve Orman Bakanlığı 5. Bölge Müdürlüğü Kutahya İl Şube Müdürlüğü sorumluluğunda yapılmıştır. İzmir örnekleri konusunda bize yardımcı olan Öğr. Gör. Dr. Volkan EROĞLU'na, ayrıca T.C. Tarım ve Orman Bakanlığı 5. Bölge Müdürlüğü Kutahya İl Şube Müdürlüğü ve T.C. Orman Genel Müdürlüğü Kutahya Orman Bölge Müdürlüğü Domaniç Orman İşletme Müdürlüğü'ne teşekkür ederim.

The Using of Probiotics for Aquatic Organisms

Semra Küçük

Adnan Menderes University, Faculty of Agriculture, Department of Aquacultural Engineering, South Campus, 09100, Aydın/Turkey, skucuk@adu.edu.tr

Abstract

One of the important agricultural activities that have high development potential is aquaculture. The probiotics are the vital ways to increase agricultural products. There are bacteria, bacteriophages, microalgae and yeasts as probiotics. The common probiotics that are used for aquaculture practices (water, feed supplements) are showed as bacteria such as *Lactobacillus*, *Lactococcus*, *Leuconostoc*, *Enterococcus*, *Carnobacterium*, *Shewanella*, *Bacillus*, *Aeromonas*, *Vibrio*, *Enterobacter*, *Pseudomonas*, *Clostridium*, and yeasts such as *Saccharomyces*, *Debaryomyces* species. Probiotics are used as feed supplements for fish in order to increase growth performance, feed utilization, stress response, immune responses, disease resistance, general vigor, and alternatives to antibiotics. There are present lots of currently available mono or multi strains of probiotics,. The probiotics (*Vibrio harveyi*) release some beneficial effects on the fish gut defenses. They protect digestive tract against to inflammation. Some lactic acid bacteria (*Brevibacillus brevis*, *Vagococcus fluvialis*) help digestion of art fish by sticking to mucosal epithelium of the gastrointestinal tract. The probiotics increase feed digestibility by segregation of different digestive enzymes. Probiotics are commercially used to produce organic acids, fatty acids, biotin, vitamin B₁₂, hydrogen peroxide, antibiotics, bacteriocins, siderophores, and lysozyme. Some previous studies are indicated that the probiotics have important health benefits of some aquatic animals (Japanese flounder, black tiger prawns, *Penaeus monodon*, white leg prawns, *Litopenaeus vannamei* and western king prawns, *Peneus latissulcatus*). In this study, it is going to be given more detail information about the definition, mechanism, functions of probiotics, and indicating the previous studies being done on the using of probiotics for aquatic organisms.

Key Words: Aquatic organisms, Probiotics, Aquaculture.

Probiyotiklerin Akuatik Orgnizmalarda Kullanımı

Özet

Yüksek gelişim potansiyeline sahip tarım aktivitelerinden biri akuakültürdür. Tarım ürünlerini artırmak için en önemli yollardan biri probiyotiklerdir. Probiyotik olarak bakteriler, bakteriofajlar, mikroalgler ve mantarlar vardır. Akuakültür uygulamalarında (su, yem katkıları) kullanılan yaygın probiyotikler bakteri olarak örneğin, *Lactobacillus*, *Lactococcus*, *Leuconostoc*, *Enterococcus*, *Carnobacterium*, *Shewanella*, *Bacillus*, *Aeromonas*, *Vibrio*, *Enterobacter*, *Pseudomonas*, *Clostridium sp.* ve maya olarak örneğin, *Saccharomyces*, *Debaryomyces sp.* gösterilebilir. Balıklarda büyüme performansı, yem kullanımı, strese yanıt, bağışıklık yanıtı, hastalıklara karşı dayanıklılık, genel dayanıklılık ve antibiyotiklere karşı alternatif olma gibi özellikleri artırmak için probiyotikler yem katkı maddesi olarak kullanılmaktadır. Güncel olarak birçok mono veya çoklu probiyotikler mevcuttur. Probiyotikler (*Vibrio harveyi*) balık bağırsağının savunmasına bazı yararlı etkiler bırakmaktadır ve bunlar sindirim sistemini inflamasyona karşı korurlar. Bazı laktik asit bakterileri (*Brevibacillus brevis*, *Vagococcus fluvialis*) sindirim sisteminde mukosal epiteliyuma yapışarak balığın sindirime yardım ederler. Probiyotikler yemlerin sindirilebilirliğini farklı sindirim enzimlerini salgılayarak artırır. Probiyotikler ticari olarak organik asitler, yağ asitleri, biyotin ve vitamin B₁₂ üretimine yardımcı olurken hidrojen peroksit, antibiyotik, bakteriyosin, siderofor, lizozom üretiminde kullanılmaktadır. Önceki çalışmalar bazı akuatik hayvanların (Japanese flounder, black tiger prawns, *Penaeus monodon*, white leg prawns, *Litopenaeus vannamei* and western king prawns, *Peneus latissulcatus*) sağlıklı olmaları üzerine önemli faydalara sahip olduğunu göstermiştir. Bu çalışmada, probiyotiklerin tanımı, mekanizması ve fonksiyonları ve akuatik organizmalar için probiyotik kullanımı üzerine şimdiye kadar yapılmış çalışmalar hakkında detaylı bilgiler verilmiştir.

Anahtar Kelimeler: Probiyotikler, Akuatik organizmalar, Akuakültür

Effects of Light and Dark Conditions on Root Development of Black Mulberry (*Morus Nigra* L.) Hardwood Cuttings

Fatmanur Çezik^{1*}, Çetin Çekiç¹, Kenan Yıldız¹, Hakan Karadağ¹, Osman Nuri Öcalan¹

¹Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

This study was carried out to determine the root development of black mulberry hardwood cuttings kept in light and dark conditions. The experiment was carried out in the polyethylene greenhouse of Tokat Gaziosmanpaşa University Research and Application Center, in 2021. As material, hardwood cuttings prepared from one-year-old branches of black mulberry trees were used. The cuttings were divided into 3 different groups and planted in rooting beds containing perlite with bottom heating (22±2 °C). First group of cuttings were planted into beds as soon as taken from tree (control), the second group of cuttings were plantend after the cuttings were kept under daylight conditions for 5 days (in the open) and third group cuttings were planted after the cuttings were kept in the dark conditions (in the dark) for 5 days in both conditions soaked in water. All cuttings were dipped in 6000 ppm IBA (indole-3-butyric acid) hormone for 5 seconds just before planting. The experiment is with 3 replications and there are 15 cuttings in each replication. After keeping 90 days in the rooting environment, the cuttings were removed; root number (root/stem), root length (cm), root diameter (mm), decay rate (%), rooting rate (%) and callus formation rate (%) parameters were investigated. As a result of the study, there was no statistical difference between the different conditions in the investigated parameters. The data obtained varied between the following values; rooting rate between 68.89% - 93.33%, decay rate between 24.4% - 55.5%, callus formation rate between 68.8% - 88.8%, number of roots 8.8 - 13.5 root/stem, root length 6.5 - 7.4 cm and root diameter between 1.02 - 1.16 mm.

Key Words: *Morus nigra*, IBA, Rooting, Callus, Decay

Açık ve Karanlık Koşulların Karadut (*Morus Nigra* L.) Odun Çeliklerinin Kök Gelişimi Üzerine Etkileri

Özet

Bu çalışma, karadut odun çeliklerinin aydınlık ve karanlık koşullarda bekletilerek kök gelişiminin belirlenmesi amacıyla yapılmıştır. Deneme, 2021 yılında Tokat Gaziosmanpaşa Üniversitesi Araştırma ve Uygulama Merkezine ait karadut yetiştiriciliği yapılan polietilen serada yürütülmüştür. Materyal olarak, damızlık karadut ağaçlarının bir yaşlı dallarından hazırlanan odun çelikleri kullanılmıştır. Seradan alınan çelikler 3 farklı gruba ayrılarak alttan ısıtmalı (22±2 °C) perlit ortamına dikilmiştir. Birinci grup çelikler hiç bekletilmeden (kontrol), ikinci grup çelikler 5 gün açıkta bekletildikten sonra (açıkta) ve üçüncü grup çelikler 5 gün karanlıkta bekletildikten (karanlıkta) sonra dikilmiştir. Tüm çelikler dikimden hemen önce 6000 ppm IBA (indol-3-bütirik asit) hormonuna 5 saniye süreyle daldırılmıştır. Deneme 3 tekerrürlü olup, her bir tekerrürde 15 çelik bulunmaktadır. Köklenme ortamında 90 gün bekletildikten sonra çelikler sökülerek; kök sayısı (kök/çelik), kök uzunluğu (cm), kök çapı (mm), çürüme oranı (%), köklenme oranı (%) ve kallus oluşum oranı (%) parametreleri incelenmiştir. Çalışma sonucunda, incelenen parametrelerde farklı koşullar arasında istatistiki açıdan önemli bir farklılık oluşmamıştır. Elde edilen verilere göre; köklenme oranı %68.89 - %93.33 arasında, çürüme oranı %24.4 - %55.5 arasında, kallus oluşum oranı %68.8 - %88.8 arasında, kök sayısı 8.8 - 13.5 kök/çelik, kök uzunluğu 6.5 - 7.4 cm ve kök çapı 1.02 - 1.16 mm arasında değerler almıştır.

Anahtar Kelimeler: *Morus nigra*, IBA, Köklenme, Kallus, Çürüme

Giriş

Dut (*Morus spp.*), *Urticales* takımı *Moraceae* familyasının *Morus* cinsinde yer alan, değişik iklim ve toprak koşullarına adaptasyon yeteneğinin yüksek oluşu (Özgen, 2010) ve özellikle kuşların meyvelerini yiyerek tohumlarını uzak yerlere taşımasıyla dünyanın pek çok yerinde yetişebilen bir meyve türüdür (Machii ve ark., 2002). Bu nedenle *Morus* cinsinin orijininin neresi olduğu konusunda araştırmacılar arasında fikir birliği sağlanamamıştır. *Morus* cinsine ait bazı türler ülkemizde de geniş yayılma alanı oluşturmuştur. Ülkemizde bilinen ve meyvesinden yararlanılarak en çok yetiştirilen *Morus alba* L. (beyaz dut), *Morus nigra* L. (karadut), *Morus rubra* L. (kırmızı dut), *Morus laevigata* (parmak dut) türleridir (Özbek, 1977). Bunlardan biri olan Karadut (*Morus nigra* L.), Dutgiller (*Moraceae*) familyasına ait olup anavatanı Türkiye, İran, Arabistan, Rusya ve Suriye olarak bilinmektedir (Bellini ve ark., 2000; Roger 2002). Meyveleri kuru-taze tüketimin yanı sıra pekmez, reçel, marmelat, pestil, dut ezmesi, meyveli dondurma, pasta, çörek, puding, cevizli sucuk, sirke, meyve suyu konsantresi yapımında kullanılmaktadır (Erdoğan ve Pırlak, 2005). Dutun daha çok meyvelerinden faydalandığı bilirse de yaprak, gövde ve kök kabukları da farklı alanlarda kullanılmaktadır. Yaprakları çay ve bazı yörelerde yemek

yapımında ayrıca ipek böceği yetiştiriciliğinde fayda sağlamaktadır. Gövdesi kâğıt, çuval, mobilya ve müzik aleti yapımında kullanılmaktadır (Lale ve Özçağır, 1996; Moore, 2002; Suttie, 2002). Ancak hem birçok alanda faydalanılan hem de besin değeri yüksek olan dut bitkisi için ticari anlamda yetiştiricilik istenilen seviyelerde değildir. Dut bitkisinin tohum, çelik, aşı, daldırma ve doku kültürü ile üretimi yapılmaktadır. Bunlardan en çok tercih edilen çelik ile çoğaltma yöntemidir. Çünkü çelikle çoğaltma yöntemi diğer çoğaltma yöntemlerine göre daha pratik bir uygulamadır. Fakat karadut adventif köklenme kabiliyeti zayıf olan türlerden biridir. Bu nedenle karadutta çelikle çoğaltma çalışmalarında IBA ve NAA gibi bitki hormonları kullanılarak, çelikle çoğaltması zor olan türlerde köklenme oranını artırmaya yönelik çalışmalar yapılmaktadır (Ünal ve ark., 1992; Şenel, 2002; Karadeniz ve Şişman, 2003; Koyuncu ve ark., 2003; Erdoğan ve Aygün, 2006; Yıldız ve ark., 2009; Ekizoğlu, 2010; Yağlıoğlu, 2015; Edizer ve ark., 2016). Yapılan çalışmaların sonuçları incelendiğinde, IBA uygulamalarının 1000 ila 8000 ppm aralığında değişen dozlarının köklenme oranlarına farklı etkiler gösterdiği görülmektedir. Bu çalışmanın amacı, Karadut odun çeliklerinin açıkta ve karanlık koşullarda bekletildikten sonra dikim öncesi 6000 ppm IBA uygulamasının kök gelişimi üzerine ne tür etkilerinin olacağını belirlemektir.

Materyal ve Yöntem

Deneme, Tokat Gaziosmanpaşa Üniversitesi Araştırma ve Uygulama Merkezine ait polietilen serada kurulmuştur. 1 Ocak 2020 tarihinde alınan karadut odun çelikleri üç gruba ayrılmıştır: Birinci grup çelikler hiç bekletilmeden (kontrol), ikinci grup çelikler oda koşullarında 5 gün açıkta bekletildikten sonra (açıkta) ve üçüncü grup çelikler oda koşullarında 5 gün karanlıkta bekletildikten (karanlıkta) sonra dikilmiştir. Tüm çelikler dikimden hemen önce 6000 ppm IBA (indol-3-bütirik asit) hormonuna 5 saniye süreyle daldırılmıştır. Çelikler, içinde saf perlit bulunan alttan ısıtmalı (22±2 °C) bentlere dikilmiştir. Çeliklerin sulanması düzenli aralıklarla gerçekleştirilmiştir. Çelikler dikimden 90 gün sonra köklendirme ortamından sökülerek kök sayısı (adet/çelik), kök uzunluğu (cm), kök çapı (mm), çürüme oranı (%), köklenme oranı (%) ve kallüs oluşum oranı (%) belirlenmiştir. Deneme, tesadüf parselleri deneme desenine göre 3 tekrerrürlü ve her bir tekrerrürde 15 çelik olacak şekilde kurulmuştur. Araştırma sonucunda elde edilen veriler varyans analizine tabi tutulduktan sonra uygulama ortalamaları arasındaki farklar önemlilik derecesine ($p<0.05$) göre Duncan çoklu karşılaştırma testine tabi tutulmuştur.

Bulgular ve Tartışma

Köklenme Oranı (%)

Şekil 1. incelendiğinde farklı koşullar arasında oluşan farklılıklar istatistiki açıdan önemsiz bulunmuştur. Karadut çeliklerinde köklenme oranı; kontrol uygulamasında %93.33, açıkta bekletilenlerde %73.3 ve karanlıkta bekletilenlerde %68.89 olarak belirlenmiştir. Literatürde yapılan çalışmalarda: Ünal ve ark. (1992) en yüksek köklenme oranını %14.4 bulurken, Karadeniz ve Şişman (2004) 2000 ppm IBA dozu ile %23.4, Koyuncu ve ark., (2003) 5000 ppm IBA dozu ile %33.3, Erdoğan ve Aygün (2006) 6000 ppm IBA dozu ile %60 olarak bulmuştur. Bu sonuçlara bakıldığında IBA dozunun artması ile birlikte köklenme oranının da arttığı görülmektedir. Ayrıca 2000 ppm IBA uygulamasının köklenme oranına etkisinin incelendiği diğer çalışmalarda %85 (Roussos ve ark., 2020) ve %70 (Zenginbal ve Demir 2018) gibi daha yüksek köklenme oranlarına ulaşılmıştır.

Şekil 1. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin köklenme oranı (%) üzerine etkisi

Kallus Oluşum Oranı (%)

Bitkiler, yaralanmaya tepki olarak kallus (yara) dokusu oluşturur. Bu yara dokusu köklenme ortamındaki çürümeyi önleyerek çeliklerin hayatta kalma süresini artırabilir. Yaptığımız çalışmada, kallus oluşum oranları açısından koşullar arasında belirgin bir farklılık oluşmamıştır (Şekil 2.). Kallus oluşum oranları; kontrol uygulamasında %88.89, açıkta %68.89 ve karanlıkta %75.56 olarak bulunmuştur. Literatür incelendiğinde kallus oluşum oranı 4000 ppm IBA uygulaması sonucunda %70 (Koyuncu ve ark., 2003), 8000 ppm IBA uygulaması sonucunda ise %100 (Edizer ve ark., 2016) bulunduğu bildirilmiştir.

Şekil 2. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin kallus oluşum oranı (%) üzerine etkisi

Çürüme Oranı (%)

Çürüme oranları açısından koşullar arasında belirgin bir farklılık bulunmamıştır (Şekil 3.) 6000 ppm IBA uygulaması yapılarak farklı koşullarda bekletilen karadut odun çeliklerinin çürüme oranı kontrol uygulamasında %24.44, açıkta bekletilen çeliklerde %55.55 ve karanlıkta bekletilen çeliklerde ise %51.11 olarak belirlenmiştir.

Şekil 3. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin çürüme oranı (%) üzerine etkisi

Kök Sayısı (adet/çelik)

Şekil 4. incelendiğinde koşullar arasında istatistiki açıdan önemli bir fark çıkmamıştır. Kök sayısı kontrol uygulamasında 8.84 adet/çelik, açıkta ve karanlıkta bekletilen çeliklerde sırasıyla 13.51 ve 12.76 adet/çelik olarak tespit edilmiştir. Literatürde yapılan çalışmalara bakıldığında; Koyuncu ve Şenel (2003) ve Yıldız ve ark., (2009)'nın yaptığı çalışmalar sonucunda kök sayıları sırasıyla 2.2 adet/çelik ve 3.5 adet/çelik olarak belirtilmiştir. Bizim bulduğumuz değerlere kıyasla ifade edilen bu değerler düşük bulunmuştur. Diğer çalışmalarda ise Koyuncu ve ark., (2004) 8.0 adet/çelik, Zenginbal ve Demir, (2018) 9.64 adet/çelik, Singh (2018) 8.55 adet/çelik, Roussos ve ark., (2020) ise 14.8 adet/çelik kök sayısı elde ederek yaptığımız çalışma ile benzer sonuçlar görülmüştür.

Şekil 4. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin kök sayısı (adet/çelik) üzerine etkisi

Kök Uzunluğu (cm)

Kök uzunluğu parametresinde istatistiksel açıdan bir farklılık oluşmadığı görülmüştür (Şekil 5.). Elde edilen sonuçlara göre kök uzunluğu kontrol uygulamasında 7.16 cm, açıkta bekletilen çeliklerde 6.59 cm, karanlıkta bekletilenlerde ise 7.44 cm olduğu tespit edilmiştir. Elde ettiğimiz bu değerler, diğer araştırmacılar tarafından elde edilen kök uzunluğu değerleri ile karşılaştırılacak olursa, Yıldız ve ark., (2009)'nın 6.66 cm, Zenginbal ve Demir, (2018)'in 8.23 cm, Singh (2018)'in 9.11cm ve Roussos ve ark., (2020)'nin 8 cm olarak bildirdiğiyle uyum içerisinde olduğu görülmüştür.

Şekil 5. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin kök uzunluğu (cm) üzerine etkisi

Kök Çapı (mm)

Şekil 6. incelendiğinde kök çapları bakımından koşullar arasında istatistiksel açıdan bir farklılık bulunamamıştır. Çeliklerin kök çapları kontrol uygulamasında 1.02 mm, açıkta bekletilenlerde 1.12 mm, ve karanlıkta bekletilenlerde 1.16 mm olarak tespit edilmiştir. Bulduğumuz bu değer Yıldız ve ark., (2009)'nın 2.03 mm ve Zenginbal ve Demir, (2018)'in 2.31 mm olarak bulduğu değerden düşük çıkmıştır. Bu farklılığın sebebi farklı koşullar ve ortam sıcaklıklarından kaynaklanmış olabilir.

Şekil 6. Karadut (*Morus nigra* L.) odun çeliklerinin farklı koşullarda bekletilmesinin kök çapı (mm) üzerine etkisi

Sonuç

Yapılan çalışma sonucunda, karadut odun çeliklerinin dikim öncesinde 5 gün açıkta ve karanlıkta bekletilmesinin köklenme kabiliyetlerine olumlu etkisinin olmadığı, kontrol ile benzer etki gösterdiği saptanmıştır. Deneme sonucunda incelenen parametrelerde; köklenme oranı %68.89 - %93.33 arasında, çürüme oranı %24.4 - %55.5 arasında, kallus oluşum oranı %68.8 - %88.8 arasında, kök sayısı 8.8 - 13.5 kök/çelik, kök uzunluğu 6.5 - 7.4 cm ve kök çapı 1.02 - 1.16 mm arasında değerler almıştır.

Comparison of Some Quality Parameters in Fresh and Dry Samples of *Morus Rubra* Fruits

Ala Asi Mohammed Al-Salhi¹, Mehmetcan Olgaç², Emircan Dinçer¹, Hakan Polatçı², Onur Saraçoğlu¹

¹Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

²Department of Biosystem Engineering, Faculty of Agricultural, Tokat Gaziosmanpaşa University, Tokat, Turkey,

Abstract

In Turkey, three species of mulberries, white (*M. Alba*), black (*M. Nigra*), and red-purple (*M. Rubra*) are grown commonly. These widely can be consumed fresh as well as dry. However, its rapid post-harvest decay raises major concerns about the sustainability of the fruit for both food and economic purposes. In this regard, besides the fresh consumption of black mulberry fruit, it can consume as dried it also offers an alternative way. In this study, it was aimed to compare some quality parameters in fresh and dry samples of *Morus rubra* fruits grown in TOKAT. It was applied different temperatures to *Morus rubra* fruits that at collected in two different maturity levels (semi-ripe and full-ripe). In the drying process, mulberry fruits were dried in a hot air dryer at 40, 50, 60, and 70 °C. Total phenol, total monomeric anthocyanin, total antioxidant capacity, colour values (L, a, b) chroma, hue (h°), and browning indices values will be measured in fresh and dried products. In addition, different mathematical models will be tried by constantly noting the weight drops of the products at certain time intervals and determining which mathematical model will best predict the drying kinetics.

Key Words: Antioxidant, Phenol, Anthocyanin, Drying, Mulberry

Introduction

Mulberry is a member of the family *Moraceae* and genus *Morus* and is found all over the world in a variety of climatic settings ranging from tropical to temperate Morera or mora in Spanish, Moreira in Portuguese, Murier in French, Tut in Urdu, and Sahtut in Hindi are some of the names given to it. There are over a thousand mulberry cultivars available for sericulture in China, the world's leading sericulture nation. *Morus alba* L. is the most dominant species among the 24 species and 1 subspecies (Herman et al. 2022). Mulberry is a fast-growing deciduous plant and it grows under different climatic conditions such as tropical, subtropical, and temperate throughout the world. It has been cultivated in the Northern hemisphere for centuries. In Türkiye, mulberry fruits are as important as the other temperate fruit species such as apricot, walnut, sour cherry, etc. Mulberry trees are extensively grown in southern Europe, India, and China for their foliage as foods for silkworms. However, in Türkiye and Greece mulberries are grown for fruit production rather than foliage. In Türkiye, growing conditions in the most agroecological region are very suitable for cultivating high-quality mulberry fruits, mainly from *Morus alba*, *Morus nigra*, and *Morus rubra* (Güngör ve Sengül., 2008). Mulberry production number of 69,475 tonnes in the year of 2021 (Turkish Statistical Institute- TUIK, 2018). Mulberry, because of the short harvesting season and their sensitivity to storage, fresh mulberry fruits should be preserved in some form. Unwashed berries can be kept in a container for several days in a refrigerator. Another preservation method is drying. Also, it is used in mulberry pekmez (a concentrated mulberry juice product), juices, paste, and marmalade (Doymaz, 2004). Drying is one of the oldest and most common methods used to preserve foods and it can be carried out either traditionally, by sun drying, or industrially by solar, hot air, infrared, and other drying methods (Golpour et al., 2020). The fruits are easily spoiled after harvest due to their high moisture content. For this reason, fruits are subjected to either drying processes or cold storage processes so that they can be preserved for a long time without spoiling (Doymaz, 2011). Drying agricultural products; ensures that the moisture in their content can be removed and stored for a long time. With the drying process, the physical structure of the products is reduced, making them much easier to transport. It ensures that products that need to be consumed quickly after harvesting have a longer shelf life. In our country, the drying process is mostly done in an open environment. Although the cost of this drying method is low, it negatively affects the quality of the dried product, prolongs the drying time, and does not provide a hygienic drying environment. In order to eliminate these disadvantages, drying methods have been developed in which drying is done in a closed environment and product-specific drying conditions are controlled. In the drying process, which is one of these methods, the air temperature can be controlled, the drying process can be carried out in a shorter time and a high-quality final product can be obtained (Figiel,2010).

Materials and Methods

Materials

Fruits to be Dried and Ripening Levels Semi and full-ripe purple mulberry fruits to be used as the drying material were harvested from a grower orchard in Kemalpaşa village of Tokat province on 11th of July, 2022.

1. Moisture determination process

In order to determine the moisture content, an average of 50 ± 1.5 g of fresh fruit was used and dried at 70 °C with 5 replications until the weight change was stabilized in both maturity stages (Abuska ve Doğan, 2010).

2. Drying process

The products to be subjected to the drying process within the scope of the experiment were first sorted and placed in aluminium containers in equal amounts and dimensions in a thin layer drying model as 4 replications and weighed with a precision balance with 0.01 g sensitivity. The products prepared for the drying process were weighed in an oven dryer at 40, 50, 60, and 70 °C at regular intervals until the moisture content decreased to 10% humidity and the drying process was carried out. Colour measurements of the products falling to the determined moisture level were made (Polatçı ve Taşova, 2017).

3. Oven

The oven used in the study is Şimşek Laborteknik brand and model ST-120. The cabin temperature is measured with the sensors in the oven and transmitted to the control unit. The drying air temperature is adjusted via the control unit on the oven.

4. Drying Models

During the drying process of the products, the available moisture content (ANO) values were calculated in accordance with the given equation.

$$ANO = \frac{M - M_e}{M_0 - M_e}$$

ANO: Separable humidity

M: Instant moisture content of the product

Me: Equilibrium moisture of the product

Mo: Initial moisture content of the product

Equations of the models used

Model name	Equality	Source
Page	$MR = \exp(-h \cdot t^n)$	Liu et al. (2009)
Modifiye Page	$MR = \exp[(-kt)^n]$	Toğrul (2006)
Lewis	$MR = \exp(-kt)$	Doymaz (2006)

In order to process the data obtained after the drying process of the products, Page, Yağcıoğlu, Midilli, et al. equations are used. As a result of drying, the moisture rates in the products were calculated with the given equations and the acceptable humidity rate was modelled with the model equations. It was determined which model predicted the available moisture content better.

5. Colour Measurements

Colour measurements of mulberry fruits after drying were made with a Minolta brand CR400 (Japan) colourimeter and L, a, b values were determined.

(L) refers to the brightness value of the product and varies between 0-100. When L gets the value of 0 (zero), it means that the colour is black, that is, there is no reflection, and when it takes the value of L 100, it means that the product colour is white, that is, the reflection is complete. The value (a) denotes red-green, and (b) denotes yellow-blue colours and takes (+, -) values, respectively. If the colour values are a = 0 and b = 0, it shows that the colour is Gray (McGuire, 1992). Other colour values to be calculated will be determined using the measured colour values.

Table of colour equations to be calculated

Colour Value	Equality
Croma, C	$C = (a^2 + b^2)^{1/2}$
Hue, °	$h^\circ = \tan^{-1}\left(\frac{b}{a}\right)$
colour change, ΔE	$\Delta E = \sqrt{(L - L^*)^2 + (a - a^*)^2 + (b - b^*)^2}$

Here, Croma (C): hue of the colour, hue°: angle value of the colour, colour change (ΔE): indicates the colour change value after drying compared to fresh.

6. Chemical Analyses;

6.1. Total Solution Soluble TSS

After the fruits were pureed in the homogenizer, the juices were extracted by centrifugation. Then, in a digital refractometer calibrated according to pure water (Atago PAL-1, USA) readings were made and the values were expressed as %.

6.2. Total phenolic content

Total phenolic content was measured according to the procedure described by Singleton and Rossi (1965). 40 ml of water was added to 10 g of dried mulberry sample and kept at +4 for 3 days. It was then extracted with a buffer containing acetone, water and acetic acid (70:29.5:0.5 v/v) for 24 hours in the dark. The extracts were combined with Folin-Ciocalteu's phenol reagent and water and incubated in the room for 8 minutes, then 7% sodium carbonate was added. After 2 hours, absorbance at 750 nm was measured in an automated UV-vis spectrophotometer (Model T60U, PG Instruments). Gallic acid was used as standard. Results were expressed as micrograms (μ g) gallic acid equivalent (GAE) g⁻¹ (Aglar et al. 2017).

6.3. Total Antioxidant Capacity (TEAC)

For the standard TEAC assay, ABTS⁺ was dissolved in acetate buffer and prepared with potassium persulfate. The mixture was diluted in an acidic medium of 20 mM sodium acetate buffer (pH 4.5) to an absorbance of 0.700 $\pm$ 0.01 at 734 nm for longer stability. For the spectrophotometric assay, 2.97 mL of the ABTS⁺ solution and 20 μ L of fruit extract were mixed and incubated for 10 min and the absorbance was determined at 734 nm (Gündüz et al. 2013).

Statistical analysis

In order to determine the effects of drying temperatures on the colours, drying values, and chemical analyses of mulberry fruit in two different maturity stages, a comparison was made according to the $p < 0.05$ importance level in the SPSS package program.

Result and Discussion

The first moisture contents of semi-ripe and fully ripe purple mulberries before drying are given in Table 1.

Table 1 initial moisture content of semi-ripe and full-ripe purple mulberries

FIRST MOISTURE CONTENT	
Full- Ripe	SEMI- RIPE
73.10	79.72

The final moisture values and drying times of the dried products are given in Table 2.

According to the table, the shortest drying time was observed in the semi-mature product at a drying temperature of 870 minutes and 70 °C, while the longest drying time was observed in the semi-mature product at a temperature of 7590 minutes and 40 °C. It was determined that the increase in drying temperature decreased the drying time for all products.

Table 2 final moisture values and drying times of dried products

Product	DRYING TEMPERATURE	AVERAGE MOISTURE (%)	FINAL DRYING TIME(MIN)
Full- Ripe	40	10.63	6810
	50	9.93	3150
	60	9.67	2070
	70	9.83	1350
Semi- Ripe	40	10.04	7590
	50	10.59	2970
	60	10.00	1530
	70	10.31	870

The R² values calculated in the thin layer drying model of the dried products are given in Table 3.

According to the table, the model that best predicts drying was determined as 0.9999 in fully mature product and Wang Singh at 40 °C drying temperature.

Table 3. R² values calculated in the thin layer drying model of the dried products

<i>DRYING TEMPERATURE</i>					
Product	Drying Model	40	50	60	70
Full- Ripe	PAGE	0.9945	0.9983	0.9976	0.9936
	LEWIS	0.9769	0.9887	0.9912	0.9664
	WANG SINGH	0.9999	0.9897	0.9993	0.9960
	Midilli Küçük	0.9998	0.9989	0.9984	0.9967
Semi- Ripe	PAGE	0.9950	0.9956	0.9953	0.9936
	LEWIS	0.9740	0.9793	0.9723	0.9664
	WANG SINGH	0.9996	0.9994	0.9994	0.9960
	Midilli Küçük	0.9995	0.9991	0.9994	0.9967

When Table 4 is examined, L, a, and b values were statistically different from fresh at a 5% significance level. However, when the L value was examined, there was no statistical difference between 40 and 70 C drying temperatures in semi-ripe fruit and 40 and 60 C in fully mature fruit. In the study, when the a value was examined, it was determined that there was no statistical difference at 40, 50, and 70 C drying temperatures in semi-ripe fruit, and at 40, 60, and 70 C drying temperatures in fully mature fruit. Looking at the b value; It was determined that there was no statistical difference in the drying temperatures of 40 and 50 C in semi-ripe fruit, and in 40, 60, and 70 C in fully ripe fruit.

Table 4. Fresh and dried L, a, b, values of semi-ripe and fully ripe purple mulberries

<i>Semi- Ripe</i>			
Drying Temperatures(C°)	L	a	B
<i>FRESH</i>	51.46 ^a	2.11 ^c	13.35 ^a
40 C°	33.55 ^b	5.58 ^a	5.70 ^c
50 C°	30.11 ^c	5.04 ^a	5.54 ^c
60 C°	18.99 ^d	3.36 ^b	-1.18 ^d
70 C°	32.51 ^b	5.07 ^a	8.34 ^b

<i>Full- Ripe</i>			
Drying temperatures(C°)	L	a	B
<i>FRESH</i>	21.94 ^c	10.45 ^a	0.22 ^b
40 C°	28.92 ^{ab}	5.12 ^b	2.36 ^a
50 C°	27.74 ^b	3.39 ^c	-0.62 ^b
60 C°	28.80 ^{ab}	4.80 ^b	2.00 ^a
70 C°	30.16 ^a	4.90 ^b	1.77 ^a

When Table 5 is examined, the chroma value, which shows the color saturation of the fresh fruit, was calculated as 10,52 in the fully ripe fruit. Taşova and Polatçı (2019), determined the color and some physical properties of finger mulberry fruit in their study. They found the chroma value between 6,16 and 10,85. In semi-ripe fruit, the chroma value was calculated as 13,74. In the fully ripe fruit, the lowest chroma value was found at 3,47 to 50 °C drying air, and the highest chroma value was found at 5,76 to 40 °C drying air temperature. In semi-ripe fruit, the lowest chroma value is 3,58, and 60 °C drying air temperature, The highest chroma value was calculated at a drying air temperature of 9,83 and 70 °C. When the total color change was examined, it was found that the highest drying temperature was 70 C in fully ripe fruit and 40 C in semi-ripe fruit. Tasova et al. (2021), in their study, determined the drying performance and color values of black mulberry fruit dried under different conditions. As a result of the study, the total color change for the black mulberry fruit was determined between 20-28 and the values show similar characteristics. When the color characteristics are examined, it is recommended to dry the semi-ripe fruit at 70 C and the fully ripe fruit at 40 C.

The phytochemical contents of semi-mature and fully mature levels of mulberry samples, regardless of temperature values, are given in Table 6. A statistically significant difference was found between semi-mature and fully mature products in the determination of total phenolic compounds. When compared at maturity levels, the phenolic content of fully mature products was 5532,90 (µg GAE/g), while it was found to be 3561,40 (µg GAE/g) in semi-ripe products. There was no statistical difference between maturity levels in the determination of total antioxidant capacity. However, as the maturity level increased, the antioxidant capacity increased , the antioxidant capacity increased. Antioxidant capacities were found as 4,58 (µmol TE/g) in semi-ripe fruits and 4,74 (µmol TE/g) in

fully ripe fruits. Although there is no statistical difference between the maturity levels in the amount of water-soluble dry matter, it increases in direct proportion with the increase in the maturity level. It was found as 63,55 (%) in semi-ripe products and 73,84 (%) in fully mature products. Many biochemical events such as the metabolization of sugars and acids, the hydrolysis of pectins, the production of carotenoids, and the exchange of phenolic compounds occur with the ripening of fruits and vegetables (Brummell, 2006; Prasanna et al. 2007; Tepe 2022).

Table 5 Chrome (C), Hue (H °), and Color Change (ΔE) of fresh and dried products

	DRYING METHOD	DRYING CONDITION	C	H °	ΔE
Full-Ripe	FRESH	-	10.52	1.94	-
	OVEN	40	5.76	21.90	23.84
		50	3.47	-9.71	24.54
		60	5.37	18.60	24.00
		70	5.29	17.94	25.35
Semi-Ripe	FRESH	-	13.74	50.24	-
	OVEN	40	8.33	39.61	26.30
		50	7.53	46.11	23.47
		60	3.58	-17.57	16.02
		70	9.83	55.49	24.21

Table 6. The effects of different maturity stages on phytochemical contents and TSS amounts in purple mulberry fruit.

Maturity Stage	TP ($\mu\text{g GAE/g}$)	TEAC ($\mu\text{mol TE/g}$)	TSS (%)
Semi-ripe	3561.40b	4.58	63.55
Full- Ripe	5532.90a	4.74	73.84
Materiality Level	0.013*	0.765 ^{NS}	0.260 ^{NS}

NS: Non Significant ($p > 0.05$). *: $p < 0.05$.

Regardless of their maturity level, different drying temperatures applied to the products and the phytochemical contents of fresh products are given in table 7. When all drying temperatures were compared with the fresh sample in the determination of total phenolic compounds, the difference between them was found to be statistically significant. The lowest phenolic content was found at 1253,06 ($\mu\text{g GAE/g}$) in fresh samples, while the highest phenolic content was 6607,65 ($\mu\text{g GAE/g}$) at 70 °C drying temperature. In addition, it was found that the total phenolic content showed an increasing trend with increasing drying temperatures. A statistical difference was found between fresh samples and drying temperatures in total antioxidant content. The lowest value was found as 2,13 ($\mu\text{mol TE/g}$) in fresh samples, and the highest value was 5,58 ($\mu\text{mol TE/g}$) at 40 °C.

Meral (2017) examined the effects of different drying temperatures on the antioxidant capacity in study on uskun fruit and found that the antioxidant value decreased with the increase in temperature and shortening of the time. A similar result of this judgment was found in our study at 40°C. It was observed that the dried purple mulberry products preserved their antioxidant capacity more with the long drying time and low temperature. The difference between fresh samples and drying temperatures in the amount of water-soluble substances was found to be statistically significant. The highest value was found at 70 °C with 82,75%, while the lowest value was found at 21,80% in fresh samples. With the increase in temperature, the amount of water-soluble dry matter increased. The reason for this is that the amount of soluble dry matter in water is expected to increase as the volumes of the products decrease and liquid losses are experienced.

Table 7 The effect of different drying temperatures on phytochemical contents and TSS amounts in purple mulberry fruits.

Drying Temperatures(°C)	TP ($\mu\text{g GAE/g}$)	TEAC ($\mu\text{mol TE/g}$)	TSS (%)
Fresh	1253.06 c	2.13 b	21.80 b
40	4432.65 b	5.58 a	75.25 a
50	5068.07 ab	4.98 a	82.17 a
60	5374.32 ab	5.04 a	81.50 a
70	6607.65 a	5.57 a	82.75 a
Materiality Level	0.001**	0.001**	0.001**

** $p < 0.01$.

Phytochemical results of semi-ripe fresh and dried purple mulberry samples are given in Table 8. There was a statistical difference between the applications in the determination of total phenolic. While the highest value was 4218,07 ($\mu\text{g GAE/g}$) at 70 °C, the lowest value was 1222,23 ($\mu\text{g GAE/g}$) in the semi-ripe fresh products. Statistically, differences were found between the applications in total antioxidant values of semi-ripe products. The highest value was 6,01 ($\mu\text{mol TE/g}$) at 70°C, while the lowest value was 2,02 ($\mu\text{mol TE/g}$) in semi-ripe fresh samples. There are statistical differences between applications in the amount of water-soluble dry matter. Values were found between 19,07 – 78,67%.

Table 8 Effect of different drying temperatures on phytochemical content and TSS amount in purple (semi-ripe) mulberry fruits.

Maturity	Drying Temperatures(°C)	TP ($\mu\text{g GAE/g}$)	TEAC ($\mu\text{mol TE/g}$)	TSS (%)
Semi-ripe Fresh		1222.23c	2.02c	19.07d

Materiality Level		0.001**	0.001**	0.001**

** : p <0.01.

Phytochemical contents of fully ripe fresh and dried purple mulberry samples are given in Table 9. In terms of total phenolic values, statistical differences were determined between the applications. The results ranged from 1283,89 to 8997,23 ($\mu\text{g GAE/g}$). In addition, it was observed that the phenolic content increased with the increase in drying temperatures. Statistically, differences were found between applications in total antioxidant content and the highest value was 40 °C 6,14 ($\mu\text{mol TE/g}$) while the lowest value was 2,25 ($\mu\text{mol TE/g}$) when fully ripe. There were statistical differences between the applications in terms of the amount of water-soluble dry matter. Values range from 24,53% to 88,83%.

Table 9 Effect of different drying temperatures on phytochemical content and TSS amount in purple (full-ripe) mulberry fruits.

Maturity	Drying Temperatures(°C)	TP ($\mu\text{g GAE/g}$)	TEAC ($\mu\text{mol TE/g}$)	TSS (%)
Full- Ripe Fresh		1283.89d	2.25d	24.53d
Full- Ripe 40		5463.90c	6.14a	83.83c
Full- Ripe 50		5747.23bc	4.79c	85.67b
Full- Ripe 60		6172.23b	5.39b	86.33b
Full- Ripe 70		8997.23a	5.13bc	88.83a
Materiality Level		0.001**	0.001**	0.001**

Conclusion

There are two important criteria for phytochemicals in the drying process, temperature and time. In some products, higher losses may occur even at low temperatures due to the negative effect of time. In such studies, comments can be made about the best drying method time and temperature for different species by conducting experiments at different maturity levels and temperatures. The model that best predicted the drying curves was determined as WANG SINGH. If a semi-ripe berry is being dried and it is not desired to lose its antioxidant values, we recommend it to be dried at a high degree. If a full ripe mulberry is to be dried and its antioxidant values are to be preserved, we recommend low temperature.

Effects of Paclobutrazol Applications on Rooting Performance of Black Mulberry (*Morus Nigra* L.) Hardwood Cuttings

Mehmet Emin İşbilir^{1*}, Onur Saraçoğlu¹, Emircan Dinçer¹, Alperen Donat¹, Ala Asi Mohammed Al-Sahli¹

¹Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

The cutting reproduction are the cheapest and most practical method for plants capable of clonal regeneration. However, the difficulties in adventitious root formation in black mulberry cuttings create a disadvantage for mulberry growers. In this study, it was aimed to investigate the effect of IBA and Paclobutrazol applications on the rooting ability of black mulberry hardwood cuttings. The experiment was carried out in the polyethylene greenhouse of Tokat Gaziosmanpaşa University Agricultural Research and Application Center in February 2022. As material, hardwood cuttings prepared from one-year-old branches of breeding black mulberry trees within the body of the directorate were used. The study was set up in a randomized plot design with 3 replications and 15 cuttings in each replication. In the study, pure water as a control group, 6000 ppm IBA and doses of 1000 ppm, 2000 ppm and 3000 ppm Paclobutrazol respectively were applied to black mulberry wood cuttings separately and together. After the application, the cuttings were planted in perlite medium. The cuttings were kept in the rooting medium for 90 days and then by removed; rooting rate, root number, root length and root diameter values have been recorded. As a result of the study, the effect of the applications on the root number of the cuttings was not observed while on the rooting rate, root length and root diameter parameters was observed. In terms of rooting rate, the best result was obtained from IBA+PBZ 1000 application (40.00%) compared to the control group (0.0%). The highest root length was determined in IBA 6000 application, and the thickest root diameter values were determined in PBZ 1000 application.

Key Words: *Morus nigra*, Callus, Rooting, Paclobutrazol, IBA

Paclobutrazol Uygulamalarının Karadut (*Morus Nigra* L.) Odun Çeliklerinin Köklenme Performansı Üzerine Etkileri

Özet

Çelikle çoğaltma, klonal rejenerasyon yeteneği olan bitkiler için en ucuz ve en pratik yöntemdir. Fakat kara dut çeliklerinde adventif kök oluşumunda yaşanan zorluklar, dut yetiştiricileri için dezavantaj oluşturmaktadır. Bu çalışmada, karadut odun çeliklerinin köklenme kabiliyetleri üzerine IBA ve Paclobutrazol (PBZ) uygulamalarının etkisinin incelenmesi amaçlanmıştır. Deneme, 2022 yılının şubat ayında Tokat Gaziosmanpaşa Üniversitesi Tarımsal Araştırma ve Uygulama Merkez Müdürlüğü'ne ait polietilen serada yürütülmüştür. Materyal olarak müdürlük bünyesinde bulunan damızlık karadut ağaçlarının bir yaşlı dallarından hazırlanan odun çelikleri kullanılmıştır. Çalışma, tesadüf parselleri deneme desenine göre 3 tekerrürlü ve her tekerrürde 15 çelik olacak şekilde kurulmuştur. Çalışmada kontrol grubu olarak saf su, 6000 ppm IBA ve sırasıyla 1000 ppm, 2000 ppm, 3000 ppm PBZ dozları ayrı ayrı ve bir arada kara dut odun çeliklerine uygulanmıştır. Uygulama sonrasında çeliklerin perlit ortamına dikimi yapılmıştır. Köklenme ortamında 90 gün bekletilen çelikler bu süre sonunda sökülerek; köklenme oranı, kök sayısı, kök uzunluğu ve kök çapı değerleri kaydedilmiştir. Çalışma sonucunda, çeliklerin kök sayılarında uygulamaların etkisi görülmezken köklenme oranı, kök uzunluğu ve kök çapı parametrelerinde uygulamaların etkisi gözlemlenmiştir. Köklenme oranı bakımından en iyi sonuç kontrol grubuna (%0,0) kıyasla IBA+PBZ 1000 uygulamasından (%40,00) elde edilmiştir. En yüksek kök uzunluğu IBA 6000 uygulamasında, en kalın kök çapı değerleri ise PBZ 1000 uygulamasında tespit edilmiştir.

Anahtar Kelimeler: *Morus nigra*, Kallus, Köklenme, Paclobutrazol, IBA

Giriş

Dut (*Morus Nigra* L.), yüksek adaptasyon yeteneğine sahip, farklı iklim şartlarına ve toprak koşullarına uyum sağlayabilen kuzey yarım kürenin ılıman, tropik ve subtropik iklimlerinde yetişebilen bir meyve türüdür (Yağlıoğlu, 2015). Yıllık yağış miktarı 600-2500 mm arasında olan yerlerde sulamaya ihtiyaç duyulmadan yetiştirilebilir (Saraçoğlu ve ark., 2016). Dut, dünyanın birçok bölgesinde yayılım göstermiştir ve Türkiye dutun anavatanı ve doğal yayılış alanları içerisinde yer almaktadır. Ülkemizde yaygın olarak yetiştiriciliği yapılan dut türleri *Morus alba* (beyaz dut), *Morus nigra* (karadut) ve *Morus rubra* (kırmızı veya mor dut)'dır (Yağlıoğlu, 2015). Dut bitkisinin hem yaprağı hem de meyvesi farklı alanlarda kullanılmaktadır. Yaprağı yaygın olarak ipekböceği yetiştiriciliğinde ve farmakoloji alanında değerlendirilmektedir. Ayrıca dut bitkisinin yaprakları halk arasında alternatif tedavi yöntemi olarak da tüketilmektedir. Meyveleri ise taze tüketiminin yanı sıra, kurutularak, meyve suyu olarak, şurup, pekmez veya pestil yapılarak kullanılmaktadır (Dinçer, 2020) Ülkemizde dutun genetik potansiyeli ve tüketim imkanları fazladır. Fakat bu potansiyel yeterince kullanılmamaktadır (Yağlıoğlu, 2015). Bu

potansiyelin değerlendirilmesi için karadut bitkisinin çeşitli yöntemlerle çoğaltılması ve üretiminin artırılması gerekmektedir. Meyvecilikte modern üretimin ön koşulu kaliteli ve standart fidan üretimi yapmaktır. Fidan üretiminde vejetatif olarak aşı, daldırma, doku kültürü ve çelikle çoğaltma yöntemleri kullanılmaktadır (Yıldız ve ark., 2009). Bu yöntemlerin birbirlerine göre avantaj ve dezavantajları bulunmaktadır. Aşı ile çoğaltma yöntemi belli anaçların üstün özelliklerinden yararlanmak için tercih edilir (Altuncu, 2019) fakat, karadutta aşı ile üretimde bazı zorluklar yaşanmaktadır. Aşı yapılırken meydana gelen süt salgısı ve aşı gözünün altında boşluk bulunması aşı tutmasını engellemektedir (Çekiç ve ark., 2013). Daldırma ile çoğaltma yöntemi, çoğaltılması zor olan meyve türlerinde kullanılmaktadır. Fakat bu yöntem iş gücü gereksinimi ve üretilen bitki sayısının sınırlı olması sebebi ile ticari fidan üretiminde tercih edilmemektedir (Altuncu, 2019). Doku kültürü ile üretim yöntemi ise kalifiye eleman eksikliği ve pahalı donanım gereksinimi nedeni ile henüz pratik bir yöntem değildir (Yağlıoğlu, 2015). Çelikle çoğaltma yöntemi klonal rejenerasyon yeteneği gösteren bitkilerde kullanılabilecek en ucuz ve en pratik yöntem olarak kabul edilir (Yıldız ve ark., 2009). Karadutta çelikle çoğaltma en pratik yöntem olmasına rağmen adventif kök oluşturma kabiliyetinin zayıf olması sebebi ile istenen başarı elde edilememektedir (Yıldız ve ark., 2009). Karadut gibi köklenmesi zor olan bitki türlerinde, çelikle çoğaltımda çeşitli bitki büyüme düzenleyicilerin kullanımı ile köklenme oranı artırabilmektedir (Saraçoğlu ve ark., 2016). Köklendirme amacıyla kullanılan büyüme düzenleyicilerin en yaygın kullanılanı oksin grubunda yer alan IBA (Indol bütirik asit)'dir. IBA, köklenmeyi teşvik etmektedir (Zenginbal ve ark., 2006). Yapılan çalışmalarda, çelikle çoğaltmada IBA'nın farklı dozları kullanılmış ve farklı sonuçlar elde edilmiştir (Yıldız ve ark., 2009; Çekiç ve ark., 2013). Köklenmeyi arttırmak amacı ile IBA dışında farklı bileşikler de kullanılmaktadır. Bu bileşikler arasında yer alan Paclobutrazol (PBZ) bir triazol türevi bileşik olup, düşük dozlarda bile etkisini gösterebilmektedir (Çekiç ve ark., 2013). PBZ, genellikle fide yetiştiriciliğinde durdurucu olarak kullanılmaktadır (Geboloğlu ve ark., 2015; Geboloğlu ve ark., 2016). Bir giberellin biyosentez inhibitörü olarak PBZ'nin düşük konsantrasyonlarda kullanıldığında çeliklerde kök oluşumunu uyardığı bildirilmiştir (Bueno ve ark., 2021). Bu çalışmada, karadut odun çeliklerinin köklenme kabiliyetleri üzerine IBA ve PBZ uygulamalarının etkisinin incelenmesi amaçlanmıştır.

Materyal ve Yöntem

Yapılan bu çalışma Tokat Gaziosmanpaşa Üniversitesi Tarımsal Araştırma ve Uygulama Merkez Müdürlüğü bünyesinde bulunan çelikle çoğaltma ünitesinde yürütülmüştür. Materyal olarak müdürlük bünyesinde bulunan damızlık karadut ağaçlarının bir yaşlı dallarından hazırlanan odun çelikleri kullanılmıştır. Odun çelikleri 2022 yılının şubat ayında alınarak perlit ortamına dikilmiştir. Köklenme ortamında 90 gün bekletilen çelikler bu süre sonunda sökülerek; köklenme oranı, kök sayısı, kök uzunluğu ve kök çapı değerleri kaydedilmiştir. Çalışma, tesadüf parselleri deneme desenine göre 3 tekerrürlü ve her tekerrürde 15 çelik olacak şekilde kurulmuştur. Dikimden önce odun çeliklerinin üçte birlik kısımları 6000 ppm IBA, 1000 ppm PBZ, 2000 ppm PBZ ve 3000 ppm PBZ çözeltilerine ayrı ayrı ve bir arada olacak şekilde daldırılmıştır (Çekiç ve ark., 2013). Sadece IBA uygulanan çelikler, etanol içerisinde çözünen IBA solüsyonunda 5 saniye, sadece PBZ uygulanan çelikler ise PBZ çözeltisinde 15 dakika bekletildikten sonra dikimi yapılmıştır. IBA ve PBZ'nin birlikte kullanıldığı uygulamalarda çelikler, önce PBZ çözeltisine ardından IBA çözeltisine daldırılıp dikimi yapılmıştır. Deneme sonunda çelikler sökülerek; köklenme oranı, kök sayısı, kök uzunluğu ve kök çapı parametreleri tespit edilmiştir. Elde edilen veriler SAS paket programı kullanılarak varyans analizine tabi tutulduktan sonra ortalamaların karşılaştırılmasında Duncan çoklu karşılaştırma testi ($P<0.05$) kullanılmıştır.

Bulgular ve Tartışma

Karadut odun çeliklerinden elde edilen köklenme oranı, kök sayısı, kök uzunluğu ve kök çapı verileri Tablo 1'de verilmiştir. Kontrol ve PBZ 3000 ppm uygulamalarında köklenme olmadığı için kök sayısı, kök uzunluğu ve kök çapı verileri elde edilememiştir.

Tablo 1. Farklı IBA ve PBZ uygulamalarının karadut odun çeliklerinin köklenme parametreleri üzerine etkisi

UYGULAMALAR (ppm)	KÖKLENME ORANI (%)	KÖK SAYISI (Kök Sayısı/Çelik) ^{Ö.D.}	KÖK UZUNLUĞU (cm)	KÖK ÇAPI (mm)
KONTROL	0.00 C	-	-	-
IBA 6000	31.11 AB	9.07	36.60 A	1.58 CD
PBZ 1000	2.22 C	1.00	5.00 B	2.90 A
PBZ 2000	2.22 C	7.00	5.40 B	1.94 BC
PBZ 3000	0.00 C	-	-	-
IBA + PBZ 1000	40.00 A	23.22	27.30 AB	1.45 D
IBA +PBZ 2000	33.33 AB	13.64	20.00 AB	2.02 B
IBA+PBZ 3000	22.20 B	27.87	18.00 AB	1.84 BC

Aynı sütunda aynı harfle gösterilen ortalamalar arasındaki fark önemli değildir ($p<0.05$). Ö.D.: Önemli değil.

Köklenme oranı verilerine baktığımızda kontrol grubu ve PBZ 3000 ppm uygulamasında hiç köklenme görülmemiştir. En iyi köklenme oranı ise IBA+PBZ 1000 ppm uygulamasında görülmüştür. Çeliklerin köklenme kabiliyeti üzerine tek başına uygulanan PBZ'nin etkisi zayıf kalmıştır. Fakat, IBA ile birlikte kullanıldığında, PBZ sinerjik etkileşime girerek köklenme oranını artırmıştır. Ayrıca IBA+PBZ uygulamalarında, PBZ dozları düştükçe köklenme oranı artmıştır. Çalışmamıza benzer şekilde, Çekiç ve ark., (2013) yaptığı çalışmada, PBZ'nin IBA ile birlikte uygulandığında karadut odun çeliklerinin köklenme oranını artırdığını ifade etmiştir. Kivi bitkisinin çelikle çoğaltılmasının incelendiği bir çalışmada, IBA+ PBZ uygulamalarında, PBZ'nin sabit (500 ppm) IBA dozlarının (1.500, 2.500 ve 3.500 ppm) ise artmasıyla köklenme oranının artma eğiliminde olduğu görülmüştür (Ali ve ark., 2017).

Tablo 1. de çelik başına kök sayısı verilerine bakıldığında, uygulamalar arasında istatistiksel açıdan herhangi bir farklılık oluşmamıştır. Kök uzunluğu verileri incelendiğinde ise, en yüksek kök uzunluğu IBA uygulamasından elde edilmiştir. En düşük kök uzunluğuna ise PBZ'nin tek başına kullanıldığı uygulamalarda ulaşılmıştır. PBZ'nin IBA ile birlikte kullanıldığında tek başına kullanımına kıyasla kök uzunluğuna etkisi daha çok olmuştur. Ali ve ark., (2017) yaptıkları çalışmada, 3500 ppm IBA + 500 ppm PBZ uygulaması sonucunda en yüksek kök uzunluğunu (13.53 cm) elde etmiştir. Çekiç ve ark., (2013)'nin yaptığı çalışmada ise 6000 ppm IBA uygulaması sonucunda en yüksek kök uzunluğuna (20 cm) ulaşıldığı rapor edilmiştir.

Kök çapı verilerine bakıldığında en iyi sonuç PBZ 1000 uygulamasından (2.90 mm) elde edilmiştir. Burada IBA 6000 uygulamasına kıyasla PBZ'nin kullanıldığı uygulamalar (IBA + PBZ 1000 uygulaması hariç) kök çaplarını artırmıştır. PBZ'nin bu etkisi, bitki büyümesini durdurucu özelliğinden kaynaklanmış olabilir. Çekiç ve ark., (2013)'nin yaptığı çalışmaya göre en kalın kök çapı 1.3 mm ile 6000 ppm IBA + 2000 ppm PBZ uygulaması sonucunda elde edilmiştir. Ali ve ark., (2017)'nin kivide yaptıkları çalışmaya göre en kalın kök çapına (1.18 mm) IBA 2500 ppm + Paclobutrazol 500 ppm uygulamasından ulaşılmıştır.

Sonuç

Çalışma sonucunda, en yüksek köklenme oranı IBA + PBZ 1000 uygulamasında tespit edilmiş ve bunu IBA + PBZ 2000 ve IBA 6000 uygulamaları izlemiştir. Aynı zamanda IBA + PBZ 1000 uygulamasında en düşük kök çapı değerleri gözlemlenmiştir. En yüksek kök çapı değerleri ise PBZ 1000 uygulamasında belirlenmiştir. Kök uzunluğu parametresinde en yüksek değer IBA 6000 uygulamasında görülmüş ve bunu IBA'nın PBZ ile birlikte kullanıldığı uygulamalar takip etmiştir. Elde edilen bulgular ışığında, PBZ'nin IBA ile birlikte kullanıldığında karadut odun çeliklerinin köklenme performansını artırdığı saptanmıştır.

Bioremediation in Forest Ecosystem

Sevinç Yeşilyurt¹, Muazzez Gürkan²

¹ Turkey Department of Soil Science and Plant Nutrition, Tekirdağ Namık Kemal University, Tekirdağ,

² Department of Biology, Tekirdağ Namık Kemal University, Tekirdağ, Turkey

Abstract

The most important environmental problems in today's world arise from uncontrolled increase of the population, rapidly decreasing forests and green fields, incorrect use of fields, unplanned urbanization, harmful wastes, unconscious production and consumption of energy, traffic, heavy metal loaded products of factories and mining deposits and many other human activities. Environmental pollution resulting from all these factors is an unfavorable situation in the modern world. In order to solve these problems and restore the ecosystems, fighting with pollution efficiently with rapidly developing biotechnological methods is crucial. Bioremediation is one of such technologies.

Bioremediation is the use of microorganisms to remove pollutants from soil, water and air. This is carried out either by destroying pollutants in situ or transferring polluted material to somewhere else to remediate. Different microorganisms (bacteria, algae, fungi, and plants) are used and generally certain species are determined to be suitable for different types of chemicals. In other words, bioremediation is the remediation of environment by microorganisms by combining basic principles of basic sciences and engineering methodologies. The basis of this system is the disintegrating harmful compounds into either less harmful or completely harmless molecules by the use of microorganismal metabolic pathways. For instance, *Pseudomonas putida* species were employed to remediate forest soil after fire together with a microbial consortium obtained from the forest local soil. Besides bacteria, fungi were shown to be effective in bioremediation in different studies.

This study aimed the usability of some frequently encountered microorganisms in forest ecology to remediate the pollution and will relate them to bioremediation. Moreover, it is aimed to present the importance of microorganisms which are crucial members of the ecosystems to support the studies to be carried out in this subject.

Key Words: Bioremediation, forest ecology, microorganisms, pollution

Orman Ekosisteminde Biyoremediasyon

Özet

Günümüzde en önemli çevresel problem nüfusun kontrolsüz artışı, ormanların ve yeşil alanların hızlı azalması, alanların yanlış kullanımı, plansız şehirleşme, tehlikeli atıklar, enerjinin bilinçsiz üretim ve tüketimi, trafik, üretilen ürünlerdeki ağır metal yükleri, maden birikintileri ve diğer insan aktiviteleridir. Modern dünyada tüm bu faktörlerden kaynaklanan olumsuz koşullar çevre kirliliğine sebep olmaktadır. Bu tür problemleri çözmek ve ekosistemleri iyileştirmek, kirlilikle etkili mücadele edebilen gelişen biyoteknolojik yöntemlerin kullanılması elzemdir. Biyoremediasyon bu yöntemlerden biridir.

Biyoremediasyon su, toprak ve havadaki kirletenleri mikroorganizmalar kullanarak temizleme yöntemidir. Bu yöntemde ya kirleticiler bulundukları yerde yok edilirler ya da kirli materyal başka bir yere taşınarak ıslah edilir. Farklı mikroorganizmalar (bakteri, mantar, alg ve bitkiler) kullanılabilmeyle beraber bazı türlerin bazı kimyasalların gideriminde daha uygun olduğu belirlenmiştir. Diğer bir deyişle, biyoremediasyon, temel bilim ve mühendislik uygulamalarının birleştirilmesi ile çevrenin mikroorganizmalar ile temizlenmesidir. Bu sistemin temelini mikroorganizmaların metabolik yolları ile zararlı bileşiklerin daha az zararlı ya da tamamen zararsız hale getirilmesi oluşturur. Örneğin, *Pseudomonas putida* türü lokal orman toprağından elde edilen bir mikrobiyal konsorsiyum içerisinde yangın sonrası toprağı ıslah etmek için kullanılmıştır. Bakteriler yanında, mantarında biyoremediasyonda etkin biçimde kullanılabileceği gösterilmiştir.

Bu çalışmada orman ekosistemlerinde sıklıkla karşılaşılan mikroorganizmaların kirlilik giderimde ve biyoremediasyonda kullanılabilirliği incelenmiştir. Ayrıca, ekosistemlerin önemli birer üyesi olan mikroorganizmaların öneminin vurgulanması ve bu çalışmanın bu konuda yapılacak çalışmalara yol göstermesi amaçlanmıştır.

Anahtar Kelimeler: Biyoremediasyon, orman ekolojisi, mikroorganizmalar, kirlilik

Introduction

Forest ecosystems have a great place in all the ecosystems. The productivity and efficiency of ecosystems are controlled by natural processes, especially in terms of plant nutrition processes. Therefore, these processes should be analyzed well to evaluate the productivity of these ecosystems. The first development phase of forests is important in terms of nutrition, but in the advancing years accumulation of dead plant material on the surface serves as an alternative nutrition store for the soil. Research showed that around 6.2 tons/hectare of dead cover

formed 17 years after planting of black locust (*Robinia pseudoacacia*), however, around 13.7 tons/hectare death cover formed in nut pine (*Pinus pinea*) fields. Dead covers form again and again in time and decomposition and internal cycles form the main nutrition sources (Kimmins, 1997; Keskin and Makineci, 2009). Nitrogen fixing plants have a special place by their ability to free nitrogen from atmosphere by the *Rhizobium* bacteria in their roots. Among the ligneous plants naturally grown in our county white alder (*Alnus*), eleagnus (*Elaeagnus*), cercis (*Cercis*) and astragalus (*Astragalus*) among briars can be mentioned among the nitrogen fixing plants. On the other hand, ecological and sociological function of forests, such as recreation, can serve for the needs of societies. Therefore, the productivity of forests should not only be taken in terms of trees, but all the goods and services should be evaluated together. Naturally grown mycorrhizal fungi in forests are also important for development of trees as a result of their association with tree roots. Economically important species *Tuber*, *Boletus*, *Tricholoma*, *Lactarius* are among such fungi. Besides natural processes in forests, conserving biodiversity, soil and water sources, fighting with climate change and desertification are important subjects concerning the forests (Karaman et al., 2012).

Several bacterial and fungal antagonists isolated from forest soils have been shown to be used as biological control agents. One example is *Trichoderma* isolates. These fungal isolates were effective on above ground parts of plants (Fruit and Nicot 1999, Köhl and Molhoek 2001). *Ulocladium atrum* has been used against pathogens causing problems in green parts of plants

Bacteria, fungi and yeasts are organisms used in bioremediation. Bioremediation is also an efficient method to manage polluted areas and remediate polluted soils. The success of bioremediation depends on the use of correct microorganisms and their being in the right place with right environmental factors (Strong, 2008; Frazar, 2000; Ceyhan and Esmeray, 2012; Sharma, 2012; Gürkan and Adiloğlu, 2020). Bacteria are the main microorganisms in remediation. For example, Gram negative *Pseudomonas* bacteria play an important role in the detoxification of copper, cadmium, selenium heavy metals (Halder and Basu, 2016; Wessels and Emn, 2017). *Pseudomonas* bacteria also take attention for the remediation of contaminated areas, especially by petroleum (Ceyhan and Esmeray, 2012).

Research has shown that on zinc contaminated soil, *P. luteola* and *P. polymyxa* performed well for remediation of zinc from soil. The decrease of zinc concentration upon application of *P. luteola* was especially significant. The same bacterium was also demonstrated to be efficient in remediation of copper. The results suggested that this bacterial species could be used for the remediation of heavy metals from soil. (Vanlı and Yazgan, 2008). Similarly, *P. polymyxa* had a high potential to be used for bioremediation (Mokaddem et al., 2009). Another study, by Özbucak et al. (2018), *P. luteola* and *P. polymyxa* were efficient for remediation of especially copper when used separately, but when they applied together, they could remediate zinc more efficiently.

Soil is associated with all the ecological parameters and it forms the basis of forest ecosystem. Moreover, soil is strongly related with issues such as climate change, decrease in biological diversity water and energy safety, food safety, and hence attention on soil is increasing day by day. Bioremediation has been shown to be easy and applicable for remediation of either natural problems or pollution by contamination; and the basis of bioremediation is the use of microorganisms. The current research about soil bioremediation in forest ecosystem is still not sufficient and should be supported by projects about this subject.

Cadmium And Zinc In The Environment

Aliyeva Tarana¹, Samedova Ayten¹, Hajiyeve Hadiyya¹, Melikova Afak²

¹ Baku State University, Ecological chemistry

² Azerbaijan State University of Oil and Industry, Ecological chemistry
Baku, Azerbaijan Republic

Cadmium, zinc and copper are the most important metals in the study of pollution problems, as they are widely distributed in the world and have toxic properties. Cadmium and zinc (as well as lead and mercury) are found mainly in sulfide sediments. As a result of atmospheric processes, these elements easily enter the oceans. Soils contain approximately $4.5 \times 10^{-4}\%$. Vegetation contains varying amounts of both elements, but the content of zinc in plant ash is relatively high – 0.14%, since this element plays an essential role in plant nutrition.

About 1 million kg of cadmium enters the atmosphere annually as a result of the activities of plants for its smelting, which is about 45% of the total pollution by this element. 52% of pollution comes from the combustion or processing of products containing cadmium. Cadmium has a relatively high volatility, so it easily diffuses into the atmosphere. The sources of air pollution with zinc are the same as with cadmium.

The entry of cadmium into natural waters occurs as a result of its use in galvanic processes and technology. The most serious sources of water pollution with zinc are zinc smelters and electroplating plants.

Fertilizers are a potential source of cadmium contamination. In this case, cadmium is introduced into plants that are used by humans for food, and at the end of the chain they pass into the human body. Cadmium and zinc readily enter seawater and the ocean through a network of surface and groundwater. Cadmium and zinc accumulate in certain organs of animals (especially in the liver and kidneys).

Zinc is the least toxic of all the heavy metals listed above. However, all elements become toxic if found in excess; zinc is no exception. The physiological effect of zinc is its action as an enzyme activator. In large quantities, it causes vomiting, this dose is approximately 150 mg for an adult.

Cadmium is much more toxic than zinc. He and his compounds belong to the I class of danger. It penetrates the human body over a long period. Breathing air for 8 hours at a cadmium concentration of 5 mg/m³ can cause death. In chronic cadmium poisoning, protein appears in the urine, and blood pressure rises.

When examining the presence of cadmium in food, it was found that human excretions rarely contain as much cadmium as was absorbed. There is currently no consensus on the acceptable safe content of cadmium in food. One effective way to prevent cadmium and zinc from being released as pollution is to control the content of these metals in emissions from smelters and other industries.

Soil Contamination With Protein And Vitamin Preservatives

¹Alieva Tarana, ¹Hajiyeva Hadiyya, ¹Samedova Ayten, ²Malikova Afag

¹ Baku State University, Ecological chemistry

²Azerbaijan State University of Oil and Industry, Ecological chemistry
Baku, Azerbaijan Republic

In the last 10 years, compound feeds (feed mixtures prepared from different feeds) obtained with the use of protein-vitamin concentrates (PVC) for cattle in the 80s of the twentieth century, which manifested themselves in animal husbandry due to environmental problems, have been widely developed.

The energy use of the human body is mainly associated with the consumption of animal meat. Proteins, fats and carbohydrates in meat, milk and eggs are absorbed by people by 90-98%, and in potatoes and vegetables by 70-95%. Accordingly, for animal nutrition, it is necessary to develop foods rich in protein and vitamins.

Such substances are found in microorganisms synthesized from carbohydrate-containing raw materials. On their basis, protein-vitamin concentrates are made. However, their end products, as it turned out later, are not harmless. First, during production, they cause allergies, dermatitis, bronchial asthma and, in some cases, cancer in workers. The second is the accumulation in the body of an animal of substances harmful to human health.

As a result of feeding protein-vitamin concentrates to animals, eosinophilia develops in the intestinal mucosa, granulomatosis in the liver.

It has also been proven that protein-vitamin concentrates contain 12-15 times more nucleic acids than feed. It is known that these biological polymers provide the transfer of genetic information. So it affects the genetic code of animals, birds and ultimately humans. The basis of nucleic acid in protein-vitamin concentrates is ribonucleic acid (RNA). RNA causes an increase in uric acid in the urine and blood in the human body. Leads to diseases that contain a lot of RNA.

Excessive feeding of animals with protein and vitamin concentrates leads to the accumulation of fat in the liver, increased cholesterol levels, and metabolic disorders. In this regard, protein-vitamin concentrates can be added to feed for cattle 20%, and poultry 15%.

Currently, science is trying to study the unknown properties of protein-vitamin concentrates. Therefore, it is very important to comply with the norm when added to animal feed, so as not to endanger human health.

Evaluation Of Environmentally Harmful Mineral Fertilizer Standards In Irrigated Gray Brown Soils In Samukh District

Adigozalov Parviz

Ganja State University, Environmental protection
Ganja, Azerbaijan Republic

Rye is one of the cereal plants cultivated as food and fodder in our republic. Rye grain contains 9.0-18.6% protein, 51.8-62.6% non-extractable nitrogenous substances, 1.6-1.9% fat, 2.3-2.5% depending on the characteristics of the variety and cultivation conditions. cellulose and 1.9-2.0% ash. Grain can contain up to 82% carbohydrates, most of which is starch. Starch has a positive effect on the preparation and composition of bread. Rye flour contains 3.1-4.5% gluten. The increase in gluten greatly improves its baking quality.

Ecological evaluation of lands and landscape complexes of the republic and individual regions has been studied by many authors.

In Ganja-Gazakh region, we began to study autumn rye in 2018.

If the application of agrochemical and chemical means in crop cultivation is not carried out correctly, if the given norms are not expected, it creates consequences for the environment and human health. From this point of view, optimizing the application of mineral fertilizers in crop cultivation, providing scientifically based "ecological" norms and ecological (agroecological) evaluation of soils can play an important role in preventing negative processes that may arise for the environment and human health.

The main goal of the research is to determine the ecologically harmless mineral fertilizer norms that ensure high and quality harvest from the autumn rye plant in irrigated gray-brown (chestnut) soils under the conditions of the Ganja-Gazakh region, and to determine the ecological value of these soils. It is evidence of logical evaluation.

Researches were conducted in 2018-2020 with the "Mirbashir-46" variety of winter rye on irrigated gray-brown (chestnut) soils at the Ganja Regional Agrarian Science and Innovation Center of the Ministry of Agriculture, located in the Samukh district.

The following price indicators were used during the ecological evaluation of the lands of Ganja-Gazakh region: bonity scores obtained on the basis of the internal properties of the soils (humus, nitrogen, phosphorus, potassium, UAC) during the comparative evaluation (bonitiroton) of the soils; Ecological scores obtained on the basis of special evaluation scales according to the degree of manifestation of individual characteristics of soils (pH, water-resistant aggregates, dry residue).

In the third stage of our research, the final ecological scores of dark gray-brown (chestnut), ordinary gray-brown (chestnut) and light gray-brown (chestnut) soils under ryegrass were found using "cultivation-ecological coefficients". The following formula was used for this:

$$E_{m-e} = E_b \times T_{m-e}$$

Here, E_{m-e} – is the final acculturation-ecological score of soils; E_b – soil ecological score and T_{m-e} - culturalization - ecological correction coefficient.

As a result, the environmental scores of the lands used under rye crops were calculated by applying the main credit scores.

Evaluation Of The Effect Of Fertilization And Drying Methods On Pre And Post Aflatoxin Infection In Maize Under Busogo Climatic Conditions

Erastus Dushimeyesu^{1*}, Sylvestre Habimana¹, Fabrice Musana Rwalinda^{1,2}, James MushAYIJA

¹Department of Crop Sciences, University of Rwanda, Musanze, Rwanda.

²Department of international Agricultural development, Tokyo university of Agriculture, Tokyo-Japan

*Corresponding author's Email: eradus2020@gmail.com,

Abstract

The study was carried out in 2020-2021 during the growing seasons which are 2021A that started from September 2020 till the end of January 2021 and 2021 B started from February till end of June 2021, the study was conducted in the Busogo sector, Musanze District, Northern Province. The purpose of this project was to assess the impact of fertilization and drying methods such as sun drying, dry shelter and kitchen drying on aflatoxin contamination in maize before and after harvesting. The area from which this project was conducted was chosen due to the availability of a lot of number of maize growers who cultivate them not only for consumption but also for trade purpose either processed or non-processed. During this study, a total of twenty-four (24) samples were collected, examined and evaluated for aflatoxin levels in both seasons. In the season 2021A and 2021B sample collection equivalent to twelve (12) in each season was done then dried them within 30 days by using different drying methods such as dry shelter, kitchen drying, sun drying. Randomized complete block design (RCBD) with four treatment of fertilizer combination in four replications was used in this study and all experimental plots were planted with one maize variety (H628) purchased from Rwanda Agriculture and Animal Resources Development Board. Except samples from maize cultivated without fertilizer, level of aflatoxin infection was found to be higher 10 Parts per billion. The East African countries community standard limit of 10Parts per billion which indicate a health risk to the consumer, when comparing the three drying methods employed in this study, the kitchen drying method produced lower levels of aflatoxin (1.6Parts per billion) than the dry shelter (3.2 Parts per billion) and sun drying methods (2.9 Parts per billion), samples taken from the control plot (T4) stands for no fertilizer application resulted greater levels of aflatoxin with an average of 25.75 Parts per billion compared to other treatments which yielded aflatoxin levels of at lower than 10 Parts per billion. The use of kitchen drying can be recommended as well as mixture of both organic and inorganic fertilizers when growing maize in order to reduce the level of aflatoxin.

Keywords: Maize, aflatoxin, fertilizers, drying methods, *Aspergillus*.

Introduction

Agriculture sector in Rwanda remains the major sector of the economy where 64.7% of the Rwandan population is involved in Agriculture and it contributed 26% in the GDP of the country as found in National institute of statistics of Rwanda (NISR) Labor Force Survey Trends, May 2021 report, September 2021 (NISR,2021). However, this sector faces challenges such as an ever-changing climate a concentrate on relatively brief initiatives to solve immediate and starting to emerge challenges including the soil infertility and reduced nutrient due to leaching caused by high density of the population and inappropriate harvesting a well as to remove all debris from the field after harvesting, poor information sharing channels of the agricultural related concerns, non-developed research due to narrow findings and limited variety of crops (MINAGRI,2017).

Maize is a vital staple crop in most Sub-Saharan African countries producing food that is consumed by the majority of the population in different nature, the small-scale farmers focus on cultivating a lot of quantity of food crops such as wheat, sorghum and potatoes on a large quantity of land, maize is a crop which is very important not only for consumption but also for commercial purpose because Rwanda farmers use to trade them with Tanzania and Uganda (Daly *et al*,2016,)

Eastern province of Rwanda produces a half of maize produced in Rwanda where many of them (60%) are processed into other crucial products like maize flour, most of people used to trade them informally where 80 % of maize are commercialized in that way with in the neighboring countries. Aflatoxin contamination has resulted in lower nutritional qualities in Rwandan maize output due to a variety of variables that happened throughout before and after harvesting stage (Nishimwe *et al*, 2019).

For the purpose of helping small scale farmers to produce maize which complies with maximum limit of aflatoxin, the Rwandan government launched RAB to aid farmers to the ultimate goal of the Rwanda Agriculture and animal resources development Board Aflatoxin reduction relies on some of the same good agricultural methods that help increase production. Use of resistant cultivars, timely planting, effective fertilizer use, effective control of weeds, use of appropriate pest control, drought and mitigation of nutritional issues as well as harvesting on time are all examples of these agricultural practices. Aflatoxin can also be controlled by appropriate drying after harvesting with the appropriate time, insect control which may affect maize during storage after harvesting as well as

protecting stores against pests by adopting biopesticides. All of these practices can help to limit mycotoxins upon post – harvest (Niyibituronsa *et al*, 2020). In 1990, 94 % of the population eaten maize of various types within two weeks of the poll maize was consumed at a rate of 10.8% of total food consumed in Ghana in 1987 with the remaining foods consumed at a rate of 10.3 % by all groups (Wahab *et al*, 2022).

Maize can also be used to make, baked goods, silage, animal feed, adhesives, and oil, fungus that contaminate maize in storage are able to cause mycotoxins that are dangerous to human and animal health, *Aspergillus flavus* is found to be the essential fungus of preharvest maize which cause aflatoxin. The mentioned issues favorize to maize to get unfavorable for use and also contribute to the reduction of global economy, he also reported that in Rwanda, aflatoxin found to be the serious health issues in agricultural sector (Nishimwe *et al*, 2019).

2. Materials and Methods

Study area

Experimental fields have been carried in the farm of the College of Agriculture, Animal Sciences and Veterinary Medicine, University of Rwanda. situated in the Northern province, Musanze District, Busogo Sector at 72 km from Kigali as Capital city of Rwanda to the North-West. Latitude of 1° 33' 32" South & 29° 32' 57" of Longitude East with an elevation of 2,221 m above sea level. The annual temperature in Busogo is 17°C- 20°C. The soil is relatively productive based on the overall amount of annual rainfall obtained (Meteo Rwanda, 2020).

Experimental Design

During the research, the experiment was conducted for four treatment of fertilizer combination in four replications using a factorial arrangement in Randomized complete block design (RCBD) assigned at random in each replication. Treatments were arranged as T1 (NPK 17-17-17 + DAP), T2 (Farm yard manure), T3 (NPK 17-17-17 + DAP + Farm yard manure) and T4 (control; no fertilizer application). All experimental plots were planted with one maize variety (H628) purchased from RAB at a rate of 30 kg/ha. The 16 experimental plots were placed in the same location within two (2) agricultural seasons which are season 2021A and 2021 B; plots size was set out at 5 m × 5 m (25 m²) in size per treatment and sowing the seed was done with in one day in all plots directly after field preparation where in each hole 2 grains were placed. spacing of 75 cm between rows and 40 cm with 40 cm between holes. After sowing, 30 tons of organic fertilizer (cow dung) and 100 kgs of DAP were used respectively while urea was applied during weeding.

Collecting data

Data were collected at vegetative stage in the field and at the harvest Plant emergence, plant height, leaf area index, stem diameter, plant vigor, harvested plant (number), weight and yield metrics are among the data collected.

Crop emergence: Seeds were sown so that each bed possessed twenty-four (24) plant holes, during data collection of plant emergence, we counted newly emerging plants emerged at 30 days after sowing

Height of plant (cm): For measuring plant height, the interval from the surface to the collar of developed upper leaf (three months after sowing) was measured using a meter rule. Centered plants in each bed were selected to collect data three couples were selected randomly means that 6 plants per block were selected. plants in each bed

Diameter of stem (cm): Data on stem diameter were collected by measuring the circumference (c) at two thirds (2/3) of plant height during tasseling (2.5 months after planting) and approximated diameter of stem (d) by means of the formula herewith below

$$d = \frac{c}{\pi}$$

Note that $\pi \approx 3.14$ and c = relates to the diameter of the maize stem; the technique for selecting plants to measure stem diameter was the same as for plant height sampling (Longfei *et al* 2020),

Leaf Area Index (LAI): During calculation of leaf area index, we used to divide the plant into three equal

quadrants lengthwise, using mature leaves on their middle side. $LAI = \frac{LWK}{K}$ Note that L stands for length of the leaves while W stands for the width of the leaves, K is considered as the constant which has the value of 0.75. The way LAI was done is the same way plant height selection was done. Sample selection of the plant used to calculate LAI was done on the harvestable plants by looking on their average per bed and per treatment (Rahul *et al*, 2021).

Plant vigor plant: The vigor of plants was measured by using three point-point scale where poor vigor was characterized by 1, average vigor was characterized by 2, good vigor was characterized by 3. Stem size, the number of stems bore without holes I considered all leaved including damaged ones when categorizing maize stems. The average weight (kg) of collected cobs was determined using a scale balance upon harvest. For the weight of the maize cobs, three samples were taken per plot. The average weight as sample was recorded for each treatment per block (Longfei *et al*, 2020).

Drying of maize grains

During this study, we examined the issues of maize grain management as well as their storage, in order to evaluate the good drying methods which can favorize small scale farmers, cooperatives or commercial farms to get high quality maize that are free from aflatoxin. During this study, we look out the natural and artificial drying method that are currently used. Finally, different structure of storage and drying methods fluctuating from modest family units to huge commercial units are examined as well as management suggestions for minimizing harm while storing.

During this study, we evaluated the impact of various drying processes on aflatoxin attack levels after various treatments were applied during the tests.

A. Natural drying

Sun Drying

While conducting this research, we adopted well known but old drying method which is putting maize on natural sun (sun drying). The maize grains produced from the treatments T1, T2, T3, T4 for all replications (4) were put directly under sun on sheeting for the prevention of moisture content from the soil ground to reach the maize grains.

B. Artificial Drying

Kitchen Drying:

In order for assessing the rate of aflatoxin, we used to adopt the kitchen drying as the other drying methods which is effective by putting maize grains above fire of the kitchen. Kimario (2021) reported that kitchen drying managed to reduce aflatoxin levels in maize at the rate of 78.5%.

Dry shelter:

In this study, dry shelter as one of the drying methods established by the government as post-harvest handling technology was used to evaluate its effect on aflatoxin contamination

Testing of aflatoxin

With referring to VICAM. L P (1999), we used aflatest (Watertown, MA) of OAC fluorometer. The aflatest was chosen due to its rapidity where with in only 10 min per ton test you get the results, it is also very sensitive consequently providing reading as low as 2Parts per billion to 10 Parts per billion in a sample and continues to read the results until 50 Parts per billion per sample.; it is suitable for using it in the same extract instrumentation for other mycotoxins 'test; it is easy to use thus it does not require special Those testing tools are trusted due to less toxic materials they possess in comparison with conventional methods . this method possess in numerical data in Parts per billion can be used to clean HPLC (High performance liquid chromatography).

The test was carried out by blending a crushed sample of the kernels weighing 25 g of blended maize grains mix with 5g of Na Cl and 125 ml of methanol (70%);30% of distilled water (H₂O) in a blender jar at high speed for 2 minutes in covered blender jar as it is shown in the appendix 7. Fluted filter paper was used to filter the extract and collect the filtrate in clean vessel (Neogen, 2018).

3.3. Sampling

According to Hamed (2016), we adopted the simple random sampling method by collecting and measuring the composite sample equal to the maximum of 1 kg of from each treatment in both seasons (2021A and 2021B) and dividing it into 12 sub samples of roughly 300 g each in each season. For the aflatoxin levels analysis, ground samples of roughly 25g were utilized for each sub sample and the average level was obtained, the sample collection was done with second -season maize which tend to dry out faster on the farm, the average moisture level in each treatment was 12.5%.

Within the 2 seasons of the study, total number of samples collected and tested were twenty-four (24) with combination produce of each treatment (T1, T2, T3, T4) of all replication. In accordance with the protocol used during sampling, samples were collected in polythene bags and transported them to the Rwanda standard board Laboratory for aflatoxin testing

Preparation of the sample

For avoiding the mold formation as well as aflatoxin production, maize grains were dried in order reach the moisture content of no more than 13% within 30 days, when maize are affected by aflatoxin there is a chance of getting pollution and the species causing aflatoxin causes those pollution,to address this problem, the entire 1 kg of the sample was grinded and segmented using only a Bunn and constantly fighting grinder (Mann: Bunn-o-Matic corporation Springfield, Illinois in the United States of America) in order to obtain a combined subsample for representing the overall sample characterized with codes associated with them to affiliate the items in the questionnaire (Noreddine ,2020).

Aflatoxin's extraction

During the extraction of aflatoxin,50 mg of crushed samples was mixed with 250 ml of 65% ethanol(v/v) in a laboratory mixer (IKA.Werker, Germany) and rapidly shaken for 3 min material was filtering using Whatman No.1 filter paper once it had settled (Whatman international Ltd, Maidstone, Uk) (Neogen , 2018).

Quantification of aflatoxin

The samples were analyzed by using an enzyme-linked immunosorbent assay (ELISA) to quantify the total of aflatoxin as indicated by the company's procedures using a Reveal accuscan (Neogen, USA), the ELISA has a quantitative range of 2-150 g total aflatoxins/kg and a lower of detection (LOD) OF 2G/KG (Neogen ,2018).

Statistical analysis

The levels of aflatoxin of four treatments were analyzed in the years of research from 2020-2021, simple descriptive statistics and the SPSS statistical package from 1993 at $p=0.005$ was used to evaluate data such as mean, range, variance, coefficient of variation and least significant difference. The test statistic was the variance ratio test, the 'F' distribution was used to compare two growth seasons at the same time for significant variations, the selection of it had the advantages of comparing two environments in one period (Mohd ,2017)

Results and Discussion

Impact for methods of drying on aflatoxin infection for the Cropping season 2021A & 2021B

The results of aflatoxin levels following the drying methods have shown the great impact on aflatoxin contamination, Nevertheless, the level of aflatoxin was found to have significant difference contamination in sun drying methods, kitchen drying and drying shelter methods as it is shown in table 3. the lower aflatoxin infection levels were seen when using kitchen drying (1.6 Parts per billion) when the maize is grown with fertilization of mixture of organic and inorganic fertilizers compared to sun drying (1.6 Parts per billion) and dry shelter drying method (2.2 Parts per billion).

The inconsistency ratio test demonstrated a significant difference in the influence of methods of drying all treatments (T1, T2, T3, T4) on aflatoxin contamination in the seasons 2021A and 2021B. The result shows that treatment T4 the aflatoxin levels were 26.70 Parts per billion when adopted the sun drying, whereas aflatoxin results for T3 was 1.4 when adopted the kitchen drying(Table 1).

Table 1: Aflatoxin levels measured in every treatment resulting all methods of drying within cropping season 2021A & 2021B

Results of in Parts per billion of total aflatoxin in various drying techniques for all treatments							
Treatment	Treatment description	kitchen drying		Dry shelter		Sun drying	
		2021A	2021B	2021A	2021B	2021A	2021B
T1	NPK +DAP	2.70 ^{ab}	1.60 ^{ab}	2.70 ^{ab}	3.20 ^{ab}	1.70 ^{ab}	2.90 ^{ab}
T2	FYM	3.70 ^a	4.90 ^{ab}	3.00 ^{ab}	5.0 ^{ab}	2.60 ^{ab}	1.80 ^{ab}

Impact of fertilizer application on aflatoxin infection before harvesting in season 2021A and season 2021B.

The aflatoxin contamination shown a significant difference between four treatments which are Growing maize with only inorganic fertilizer application(T1), Organic fertilizer (T2), mixture of organic and inorganic (T3) and growing maize without fertilizer application (T4).

The lower level of aflatoxin infection was found in the treatment (T3) stands for mixing the inorganic and organic fertilizer application by 5.2 Parts per billion compared with non-fertilizer application (T4) by 13.4 Parts per billion, organic fertilizer application(T2) by 8 Parts per billion, inorganic fertilizer application (T1) by 5.7 Parts per billion of the maize grown in season 2021A.

The lower-level aflatoxin infection was found in the mixture of organic and inorganic fertilizer application (T3) by 6.1 Parts per billion compared with non-fertilizer application(T4) by 14.7, organic fertilizer application(T2) by 8 Parts per billion, inorganic fertilizer application(T1) by 6.2 Parts per billion, of the maize grown in season 2021B.

Aflatoxin levels was found to be influenced by fertilizer application across the seasons of study, maize grown in T4 (Control) increased aflatoxin levels at the higher than standard limit 10 Parts per billion, whereas maize grown with a combination of organic and inorganic fertilizers (T3) reduced the level of aflatoxin contamination before harvesting at 5.2 Parts per billion, fertilizers application while growing maize have great impact on aflatoxin levels on maize. According to Gary *et al* (2018) aflatoxin levels in the farms where fertilizers were not applied raised the aflatoxin levels at the range between 34.19-62.05% after storage. again, fertilizer called yaralegum combined with green Ok influenced the reduction of aflatoxin contamination at the range of 37.40%-18.72% in the field before harvesting. The research was done following the findings from the authors mentioned above by assessing the effects that can be caused by Application of only organic fertilizers, inorganic fertilizers or mixture of organic and inorganic fertilizers as well as growing the without any fertilizer application. (Table 2)

Table 2: Impact of fertilizer application on aflatoxin infection before harvesting in cropping season 2021A & 2021B

Season	Aflatoxin results (Parts per billion)				
	Treatments				
	T1	T2	T3	T4	LSD
2021A	5.70 ^a	8.0 ^a	5.20 ^a	13.40 ^a	39.8
2021B	6.20 ^{ab}	8.0 ^{ab}	6.10 ^{ab}	14.70 ^b	3.54
Mean	5.95	8	5.65	14.5	21.67

T1:NPK + DAP,T2:Farm yard manure,T3:NPK +DAP+FYM,T4:Control

LSD:Least significance difference

Conclusion

Application of fertilizer to combat aflatoxin attack in maize

Aflatoxin was identified in detectable concentrations in maize plots grown without fertilizer. There had been a significant difference in aflatoxin levels as a result of fertilizer between T4(control) and other treatments, growing maize without fertilization resulted the significant increase in aflatoxin levels. As a result, from soil nutrient, the usage of a mix of organic and inorganic fertilizers was found to be helpful in lowering pre-harvest aflatoxin contamination. Combination of both organic and inorganic fertilizers during maize cultivation demonstrated to reduce aflatoxin in the field before harvesting compared to other treatments used during the study.

Effects of fertilizer and farm management on aflatoxin contamination development and yield metrics.

Aflasafe is achieved through the use of toxigenic strains of *Aspergillus spp*, which work by competitively excluding toxigenic strains from the substrate, only aflatoxins produced on the farm can be avoided by employing strategies such as effective farming systems and the use of aflasafe. Natural infection can only be regulated after the fact by using post-harvest application processing procedures that limit further infiltration into grains.

The results also shown that fertilizing maize with both organic and inorganic fertilizers is helpful to the plant maize to enhance growth and development which lead to the reduction of aflatoxin contamination in maize.

Acknowledgments

Much appreciation is given to the management the University of Rwanda- College of Agriculture, Animal Sciences and Veterinary Medicine, Department of Crop Sciences who gave me valuable technical assistance as well as Rwanda inspectorate, competition and consumer protection Authority (RICA) for the technical assistance governing food safety standards.

*Sorumlu yazar: hanife.mut@bilecik.edu.tr

Abstract

The cultivation of two or more plant species at the same time in the same field during a growing period is called intercropping. Intercropping system is frequently applied to increase the yield and quality of hay, especially in forage crop cultivation. The aim of current study was to determine hay yield and quality traits of Berseem clover “C” (*Trifolium alexandrinum* L.) annual ryegrass “R” (*Lolium multiflorum* L.) mixtures (100+0%, 80+20%, 60+40%, and 20+80%) in Bilecik ecological condition during 2021-2022 vegetation period. The experiment was arranged in randomized blocks design with three replications. In the study, hay yield, crude protein ratio (CP) protein yield, acid detergent fiber (ADF), neutral detergent fiber (NDF), potassium (K), phosphorus (P), calcium (Ca) and magnesium (Mg) contents were determined. The highest hay and crude protein yields were determined in 60%C+40R (670.83 and 105.87 kg/da), 40%C+60R (780.53 and 112.87 kg/da), and 20%C+80R (721.17 and 109.03 kg/da) mixtures. CP, ADF, and NDF contents of the mixtures ranged from 14.27-17.73%, 33.89-37.59%, and 46.39-65.30%. Macronutrients, which are important for animal nutrition and health, were high in all processes. As a result, it was concluded that the ratio of Beersem clover in mixtures annual ryegrass should be between 20-60% in terms of forage yield and quality in Bilecik ecological conditions.

Key Words: Beersem clover, Annual ryegrass, intercropping, yield, quality.

İskenderiye Üçgülü (*Trifolium alexandrinum* L.) Tek Yıllık Çim (*Lolium multiflorum* L.) Karışımlarının Ot Verimi ve Kalitesi

Özet

Bir yetiştirme dönemi içerisinde aynı tarlada, aynı anda iki ya da daha fazla bitki türünün birlikte yetiştirilmesi karışık ekim olarak adlandırılmaktadır. Özellikle yem bitkileri tarımında otun verim ve kalitesini arttırmak amacıyla karışık ekim sistemi sıklıkla uygulanmaktadır. Bu çalışmada, Bilecik ekolojik koşullarında İskenderiye üçgülü (*Trifolium alexandrinum* L.) “Ü” ile tek yıllık çim (*Lolium multiflorum* L.) “Ç” karışımlarının (%100+0, %80+20, %60+40 ve %20+80) ot verimi ve kalitesinin belirlenmesi amaçlanmıştır. Çalışma 2021-2022 yılı vejetasyon döneminde ve Tesadüf Blokları Deneme Desenine göre yürütülmüştür. Çalışmada karışımların kuru ot verimi, ham protein oranı (HPO), protein verimi, asit deterjanda çözünmeyen lif (ADF), nötr deterjanda çözünmeyen lif (NDF), potasyum (K), fosfor (P), kalsiyum (Ca) ve magnezyum (Mg) içerikleri belirlenmiştir. En yüksek kuru ot ve ham protein verimi %60Ü+40Ç (670.83 ve 105.87 kg/da), %40Ü+60Ç (780.53 ve 112.87 kg/da) ve %20Ü+80Ç (721.17 ve 109.03 kg/da) karışımlarında belirlenmiştir. İşlemlerin HPO, ADF ve NDF içerikleri %14.27-17.73, %33.89-37.59 ve %46.39-60.30 arasında değişmiştir. Hayvan besleme ve sağlığı açısından önem teşkil eden makro besin elementleri ise tüm işlemlerde yüksek olmuştur. Sonuç olarak Bilecik ekolojik koşullarında yem verimi ve kalitesi açısından İskenderiye üçgülünün tek yıllık çim ile oluşturulan karışımlarında oranının %20-60 arasında olması gerektiği sonucuna varılmıştır.

Anahtar Kelimeler: İskenderiye üçgülü, tek yıllık çim, karışık ekim, verim, kalite.

Giriş

Dünyada ve ülkemizde ekilebilir tarım alanlarını artırma imkânlarının azalması ve nüfusun sürekli artması, bitkisel üretimle uğraşanları mevcut tarım alanlarından azami derecede yararlanma yollarını aramaya yöneltmiştir. Bu yollardan biri de karışık ekim sistemidir (Acar ve ark., 2006). Özellikle yem bitkileri tarımında uygulanan karışık ekim sistemleri ile hem arazi kullanım verimliliği artmakta hem de çevresel kaynaklar en ekonomik şekilde değerlendirilmektedir (Awaad ve ark., 2018). Ülkemizde üretim için gerekli mazot, kimyasal gübre ve pestisit fiyatlarındaki artış, her geçen gün artan erozyon ve çevre kirliliği nedeniyle tarım sistemlerinde özellikle tek yıllık baklagillerin kullanımı daha da önem kazanmıştır (McCartney ve Fraser, 2010).

Son yıllarda yem bitkileri tarımında otun verim ve kalitesini arttırmak amacıyla baklagiller ile buğdaygil ya da diğer familyalara ait bitkilerin birlikte karışım halinde yetiştiriciliği yaygın hale gelmiştir (Kavut ve Geren, 2017). Böylece hayvanlar için de daha dengeli bir yem sağlamaktadır.

Karışım halinde yetiştirilen bitkiler aynı ya da farklı familyalarda olabilmektedir. Karışık ekimlerde türlerin belirlenmesi çok önemlidir. Nitekim bitkilerin birbirleri arasında doğacak olan rekabetler bir takım sorunları ortaya çıkarabilir. Dolayısıyla sahip olduğu farklı morfolojik özellikleri sayesinde ışık, su ve besin maddesi alımında birbirleri ile rekabet halinde olacaklardır. Karışımlarda türler kadar tohum oranları da rekabeti arttırmaktadır. Öyle

ki, karışım içerisinde tahıl oranı fazla olursa; erken ilkbaharda daha hızlı gelişen tahıllar kardeşlenerek diğer türün gelişimini engelleyecektir. Bu nedenle karışımdaki türler arasında dengeyi sağlamak için hem karışıma girecek tür/türlerin hem de tohum oranlarının iyi ayarlanması gerekmektedir.

Türkiye’de Akdeniz bölgelerinin meralarında doğal bir şekilde yetişen İskenderiye üçgülü (*Trifolium alexandrinum* L.) tek yıllık olup, yarı kurak koşullara iyi uyum sağlayan, serin mevsim baklagil yem bitkisidir. Bitki ana ve ara ürün olarak yetiştirilebilmekte olup karışıma girdiğinde ise otun hem verimini hem de kalitesini yükseltmektedir. Gençkan (1983) İskenderiye üçgülünün besleme değerinin yüksek olduğunu ve özellikle de sığır ve domuzların çok istekli tükettiğini bildirmiştir.

Buğdaygiller familyasında yer alan tek yıllık çim (*Lolium multiflorum* L.) lezzetli, sindirimi kolay, enerji ve protein değeri bakımından zengin olan bir yem bitkisidir. Bitki yeşil ot, kuru ot ve silaj olarak da değerlendirilebilmektedir. Yüksek besin içeriği ve kuru madde oranı sayesinde hayvanlarda hem süt hem de et kalitesinde artışı sağlar. Ayrıca uygun ekolojik koşullarda 20 günde bir biçime gelmektedir (Anonim, 2021).

Bu çalışmada İskenderiye üçgülü (*Trifolium alexandrinum* L.) ile tek yıllık çim (*Lolium multiflorum* L.) karışımlarının ot verimi ve kalitesinin belirlenmesi amaçlanmıştır.

Materyal ve Yöntem

Bu çalışma Bilecik Şeyh Edebali Üniversitesi, Tarımsal Uygulama ve Araştırma Arazisinde 2021-2022 vejetasyon döneminde yürütülmüştür. Deneme alanının toprak yapısı killi tınlı olup, hafif alkalidir (7.70). Toprağın kireç içeriği %7.98 (orta), fosfor içeriği 222.21 kg/da (yüksek), potasyum içeriği 151.15 kg/da (yüksek) ve organik maddesi ise %1.22 (az) olarak belirlenmiştir. Deneme alanının yürütüldüğü yerin yağış toplamı uzun yıllar ortalamasında 364.6 mm iken, 2021-2022 vejetasyon döneminde 347.3 mm olmuştur. Sıcaklık ortalaması uzun yıllar ve 2021-2022 deneme yılında sırasıyla 9.2 °C ve 14.4 °C olmuştur (Tablo 1).

Tablo 1. Deneme alanının uzun yıllar ile çalışmanın yürütüldüğü yıla ait iklim verileri*

Aylar	Sıcaklık (°C)		Yağış (mm)	
	Uzun yıllar	2021-2022	Uzun yıllar	2021-2022
Kasım	9.1	15.7	36.7	35.0
Aralık	4.6	9.8	55.7	39.6
Ocak	2.5	5.3	50.4	54.6
Şubat	3.7	9.3	42.6	63.5
Mart	6.4	6.6	47.3	23.1
Nisan	11.5	19.6	42.1	22.7

*Bilecik Meteoroloji İl Müdürlüğü

Çalışma Tesadüf Blokları Deneme Desenine göre 3 tekrarlamalı olarak kurulmuş olup, ekim işlemi elle gerçekleştirilmiştir. Parsel uzunluğu 4 m olup, parseller ise 6 adet sıradan oluşmuştur. Bitkilerin sıra arası mesafesi ise 20 cm olarak ayarlanmıştır. Tohumluk miktarı (Yalın olarak) İskenderiye üçgülünde (Efsane) 1 kg/da, tek yıllık çimde (İlkadım) 2 kg/da olarak hesaplanmıştır. İskenderiye üçgülü ile tek yıllık çim 5 farklı karışım oranında (%100+0, 80+20, 60+40, 40+60 ve 20+80) ekilmiştir. Deneme yerinde yapılan toprak analizleri sonucuna göre bitkilere ekimle birlikte dekara 8 kg P ve 5 kg N gelecek şekilde taban gübresi verilmiştir. Hasat işlemi İskenderiye üçgülünde ve karışımlarda İskenderiye üçgülünün %50 çiçeklenme döneminde, tek yıllık çimde ise süt olum döneminde gerçekleştirilmiştir. Bitkiler hasat edildikten sonra sabit ağırlığa gelinceye kadar etüvde 60 °C de kurutulmuştur. Daha sonra bu örnekler analize hazır hale getirilmek için 1 mm elek çapındaki değirmende öğütülmüştür. Öğütülen örneklerin ham protein oranı, asit deterjanda çözünmeyen lif (ADF), nötr deterjanda çözünmeyen lif (NDF) ile besin madde içerikleri (Potasyum (K), fosfor (P), kalsiyum (Ca) ve magnezyum (Mg)) Near Infrared Reflectance Spectroscopy (NIRS) (Foss 6500) cihazı ile IC-0904FE paket programı kullanılarak belirlenmiştir. İskenderiye üçgülü ile tek yıllık çim karışımlarında ortalama ham protein oranı, ADF, NDF ve makro besin elementleri, bitkilerin botanik kompozisyonundaki oranları ile söz konusu özelliklerin çarpılmasıyla hesaplanmıştır. Verilerin değerlendirilmesi (SPSS 22.0 istatistik paket programı) Tesadüf Blokları Deneme Desenine göre gerçekleştirilmiş olup, işlemlerin karşılaştırılmasında ise Duncan testi kullanılmıştır.

Bulgular ve tartışma

İskenderiye üçgülü ile tek yıllık çim karışımlarının kuru ot verimi, ham protein oranı (HPO), ham protein verimi (HPV), asit deterjanda çözünmeyen lif (ADF) ve nötr deterjanda çözünmeyen lif (NDF) içerikleri Tablo 2’de verilmiştir. Buna göre tüm özellikler üzerinde karışımların etkisi çok önemli ($P<0.01$) olmuştur.

En yüksek kuru ot ve protein verimi istatistiksel olarak aynı grupta yer alan %60Ü+40Ç (670.83 ve 105.87 kg/da), %40Ü+60Ç (780.53 ve 112.87 kg/da) ve %20Ü+80Ç (721.17 ve 109.03 kg/da) karışımlarından, en düşük ise yalın

İskenderiye üçgülünden (213.53 ve 37.90 kg/da) elde edilmiştir (Tablo 2). Karadeniz ve Kökten (2022) Elazığ koşullarında yaptıkları çalışmada İskenderiye üçgülü ile tek yıllık çim karışımlarının kuru ot ve protein verimini sırasıyla 670.2-1659.2 kg/da ve 76.3-205.5 kg/da arasında değiştiğini bildirmişler. Sever (2021) Aydın koşullarında İskenderiye üçgülü ile İtalyan çimi karışımlarının kuru ot ve ham protein veriminin sırasıyla 769.3-1038.8 kg/da ve 114.11-190.76 kg/da, Polat ve ark. (2021) ise Şanlıurfa koşullarında 680-1317 kg/da ve 132.4-234.3 kg/da arasında olduğunu bildirmişlerdir.

ADF ve NDF ruminant rasyonlarının enerji göstergesi olarak kabul edilmektedir. Söz konusu özellikler yemin alınabilirliği ve sindirimi açısından önem teşkil etmektedir. Çalışmada işlemlerin ADF ve NDF oranı %33.89-37.59 ve %46.39-60.30 arasında olmuştur. Ghanbari-Bonjar ve Lee (2003) ile Gülümser, (2016) yaptıkları çalışmalarda baklagil ile buğdaygil karışımlarında baklagillerin buğdaygillere oranla daha düşük ADF ve NDF oranına sahip olduğunu bildirmişlerdir. Çalışmadan elde edilen ADF ve NDF oranı söz konusu araştırmacıların bulguları ile benzerlik göstermektedir.

Tablo 2. Karışımların KOV, HPO, PV, ADF ve NDF özelliklerine ait veriler

İşlemler	KOV (kg/da)**	HPO (%)**	PV (kg/da)**	ADF (%)**	NDF (%)**
%100 İskenderiye üçgülü (Ü)	213.53 d	17.73 a	37.90 c	33.89 d	46.39 d
%100 İtalyan çimi (Ç)	572.23 c	14.35 d	82.03 b	36.76 ab	60.30 a
%80Ü+20Ç	615.63 bc	14.27 d	87.63 b	37.59 a	56.50 b
%60Ü+40Ç	670.83 ab	15.78 b	105.87 a	34.34 d	54.99 c
%40Ü+60Ç	780.53 a	14.46 d	112.87 a	35.94 bc	57.17 b
%20Ü+80Ç	721.17 ab	15.12 c	109.03 a	35.48 c	56.26 bc
Ortalama	595.66	15.28	89.22	35.67	55.26

(**) 0.01 düzeyinde önemli. Aynı sütun içerisinde aynı harfte gösterilen ortalamalar arasında farklılık yoktur. KOV: Kuru ot verimi; HPO: Ham protein oranı; PV: Protein verimi; ADF: Asit deterjanda çözünmeyen lif; NDF: Nötr deterjanda çözünmeyen lif.

İskenderiye üçgülü ile tek yıllık çim karışımlarının potasyum (K), fosfor (P), kalsiyum (Ca) ve magnezyum (Mg) içeriklerine veriler Tablo 3’de verilmiştir. Buna göre tüm özellikler üzerinde karışımların etkisi çok önemli ($P<0.01$) olmuştur.

Çalışmada işlemlerin K, P, Ca ve Mg içerikleri sırasıyla, %2.59-2.94, %0.31-0.39, %0.31-1.28 ve %0.15-0.20 arasında değişmiştir (Tablo 3). Hayvanlar için gerekli olan makro besin elementlerinin başında gelen K, P, Ca ve Mg hem hayvanların hem de hayvansal ürünlerin verim ve kalitesi açısından çok önemlidir. (Başbağ ve ark., 2011; Gürsoy ve Macit, 2017). Hayvanların makro besin elementi ihtiyacının karşılanması için kaba yemlerde K oranının en az %0.8, P oranının %0.21, Ca içeriğinin %0.18-0.44 ve Mg içeriğinin ise %0.04-0.10 arasında olması gerekmektedir (Yozgatlı, 2017). Karışımlarda belirlenen besin elementleri hayvanların ihtiyaçlarını karşılayacak düzeydedir (Tablo 3).

Tablo 3. Karışımların makro besin içeriklerine ait veriler

İşlemler	K (%)**	P (%)**	Ca (%)**	Mg (%)**
% 100 İskenderiye üçgülü (Ü)	2.59 f	0.31 d	1.28 a	0.20 a

Ortalama	2.79	0.37	0.65	0.17

(**) 0.01 düzeyinde önemli. Aynı sütun içerisinde aynı harfte gösterilen ortalamalar arasında farklılık yoktur. K: Potasyum, P: Fosfor; Ca: Kalsiyum, Mg: Magnezyum.

Sonuç

Bilecik ekolojik koşullarında İskenderiye üçgülü ile tek yıllık çimin farklı tohum oranlarında birlikte ekiminin ot verimi ve kalitesine etkilerinin araştırıldığı çalışma sonucunda; yem verimi ve kalitesi açısından İskenderiye üçgülünün tek yıllık çim ile oluşturulan karışımlarında oranının %20-60 arasında uygun olabileceği, ayrıca çalışmanın 1 yıl daha yürütülmesi gerektiği kanısına varılmıştır.

Abstract

Beekeeping, which is a livestock branch made depending on nature, is to collect nectar from many vegetable sources from various regions, and to transform them into different bee products in the most economical and appropriate seasonal periods. Many products are obtained with beekeeping. The contribution of these products to the economy is very high. The use of bee products on human health has also increased in recent years. Apart from these, bees also make important contributions to the ecosystem. They are pollinators of many plant species existing in the world and they also serve as pollinators of many fruits and vegetables produced in greenhouses. Thanks to the pollinatorship of bees, the quality of the products obtained is increasing. Again, with its pollinator function, bees ensure the continuity of many endangered plants, and play an important role in ecosystem balance by increasing plant and animal diversity. Bees are not only involved in the pollination of plants that need an external pollinator, but also the product quality and quantity are increased in many plants that perform their own pollination. In this review, the importance of bees in pollination and the effect of global warming on bees are mentioned.

Key words: *Bee, beekeeping, pollination, global warming*

Polinasyonda Arılar Ve Küresel Isınmanın Arılara Etkisi

Özet

Doğaya bağlı olarak yapılan bir hayvancılık kolu olan arıcılık, aslında var olan arı kolonilerinin, çeşitli bölgelerden birçok bitkisel kaynaklardan nektar toplayarak bunları en ekonomik şekilde ve uygun mevsimsel dönemlerde değişik arı ürünlerine dönüştürülmesini sağlamaktır. Arıcılık ile birçok ürün elde edilmektedir. Elde edilen bu ürünlerin ekonomiye olan katkısı oldukça fazladır. Arı ürünlerinin insan sağlığı üzerinde kullanımı da son yıllarda giderek artmış durumdadır. Bunların dışında arıların ekosistem üzerine de önemli katkıları bulunmaktadır. Dünya üzerinde var olan birçok bitki türünün tozlayıcı durumunda olup yine seralarda üretimi gerçekleştirilen birçok meyve ve sebzenin de polinatörü olarak görev alırlar. Arıların polinatörlükleri sayesinde elde edilen ürünlerin verim ve kalitesi artmaktadır. Yine tozlayıcı görevi ile arılar nesli tükenmekte olan birçok bitkinin neslinin devamını sağlamakta, bitki ve hayvan çeşitliliğini artırarak ekosistem dengesinde önemli rol oynamaktadır. Arılar sadece dış tozlayıcıya ihtiyaç duyan bitkilerin tozlaşmasında görev almaz, kendi polinasyonunu gerçekleştiren birçok bitkide de üreticiler tarafından kullanılarak ürün kalite ve miktarının artırılması sağlanır. Bu derlemede arıların polinasyonda ki öneminden ve küresel ısınmanın arılar üzerinde ki etkisinden bahsedilmiştir.

Anahtar Kelime: *Arı, polinasyon, arıcılık, gıda, küresel ısınma*

1.Giriş

Dünya genelinde tarım tarihi uzun yıllar öncesine dayanmaktadır. Avrupa' ya bakıldığında endüstri devrine, Anadolu da ise Asurlar- Hitit uygarlıkları gibi uygarlıklara kadar uzanmaktadır. Osmanlı döneminde ise tarımsal faaliyetler gelişme göstermiş ve bugün hale ülkemiz önemli tarım arazileri bakımından zengin bir ülke olup, tarımsal faaliyetlerin günden güne geliştiği bir yerdir (Altan ve ark.,2000, Yavuz, 2005). Hayvancılık kollarından olan arıcılığın bitkisel üretime olan olumlu etkisi göz ardı edilemez düzeylerde.

Geçmiş yüzyıllardan günümüze kadar gelmiş sözlü, yazılı kaynaklar ve arkeolojik kazılara bakıldığında arıcılığın uzun yıllara dayanan bir tarihi olduğu görülmektedir. Yani arılar hem doğal varlıklar hem de kültürel varlıklar olarak kabul edilmektedir. Arılar insanoğlunda merak uyandıran bir hayvancılık kolu olmayı başarıp, ilk çalışmalar 16. yüzyılda gerçekleştirilmiştir. İlerleyen teknolojiler ve arıların hem doğaya olan faydaları hem de insan sağlığı üzerine olan faydaları ile günden güne gelişen bir hayvancılık dalı haine gelmiştir (Sancak ve ark.,2013). Arıcılıkta amaç aslında var olan arı kolonilerinin, çeşitli bölgelerden birçok bitkisel kaynaklardan nektar toplayarak bunları en ekonomik şekilde ve uygun mevsimsel dönemlerde değişik arı ürünlerine dönüştürülmesini sağlamaktır. (Erdoğan ve ark., 2004).

Dünya genelinde ülkelere bakıldığında bizim ülkemiz var olan bitki florası çeşitliliği ve 4 farklı mevsimin bir arada yaşanması ile arıcılık için elverişli ülkelerin arasında yer almaktadır. Bugün FAO'nun açıkladığı rakamlara göre dünya geneli 92.291.583 adet kovan varlığı olup bunlarda üretilen bal miktarı ise 1.851.541 tondur. Türkiye'nin bu veriler arasında yer alan kovan miktarı 7.947.687 adet , bal miktarı ise 114.113 tondur (Çizelge 1). Bu veriler ile Türkiye FAO tarafından yayınlanan listede dünya sıralamasın da üçüncü sırada yer almaktadır (Anonim,2020; Öztürk ve Erkan,2020).

Çizelge1. Dünya Arıcılık Verileri

	Ülke	Kovan Sayısı (adet)	Bal Üretimi (ton)	Bal Verimi (kg/kovan)
1.	Hindistan	13.048.275	67.442	5,17
2.	Çin	9.048.546	446.900	49,39
3.	Türkiye	7.947.687	114.113	14,36
4.	İran	6.601.394	77.567	11,75

Dünya üzerinde var olan her canlının ekosistemde dengenin sağlanmasında bir görevi vardır. Ülkemizde gelişim gündün güne gelişme gösteren arıcılığın ise ekosistem de önemli bir yeri vardır.Örneğin; Kendileri küçük olan bu canlılar aslında yediğimiz besinlerin yüzde %90'nın tozlayıcısı konumundadır

1.1. Arılar ve polinasyon

Bitkisel üretim de tozlaşma çeşitli yollarla gerçekleşmektedir. Örneğin; rüzgar yolu ile, bazı böcekler ile. Tozlaşmada görev alan böcekler arasında en önemlisi arılardır., arıların yapılan birçok araştırmada sürdürülebilir çevre için tozlaşmaya yardımcı olduğu ve bitkilerde verimliliği artırdığı kanıtlanmıştır (Topal ve ark., 2013).

Yapılan araştırmalarda bitkilerin bal arılarının toplayabileceği türden polenler ürettiğini, bunu polenleri hem erkek bitkilerin çiçeklerinden hemde dişi bitkilerin çiçeklerinden toplayabileceğini bildirmişlerdir. Ancak bazı çalışmalar ise sadece dişi çiçeklerden toplanan polenleri tercih ettiğini bazıları ise sadece erkek çiçeklerden toplanan polenleri tercih ettiğini vurgulamıştır. Sonuçlara bakıldığında ise, bal arılarının hem erkek çiçeklerden verimli polenleri hem de dişi çiçeklerden kısır polenleri aradıklarını ve topladıklarını göstermektedir. Bunun sebebi ise doğada var olan çiçeklerde nektar ve polen koku ipuçları yer almaktadır. Bu kokularda polinatörler tarafından ilk yiyecek aramasında tanımlanır ve koku hafızalarına yerleşir. Arı davranışlarında, arılar polen kokularını belirleyebildikleri için bal arılarında koku kaynaklı davranış araştırılmıştır. Arılarda davranışsal özellikleri ile polen kokularını algıladıklarını, polen tek besin kaynakları olsa bile belli düzeylerde tozlaşmaya izin verdikleri vurgulanmıştır. (Goodwinand Congdon;2018). Farina ve ark. (2007), yaptıkları bir çalışmada arıların koku davranışı ile ayçiçeği bitkisinde tozlayıcı ziyaretlerini artırdığı yönünde bir hipotez ileri sürmüşlerdir.

Arıcılığın geçmişi uzun yıllara dayansa da arıların bitkisel üretimde oynadığı rol hakkında az şey biliniyordu. Arıların tozlaşmada oynadığı önemli rol hakkındaki bilgiler on sekizinci yüzyılın ortalarına kadar uzanmaktadır. Ancak bu bilgilerin teorik olarak kullanımları 1900'lü yıllarda görülmektedir (Crane,1999; Lorenz,2021). Bal arısı kendi ihtiyaçları doğrultusunda gün içinde bal özü ve polen toplayarak zamanlarını geçirirler. Bu işlem sırasında üzerlerine yapışan çiçek tozlarını bir çiçekten başka çiçeğe taşırlar (Şahinler, 2000; Kekeçoğlu ve ark., 2014). Dünya üzerinde yer alan çiçekli bitkilerin %16'sının, tarımsal olarak üretimi yapılan bitki türlerinin yaklaşık olarak 400 tane bitki türünün polinasyonu bal arıları tarafından gerçekleştirilmektedir (Karaman,2018).

2017 yılında yapılan bir çalışmada bal arısı ve bambus arısının kiraz bitkisi üzerine ziyaret sıklığı ve etkinliğinin tozlaşmaya olan katkısı araştırılmış. Bu çalışmanın sonuçları incelendiğinde arıların iki yıllık veri ortalamasına göre bal arısı ve bambus arılarının çiçekleri ziyaret sıklığı %93, %94 olarak belirlenmiş. Oransal olarak bakıldığında bambus arısı ve bal arısının diğer tozlayıcılara kıyasla daha fazla tozlama etkinliğinde bulunduğunu gözlemlemişlerdir. Yapılan araştırmada bambus ve bal arılarının ziyaret ettiği bitkilerin meyve tutma oranının en fazla olduğu sonucunu elde etmişlerdir (Topal ve ark, 2017).

FAO verilerine göre dünya nüfusunun %90'nın beslendiği 100 ürün (elma, armut, badem böğürtlen gibi) arılar tarafından tozlaştırılmaktadır (Anonim, 2016). Yonca bitkisine arıların tozlayıcı etkisini incelemek amaçlı yapılan çalışmalarda, yonca bitkisinin meyve bağlama, tohum tutma, meye ve tohum verimindeki çok önemli farkın büyük oranda tozlayıcı arılardan kaynaklandığı ortaya çıkmıştır (Avcı ve ark, 2010, Öztürk, 2015).

Bal arılarının kivi bitkisi üzerinde yer alan polenlerden yararlanma oranı oldukça yüksektir. Kivi bitkisi polenlerinden bal arılarının yararlanması üzerine yapılan araştırma sonucuna göre, bal arıları tarafından tozlaştırılan kivi çiçeklerinin %98.92'sinin meyveye dönüştüğü ancak arı girişine engel olunan kivi çiçeklerinin ise sadece %32.08'si döllenerek meyveye dönüştüğü saptanmıştır.

Apis mellifera l. kivide verim ve kaliteyi artırmada önem taşımaktadır. Arıların besin ihtiyaçları açısından bakıldığında, kivi bitkisinin bal arıları için çok iyi bir polen kaynağı olduğu belirtilmiştir. Aslında bu durumda hem bitki hem arılar için karşılıklı bir yarar söz konusudur (Kuvancı ve ark., 2016). Kivi bitkisinin tozlaşmayla kalitesinin artırıldığı bilinci ile yapılan bir araştırmada bal arısını yiyecek arama davranışını yönlendirmek arıların kivi çiçeklerini ziyaretlerini arttırmak için, kivi bahçesinde kokuların kullanımı gerçekleştirilmiş. *Apis mellifera*'nın kivi çiçeklerini ziyaretindeki bu tür bir artışın, tozlaşma etkinliğini artıracak daha iyi (daha büyük ve daha düzenli meyve şekline) bir meyve kalitesine sebebiyet vereceği düşünülmüştür. Araştırmada dişi çiçeklere

yapay kokular (şeker şurubu, şeker şurubu ve *Lavandula hybrida* özütü gibi) işlenmiş. Sonuç olarak da, çekici madde *Lavandin Grosso* serpilmiş dişi çiçeklere daha fazla bal arısı ziyareti olduğu ve daha yüksek meyve kalitesi (ağırlık, tohum sayısı, meyve büyüklüğünde düzenlilik) gösterdikleri bildirilmiştir (Meroi Arcerito ve ark., 2021). Çilek bitkisi üzerine arıların tozlayıcı etkisi araştırılmış bu araştırma sonucunda da arıların çilek meyve kalitesini, iriliğini, tozlanma ve dölleme düzeyini arttırdığı gözlemlenmiştir (Sarıdaş ve Kargı, 2017). Bakla sebzesinde arılar tozlayıcı olarak kullanılmadığı da dane verimin azalma gösterdiği, bu oranın %20-%70 arasında değişiklik göstermiş olduğu bildirilmiştir (Sıralı ve ark, 2011)

Bambus terrestris arıları özellikle Akdeniz bölgesinde sahil kesimlerinde yapılan seracılıkta domates ve biber bitkilerinin tozlaşması için kullanılmaktadır. Bu arılara bölgede ilgi oldukça fazla olup ticari amaçla üretimleri gerçekleştirilmektedir. Her geçen yıl sera alanlarında kullanılan *Bambus* koli sayısı artış göstermektedir.

Polinasyon amacıyla yurt dışında yer alan birçok firmadan ana arı ithalatı gerçekleştirilmektedir. Çünkü ana arı kolonileri nispeten daha düşük fiyatlarla alınabilmekte ve de arıların doğaya bağlı olarak daha kolay koşullarda yetiştirilebilmesi, koloni içinde besin toplamak amacıyla fazla sayıda bireye sahip olmaları gibi sebeplerden dolayı meyve bahçelerinde tozlayıcı olarak tercih edilmektedirler. *Bambus* kolonileri, yaşam döngülerini tamamladığında yaklaşık olarak ana arılardan 60-70 adet işçi arı ve 120 adet erkek arı meydana gelir. İthalat sonucu alınan bu arıların ne kadarının doğal hayatta yuva oluşturduğu, kaçının çiftleşmesinin gerçekleştiği bilinmemektedir. Bu durum aslında arılar ile diğer polinatör böcekler arasında rekabete sebep olarak doğal dengenin bozulmasına sebep olabilir bu nedenle ana arı ithalatının ve ana arı üretiminin dikkatli olarak gerçekleştirilmesi gerekmektedir. Çünkü doğal ekosistemde meydana gelen bozulma ile bitkilerin polinasyonu engellenebilir, parazit ve patojenlerin bitkiler arası taşınmasına ve de genetik çeşitlilikte açılmaları sebep olabilir (Gösterit ve Güler, 2005).

Bitkilerin tozlaşmasında görev alan arıların diğer bir yararı ise tozlaşmayı sağladığı bitkilerden meydana gelen meyve üzerinedir. Arılar ile tozlaşan bitkilerden elde edilen meyveler daha düzgün şekli ve kalitesi yüksek, meyve bağlanma oranı yüksek, meyve tohum sayısı fazla, meyve iriliği fazla, yağlı tohumlarda yağ oranı fazladır ürünler elde edilir. Bunların yanında arı ürünlerinde çeşitlilik artar, arıların polinasyonun da artış ve hasat ile üretim aynı zamanda gerçekleşme imkanı bulur (Karadeniz, 2012; Yılmaz, 2016).

İnsanların doğal kaynakları kullanımı ekosistem dengesini değiştirmede temel bir itici güç görev görmektedir. Özellikle bu itici gücün etkileri böcekleri ve polinasyon da oldukça önemli olan bal arılarını etkilemektedir. Ekosistem de meydana gelen değişimlerde arıların davranışsal olarak değişmelerine sebep olmaktadır. Özellikle hızla artan kent nüfusu nedeni ile doğal kaynakları kısıtladığı bu nedenle arıların insan egemen bir doğada farklı gıda kaynaklarına yönelmeye itmektedir. Ancak bal arılarında meydana gelen bu davranışsal değişiklik henüz tam olarak anlaşılamamıştır.

1.2.Küresel ısınma ve iklim değişikliğinin arılar üzerine etkisi

Bütün dünya da dikkat çekmeye başlayan önemli bir olayda küresel ısınmadır. Küresel ısınma ile oluşan iklimde meydana gelen değişimler her geçen gün yaşantımızı daha da etkilemektedir. İklimde oluşan değişikliklerden dünya üzerinde yaşayan birçok canlının etkileneceği öngörülmektedir. Bu değişimden en çok etkilenecek varlıkların arasında böcekler yer almaktadır. Böceklerin vücut yapısı sıcaklık ve nemde meydana gelecek ani değişimlere uyum sağlayamayarak üreme kapasiteleri, yer değiştirme sürelerini etkileyeceği öngörülmektedir (Şahinler ve ark., 2008).

Sıcak ve nem oranında meydana gelecek değişimler bölgede yaşayan canlıların bulundukları bölgeyi terk etmesine neden olacağı gibi bazı bölgelerde de istilacı tür adı verilen bölgeye özgü olmayan türlerin o bölgeye yerleşmesine olanak verebilecektir. Bunlara ek olarak ise bazı türlerin ise küresel ısınma ile yok olma tehlikesi ile karşı karşıya olduğu bildirilmektedir (Doğan ve ark., 2010). Beş yıl önce imzalan Paris İklim antlaşmasına göre küresel ısınmanın 2030 yılına kadar 2 derecenin altında tutulması gerektiği öngörülmesine karşın, Birleşmiş Milletler Çevre Programı raporuna göre (2020) küresel ısınmanın bu koşullarda 3 santigrat derecenin üzerine çıkacağını vurgulamıştır (Anonim,2021). Bu konunun arılar üzerinde etkisini ele alan çalışmada ise kış sıcaklığının artması ile 9 arı türünde bazı türleri olumsuz etkilediğini, ağırlık kaybı yaşandığını, enerji tüketimlerinin arttığını, ilkbahar mevsiminde ise yaşam döngülerinin sona erdiğini bildirmiştir. Ancak tozlaşma kabiliyeti fazla olan yaban arılarında ise adaptasyon kabiliyetinin oldukça yüksek olduğunu belirtilmiştir (Fründ ve ark., 2013). Yapılan başka bir araştırmada ise Orta Avrupa ve Balkanlar'da, İskandinavya'dan Akdeniz'e kadar uzanan 11 Avrupa ülkesindeki 16 farklı genetik orijinli 5 *Apis mellifera* alt türüne ait (carnica, ligustica, macedonica, mellifera, siciliana) 20 arılıkta bulunan 597 koloni seçilerek, genotip ve çevrenin arılar üzerine etkisine bakılmıştır. Araştırma sonuçlarında ise Yavru popülasyonu Kuzey'de daha küçük olma eğiliminde iken, Güney Avrupa'ya yerleştirilen koloniler soğuk koşullara yerleştirilen kolonilere göre daha düşük yetişkin arı popülasyonuna sahip olma eğiliminde olduğunu gözlemlenmiştir. Yani bu demek oluyor ki sıcak iklimlerdeki arılar daha kısa yaşam süresi gösterirken, kuzeyde daha kısa yavru yetiştirme dönemi olmaktadır. (Hatjina ve ark., 2014).

Bal arılar dünya üzerinde birçok gıda türünün ve bitkilerin polinatördür. Arılar olmadan küresel gıda üretimi düşünülemez. Arıların genetik yapısına bakıldığında ise yeni çevre şartlarına uyum sağlayabilecek yapıya sahip olduğu bildirilmiştir. Ancak iklimde meydana değişimler bitkilerin çiçek kalitelerinin düşmesine neden olarak arıların kolonilerinde dolaylı yoldan kayıplara sebebiyet verebilir. Bunun yanında ise bal arısı ırkları arasında

nektar bulmak için bir rekabet ortamı yaratacağı öngörülen sonuçlar arasındadır (Le Conte ve Navajas, 2008). Bal arıları gün içerisinde nektar toplamak için bir çok çiçeği ziyaret etmektedir. Ancak ziyaret ettikleri nektar kaynağında yeterli nektar bulunmaması arılar için önemli bir stres unsurudur. Bu durumda tarlacı arılar arasında rekabeti azaltmaya yönelik bir işbirliği hedeflendiği görülmektedir (Hranitz ve ark., 2009). Daha da önemlisi ise yapılan bir çalışmada ise bal arıları, nektar ve polen kaynaklarının yetersiz olması durumunda mevcut kısıtlı besinin gelecek generasyona kalabilmesi için başlarını petek gözlerine sokarak kendilerini imha ettikleri bildirilmiştir (Yücel, 2008).

İklimsel değişimler tüm canlılarda olduğu gibi arılarında yaşam kalitelerini verimlerini hayatta kalmasını, üreme kabiliyetlerini etkilemektedir. Son yıllarda yapılan birçok araştırmada sonuçlar bunları göstermektedir. Örneğin, Yürütülen bir araştırmada Kayseri de özellikle erken ilkbahar aylarında arıların yavru yetiştirmek için ihtiyaç duydukları nektar ve polen kaynaklarının kıt olduğunu belirtmiştir. Son yıllarda ise arıcıları, küresel ısınmanın da bir etkisi olarak çiçek açma ve nektar salgılama dönemlerinin değiştiği ve bal veriminin düştüğü konusunda şikayetçi olduğunu bildirmişlerdir. Bunların önemi ise bal arılarının yavru yetiştirmek için daha fazla nektara ihtiyacının olduğu, bunun içinde mart-nisan aylarında ek yemlerle beslemenin zorunlu hale getirilmesi gerektiği vurgulanmıştır (Bekret ve ark., 2015).

Bir başka araştırmada ise sıcaklığın değişiminin, rüzgar hızının, yağış miktarının bal verimine etkisi araştırılmış. Araştırmanın sonuçlarında ise bal üretimi ile iklimsel değişikliğin pozitif korelasyon gösterdiği bildirilmiştir (Schweitzer ve ark., 2013).

Bütün canlılarda en önemli ihtiyaç olan besin maddesi sudur. Arılar içinde suyun büyük önemi vardır ki larval gıdanın %66'sı sudan oluşmaktadır. Yine arılar sıcak havalarda kovanda ki ısı dengesini ayarlamak, besinlerin sindirilerek metabolize edilmesinde, çözünmüş besin maddelerinin vücut organlarına taşınmasında, atık maddelerin uzaklaştırılmasında sudan yararlanır. Küresel ısınma ile doğa da su miktarında meydana gelen azalma ise arıların bu işlemleri gerçekleştirmesinde zorluk yaşamasına neden olacaktır (Yörük ve Şahinler, 2013).

İşçi arılar tarlacılık ve diğer koloni faaliyetlerini gündüz gerçekleştirmektedirler, geceleri ise bu faaliyetler önemli ölçüde azdır. Kolonide ki bal arılarında oksijen tüketimi ile karbondioksit üretimi incelendiğine en düşük metabolizma oranları sabah, en yüksek oranın ise öğleden sonra olduğu gözlenmiştir. Buna ek olarak ise Kolonilerde gündüz gözlenen metabolizma oranları geceye oranla daha fazla olduğu bildirilmiştir (Southwick ve Moritz, 1987). Laboratuvarında çevre ısısının sabit tutulduğu arılarda ise metabolizma oranları karşılaştırıldığında gündüz gözlenen metabolizma oranlarının geceye oranla 8 kat daha fazla olduğunu bildirilmiştir. Ancak ışığın yoğunluğunun ve karanlık şartlar altında metabolizma ritminin içsel sosyal saat tarafından belirlenerek sabit kaldığını gözlemlemişlerdir (Southwick ve Moritz, 1987).

Arılar için diğer önemli nokta ise kovan sıcaklığının ve nemimin sabit tutulmasıdır. İşçi arılar tarafından gerçekleştirilen bu işlem, nektarın bala dönüşmesi (olgunlaşma), açık gözlerdeki yavruların kurumaması, yumurtaların yüksek oranda çatlayarak larvaların oluşması için de gereklidir. Diğer bir açıdan ise ana arının yumurtladığı yumurtaların çatlaması, larvaların gelişebilmesi için mevcut rubet oranının %90-95 oranında olması gerekmektedir. Bu rubet oranının daha fazla ya da daha az olduğu (% 100,%80,%50 ve %20 nem oranında) çalışmalar yapılmış ve bu durumda yumurtaların larvaya dönüşümün azaldığı, yumurtaların kuruduğu için çatlayamadığı bildirilmiştir (Doull, 1976). Yine ana arının çiftleşme uçuşuna çıktığı dönemlerde ise iklimde meydana gelen değişimler nedeni ile oluşan yağmurlu havalarda ana arı bu uçuşu gerçekleştirememekte, yada tam çiftleşememe gibi sorunlar nedeni karşılaşılmaktadır. Bu durum sonucunda ise ana arının verim kalitesi azalmaktadır.

Küresel ısınmanın diğer bir sonucu ise bitkilerin çiçeklenme döneminin başlangıcında, böceklerin (tozlayıcıların) ilk görülmeye başladığı zamanlar ve sezonları, sıcaklıkta meydana gelen artmalar ile birlikte bu dönemlerin tarihlerinde değiştiği ve arttığı gözlemlenmiştir. Tüm türler arasında meydana gelen bu fenolojik tepkiler farklılık gösterse de bitkiler ve tozlayıcıları arasında bu tepkilerin oranları aynı olduğu ortaya çıkmıştır. Yani bitkilerin çiçeklenme ve tozlaşma aktivite zamanının sıcaklıktan çok güçlü etkilendiğini gösterirken, bitki ve tozlayıcıların fenolojisi, coğrafik dağılımı aynı zamanda bulunma oranları iklim değişikliğinden etkilenmektedir (Hegland ve ark., 2009).

Küresel iklim değişikliğinin artış gösterdiği son dönemlerde biyoçeşitlilik oldukça önem arz etmektedir. Bal arılarının bölgeye adaptasyon yetenekleri oldukça güçlü olsa da ülkelerde kalkınma politikalarının sonuçları ile bölge yerli arılarının geleceği tehlikeliye girmektedir. Koç ve Karacaoğlu 'nun gerçekleştirdikleri araştırmada, Ege Bölgesi koşullarında Anadolu arısı Ege ekotipi, Kafkas ve İtalyan ırkı genotiplerinden oluşturulan gruplarda, yavru alanı, arılı çerçeve sayısı, uçuş etkinliği, hırçınlık ve bal verimi gibi bazı davranış ve fizyolojik özellikleri incelenmiştir. Genetik olarak farklılığı bulunan gruplar da 10 dönemde ölçülen arılı çerçeve sayıları, yavru alanları, uçuş etkinliği bakımından dönemler ve bal verimlerinin, genotipler arası farkların, önemli olduğu bildirilmiştir. Bölgede Kafkas genotipinin küresel iklim değişikliğinin devam etmesi durumunda bu ırkın yetiştirilmesinin olanaksız hale geleceği bildirilmiştir (Koç ve Karacaoğlu, 2012).

Sonuç

Ekosistem üzerinde var olan bir düzen ve denge vardır. Bu dengenin sağlanmasında arıların önemi oldukça fazladır. Birçok bitki türünün tozlaşmasında görev alan arılar sayesinde bitki çeşitliliği artmakta olup bu bitkilerde elde edilen ürün kalitesi-miktarı da artış göstermektedir. Arılar ile tozlaşması gerçekleşen bitkilerden meydana gelen meyvelerin miktarları daha fazla olup daha düzgün şekilli ürünler meydana gelmektedir.

Arılar birçok bitki türünün polinasyonunu gerçekleştirmektedir. Bitki çeşitliliğinin devamı için arıların önemi bir kez daha karşımıza çıkmaktadır. Nesli tükenmek üzere olan bazı bitkilerin nesillerinin devamını sağlamaktadırlar. Tükettiğimiz gıdaların %80 'nin tozlayıcısı arılardır. Arılar sayesinde gıdaların raf ömrü uzayarak sofralarımıza kadar gelebilmektedir.

Ekosistem de ki yeri oldukça önemli olan arı ırklarının sadece doğaya olan faydaları değil biz insanlara da olan faydalarını düşünerek bu canlıları koruma altına almalıyız. Nesillerini devamı için mümkün olduğunda tarım ilaçlamalarından kaçınıp, eğer ilaçlama yapılacaksa bu canlılar baz alınarak ilaçlama gerçekleştirilmelidir. 30.11.2011 tarihli Resmi Gazetede 28128 sayı ile yayınlanarak yürürlüğe girmiş Arı Yönetmeliğinde zirai ilaçlama tedbirleri olarak uyuması gereken hususlara yer verilmiştir. Bu yönetmelik kapsamında zirai mücadele gerçekleştirilmelidir. Arıcıların bu konuda bilinçlendirilmesi, arıcılık eğitimlerinin verilmesi gerekmektedir.

Yine çağımızı için önemli bir sorun haline gelen küresel iklim değişikliğine karşı yapılacak bilimsel çalışmaların artırılması gerekmektedir. Ani ısı değişimleri sonucu meydana gelen floradaki etkileri doğrudan arıcılığı ve arıların nektar kaynaklarını da etkilemektedir. Dolaylı yoldan yine arıcılar için işçilik ve gezginci arıcılığın yapılabilmesi için nakliye ücretlerinin artmasına neden olarak üretim maliyetleri fazlaşmaktadır.

İklimsel ve coğrafik faktörlerde türlerin biyoçeşitliliğinin dağılımı için önem taşımaktadır. Bu nedenle bölgeye uygun ırkların yetiştirilmesi, bu ırklar ile arıcılığın sürdürülmesi açısından önem taşımaktadır.

Arı neslin tükenmesinin insan neslinin de tükenmesi demek olduğunu aklımızdan çıkarmamalıyız. Einstein de söylediği gibi ‘ Arılar olmasa insanlığın 4 yıl ömrü kalır ‘.

Insecticidal activity of the seed powders of Bush banana, *Uvaria afzelli* Scott Elliot against maize weevil, *Sitophilus zeamais* Motschulsky (Coleoptera: Curculionidae).

Obembe Olusola Michael

Department of Plant Science and Biotechnology, Plant Resources management Program, Ekiti State University, Ado Ekiti, Nigeria

Abstract

The seed powders of bush banana, *Uvaria afzelli* Scott Elliot were sun-dried and pulverized and stored in labeled containers. The powders' activity was investigated on maize weevil, *Sitophilus zeamais* Motschulsky in the laboratory for mortality, oviposition and adult emergence effects using standard methods. The long-term storage and viability of the treated maize grains were also investigated using emergent holes and the ability of the grains to germinate respectively as indices. The results showed that dosage treatment at 9 g/90 g of maize was the most potent against *S. zeamais*. This dosage treatment caused 100 % mortality of weevils within 15 days of exposure. The least potent powder dosage was 3 g/90 g of maize and this caused 42.25 % mortality of weevils within 20 days of exposure. The powder also caused a significant reduction in the number of eggs laid and adult emergence. The most negligible percentage adult emergence of 8.25 % was recorded in maize grains treated with 4.5 g/20 g of powder while the highest was recorded in grains treated with 1.5 g/20 g dosage of seed powder. The least grain damage of 12.12 % was recorded in grains treated with 9 g/90 g of seed powder while the highest (18.13 %) was recorded in maize grains treated with 3 g/90 g of seed powder. The three seed powder dosages used showed positive protectant ability because weevil perforation index did not exceed 50. The seed powder increased seed viability as germinability ranged from 82.34 % to 85.25 %. The results obtained showed that *U. afzelli* seed powder effectively controlled *S. zeamais*, enhanced germinability of maize and could serve as alternative to conventional insecticide.

Key words: *Uvaria afzelli*, *Sitophilus zeamais*, oviposition, seed powder, mortality, adult emergence, seed viability.

Investigation of Vegetable Milk (Extract) Production from Pumpkin Seeds

Mustafa Ozturk^{1*}, Umut Yılmaz¹, Burak Özgün¹, Ebru Karaçalı¹, Melis Aksoy¹

¹Food Engineering Department, Faculty of Engineering, Sakarya University, Sakarya, TURKEY

Abstract

In order to prevent the food shortage in the world, it has become important to obtain consumable food products from the by-product of fruits and vegetable processing. In this study, the production of vegetable milk from the waste pumpkin seeds of the pumpkining industry was investigated. Pumpkin seeds were obtained from a local company producing pumpkin products in Sakarya, and vegetable milk was obtained by water extraction. Composition and color analyzes of the raw and roasted pumpkin seed milks were carried out. Raw and roasted pumpkin milks were flavored with coffee and vanilla and sensory evaluation conducted on a hedonic scale with 33 panelists. As a result of the sensory analysis, it was revealed that pumpkin seed milk flavored with vanilla and coffee was more liked than unflavored (plain) pumpkin seed milk. No sensory differences were detected between roasted and raw pumpkin seed milks.

Bal Kabağı Çekirdeğinden Bitkisel Süt (Öz) Üretiminin İncelenmesi

Özet

Dünyada yaşanan gıda yetersizliğinin önüne geçebilmek için gıda ham maddelerinin işlenmesi sonrası atık olarak ortaya çıkan kısımlarından tüketilebilir gıda ürünü elde edilmesi önemli hale gelmiştir. Bu çalışmada bal kabağı ürünleri üretiminde ortaya çıkan atık çekirdekten bitkisel süt üretimi incelenmiştir. Sakarya’da lokal bir bal kabağı ürünleri üreten firmadan bal kabağı çekirdekleri temin edilmiş ve özü çıkartılarak bitkisel süt elde edilmiştir. Elde edilen çiğ ve kavrulmuş bal kabağı çekirdeği sütlerinin kompozisyon ve renk analizleri gerçekleştirilmiştir. Çiğ ve kavrulmuş bal kabağı sütleri kahve ve vanilya ile aromalandırılarak 33 panelist ile hedonik ölçekte duyuşal olarak değerlendirilmiştir. Yapılan duyuşal analiz sonucunda vanilya ve kahve ile aromalandırılmış bal kabağı çekirdeği sütlerinin aromalandırılmamış (sade) bal kabağı çekirdeği sütlerinden daha çok beğenildiği ortaya çıkmıştır. Kavrulmuş ve çiğ bal kabağı çekirdeği sütlerinin arasında duyuşal farklılık tespit edilmemiştir.

Do IBA and Paclobutrazol Applications Increase Rooting Performance of Blackberry Cuttings?

**Muhammed Rahmetullah Çiğdem¹, Alperen Donat¹, Emircan Dinçer¹, Kenan Yıldız¹,
Osman Nuri Öcalan¹**

¹ Horticulture, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, Turkey

Abstract

Difficulties in adventitious root formation in blackberry (*Rubus fruticosus* L.) cuttings create a disadvantage for producers. The aim of this study is to investigate the effect of different growth regulator applications on the rooting ability of blackberry hardwood cuttings in order to avoid this problem. The experiment was carried out in the polycarbonate greenhouse of Tokat Gaziosmanpaşa University Agricultural Research and Application Center. In the experiment, in addition to the control (pure water) group, Indole-3-Butyric Acid (6000 ppm IBA) and different doses of paclobutrazole (1000 ppm PBZ1, 2000 ppm PBZ2, 3000 ppm PBZ3) were applied to hardwood cuttings separately and in combination. After the application, the cuttings were planted in perlite medium and left to root for 90 days. At the end of this period, in the cuttings removed; rooting rate, callus formation rate, root number, root length and root diameter parameters were examined. As a result of the study, the highest rooting rate was obtained from the IBA applied cuttings (%42.22), followed by the PBZ1 applied cuttings closest (%33.33). In addition, it was determined that PBZ applications had positive effects on root diameter compared to the control group. The results obtained are important in terms of contributing to the literature and benefiting the enterprises.

Key Words: *Rubus fruticosus* L., Hardwood cutting, Callus, IBA

IBA ve Paclobutrazol Uygulamaları Böğürtlen Çeliklerinin Köklenme Performansını Arttırır Mı?

Özet

Böğürtlen (*Rubus fruticosus* L.) çeliklerinde adventif kök oluşumunda yaşanan zorluklar üreticiler açısından bir dezavantaj oluşturmaktadır. Bu çalışmanın amacı yaşanan bu sıkıntının önüne geçmek adına farklı büyüme düzenleyici uygulamalarının böğürtlen odun çeliklerinin köklenme kabiliyeti üzerindeki etkisini araştırmaktır. Deneme, Tokat Gaziosmanpaşa Üniversitesi Tarımsal Araştırma ve Uygulama Merkezine ait polikarbon serada yürütülmüştür. Denemede, kontrol (saf su) grubuna ek olarak İndol-3-Bütirik Asit (6000 ppm IBA) ve farklı dozlarda paclobutrazol dozları (1000 ppm PBZ1, 2000 ppm PBZ2, 3000 ppm PBZ3) odun çeliklerine ayrı ayrı ve kombinasyon şeklinde uygulanmıştır. Uygulama sonrasında çelikler, perlit ortamına dikilmiştir ve 90 gün boyunca köklenmeye bırakılmıştır. Bu süre sonunda sökülün çeliklerde; köklenme oranı, kallus oluşum oranı, kök sayısı, kök uzunluğu ve kök çapı parametrelerine bakılmıştır. Çalışma sonucunda, en yüksek köklenme oranı IBA uygulanan çeliklerden elde edilmiştir (%42.22) ve bunu en yakın PBZ1 uygulanan çelikler takip etmiştir (%33.33). Ayrıca PBZ uygulamalarının kök çapı üzerine kontrol grubuna kıyasla olumlu etkilerinin olduğu saptanmıştır. Elde edilen sonuçlar literatüre katkı sağlaması ve işletmelerin faydalanması açısından önem arz etmektedir.

Anahtar Kelimeler: *Rubus fruticosus* L., Odun çeliği, Callus, IBA

Giriş

Rosaceae familyasının bir üyesi olan böğürtlen (*Rubus* L.) bitkisi (Antunes ve ark., 2002), Türkiye’de yabancı olarak da yetişebilen bir üzümü meyvedir. Böğürtlen lif, antosiyanin, antioksidan ve temel vitaminler açısından zengindir (Wu ve ark., 2010). Böğürtlen, sürgün ve doku kültürünün yanı sıra otsu, odunsu ve kök çelikleri ile çoğaltılabilmektedir (Antunes ve ark., 2004). Meyvecilikte elde edilen ürünlerin homojen özellik göstermesi, vejetatif çoğaltma yöntemleriyle üretilen fidanlardan geçmektedir (Yıldız ve ark., 2009). Dolayısıyla çelikle çoğaltma yöntemi en çok tercih edilen yöntemlerden biridir. Çelikle çoğaltmanın başarılı olması, genetik köklenme potansiyeline ek olarak, ana bitkinin fizyolojik koşulları, çelik dikim zamanı, hormonal denge, sıcaklık, ışık ve neme bağlıdır (Fachinello ve ark., 2005). Çeliklerin köklenme potansiyelinin artmasında bazı büyüme düzenleyiciler kullanılmaktadır. Bunlar arasında en yaygın olanı, köklenme yüzdesini artıran ve köklenmeyi teşvik eden İndol-3-Bütirik Asit (IBA)’tır (Han ve Ark., 2009). En çok kullanılan sentetik oksinler arasında olan IBA, çok sayıda türde etkisini göstermektedir. Ayrıca toksik olmaması ve oksinin bozulmasına yol açabilecek enzim sistemlerinin etkisine çok az duyarlıdır (Pires ve Biasi, 2003). Literatüre bakıldığında IBA ile yapılan çalışmalarda, IBA’nın köklenmeye olumlu etkisinin olduğu görülmektedir (Yıldız ve ark. 2009; Koyuncu ve ark. 2004; Erdoğan ve Aygün 2007; Karadeniz ve Şişman 2004).

Paclobutrazol (PBZ), hücre uzamasını engelleyen bir büyüme düzenleyicidir. (Couture, 1982). Bitki gelişimini engelleyici etkiye sahip olduğu da bilinmektedir (Soumya ve ark., 2017; Geboloğlu ve ark., 2015). Paclobutrazol, gibberellin sentezini inhibe etmesi nedeniyle etilen üretimini yavaşlatarak, sitokinin ve ABA içeriğini artırması

sonucunda fitohormonların durumunun değişiminde etkiye bulunur (Kamoutsis ve Sereli, 1999). Köklenme çalışmalarında Paklobutrazolun tek kullanımı ve IBA ile kombinasyon yapılan çalışmalarda köklenmeye olumlu etkisinin olduğu belirtilmiştir (Henrique ve ark., 2006; Çekiç ve ark., 2012; Bueno ve ark., 2021). Literatüre bakıldığında üzümsü meyvelerde IBA kullanımı 2500 ppm ile 7500 ppm arasında, PBZ kullanımının ise 100 ppm ile 3000 ppm arasında değiştiği görülmektedir. Bu çalışmanın amacı IBA ve PBZ'nin ayrı ayrı ve birlikte kullanımının böğürtlen odun çeliklerinde köklenme potansiyeline etkisini incelemektir.

Materyal ve Yöntem

Çalışma 2021-2022 yıllarında, Tokat Gaziosmanpaşa Üniversitesi Araştırma ve Uygulama Merkezine ait polikarbon serada yürütülmüştür. Denemede kullanılan çelikler, aynı Araştırma ve Uygulama Merkezinde bulunan Jumbo böğürtlen çeşidinin 1 yaşlı dallarından temin edilmiştir. 15 cm boyunda kesilen çelikler, polikarbon sera içerisinde yer alan sisleme ünitesine sahip köklendirme masalarında perlit ortamına dikilmiştir. Dikimden önce çeliklere kontrol grubu (saf su) haricinde; 6000 ppm IBA, 1000 ppm, 2000 ppm ve 3000 ppm PBZ ayrı ayrı ve kombinasyon şeklinde uygulanmıştır. Çeliklerin üçte birlik kısmı IBA solüsyonunda 5 saniye, PBZ solüsyonunda ise 15 dakika boyunca bekletilmiştir. Denemede pozitif kontrol olarak 6000 ppm IBA kullanılmıştır. Deneme, tesadüf parselleri deneme desenine göre 3 tekerrürlü ve her tekerrürde 15 çelik olacak şekilde planlanmıştır. 90 gün süre ile perlit ortamında bekletilen çelikler, çalışma sonunda özenle çıkarılmış ve köklenme oranı, kallus oluşum oranı, kök sayısı, kök uzunluğu ve kök çapı parametrelerine bakılmıştır. Elde edilen veriler SAS paket programı kullanılarak varyans analizine tabi tutulduktan sonra uygulamaların karşılaştırılmasında Duncan çoklu karşılaştırma testi ($P < 0.05$) kullanılmıştır.

Çizelge 1. Çalışmada kullanılan Bitki Büyüme Düzenleyicileri ve dozları.

Uygulamalar	IBA (Konsantrasyon – ppm)	PBZ (Konsantrasyon – ppm)
Kontrol (Saf Su)	0	0
IBA	6000	0
PBZ1	0	1000
PBZ2	0	2000
PBZ3	0	3000
IBA+PBZ1	6000	1000
IBA+PBZ2	6000	2000
IBA+PBZ3	6000	3000

Bulgular ve Tartışma

Kök uzunluğu, kök çapı ve kök sayısı:

Çalışmada, farklı büyüme düzenleyicilerle muamele edilen böğürtlen odun çeliklerinin; kök uzunluğu (cm), kök çapı (mm) ve kök sayısı parametrelerine ait veriler Çizelge 2' de belirtilmiştir. Elde edilen verilere göre kök uzunluğu ölçümlerinde istatistiksel açıdan bir fark görülmemiştir. Buna karşılık kök çapı ve kök sayısı parametrelerinde istatistiki olarak fark oluşmuştur. Denemede, kök çapı verilerine bakıldığında, en yüksek değer PBZ2 uygulamasından elde edilirken en düşük değerler ise kontrol grubu ile birlikte IBA ve IBA+PBZ2 uygulamalarında görülmüştür. Çalışmada kök sayısı bakımından en düşük değerler PBZ1, IBA+PBZ1 ve IBA+PBZ3 uygulamalarında ortaya çıkmış, en yüksek değerler ise IBA ve IBA+PBZ2 uygulamasında saptanmıştır. PBZ2 ve PBZ3 ile muamele edilen çelikler ise kontrol grubu ile benzer özellik göstermiştir.

Yaptığımız çalışmada, yapılan uygulamaların kök uzunluğunu artırmada herhangi bir etkisinin olmadığı sonucuna ulaşılmıştır. Çekiç ve ark., (2013) kara dut ve mor dut ile yaptıkları çalışmada, kara dutta kök uzunluğunu artıran en iyi uygulamanın 2 cm ile IBA uygulaması, Mor dutta ise 3.03 cm ile IBA+PBZ uygulaması olduğunu bildirmiştir. Yıldız ve ark., (2009) yaptıkları çalışmada, kara dut çeliklerine uyguladıkları 7500 ppm IBA ile en yüksek kök uzunluğu değerine (9.58 cm) ulaştıklarını rapor etmişlerdir. Bueno ve ark., (2021)'nin yaptıkları çalışmada, 1000 ppm IBA uygulaması sonucunda 13,27 cm kök uzunluğu, 200 ppm PBZ uygulamasında ise 10,89 cm kök uzunluğu elde edildiği bildirilmiştir. Literatürdeki bu değerler bizim bulduğumuz değerlere göre yüksek çıkmıştır. Bunun sebebi kullanılan materyalin farklı tür olmasından kaynaklanmış olabilir.

Kök çapına bakıldığında, yapılan uygulamalar arasında en etkili uygulama, PBZ2 (2.08 mm) olmuştur, bunu PBZ3 (1.91 mm) uygulaması takip etmiştir. Çekiç ve ark., (2013) yaptıkları çalışmada kara dut için 2000 ppm PBZ uygulaması sonucunda kök çapının 0.2 mm bulunduğunu, IBA+PBZ uygulaması sonucunda ise 1.3 mm ile en yüksek değere ulaşıldığını ifade etmiştir. Aynı çalışmada mor dut için ise en iyi sonucun 2.1 mm ile PBZ uygulamasından elde edildiğini ifade edilmiştir. Bu çalışmada karaduttan elde edilen değerler bizim elde ettiğimiz değerlerden düşük olurken, mor dut için ifade edilen değerler çalışmamızla uyuşmaktadır. Serdar ve ark., (2021) 6000 ppm toz IBA uygulaması sonucunda 1.1 mm kök çapı elde etmiştir. Bizim çalışmamızda da benzer sonuç çıkararak 6000 ppm IBA uygulaması sonucunda 1.15 mm kök çapı elde edilmiştir.

Kök sayısına bakıldığında, yapılan uygulamalarda kök sayısını artırmada en başarılı uygulama IBA (8.69 adet/çelik) olurken, bunu IBA+PBZ2 uygulaması (8.58 adet/çelik) takip etmiştir. Bulduğumuz bu değer, Zenginbal

ve Demir, (2018)'in 4000 ppm IBA uygulaması sonucunda bulduğu değere (9.64 adet/çelik) benzerdir. Başka bir çalışmada ise Hussain ve ark., (2014) 2000 ppm IBA uygulaması sonucunda 13.5 adet/çelik değerine ulaştıklarını belirtmiştir. Belirtilen bu değer bizim bulduğumuz değerden yüksektir. Bu uyumsuzluk, farklı yetiştirme ortamı ve farklı kök bölgesi sıcaklıklarından kaynaklanmış olabilir.

Çizelge 2. Farklı büyüme düzenleyici uygulamalarının böğürtlen odun çeliklerinde kök uzunluğu, kök çapı ve kök sayısı parametrelerine etkisi.

IBA=6000 ppm Indol Butiric Acid, PBZ1=1000 ppm Paclobultrazol, PBZ2=2000 ppm Paclobultrazol, PBZ3=3000 ppm Paclobultrazol, IBA+PBZ1=6000 ppm Indol Butiric Acid+1000 ppm Paclobultrazol, IBA+PBZ2=6000 ppm Indol Butiric Acid+2000 ppm Paclobultrazol, IBA+PBZ3=6000 ppm Indol Butiric Acid+3000 ppm Paclobultrazol. Harflendirmeler uygulamaları temsil etmektedir. Aynı satırda bulunan aynı harfler, uygulamalar arasında fark bulunmadığını göstermektedir ($p < 0,05$).

Köklenme oranı ve kallus oluşum oranı:

Çalışmada, farklı büyüme düzenleyicilerin böğürtlen odun çeliklerine uygulanması sonucu ortaya çıkan köklenme ve kallus oluşum oranlarına ait veriler Çizelge 3'de verilmiştir. Verilerin istatistiksel analizi sonucunda her iki parametre için uygulamalar arasında fark olduğu saptanmıştır. Köklenme oranı bakımından en yüksek değer IBA uygulamasından elde edilmiştir, bunu PBZ1 uygulaması takip etmiştir. En düşük değerler ise kontrol grubu ile birlikte PBZ3, IBA+PBZ1 ve IBA+PBZ3 uygulamalarında ortaya çıkmıştır. PBZ2 ve IBA+PBZ2 uygulamaları ise kontrol grubu ile benzerlik göstermiştir. Kallus oluşum oranı bakımından en yüksek değerler PBZ1, PBZ2, PBZ3 ve IBA+PBZ1 uygulamalarından elde edilmiştir. En düşük değer ise IBA+PBZ2 uygulamasında tespit edilmiştir. Ayrıca kallus oluşumu ile köklenme oranı arasında bir bağlantı kurulamamıştır. Önceki çalışmalarda, Bueno ve ark., (2021) böğürtlenin köklenme performansı üzerine yaptıkları çalışmada 2000 ppm IBA + 400 ppm PBZ uygulaması sonucunda %36.67 köklenme elde ettiklerini bildirmiştir. Bu değer bizim bulduğumuz değerle uyusmaktadır. Yapılan başka çalışmalarda, Karadeniz ve Şişman, (2004) 2000 ppm IBA uygulaması sonucunda %23.4 köklenme, Yıldız ve ark., (2009) ise 6000 ppm IBA uygulaması sonucunda %24 köklenme başarıları tespit ettiklerini rapor etmiştir. Bu sonuçlar elde ettiğimiz verilere kıyasla daha düşüktür. Roussos ve ark., (2020) yaptıkları çalışmada, 2000 ppm IBA uygulaması sonucunda %85 köklenme elde ettiklerini bildirmiş, Çekiç ve ark., (2013) ise mor dut çelikleri ile yaptıkları köklenme çalışmasında IBA+PBZ uygulaması sonucunda %79.6 değerine ulaştıklarını ifade etmiştir. Bulunan bu sonuçlar, bizim çalışmamıza göre daha yüksek çıkmıştır. Literatürde belirtilen bu farklılıklar; çelik alma zamanı, çelik dikim zamanı, uygulama dozları, yetiştirme ortamının ısı ve kullanılan genotiplerin farklı olması gibi birçok nedenden kaynaklanmış olabilir.

Çizelge3. Farklı büyüme düzenleyici uygulamalarının böğürtlen odun çeliklerinde köklenme oranı ve kallus oluşturma oranına etkisi (%).

IBA=6000 ppm Indol Butiric Acid, PBZ1=1000 ppm Paclobutrazol, PBZ2=2000 ppm Paclobutrazol, PBZ3=3000 ppm Paclobutrazol, IBA+PBZ1=6000 ppm Indol Butiric Acid+1000 ppm Paclobutrazol, IBA+PBZ2=6000 ppm Indol Butiric Acid+2000 ppm Paclobutrazol, IBA+PBZ3=6000 ppm Indol Butiric Acid+3000 ppm Paclobutrazol. Harflendirmeler uygulamaları temsil etmektedir. Aynı satırda bulunan aynı harfler, uygulamalar arasında fark bulunmadığını göstermektedir ($p < 0,05$).

Sonuç

Yapılan bu çalışmada Böğürtlen odun çeliklerine IBA ve PBZ uygulamaları yapılarak çeliklerin köklenme performansları incelenmiştir. Çalışma sonucunda, uygulamaların kök uzunluklarını artırmada kayda değer bir etkisi olmamıştır. Çeliklerin kök sayısı ve köklenme oranlarında en etkili uygulama 6000 ppm IBA (pozitif kontrol) uygulaması olmuştur. En yüksek kallus oluşumu PBZ1, PBZ2, PBZ3 ve IBA+PBZ1 uygulamalarında görülmüştür. Çalışmada, kallus oluşumu ile kök sayısı, kök çapı veya köklenme oranı arasında doğrudan bir ilişki kurulamamıştır. IBA'ya kıyasla PBZ, kök çaplarının artmasında daha etkili olmuştur. PBZ2 uygulaması sonucunda daha kalın kökler oluşmuştur ancak kök sayısı oluşturmada IBA kadar etkili olamamıştır. Sonuç olarak çalışmamızda IBA'nın çelik başına kök sayısını artırdığı, PBZ'nin ise kök çaplarını artırdığı tespit edilmiştir. Bu doğrultuda çalışmamız fidan canlılığının sağlanması için en uygun dozların belirlenmesine yönelik yapılacak olan çalışmalara kaynak oluşturmaktadır.

Comparison of egg production and stress level of white and brown layer hens kept in different production systems

Arda Sözcü¹, Merve Gündüz¹

¹Department of Animal Science, Faculty of Agriculture, Bursa Uludag University, Bursa, Turkey

Abstract

This study was performed to compare the egg production level and stress level of white and brown layer hen genotypes kept in conventional cage (CC) and free-range (FR) system. A total of 960 white (Atabey (AB) and Lohmann White (LW)) and brown (Atak-S (AS) and Lohmann Brown (LB)) layer hens (n=240 hens/genotype/production system) were used in the experiment. The experimental groups were assigned as four groups: 1- AS in FR system, 2- AB in FR system, 3- LW in CC, 4- LB in FR system. Production performance was determined as the mean of egg production, egg weight and efficiency of feed utilization between 64 and 72 weeks of age. Stress level was assessed by determination of heterophil/lymphocyte ratio (H/L) at 72 weeks of age. The mean of egg production was found as 69.4% in AS in FR, 76.9% in AB in FR, 71.6% LB in FR, and 77.5% in LW in CC (P<0.01). The mean of egg weight was changed between 64.0 g and 67.8 g among the experimental groups (P<0.01). More efficient of feed utilization was observed in LW in CC system (2.02, P<0.01). At 72 weeks of age, the H/L ratio was found to be highest in the LW in CC system than the other experimental groups (1.47, P<0.01). These findings concluded that the hens kept in CC had a higher egg production with an efficient of feed utilization but was more stressful compared to the FR production system.

Key Words: Conventional cage, Free-range, Egg production, Feed efficiency, H/L ratio

Farklı Üretim Sistemlerinde Yetiştirilen Beyaz ve Kahverengi Yumurtacı Tavukların Yumurta Verimi ve Stres Düzeylerinin Karşılaştırılması

Özet

Bu çalışma konvansiyonel kafes (KK) ve serbest dolaşımli yetiştirme sisteminde (SD) yetiştirilen beyaz ve kahverengi genotipli yumurtacı tavukların yumurta verim seviyesi ve stres düzeylerinin karşılaştırılması amacıyla yürütülmüştür. Çalışmada beyaz (Atabey (AB) ve Lohmann Beyaz (LB)) ve kahverengi (Atak-S (AS) ve Lohmann Kahverengi (LK)) yumurtacı genotipler olmak üzere toplam 960 adet tavuk kullanılmıştır (n=240 tavuk/genotip/yetiştirme sistemi). Denemede dört farklı grup oluşturulmuştur: 1- AS genotipi SD sistemde, 2- AB genotipi SD sistemde, 3- LB genotipi KK sistemde, 4- LK genotipi SD sistemde. Üretim performansının değerlendirilmesi için 64-72 haftalık yaş dönemi için ortalama yumurta verimi, yumurta ağırlığı ve yemden yararlanma oranı belirlenmiştir. Stres düzeyinin değerlendirilmesi için 72 haftalık yaşta heterofil/lenfosit oranı (H/L) belirlenmiştir. Ortalama yumurta verimi SD sistemde yetiştirilen AS genotipi için %69.4, SD sistemde yetiştirilen AB genotipi için %76.9, SD sistemde yetiştirilen LK genotipi için %71.6 ve KK sistemde yetiştirilen LB genotipi için %77.5 olarak bulunmuştur (P<0.01). Ortalama yumurta ağırlığı deneme gruplarında 64.0 g ile 67.8 g değerleri arasında değişim göstermiştir (P<0.01). Yemden yararlanma oranının ise KK sistemde yetiştirilen AB genotipi için daha düşük olduğu gözlenmiştir (2.02; P<0.01). 72 haftalık yaşta H/L oranı KK sistemde yetiştirilen LB genotipli tavuklarda 1.47 değeri ile diğer deneme gruplarından daha yüksek olduğu tespit edilmiştir (P<0.01). Elde edilen bu bulgular, serbest dolaşımli yetiştirme sistemi ile kıyaslandığında, konvansiyonel kafes sisteminde yetiştirilen tavukların yumurta veriminin daha yüksek olduğu ve yemi daha etkin şekilde kullanabildikleri, ancak stres seviyelerinin ise daha yüksek olduğunu göstermektedir.

Anahtar Kelimeler: Konvansiyonel kafes, Serbest dolaşımli yetiştirme sistemi, Yumurta verimi, Yemden yararlanma oranı, H/L oranı

Giriş

Yumurta tavukçuluğu, Türkiye’de hayvansal üretim içerisinde önemli ve büyük bir paya sahip (2020 yılı 19.788.000.000 adet yumurta üretimi, Tapa, 2021), ülke ekonomisi ve tüketicilerin beslenmesine sağladığı katkı bakımından da oldukça aktif bir üretim faaliyetidir (Demircan ve ark., 2010). Son yıllarda hayvan refahı ile ilgili gelişmeler ve tüketicilerin sağlıklı ve güvenilir gıda tüketimi konusundaki taleplerin artışına bağlı olarak kanatlı üretiminde bazı değişiklikler ve yenilikler gündeme gelmiştir (Wojciechowska-Solis, 2021). Yaşanan bu gelişmelere paralel olarak, başta AB ülkeleri olmak üzere dünya genelinde yumurta tavukçuluğunda hayvan refahının dikkate alındığı alternatif yetiştirme sistemleri gündeme gelmiştir (Mutibvu ve ark., 2017).

Yumurta tavukçuluğunda konvansiyonel kafes sistemi yaygın şekilde kullanılmaktayken, entansif üretimde tavukların dar alanda barındırılması, yüksek stres ve düşük refah seviyesi gibi olumsuzluklardan dolayı (Campo ve ark., 2010), Avrupa Birliği Komisyonu konvansiyonel kafeslerde yumurta tavukçuluğunu 2012 yılında üye ülkelerde kullanımının yasaklanması kararını almıştır (EC/1999/74). Bu karara paralel olarak, serbest yetiştirme

sistemi ve organik üretim olmak üzere bazı alternatif sistemler geliştirilmiştir. Bu üretim sistemlerinde hayvanlara gezinti alanlarının sağlanması, otlatma imkanının verilmesi, doğal davranışların sergilenmesine olanak tanınması hayvan konforu ve refahının iyileştirmesine katkı sağlamaktadır (Ferrante ve ark., 2009).

Türkiye’de yumurta üretiminde farklı üretim sistemleri kullanılmakta olup, üretimin büyük bir kısmı kafes sistemi ile sağlanmaktadır. Mevcut veriler incelendiğinde, 2018 yılındaki yumurta üretiminin yaklaşık %78.3’lük kısmı konvansiyonel ve zenginleştirilmiş kafeslerde, diğer %21.7’lik kısmının ise serbest dolaşimli yetiştirme sistemi ve organik yumurta tavukçuluğu olmak üzere diğer alternatif yetiştirme sistemlerinden sağlandığı görülmektedir (Tepa, 2021).

Bu çalışmanın amacı, konvansiyonel ve serbest yetiştirme sisteminde yetiştirilen farklı yumurtacı genotipleri (Atak-S, Atabey, Lohmann) yumurtlama performansı, yumurta ağırlığı ve stres indikatörü olarak kabul edilen H/L oranı bakımından karşılaştırmaktır.

Materyal ve Yöntem

Bu çalışma, Bursa Uludağ Üniversitesi Ziraat Fakültesi bünyesindeki hayvancılık işletmesinde bulunan kanatlı yetiştirme biriminde, dört farklı genotipli (beyaz yumurtacılar: Atabey (AB), Lohmann Beyaz (LB); kahverengi yumurtacılar: Atak-S (AS), Lohmann Kahverengi (LK)) toplam 960 adet yumurtacı tavuk kullanılarak, iki farklı yetiştirme sisteminde (konvansiyonel kafes (KK) ve serbest dolaşimli yetiştirme sistemi (SD)) yürütülmüştür. Dört farklı deneme grubu oluşturulmuştur (n=240 tavuk/genotip/yetiştirme sistemi): 1- AS genotipi SD sistemde, 2- AB genotipi SD sistemde, 3- LB genotipi KK sistemde, 4- LK genotipi SD sistemde. Çalışma 64-72 haftalık yaş döneminde sürdürülmüştür.

Konvansiyonel sistemde 3 katlı batarya tipi kafes sistemi kullanılmıştır. Serbest dolaşimli yetiştirme sistemi ise kapalı barınak ve açık gezinti (otlatma) alanı olmak üzere iki kısımdan oluşmaktadır. Yetiştirme standartları ve çevresel koşullar bakımından çalışmada kullanılan genotip için önerilen bakım ve besleme standartları uygulanmıştır. Denemede yumurtacı tavuklar 2800 kcal/kg ME, %16.5 ham protein, %4.00 Ca ve % 0.37 yararlanılabilir P içeren II. dönem ticari yumurta yemi ile beslenmiş olup, çalışma boyunca yem ve su *ad libitum* düzeyde sağlanmıştır. Aydınlatma süresi olarak günlük 16 saat aydınlık:8 saat karanlık programı uygulanmıştır. Araştırma dönemi boyunca çevre sıcaklık ve nem değerleri minimum-maksimum değerleri ölçen termometre ve higrometre kullanılarak günlük olarak (kümes içi ve gezinti alanı) kaydedilmiştir. Serbest dolaşimli yetiştirme sisteminde otlatma alanı İngiliz çimi (*Lolium perenne*, %60), yonca (*Medicago sativa*, %30) ve ak üçgül (*Trifolium repens*, %10) bitkileri kullanılarak oluşturulmuştur. Konvansiyonel kafes sistemi ve serbest dolaşimli yetiştirme sistemlerinde tavuklara sağlanan kümes ve barındırma koşulları Tablo 1’de verilmiştir.

Kümes ve barındırma koşulları	Konvansiyonel kafes sistemi	Serbest dolaşimli yetiştirme sistemi (kapalı alan)	Serbest dolaşimli yetiştirme sistemi (gezinti alanı)
Barındırma yoğunluğu	562.5 cm ² /tavuk	3.33 tavuk/m ²	5 tavuk/m ²
Yumurta kanalı	Var	-	-
Tünek	-	18 cm tünek alanı/tavuk	-
Folluk	-	3.5 tavuk/folluk	-
Eşelenme alanı	-	Var	Var

Çalışmada üretim performansının değerlendirilmesi için, 64-72 haftalık yaş dönemi için ortalama yumurta verimi, yumurta ağırlığı ve yem dönüşüm oranı belirlenmiştir. Yumurta veriminin belirlenmesi içi, yumurta toplama işlemi günlük olarak ve her gün aynı saatte olacak şekilde kayıt altına alınmıştır. Elde edilen veriler kullanılarak ortalama yumurta verimi (tavuk/gün, %) belirlenmiştir. Ortalama yumurta ağırlığının belirlenmesi için, deneme gruplarına ait günlük olarak toplanan yumurtalar, haftanın hep aynı günü olmak üzere haftalık olarak teker teker ± 0.1 g hassasiyetle tartılarak belirlenmiştir. Her haftaya ait ortalama yumurta ağırlığı kullanılarak, deneme grubu bazında 64-72 haftalık ortalama yumurta ağırlığı hesaplanmıştır. Yem dönüşüm oranının belirlenebilmesi için deneme gruplarına verilen yem günlük olarak kayıt altına alınmış ve haftalık yem tüketim değerleri belirlenmiştir. Yem dönüşüm oranının hesaplanması için tüketilen yem miktarı yumurta kitle ağırlığına bölünmüştür.

Stres düzeyinin değerlendirilmesi için 72 haftalık yaşta heterofil/lenfosit oranı (H/L) belirlenmiştir. Bu amaçla, her deneme grubundan rastgele seçilen 5 adet tavuktan kan alınmış, alınan kan örneklerinden her bir lama bir damla kan damlatılarak epiferik yayma işlemi ile frotiler hazırlanmıştır. Frotilerin açık havada kurutulmasından sonra May-Grünwald ve Giemsa yöntemleri ile boyanmıştır (Gross ve Siegel 1983). Hazırlanan bu preparatlar dijital kameralı mikroskop (Leica, DM-500, İsviçre) ile incelenmiştir. Mikroskopik incelemede her bir preparat $\times 100$ ’lük objektif ile hücre sayımı işlemine tabi tutulmuştur. Sayım işlemi her bir preparat üzerinde lenfosit, nötrofil, monosit, heterofil, özonofil olmak üzere toplam 100 adet lökosit tamamlanana kadar devam etmiştir. Elde edilen heterofil ve lenfosit değerleri kullanılarak heterofil lenfosit oranı belirlenmiştir.

Denemede elde edilen verilerin gruplar arasındaki istatistiksel önemli farklılıklar genel varyans analizi ile Minitab 16 paket programı kullanılarak belirlenmiştir. Denemede elde edilen yüzde değerler açı transformasyonu (arc-sin) uygulandıktan sonra varyans analizi yapılmıştır. Deneme gruplarının ortalamaları arasındaki farklılıkların

karşılaştırılması için Tukey testi uygulanmıştır. Verilerin istatistiksel analizleri $P<0.01$ olasılık düzeyinde yapılmıştır.

Bulgular ve Tartışma

Çalışmada, farklı genotipli tavukların konvansiyonel sistem ve serbest dolaşimli yetiştirme sistemlerinde 64-72 haftalık yaş dönemleri arasındaki yumurta verimi Şekil 1’de gösterilmiştir. Çalışma sonucunda elde edilen veriler kıyaslandığında, en yüksek yumurta verimi konvansiyonel kafes sisteminde yetiştirilen Lohmann Beyaz genotipli yumurtacı tavuklarda (%77.5), en düşük yumurta verimi ise serbest dolaşimli yetiştirme sisteminde Atak-S genotipli kahverengi yumurtacı tavuklarda (%69.4) gözlenmiştir ($P<0.01$). Konvansiyonel kafes sisteminde yumurta veriminin diğer gruplardan daha yüksek olması, yetiştirme sistemleri arasında tavuklara sağlanan çevresel koşullardan kaynaklanması muhtemeldir (Meng ve ark., 2015). Nitekim, serbest dolaşimli yetiştirme sisteminde tavukların gezinti alanında daha fazla enerji harcaması yumurta veriminin konvansiyonel sisteme göre daha düşük olmasına neden olmuş olabilir. Ayrıca, çalışmada farklı genotiplerin kullanılması da bu farklılığa neden olduğu daha önce yapılan çalışmalarda açık bir şekilde ortaya konmuştur (Rakonjac ve ark., 2021; Sozcu ve ark., 2021).

Şekil 1. Deneme gruplarının yumurta verimi bakımından karşılaştırılması ($P<0.01$)

Çalışmada, farklı genotipli tavukların konvansiyonel sistem ve serbest dolaşimli yetiştirme sistemlerinde 64-72 haftalık yaş dönemleri arasındaki ortalama yumurta ağırlığı Şekil 2’de gösterilmiştir. Yetiştirme sisteminin ortalama yumurta ağırlığı üzerine etkileri hakkında farklı literatür bildirişleri bulunmaktadır. Hidalgo ve ark. (2008) serbest yetiştirme sisteminden elde edilen yumurtaların konvansiyonel kafes sisteminde elde edilen yumurtalardan daha ağır olduğunu ifade etmiştir. Diğer yandan, serbest dolaşimli yetiştirme sistemi ve organik üretim sisteminde yumurta ağırlığının daha düşük olduğunu bildiren araştırmalar da bulunmaktadır (Minelli ve ark., 2007; Krawczyk, 2009). Mevcut bulgular incelendiğinde hem yetiştirme sisteminin hem de genotipin yumurta ağırlığı üzerine etkili faktörler olduğu açıkça görülmektedir.

Şekil 2. Deneme gruplarının yumurta ağırlığı bakımından karşılaştırılması ($P<0.01$)

Çalışmada, farklı genotipli tavukların konvansiyonel sistem ve serbest dolaşimli yetiştirme sistemlerinde 64-72 haftalık yaş dönemleri arasındaki ortalama yemden yararlanma oranları Şekil 3’te gösterilmiştir. En etkin yem dönüşüm oranının konvansiyonel kafes sisteminde yetiştirilen Lohmann Beyaz genotipli yumurtacı tavuklarda elde edildiği gözlenmektedir. Rakonjac ve ark. (2021) yapmış oldukları çalışmanın sonucunda, kafeste ve organik

üretim sisteminde yetiştirilen Lohmann LSL Beyaz yumurtacı tavuklar için yem dönüşüm oranını sırasıyla 1.87 ve 2.65, ATAK-S kahverengi yumurtacı genotip için ise sırasıyla 2.32 ve 2.43 olarak bulduklarını ifade etmiştir.

Şekil 3. Deneme gruplarının yemden yararlanma oranı bakımından karşılaştırılması ($P<0.01$)

Çalışmada, farklı genotipli tavukların konvansiyonel sistem ve serbest dolaşımli yetiştirme sistemlerinde 72 haftalık yaşta H/L oranı değerleri Şekil 4'te gösterilmiştir. Konvansiyonel kafes sisteminde yetiştirilen Lohmann Beyaz genotipli yumurtacı tavuklarda bu değer diğer deneme gruplarındakine göre daha yüksek olduğu gözlenmiştir ($P<0.01$). Belirli çevre koşulları altında tavukların stres faktörlerine maruz kalması sonucunda, bazı kan değerlerinde değişimler meydana gelmekte olup, H/L oranı bu değerler arasında yer almakta ve stres indikatörü olarak kabul edilmektedir. Yumurtacı tavuklarda stres düzeyinin artmasıyla beraber H/L oranında artış meydana gelmektedir (Davis ve ark., 2008). Mevcut çalışma bulguları ile Shini (2003) tarafından bildirilen bulgular benzerlik göstermektedir.

Şekil 4. Deneme gruplarının H/L oranı bakımından karşılaştırılması ($P<0.01$)

Elde edilen bulgular incelendiğinde, farklı genotiplerin farklı yetiştirme sistemlerindeki yumurta verimi ve stres seviyeleri değişkenlik göstermektedir. Bu nedenle, farklı çevre koşulları altında özellikle alternatif yetiştirme sistemlerinde yumurtacı tavukların verimliliğinin ve refah seviyelerinin değerlendirilmesi pratik açıdan önem taşımaktadır.

²Department of Horticulture, Malatya Turgut Özal University, Faculty of Agriculture, Malatya, Türkiye

Abstract

Global climate change, regional economic and political crises, and problems experienced just outside our borders have a significant impact on agriculture and food markets. In order to increase agricultural productivity, techniques are sought for soil and product management, more economical use of resources and minimizing damage to the environment. It is aimed to give up the classical production and to implement an application form that handles the land with a non-homogeneous variable approach. Turkey is one of the most important agricultural countries of the world. In this new era, we call the age of smart life, which has the potential to become an important player in national and global markets with its sensitive and smart agriculture applications supported by new electronic-based technologies. New technologies such as the Internet of Objects, Artificial Intelligence, and Big Data appear as basic technologies for "Smart Agriculture" in parallel with all sectors. It is aimed to increase productivity, quality and added value in agriculture with smart technologies. With Agriculture 4.0, a significant competitive advantage will be achieved by working less but smarter, obtaining more and quality products with less resources. In this process, Turkey has to maximize the development and use of technology in the agricultural production system and create a structure that can compete in the international arena.

Smart agriculture technologies are mainly developed to ensure sustainability. Smart agriculture technologies are needed for our farmers to maintain their profitability and for the optimization of all our agricultural inputs. In order to develop these technologies for a sustainable agriculture in Turkey, we must produce the right strategies and policies.

Key words: agriculture 4.0, precision agriculture, smart agriculture, sustainability, yield,

Dünya’da Akıllı Tarım Aşamaları

Özet

Küresel iklim değişikliği, bölgesel ekonomik ve siyasi krizler ile sınırlarımızın hemen dışında yaşanan sorunlar tarım ve gıda piyasalarını önemli ölçüde etkilemektedir. Tarımsal verimliliği artırmak için toprak ve ürün yönetimini, kaynakların daha ekonomik kullanımını ve çevreye verilen zararın en aza indirilmesini sağlayan tekniklerin arayışına gidilmektedir. Klasik üretimden hayata geçirilerek, araziye homojen olmayan değişken bir yaklaşımla ele alan bir uygulama biçiminin hayata geçirilmesi hedeflenmektedir. Türkiye dünyanın en önemli tarım ülkelerinden birisidir. Akıllı yaşam çağı olarak adlandırdığımız bu yeni dönemde elektronik temelli yeni teknolojilerle desteklenen hassas ve akıllı tarım uygulamaları ile ulusal ve küresel pazarlarda önemli bir oyuncu olma potansiyeline sahiptir. Nesnelerin İnterneti, Yapay Zekâ, Büyük Veri gibi yeni teknolojilerin tüm sektörlere paralel olarak “Akıllı Tarım” için de temel teknolojiler olarak karşımıza çıkmaktadır. Akıllı teknolojiler ile tarımda verimlilik, kalite ve katma değeri artırma hedeflenmektedir. Tarım 4.0 ile daha az ama daha akıllı çalışarak, az kaynakla daha fazla ve kaliteli ürün elde ederek önemli rekabet avantajı yakalanabilecektir. Türkiye bu süreçte, tarımsal üretim sisteminde teknoloji geliştirmeyi ve kullanımını üst düzeye çıkarıp, uluslararası alanda rekabet edebilecek bir yapıyı oluşturmak durumundadır.

Akıllı tarım teknolojileri temel olarak sürdürülebilirliği sağlamak amacıyla geliştirilmektedir. Çiftçimizin karlılığını sürdürebilmesi için, tüm tarım girdilerimizin optimizasyonu için, akıllı tarım teknolojilerine gereksinim vardır. Türkiye’de sürdürülebilir bir tarım için bu teknolojileri geliştirebilmek için doğru strateji ve politikaları üretmeliyiz.

Anahtar Kelimeler: akıllı tarım, hassas tarım, sürdürülebilirlik, tarım 4.0, verim

Giriş

Dünya nüfusunun 2030 yılında 8,6 milyar, 2050 yılında yaklaşık 10 milyar ve 2100 yılında 11,2 milyar olacağı tahmin edilmektedir (Anonim, 2020a). Bu tahminler doğrultusunda küresel gıda talebinde %70’lik bir artış olacağı bildirilmektedir (Güzey vd., 2020; Rehman vd., 2022). FAO’nun değerlendirmelerine göre, insan nüfusunun %60’ından fazlası tarıma bağımlıdır ve toplam arazi alanının yaklaşık %12’si tarımsal üretim altındadır (Mistry vd., 2022). Tarih boyunca medeniyetlerin gelişimine katkı sağlayan tarım sektörü, dünyanın en büyük besin kaynağıdır. Ayrıca 2020 yılından itibaren tüm dünyayı etkisi altına alan Koronavirüs salgını ile yaşam döngüsünde tarımın ne kadar önemli bir rol oynadığı daha net ortaya çıkmıştır. Dünya nüfusedeki artışın yanı sıra kentleşmenin artması da gıda talebine olan ihtiyacı artırmaktadır. Toprak erozyonu, ormansızlaşma, yanlış kullanım, aşırı otlatma, yanlış ekim nöbeti, dengesiz gübre kullanımı gibi nedenlerle tarım alanlarının giderek

azalmakta olduğu belirtilmektedir (Kılavuz ve Erdem, 2019). Küresel ısınma sonucu iklim değişiklikleri, tarım arazilerinin ve doğal kaynakların azalması, sürekli değişen piyasa gereksinimleri, tarım sisteminin değiştirilmesi gerektiğini göstermektedir. Sürdürülebilir tarım ilkelerini gerçekleştirmek için teknoloji, araştırma ve geliştirme mümkün olan en geniş ölçüde kullanılmalıdır (Friha vd., 2021). Mevcut sorunlar ve gelecekte ortaya çıkabilecek sorunların çözümü, tarım sektörünün gelişmesini ve modernleşmesini zorunlu hale getirmiştir (Rehman vd., 2022). Geleneksel tarım yöntemlerinin yetersiz kaldığı günümüzde, verimliliği artıran ve maliyetleri düşüren Tarım 4.0 (akıllı tarım) uygulamalarına odaklanmak gerekmektedir (Kılavuz ve Erdem, 2019). Modern toplumlarda yenilikler, tarımsal kalkınmanın ön koşulu olarak kabul edilmektedir. Yeni değerler üretmenin bir yolu olarak tanımlayabileceğimiz inovasyon, yaşam süreci boyunca her alanda olduğu gibi tarım sektöründe de varlığını sürdürmektedir. Tarımda sürdürülebilir yenilikleri gerçekleştirirken çevre üzerindeki olumsuz etkileri azaltmak veya önlemek, ekonomik ve sosyal çıkarlar dengesini gözetmek önceliklidir (Şenol, 2021). Bu doğrultuda tarlalarda bitki ekimi, ürün hasadı, ilaçlama, sulama, toprak, bitki ve hayvan sağlığı, sıcaklık izleme, gübreleme, yabancı ot kontrolü ve rutin tekrarlı çalışmalar kapsamında birçok faaliyette sensörler, uçan gözler (drone) kullanılmaktadır. Akıllı tarım kapsamında (tarım 4.0) nesnelerin interneti (IoT) teknolojisi ve robotlar gibi uygulamalar kullanılmaya başlanmıştır (Baran ve Karaçuha, 2021).

1. Tarımda Dijital Dönüşüm Aşamaları

İnsanoğlu 150 bin yıllık dünya serüvenini yaklaşık 140.000 yıllık yaşam biçiminde büyük bir değişiklik olmadan atlatmıştır. Göçebe bir hayat sürerken, avcılık ve toplayıcılık ile karşılandıkları yerde yiyecekleri biterse yiyecek bulabilecekleri başka bir yere göç etmişlerdir. Doğanın döngüsü ile uyum içinde olan insan yaşamı, yaklaşık 12 bin yıl önce (M.Ö. 9500) kalıcı bir dönüşüm geçirmiştir. Yerleşik hayata geçişle birlikte toprağın sunduğu imkanlar kullanarak üretime yani tarıma geçilmiştir (Pakdemirli vd., 2021). Tarımda sürdürülebilirlik en önemli konudur ve sürdürülebilirliği sağlamanın yolu da tarım sektöründe yenilikleri hayata geçirmekten geçmektedir. Dijital tarımda gelinecek durum bir anda gerçekleşen bir süreç değildir. Sanayi devriminin evrelerinde olduğu gibi "Tarım 4.0" da yıllarca süregelen bir gelişim evresi yaşamıştır (Kılavuz ve Erdem, 2019; Güzey vd., 2020). Bu dönüşüm sürecinin bir sonraki basamağının "Toplum 5.0" veya "süper akıllı toplum" olduğu belirtilmektedir. Tarım 4.0 üzerine kurulu insan odaklı bir yaklaşımı hedefleyen bilgi toplumu türü olarak tanımlanmaktadır.

Bu aşamalar;

Tarım 1.0 Hayvan gücü ve mekanizasyonun birlikte kullanımı

Tarım 2.0 Tarımda motor ve traktörlerin kullanılmaya başlanması

Tarım 3.0 Yönlendirme sistemleri ve hassas tarım uygulamalarına geçilmesi

Tarım 4.0 Biyoloji ve teknolojinin birleşmesi

Tarım 5.0 Robotik ve yapay zekâ, olarak belirtilmektedir (Güzey vd., 2020; Saracel ve Aksoy, 2020)

Tarımın gelişim evrelerini detaylı ele almak, tarım devriminin uzun bir süreç olduğunu anlamakta daha etkin olacaktır.

1.1. Tarım 1.0

İnsan ve hayvan gücünün ön plana çıktığı geleneksel tarım çağı olarak tanımlanmaktadır (Friha vd., 2021). Yoğun tarımsal üretimin baskın olduğu, üretimin ve verimliliğin düşük olduğu, tarımın doğa ve iklim koşullarına bağlı olduğu bir dönem olarak bildirilmektedir. Yeni makinelerin tanıtıldığı, tarım için yeni ticari yaklaşımların oluşturulduğu, ekili alanların genişletildiği, tarım bilimi ve mühendisliğinin olgunluğa ulaştığı bir aşama olarak tanımlanmaktadır (Yaman vd., 2021). Tarım 1.0, insan gücü dönemi olarak adlandırılmakta ve bu dönemde "Ne kadar çok kişi iseniz, o kadar güçlünüz" ifadesi kullanılmaktadır (Pakdemirli vd., 2021).

1.2. Tarım 2.0

"Yeşil Devrim" olarak bilinen bu evre 1950'li yılların sonlarında başlamıştır. Azot takviyesi, sentetik pestisitler, gübreler ve tarımsal uygulamalarda gelişmiş makinelerin kullanımı, verim potansiyelini ve getirilerini büyük ölçüde artırmıştır. Küçük aile çiftliklerinin yerini büyük işletmelerin almaya başladığı, hibrit tohumların geliştirildiği ve modern sulama sistemlerinin ilk örneklerinin kullanılmaya başlanmasının bu dönemde olduğu belirtilmektedir. Bu süreçte ilk kez 1960'lı yıllarda şarap hasat makineleri kullanılmış ve 1982'de ilk genetiği değiştirilmiş bitkiler dikilmiştir. İçten yanmalı motorun kullanımı bu aşamanın belirleyici unsuru olarak kabul edilmektedir (Yaman ve ark., 2021). Ticaretle yetiştirilen bitkilerin taşınması, üçlü ve dörtlü münavebe sisteminin kullanılması bu döneme rastlamaktadır. Tarım 2.0 dönemi, arazi gücü dönemi olarak tanımlanmakta ve "Ne kadar araziniz varsa, o kadar güçlünüz" ifadeleri kullanılmaktadır (Pakdemirli vd., 2021).

1.3. Tarım 3.0 (Hassas Tarım)

Önceki dönemlerden farklı olarak, yüksek üretkenlik, verimlilik ve sürdürülebilirlik taleplerini etkin bir şekilde birleştiren, dijitalleşme, yeni biyoloji ve çeşitli mühendislik disiplinleri arasındaki artan yakınlaşmadan üretken stratejilerin temeli olarak yararlanan Tarım 3.0'ın temel bileşenlerinden bilgi, makinenin yerini almaktadır. Fiziksel çalışmadan çok düşünsel çalışma, neyin üretildiğinden çok nasıl üretildiği ön plana çıkmaktadır. Hassas tarım olarak tanımlanan bu aşama, askeri GPS sinyallerinin halka tanıtılmasıyla başlamıştır. Bu dönemde biçerdöverlere, verim takibi sağlayan sistem ve ekranların yerleştirildiği, tarımsal veri işlemeye olanak sağlayan bilgisayar programlarının ortaya çıktığı belirtilmektedir (Yaman vd., 2021). Tarım 3.0'ın en önemli özelliğinin tohum

ıslahına başlanması, sulama imkân ve kabiliyetlerinin gelişmesi, üretimde gübre, aşı, zirai ilaç ve makine kullanımı olduğu belirtilmiştir. Tarım 3.0 döneminde "Ne kadar çok makine ve girdiniz varsa o kadar güçlüsünüz" ifadeleri kullanılmaktadır (Pakdemirli vd., 2021).

1.4. Tarım 4.0 (Akıllı Tarım)

Sanayi 4.0 ile sanayide yaşanan devrime benzer şekilde tarım sektöründe de yaşanmaya başlanmıştır. Bu süreç "Tarım 4.0, Akıllı Tarım, Dijital Tarım", E-Tarım olarak adlandırılmakta ve genel olarak sensörler, algılayıcılar, mikro işlemciler, otonom karar sistemleri, bulut tabanlı bilgi ve iletişim teknolojileri gibi akıllı teknolojilerin tarım sektöründe uygulanmasını ifade etmektedir. İnternet tabanlı portallar ve çeşitli algoritmalar sayesinde büyük verilerin depolanması, analiz edilmesi, tarladan sofraya kadar tüm sürecin takip edilmesi ile geleceğe yönelik tahminler yapmanın mümkün olduğu bildirilmektedir. Tarım 4.0 uygulamaları, tarım sektörünün daha verimli, rekabetçi, çevre dostu ve sürdürülebilir olması için önemli ve etkili araçlar oluşturmaktadır. Tarım 4.0'da kullanılan teknolojiler; Tedarikçiler, üreticiler, araçlar ve teknoloji sağlayıcılar yani tarım sektöründe çalışan farklı aktörlerin faaliyetlerini kapsamaktadır. Nesnelerin interneti, büyük veri ve akıllı algoritmalar ile tüm bu aktörlerin faaliyetleri bir araya getirilebilir (Anonim, 2020a). Akıllı tarım yöntemleri, daha az girdi (su, enerji, gübre, zirai ilaçlar) kullanarak tarımsal üretimin niceliğini ve kalitesini artırmayı amaçlamaktadır. Akıllı tarım yöntemleri esas olarak yeni sensör teknolojileri olan uyduya dayanmaktadır (Güzey, 2020). Akıllı tarım, kaynakları daha verimli kullanan ve hassas bir yaklaşıma dayalı olarak daha verimli ve sürdürülebilir tarımsal üretim sağlama, üreticiye daha iyi karar verme veya daha verimli ticari faaliyetler ve yönetim şeklinde katma değer sağlama potansiyeline sahiptir. Bu açıdan akıllı tarım, birbirine bağlı yönetim bilgi sistemleri, hassas tarım ve tarımsal otomasyon-robot olmak üzere üç teknoloji alanıyla güçlü bir şekilde bağlantılı olduğu bildirilmektedir (Duman, 2019).

1.5. Tarım 5.0

Tarım 5.0 aşamasının tamamen robotik uygulamalar, araçlar ve yapay zekâ etrafında şekilleneceği tahmin edilmektedir (Yaman vd., 2021). Hassas tarım ve otonom karar destek sistemleri ilkelerini takip ederek, insan gücü olmayan üreticilerin eylemlerini içermektedir (Zambon vd., 2019). Genel olarak, üreticilerin mahsulleri hasat etmesi ve mahsullerin verimli olması için gerekli kültürel süreçleri uygulaması için birçok işçiye ihtiyaç vardır. Ancak toplumda kentleşme giderek artmakta ve tarımla ilgilenen insan sayısı azalmaktadır. İşçi sıkıntısına yardımcı olacak çözümün ise yapay zekâ özelliklerini entegre eden tarım robotları olduğu belirtilmektedir. Tarım robotlarının ortaya çıkmasıyla birlikte birçok ülkede verimliliğin arttığı ve maliyetlerin düştüğü gözlemlenmektedir. Bu teknolojinin dezavantajının küçük ölçekli çiftçilerde daha belirgin olduğu ve bunun sebebinin teknolojinin maliyeti olduğu bildirilmektedir (Saiz-Rubio ve Rovira-Más, 2020).

2. Akıllı Tarım Çağı

2011 yılında Almanya'nın bilişim teknolojileri ile sanayinin bir araya geleceği, entegre bilgisayar sistemleri ile maksimum verimle üretimin yapılacağı ve yapay zekanın ön plana çıkacağı bir sanayi devrimine gireceği açıklanmıştır. Tarım sektörü ile bilgisayar sistemlerinin entegre olmasının büyük önem taşıdığı bildirilmiştir. Bu evre, tarım sektörünün tüm değer zinciri basamaklarının birbiri ile gerçek zamanlı ve sürekli bağlantı halinde olacağını ifade etmektedir (Saygılı vd., 2018). Toprak ve ürün yönetiminin tarımsal verimliliği artırmasını, kaynakların daha ekonomik kullanımını ve çevreye verilen zararı en aza indirmesini sağlayan bir teknik, "Tarım 4.0", "Akıllı Tarım", "Dijital Tarım" olarak tanımlanmaktadır. Güvenli ve sağlıklı gıdaya erişim sağlamaktadır, bilgi paylaşımını ve karar verme süreçlerini hızlandırmaktadır. Akıllı tarım ile geleneksel üretimin terk edilmesi ve homojen olmayan arazinin değişken koşullarına uygun tarımsal faaliyetlerin uygulanması amaçlanmaktadır. Akıllı tarım teknikleri, toprak işlemeden hasada kadar bitkisel üretimin hemen her evresinde kullanılabilir (Koç vd., 2020). Tarım 4.0 uygulamaları, tarım makineleri ve sahaları sensörlerle donatılarak ve birbirleri ile haberleşerek yapılmakta olup, modern teknolojilerin kullanımı ile verim ve kalitenin artırılması hedeflenmektedir. Akıllı sistemler ile tarımsal üretim için çok önemli olan iklim koşulları, toprak durumu, bitkilerin mineralleri, sulama ve hasat süreleri gibi faktörler hızlı ve eş zamanlı olarak üreticilerin bilgisine sunulmakta ve kaynakların verimli kullanılması sağlanmaktadır. Teknolojiye dayalı bu uygulamalar ile yüksek kaliteli ve besin değeri yüksek ürünler üretilerek üretim maliyetleri önemli ölçüde düşürülebilmekte ve ülkelerin uluslararası rekabet gücü artırılmaktadır.

Sonuç olarak, nesnelerin interneti (IOT) olarak adlandırdığımız makinelerin birbirleriyle senkronizasyon halinde olması, bilgi ve iletişim teknolojileri (BİT) tarım sektöründeki teknolojik uygulamaların temel yapısını oluşturmakta ve bunlara bağlı olarak büyük veri analizi ve akıllı algoritmalar ile verimlilik ve kalite artışı sağlanabilmektedir (Saygılı vd., 2018).

3. Akıllı Tarım Bileşenleri

Akıllı Tarım bileşenlerinin kullanımı, maliyetleri düşürürken faydaları artırmaktadır ve çiftçilerin çevresel zorlukların üstesinden gelmesine ve daha sürdürülebilir tarım geliştirirken artan nüfusun besin ihtiyacını karşılamak için gıda üretimini sürdürmelerine yardımcı olabilecek çözümler sunmaktadır. En etkili çözüm, sorunun tespiti ve uygulama hatalarına karşı önleyici, zamanında ve doğru müdahalelerin yapılmasıdır. Çözüm sürecini kolaylaştırmak ve kısaltmak için Akıllı Tarım araçlarından destek alınmaktadır.

3.1. Nesnelerin İnterneti (Nİ, IoT)

Fiziksel olarak tanımlanmış nesnelerin birbirleriyle veya daha büyük sistemlerle bağlantı halinde olduğu iletişim ağıdır. İnsan müdahalesi olmadan internet üzerinden gerçekleşen bir iletişim sistemidir. IoT teknolojisi enerji sistemleri, iletişim, lojistik, tarım, sağlık ve sanayi gibi birçok alanda kullanılmaktadır (Bıçakçı, 2019). Söz konusu IoT teknolojisi ile çiftçiler bir telefon veya tablet ile arazilerini uzaktan kontrol edebilmektedirler. Bu teknoloji ile tarım arazilerine ne tür tohumların ekileceğinden, ihtiyacı olan gübre miktarına, değişen iklim koşullarının izlenmesine kadar birçok konunun izlenmesine olanak sağlayan düzeneklerden oluşmaktadır (Ercan vd., 2019). Nesnelerin İnterneti (IoT) teknolojisi çiftlik yönetim sistemine başarıyla uygulandığında, yüksek verim kalitesinde hasat elde etmek için tarımsal çevre kontrolünden ürün gelişme evresine kadar bilgilerin doğru bir şekilde izlenmesine yardımcı olmaktadır (Duman ve Özsoy., 2019). Nesnelerin interneti teknolojisinin kullanıldığı akıllı tarım sayesinde çiftçinin tarım işi kolaylaşmakta ve aynı zamanda uygulanan politika ile üretilen ürünlerin verim ve kalite değerleri artmaktadır. Akıllı tarım uygulamaları sayesinde çiftçiler, tablet veya telefon kullanarak tarlalarını uzaktan kontrol edebilmekte, mobil uygulamalarla sulama, nem, sıcaklık gibi birçok işlemi izleyebilmektedirler.

Nesnelerin İnterneti 5 katmandan oluşmaktadır;

- Algılama Katmanı
- Ağ Katmanı
- Orta Katman
- Uygulama Katmanı
- İş Katmanı

Çeşitli sensörler (toprak PH, sıcaklık, nem, ışık yoğunluğu vb.) farklı parametrelerin ölçümü için ürün alanına yerleştirmektedir. Her bir aygıt tanımlama amaçlı atanan IP (Internet Protocol) adresi ile ağda yer almaktadır. Sensörler ile ürün alanından toplanan veriler, kablosuz veya diğer yöntemlerle internete bağlı ağ geçidi kullanılarak buluta (cloud) gönderilmektedir. Bulut ortamındaki veriler analiz edilerek veya doğrudan çiftçilerin akıllı telefonlarına veya bilgisayarlarına iletilmektedir. Bu durum çiftçilerin doğru kararlar almasında etkin bir rol oynamaktadır. Akıllı tarımda kullanılan uygulamalardan bazıları tarım arazilerinin takibi ve otomatik olarak sulanmasıdır. Akıllı sulama sistemleri, toprağın ihtiyacı olduğu noktaya tam ihtiyacı olduğu kadar su verebilmektedir. Sistemde bir su sızıntısı olması durumunda bunu üreticiye bildirebilmektedir. Sulamanın bu şekilde amaca odaklı verimli kullanımı, toprağın kalitesinin ve küresel ısınmanın tehdidi altındaki bölgelerde su kaybını önleyip mevcut rezervlerinin korunmasını sağlamaktadır (Rajalakshmi ve Mahalakshmi., 2016; Mohanraj vd., 2016). Araştırmacıların çalışmaları sonucunda, sahaya özgü hassas gerçek zamanlı tarla izleme, değişken oranlı sulama ile minimum su kullanarak verimliliği en üst seviyeye çıkarmak için sulama sisteminin kontrolünü amaçlayan dağıtılmış kablosuz sensör ağı kullanan bir uzaktan algılama ve kontrollü sulama sistemi geliştirmişlerdir (Kim vd., 2008). Başka bir çalışmada depoda sıcaklık bakımı, nem bakımı ve hırsızlık tespiti dahil akıllı depo yönetimi geliştirilmiştir (Gondchawar ve Kawitkar., 2016). Önerilen bir bitki sulama sisteminde, toprak nem sensörü ile topraktaki nem seviyesi kontrol edilerek, nem seviyesi düşükse bitkiye su sağlamak için bir su pompası çalıştırılmaktadır. Sistem toprakta yeterli nem bulduğunda su pompası otomatik olarak kapanacaktır. Sistem pompayı her açtığında veya kapattığında, su pompasını ve toprak nemi durumunu günceller ve IOT modülü aracılığıyla kullanıcıya bir mesaj göndermektedir (Rajakumar vd., 2018). Başka bir çalışmada mikrodenetleyiciye senkronize olan ESP8266 wi-fi modülü şeklinde bir IOT ağı üzerinden internete verilerin aktarıldığı bir çalışma önermişlerdir. Sistem, kontrolöre verilen bilgilere göre su pompasının açılıp-kapıtılması, LDR ve Lazer kullanarak yaprağın klorofil içeriğinin ve azot içeriğinin elde edilmesi amacıyla kullanıldığından otomatik sulamayı geliştirmeyi amaçlamaktadır (Kumar ve Ramasamy., 2017).

Nİ teknolojisinin özellikle seracılığa sağladığı birçok fayda vardır:

- Veriler bulutta depolanmakta ve böylece serada yetiştirilen ürün hakkında, yetiştiriciler için bilgi havuzu oluşmaktadır. Oluşan havuzdan üreticiler istedikleri kriterler hakkında bilgi edinme imkanına kavuşmaktadır.
- Toprak nemi izlenerek su kullanımı azaltılır ve su israfı önlenir. Toprak neminin tarla kapasitesinde kalması sağlanır ve bu şekilde maksimum verim ve kalite sağlanır.
- Sera havasının CO₂ oranı izlenerek ve kullanımı kontrol edilerek karbondioksit gübrelemesi yapılır. Bu sayede kimyasal gübre kullanımı azaltılmakta ve çevre dostu bir su ürünleri yetiştiriciliği sağlanmaktadır.
- Sera içindeki havanın bağıl nemi kontrol edilerek hastalık ve zararlılar kontrol altına alınır. Bu sayede kimyasal ilaç kullanımı azaltılmış olur. Güvenli gıda üretilir ve çevreye duyarlı bir tarım yapılır (Kalkışım, 2020).

3.2. Bulut Bilişim / Hesaplama

Bulut teknolojisi ile müşterinin esnek taleplerini minimum çaba veya hizmet sağlayıcı etkileşimi ile karşılamak için internet üzerinden paylaşılan kaynakları, yazılımları, uygulamaları ve hizmetleri sağlamaktadır (Topakcı ve Ünal., 2010). Toprak ve havayla ilgili araştırma, mahsul ve çiftçiyle ilgili verilerin tümü merkezi bir konumda saklanabilir ve veri kullanılabilirliği sağlanmaktadır. Akıllı tarım teknolojisi, geleneksel tarımsal üretim sistemini monotonluktan kurtarır ve tarlaları küçük parçalar halinde değerlendirme olanağı sağlamaktadır. Akıllı tarım teknolojisinin bileşenleri olan GPS, GIS, uzaktan algılama ve mahsul verimi görüntüleme sistemleri, arazideki

farklılıkları tespit etmek için kullanılmaktadır. Belirlenen veriler, akıllı tarımın son ve en hayati halkası olan değişken oranlı uygulama sistemi yardımıyla değerlendirilerek sonuçlandırılmaktadır (Uzun vd., 2018). Bulut bilişimin tarım için faydalı bir teknoloji olmasının yanında bazı zorlukları da vardır. Bunlar; Ağ bağlantısı ve sürekli internet bağlantısı ihtiyacı, çiftçinin teknolojiyi verimli kullanamaması, daha az fiziksel kontrol, bilgisayar korsanlarının hedefi olması, düşük hızlı bağlantılarla verimsiz çalışma ve güvenlik riskleri olarak ifade edilebilir (Choudhary ve ark., 2016).

3.3. Uydu ve Hava Araçları

Son yıllarda gelişen teknoloji ile birlikte tarımsal faaliyetlerde uydu ve hava araçları yaygın olarak kullanılmaktadır. Özellikle uçaklara yerleştirilen sensörler yardımıyla tarımsal üretimde, nakliyyede, tarımsal ilaçlamada, yangın söndürmede ve arazinin verimli kullanımında ürün miktarını tahmin etmek mümkündür. Uydu görüntüleri yardımıyla sahadaki sorunlu alanlar belirlenir ve üreticiler bu noktaya odaklanmaktadır. Akıllı sulama, gübreleme ve ilaçlama ile yüksek verim elde edilebilmektedir. Akıllı tarım sayesinde tarlanın bulunduğu alandaki hava ve toprağın nem ve sıcaklık ölçümleri gerçek zamanlı olarak yorumlanabilmektedir (Tamura vd., 2018; Ercan vd., 2019; Kirmikil ve Ertaş., 2020).

3.4. Büyük Veri

Büyük veri, yaygın olarak kullanılan programların depolama, yönetim ve işleme kapasitesinin ötesinde olan veri kümelerini tanımlamak için kullanılan bir terimdir. Büyük verinin devasa boyutları ile ondan yararlanmak için gereken analitik karmaşıklığının birleşimi, yeni sınıf teknolojilerinin ve bunları yönetmek için araçların geliştirilmesine yol açmaktadır (Donzia vd., 2018). Tarımda büyük veri uygulamaları; fırsatlar arasında kıyaslama, sensör kullanımı ve hesaplama, tahmine dayalı modelleme ve mahsul bozulma riskini yönetmenin yanı sıra çiftçilere farklı tarımsal kaynaklardan toplanan gerçek zamanlı verilerden ipuçları sağlama yer almaktadır. Sonuç itibarı ile büyük veri, tarım sektöründe gelecekteki sonuçlarına (tahmini verim modeli, tahmini yem alım modeli, vb.) tahmin edilebilir iç görüler sağlamak, gerçek zamanlı operasyon kararlarını yönlendirebilmek ve yeni iş modelleri kurmayı sağlamaktadır (Wolfert vd., 2017).

3.5. İnsansız Hava Aracı (Drone)

Pilotu olmayan araçlar olarak tanımlanmaktadır. İHA'ların tarımda kullanımı, akıllı tarımda kullanılacak verilerin altyapısını oluşturacak olan uzaktan algılama ve bitki izleme tekniklerine bağlıdır. Bitkilerde hastalık ve zararlı tespiti, verim/olgunluk tahmini, yabancı ot tespiti, su kaynakları kontrolü ve işçi denetimine yönelik pasif uygulamalar olarak belirtilmektedir (Türkseven vd., 2016; Ercan vd., 2019)

3.6. Otonom ve Robotik

Otonom ve robot teknolojileri hemen her sektörde verimli kullanıldığı gibi tarım sektöründe de başarılı bir şekilde kullanılmaktadır. Bu teknolojilerin fiyatlarının karşılanabilmesi için büyük ölçekte tarım arazilerine ihtiyaç duyulmaktadır. Arazide ürünleri ve saplarını birbirinden ayıran otonom biçerdöverler, tarlaları hassas bir şekilde süren ve tohumlayan otonom traktörler ve tarım makineleri bu alana örnek gösterilebilmektedir. Çiftçi robotlar ekim yapılacak olan tarlanın her bir alanını analiz ederek tohumu maksimum verim alınabilecek noktaya ekebilmektedir. Ayrıca tarlada bulunan zararlı otları belirleyip zirai ilacı uygulayarak temizleyen robot sayesinde zararlı otlara yönelik yapılacak ilaçlama oranı ve insan emeği önemli oranda düşürülmektedir (Uzun vd., 2018). Bu yönde yapılan çalışmalara bakıldığında; (Blasco vd., 2002) tarafından sebzelerde tüketicinin güvenilir ürün isteği yönünde yabancı otlarla mücadele etkin kontrol sağlayabilecek hafif yapılı, kolay hareket edebilen robot tasarımı sunulmaktadır. Sistemin verimli çalıştığı İspanya'da marul yetiştiriciliği yapılan bir alanda ispat edilmiştir. Sebze alanlarında yapılan çalışmalara bakıldığında; Domateste (*Lycopersicon esculentum* L.) yabancı otlarla mücadele amacıyla hedef odaklı bir robotik sistem kullanılmıştır (Lee vd., 1999) ve Lahanada (*Brassica oleracea* L.) da benzer bir uygulama yapılmıştır. (Mao vd., 2014) tarafından fide dikimiyle ilgili seralarda kullanıma sunulan bir robot geliştirilmiştir. Hava ile entegre işçilik açısından yüksek hızda fide dikim tapası mevcut bir sistemdir (Hu vd., 2014). Marul ile yabancı otlar arasında gerçekleşen rekabette marul bitkisinin ekonomik özelliğinden dolayı doğaya tutunabilmesini sağlayacak, organik tarımda da kullanılabilen marul robotu marulun etrafındaki yabancı otları parçalayıp ve marula gübre uygulayıp verimin çift yönlü olarak yükselmesinde fayda sağlamaktadır (Kushwaha vd., 2016). Başka bir çalışmada öncelik amaç, bitkiden sinyal almaktır, kültür bitkisine floresan özellikte bir bileşimin uygulanıp gerekli sinyalizasyonun oluşumu sağlandıktan sonra görsel sistem bulunan bir yabancı ot mücadele aracı yabancı otlarla mücadele edebilmektedir. Yapılan çalışmada kullanılan görsel etkisi yüksek olan bir bileşik kullanılmıştır ve kereviz köklerine çeşitli dozlarda uygulaması yapılmıştır. Etkili düzeyde uygulanan bileşik sayesinde robotikler kereviz bitkilerini görülebilir kılıp yabancı otların robotların görsel aksamılarınca kolay fark edilebilir olmasını sağlayacaktır (Su vd., 2020; Çolak ve Işık., 2021). Robotların önümüzdeki senelerde tarımsal üretimin bazı önemli işlerde büyük traktörlerin yerini alacağı düşünülmektedir. Tarımsal uygulamalarda yabancı ot ve zararlılarla mücadelede robot benzeri traktörler, ekim robotları, mahsul hasat robotları, gübreleme, ilaçlama ve otonom robotlar gibi çeşitli robotların kullanılması öngörülmektedir (Tekin, 2013). İlaçlama ve Ayıklama Robotları, veri tabanlarındaki yabancı ot görüntülerini kullanarak yabancı otları tespit edip toplamak veya pestisitleri bitkiye değil doğrudan yabancı ota uygulamak üzere eğitilmekte ve geliştirilmektedir. Artan sayıda yabancı otların pestisitlere karşı dirençli hale gelmesi, bunların toplam maliyeti ve kullanımı ile bu teknoloji hem çiftçilerin altyapısına hem de çevreye büyük bir destek

sağlamaktadır (David, 2017). Akademik bir çalışmada, kablosuz robot, farklı çevresel değişkenleri ölçmek için çeşitli sensörlerle kuşatılmıştır. Robot; nem algılama, kuşları ve hayvanları uzaklaştırma, böcek ilacı püskürtme, ileri veya geri hareket etme ve açma-kapama elektrik motorunu kontrol etme gibi görevleri yerine getirebilen temel özelliklere sahiptir. Önerilen kablosuz mobil robot arazilerde test edilmiş, okumalar izlenmiş ve sistemin akıllı tarım sistemleri için çok kullanışlı olduğunu gösteren tatmin edici sonuçlar gözlemlenmiştir (Krishna vd., 2017).

3.7.) Siber Fiziksel Sistemler

Siber-fiziksel sistemler, hassas kontrol ve optimizasyon sağlamak için siber unsurları fiziksel bileşenlere entegre etmektedirler. Tarımda akıllı makineler ve sensörler yaygınlaştıkça ve bunlardan elde edilen verilerin miktarı ve kapsamı arttıkça süreçler giderek daha fazla veriye odaklı ve veriye dayalı hale gelmektedir. Yönetim görevlerine dayalı olarak Akıllı Tarım, yalnızca sahadaki değişkenlik üzerine geliştirilen verilerle değil, aynı zamanda gerçek zamanlı olaylar tarafından tetiklenen bağlam ve durumsal farkındalık ile hassas tarımın ötesine geçmektedir. Akıllı cihazlar, geleneksel araçlara (yağmur ölçer, traktör, dizüstü bilgisayar vb.) otonom bağlam farkındalığı ekleyerek bu araçları genişletir. Bu durumda, robotların kontrolde önemli bir rol oynayabileceği öne sürülmüştür, ancak rolü analiz ve planlamadaki insanlar makineler tarafından daha fazla desteklenir, böylece siber-fiziksel döngü neredeyse özerk hale gelmektedir (Wolfert vd., 2017). Siber fiziksel sistemlerin iklim, toprak ve mahsuller ile ilgili gerekli ve uygun oluşumları yüksek doğrulukla toplayabilmesi beklenmektedir. Toplanan veriler sulama, nem, bitki sağlığı vb. gibi dış kaynakları yönetmek için kullanılmaktadır. Burada önemli unsurlar akıllı cihazlar ve sensörlerdir. Akıllı cihazlar ve sensörler ile tarımda kullanıcılara faydalı içerik bilgileri sunulmaktadır. Literatürde topraktaki iyonik konsantrasyon, nem ve besin maddeleri hakkında bilgi elde etmek için sensörler bulunmaktadır (Ali vd., 2017; Pandey vd., 2018); güneş ışınlarından elde edilen fotovoltaiik enerjinin güç kaynağı olarak kullanılması ve çeşitli sulama işlerinin gerçek zamanlı uzaktan yönetimi; kurumsal mimari ile simülasyon için buluşsal tabanlı bulanık vaka tabanlı akıl yürütme ve değer akışı eşleme kullanarak yeni akıllı tahmine dayalı tarımsal gıda izlenebilirliği sağlayan siber-fiziksel tabanlı yaklaşımlar sunulmaktadır (Chen, 2018).

4.Dünyada Akıllı Tarıma Dayalı Seçilmiş Teknolojiler

Tablo.1 Akıllı tarıma dayalı uygulamalar

Referans	Uygulama	Tanım
Friha vd., 2021	Toprak Analizi	Arazi yönetimi, toprak özellikleri hakkında bilgi verir. Çiftçilerin arazi yapısı hakkında bilgi sahibi olmasını ve alınmasını gereken önlemleri anlamalarında yardımcı olur.
Saba vd., 2017	Farm Manager	Farm Manager uygulaması ekimden önce uygulanması gereken teknikler konusunda yardımcı olmaktadır.
Friha vd., 2021	Zararlı Yönetimi	Zararlı oluşumu bilgilerini toplayarak zararlı kontrol çözümleri sunmaktadır.
Saba vd., 2017	Agrippa	Mahsullerin geçmişini (Ekim, gübreleme, hasat vb.) depolamaktadır.
Friha vd., 2021	Gübre Yönetimi	Gerekli optimum gübre bileşimini belirlemektedir Ayrıca fiyat kıyaslamasını dikkate almaktadır.

Tablo.2 Akıllı tarımda üretimi arttırmak için kullanılan IOT tabanlı sensörler

Referans	Sensörler	Tanım
Sudarshan vd., 2019	DHT11 Sensörü	Sıcaklık ve nemi ölçmektedir
Ganesh vd., 2018	SEN0193 Sensörü	Toprak nemini ölçmektedir
Nagamani vd., 2019	SKU SEN0189 Sensörü	Bulanıklık sensörü suyun kalitesini belirlemektedir
Jayasuriya vd., 2018	BH1750 Sensörü	Işık yoğunluğunu ölçmektedir
Odesola vd., 2019; Boursianis vd., 2020	Yağmur Sensörü	Yağmur basıncını ölçmektedir

Rehman vd.,2022

5.Dünya’da Akıllı Tarım ’da Önde Gelen Ülkeler

Tarım sektöründe öncü olarak bilinen Hollanda ve İsrail Tarım 4.0 uygulamalarını diğer ülkelere göre daha hızlı kabullenmişlerdir. Bu ülkelerin yanında, Tayvan’ın Tarım 4.0’a uygun, kayda değer önemli çabaları büyük değişimler ortaya çıkarmıştır (Kılavuz ve Erdem., 2019). Türkiye’de bu ülkeleri model almayı hedeflemektedir.

5.1.) Hollanda’da Dijital Tarım

Hollandalı çiftçiler, yüksek verimli sulama sistemleri, tohumda ileri teknolojiler, yenilenebilir enerji sistemleri, robotlar ve otomasyon sistemleri, büyük veri analizi ve akıllı yazılımları çiftliklerinde kullanarak dijital tarım dönüşümünde büyük başarı elde etmektedirler. 2019 verileri incelendiğinde Hollanda Küresel Rekabet Edebilirlik Endeksi’nde 4. sırada yer almaktadır (Kırmıkil ve Ertaş., 2020). Hollanda’da tarım sektöründe hassas tarım uygulamaları ile su ve gübrenin verimli bir şekilde kullanımı sağlanmaktadır (Tekinerdoğan, B., 2018). Avrupa’nın en küçük ve en yoğun nüfusa sahip ülkesi olan Hollanda, yeniliklere açık olan kümelenme (Porter) modelini benimsemektedir. Kümeleme modelinin özellikleri; İlgili ve destekleyici şirketlerin coğrafi olarak yoğunlaşması, birbirlerinden bilgi alma ve güvene dayalı ilişkilere sahip olma, tohum şirketleri arasında olumlu etkileşim, ticaret, lojistik, üretim, eğitim, araştırma, şehre yakınlık ve diğer destekleyici tarım sektörlerinin varlığını kapsamaktadır (Vossenaar, 2018). Tarım ürünlerini işlemeye yönelik makineler, robotik yumuşak meyve toplayıcılar gibi yüksek düzeyde otomasyona sahiptir, tarımda dünyanın en başarılı üniversitesi olan Wageningen Üniversitesi, yaşam bilimleri ve doğal kaynaklarda bilimsel ve ticari konularda araştırmalar yapmaktadır. Hollanda’nın dijital tarımdaki bu başarısının sürdürülebilir ve teknolojiye dayalı tarım politikalarını benimsemesinden kaynaklandığı görülmektedir (Erdem ve Lider., 2019). Hollanda hükümeti, tarımda uzun vadeli ve verimliliği artırıcı uygulamalar için uydu verilerini satın almıştır ve elde ettiği verilerle üreticilere ürün gelişimi, toprak ve atmosfer gibi bilgileri online olarak açıklamaktadır. Bu veriler sayesinde üreticilerin ürünlerini yakından takip ederek verimlilik artışı ve sürdürülebilir tarım sağladıkları belirtilmektedir (Saygılı vd., 2018). Hollanda’nın tarımda dünyanın önde gelen ülkeleri arasında olmasının başlıca nedenleri; Altyapının sağlam olduğu, tarım üniversitelerine gerekli önemin verildiği, çiftçilerin devletle iş birliği içinde olduğu gösterilmektedir.

5.2. Tayvan’da Dijital Tarım

Tarım sektörü Tayvan ekonomisinde en büyük payı kapsamaktadır. Tarımda akıllı tarım uygulamaları ve teknolojik cihazlarıyla dünyada adından söz ettirmektedir. Ülke; Kapalı tarım, LED sektörü, IoT teknolojileri, damla sulama sistemleri, hassas tarım uygulamaları, güneş panelleri, dikey çiftlikler, drone’lar, robotlar ve otomasyon sistemleri gibi Tarım 4.0’da kullanılan tüm bileşenlerin önemli bir üreticisi olduğu görülmektedir. Ayrıca Tayvan, Asya ve Çin pazarlarına girmek isteyen tarım şirketleri için oldukça önemli bir ülkedir. Sahip olduğu mühendislik altyapısı ile akıllı tarımda ihtiyaç duyulan diğer tüm faktörler için nitelikli iş gücü sağlayabilmektedir (Kılavuz ve Erdem, 2019). Tayvan, 2019 Küresel Rekabetçilik Endeksi’nde (Anonim, 2019c) 12. sırada yer almaktadır. Tarımda iklim değişiklikleri sonucunda verim düşüşleri ve ürün kayıpları yaşanmakta bu soruna çözüm olarak Tayvan kapalı tarıma önem vermektedir. Kapalı tarımda LED teknolojilerine ihtiyaç duyulmakta olup, Tayvan bu konuda dünyanın en büyük ikinci LED sektörüne sahiptir ve LED teknolojisindeki gelişmeler kapalı tarımı desteklemektedir. Robot ve drone üretimine önem veren Tayvan, büyük ölçekli tarımsal projelerin ihtiyaç duyduğu enerji kaynakları için güneş pili üretiminde de dünyada ilk sırada yer almaktadır. Taoyuan’da bulunan Yes Health iFarm, tamamen kontrol edilebilen akıllı bir çiftlik sistemine sahiptir. 14 kata sahip olan dikey tarım tesisinde, kontrol edilebilen nem, sıcaklık ve hava akışları yanında klasik müzik ile de bitkilerin besin maddelerini emilimi araştırdıkları bir diğer konudur (Kılavuz ve Erdem., 2019). Gençleri tarıma çekmek, Tayvan’ın uluslararası rekabete açık ihracat endüstrisinin gelişmesine yardımcı olacağı düşünülmektedir ve bu amaçla yetenek geliştirmede yeni nesil için yeni bir tarımsal eğitim stratejisi geliştirilmektedir. Bu eğitim, akıllı tarım 4.0 çerçevesine sıkı sıkıya bağlı kalarak, önde gelen endüstrilerin iş başında eğitim ve uluslararası uzmanlıkla ilgili taleplerini karşılamayı amaçlamaktadır. Tarım 4.0 kapasitelerini ve teknik istişareleri hızlandırmak için endüstri-hükümet-akademik-araştırma ittifaklarından uzmanlar ve akademisyenler, önde gelen 10 sektör için “4.0 Endüstri Hizmet Ekibini oluşturmuşlardır. "Akıllı Üretim ve İnsan Makineleri Koordineli Yardımcı Cihaz Geliştirme", "Tarımsal Teknik Uzman Sistem Uygulaması" ve "Dijital Hizmet ve İzlenebilirlik Veri Değişimi" olmak üzere üç profesyonel teknik grubun yanı sıra "İş Yönetimi ve Operasyon Destek" teknik destek grubu bulunmaktadır (COA, 2016).

5.3. İsrail’de Dijital Tarım

İsrail’in tarımsal işgücü kıtlığı, ekilebilir tarım arazilerinde yüksek tuz içeriği, doğal su alanlarının kıtlığı, ülke konumu ve yüzölçümü gibi olumsuz etkileri olsa da dijital tarımda başarılı ülke örnekleri arasında dikkat çekici bir konumda olduğu belirtiliyor. Ülke gıda ihtiyacının %95’ini üretmek için sektöre yön vermektedir. Tarım teknolojisi, yüksek teknoloji ürünleri, iletişim ve kimya sektörlerinde dünyanın önde gelen ülkelerinden biridir. Tarım sektöründe toprak ve su kıtlığı altında yüksek teknolojileri kullanmaktadır. Damla sulama sistemini dünyaya tanıtan, verimsiz alanlarda her türlü tarım ürününü elde eden, kuraklığa dayanıklı tohum çeşitleri elde eden, tarımsal faaliyetlerde kendi kendine yeten, hasat sonrası dayanıklılık sağlayan operasyonlar gerçekleştiren ve başarıyı yakalayan bir ülkedir. İsrail, tarımdaki olumsuzlukları avantaja çevirmeyi başarmış ülkeler arasında öncüdür. (David, 2017; Kılavuz ve Erdedem., 2019). Görüldüğü gibi İsrail, teknolojiyi en iyi şekilde kullanarak olumsuz koşullarda kendini geliştiren ve Türkiye dahil birçok ülkeye damlama sulama sistemlerini, gelişmiş tohum, gübre ve tarım teknolojileri satan bir ülkedir.

5.4. Japonya’da Dijital Tarım

Japonya, 2019 verilerine göre Küresel Rekabetçilik Endeksi’nde 6. sırada yer almaktadır (Anonim, 2019c). Tarımda çalışan nüfus az, yaş ortalaması yüksek, vergileri yüksek ve kırsal kesimde üretilen ürünler ancak büyük

şehirlerde veya uluslararası pazarlarda ihraç edilebilmektedir. Ancak Japonya akıllı tarıma yaptığı yatırımlarla sektöre ivme kazandırmıştır. Robotlar aracılığıyla her 8 saniyede bir meyve toplayarak hasadı hızlandırmışlardır. Biyolojik çiftlikler kurmuşlardır. Biyo-çiftliklerde çiftçiler bilgisayarlarla sıcaklık, ışık ve nemi kontrol edebilmektedirler. Kameralar ve sensörler ile doğru hasat zamanı, toprağın su tutma kapasitesi, sıcaklık, haşere kontrolü ve gün ışığı süresini belirleyebilmektedir. Aynı zamanda sahip olduğu lens sistemi ile zararlı güneş ışınlarını engelleyerek üretim yapabilmektedir (Saygılı vd., 2018).

5.5. ABD’de Dijital Tarım

Amerika Birleşik Devletleri dünyanın en büyük tarım ihracatçısıdır. Bunun temel nedeni teknolojiye yaptığı yatırımlar ve teknoloji kullanımını öğretmesidir. Enstitülerde üretimde verimliliği artırmayı, su, zirai ilaç ve gübre tasarrufu sağlamayı, maliyetleri düşürmeyi, çevreye verilen zararı azaltmayı ve gıda güvenliğini sağlamayı; Fizik, mühendislik, bilgisayar bilimleri ve teknoloji gibi konularda da eğitim desteği sağlamaktadır. Amerika dünya badem üretiminin %80’ini üretmektedir. Bademlerin su ihtiyacının fazla olması nedeniyle üretim maliyeti oldukça yüksektir. Badem ağaçlarına yerleştirilen sensörler yardımıyla toprak analizleri yapılarak bu sorun önlenmiştir. Üreticilerin sulama sistemlerine aktarılan bilgileri toplayarak %20 tasarruf sağlandığı ve uygun sulamanın sağlandığı görülmüştür. NASA’ya gönderilen gözlem uydusu ile nem miktarı ölçülmüştür ve üç günde bir kuraklık, iklim değişikliği ve taşkınlar hakkında detaylı bilgi alınabilmektedir (Saygılı vd., 2018).

5.6. Türkiye’de Dijital Tarım

Günümüzde uygulanan tarımsal destekler arasında mazot, gübre, toprak analizi, fark ödemesi, hayvancılık, sertifikalı tohum/fidan kullanımı ve tohum üretimi, Tarım Muhasebesi Veri Ağı sistemine katılım, organik ve iyi tarım, biyolojik ve biyoteknik kontrol, tarımsal yayım ve danışmanlık hizmetleri, Ar-Ge projeleri yer almaktadır. Ancak bu desteklerin tarımın geliştirilmesi, üreticilerin kırsalda kalmasının sağlanması ve üretimde verimliliğin artırılması açısından pek yeterli olmadığı görülmektedir. Dijital tarım uygulamaları, suyun verimli kullanımı, toplulaştırılmalı tarım, çiftçilerin eğitimi ve danışmanlık, parça parça üretimden seri üretime geçiş, kooperatifler gibi uygulamaların yanı sıra devletin önemli yatırımları desteklemesi gerekmektedir. Bu sayede uzun vadede Türkiye net tarım ürünleri ihracatçısı olurken, tarımsal desteklerin bütçe üzerindeki yükü en aza indirilmiş olacaktır. Diğer sektörlerden farklı olarak tarımın devlet desteğine ihtiyacı vardır, ancak bu destek doğrudan gelir desteği değil, tarımsal Ar-Ge, su yönetimi, dijital tarım uygulamaları, çiftçi eğitimi ve rehberliği şeklinde destekler olmalıdır. Günümüz iklim değişikliklerinde piyasa mekanizması ile tarımda optimal üretim ve fiyatın oluşmayacağı ve tarımın piyasa mekanizmasına bırakılamayacak kadar önemli stratejik bir sektör olduğu kabul edilmelidir. Sadece gıda açısından değil, sanayinin ihtiyaç duyduğu ve yetersiz üretim nedeniyle ithal edilen tüm girdiler akıllı tarım uygulamaları ile ülke içinde üretilmeye çalışılmalıdır. Türkiye bu potansiyele sahiptir, sadece doğru ve uzun vadeli politikalara ihtiyaç duymaktadır. Tarım sektörü, devlete yük olan bir sektörden doğru politikalarla ekonominin rekabet gücü yüksek sektörlerinden biri haline gelmelidir. Ayrıca çiftçinin gelir düzeyi artarken, Türkiye gıda güvenliği ve sağlığı açısından dışa bağımlılığını azaltmakta ve köyden kente göçü azaltmaktadır (Kılavuz ve Erdem, 2019).

Dünyada çok az ülke Türkiye kadar bitki çeşitliliğine sahiptir. Ancak bu avantajlı coğrafyada tarım sektörünün mevcut durumu, profesyonel ve uygun yöntemlerle değil, ortalama olarak geçimlik tarım yapılmaktadır (Anonim., 2018b). Ülkedeki tarımsal işletmelerin çoğu, geçimlik tarıma, ölçek ekonomisi sorunu nedeniyle düşük üretkenliğe ve pazar için düşük üretime yol açan küçük aile işletmeleri şeklindedir. Ayrıca yüksek girdi maliyetleri ile azalan üretim sonucu gıda fiyatları artmakta, üretimin tüketime oranının düşmesi nedeniyle ithalat yapılmaktadır. Avrupa Komisyonu, AB ile üye ülkeler arasındaki bütçenin tarım politikalarında daha etkin kullanılmasını sağlayacak değişiklikler kapsamında su yönetiminde büyük önem taşıyan dijital tarımın yaygınlaştırılmasına karar vermiştir. Akıllı sulama teknolojilerinin yaygınlaşması ile su israfı önemli ölçüde azaltılacak ve geri dönüşüm çalışmaları ile tarım sürdürülebilir hale gelecektir. Türkiye’nin sürdürülebilir tarım için, daha önce bahsi geçen Tayvan, Hollanda ve İsrail örneklerinde olduğu gibi detaylı bir politikaya, tarımda dijitalleşmeye, Ar-Ge ve bilimsel çalışmalara ve hükümet desteğine ihtiyaç duymaktadır. İsrail olumsuz koşullarda bile kendine yetecek tarım üretimi yapıyorsa, coğrafi olarak büyük ve verimli topraklara sahip ülkemizde de kapsamlı Ar-Ge çalışmalarına, kooperatifleşmeye, tarım eğitimine ve tarımda makineleşmeye yönelerek dünyanın tahıl ambarı ve sebze meyve ihracatçısı konumuna gelmesi mümkün olacaktır (Kılavuz ve Erdem, 2019). Türkiye’de tarımsal kırsal örgütlenme ile ilgili birçok bakanlık ve kuruluş bulunmaktadır. Tarımsal faaliyet ve organizasyonların birçok kurum tarafından yürütülmesi, yetki çatışmasına ve hizmetlerde verimsizliğe neden olmaktadır. Ülkede çok sayıda kooperatif olmasına rağmen, kooperatiflerin çoğu küçük ölçeklidir ve çok azı kooperatif ilkelerine uygun bir yapıya sahiptir. Ayrıca yönetim, mevzuat, finansman, organizasyon, eğitim ve araştırma gibi birçok sorunu vardır. Gerçekte kooperatifler, tarımda modernleşme ve verimliliği artırmada önemli kuruluşlardır. Gelişmiş ülkeler geçmişte olduğu gibi bugün de tarımda ciddi örgütlenmeleri desteklemiştir. Bu nedenle Türkiye’de kooperatif sektörünün sorunlarının çözülmesi ve desteklenmesi, tarımda verimlilik artışı açısından öncelikli olarak ele alınması gereken bir konudur (İnan vd., 2000; Kılavuz ve Erdem., 2019; Semerci, 2022). Hollanda ve İsrail başta olmak üzere bu ülkelerin başarısının teknolojiye dayandığı aşikardır. Toplam ihracat ve ithalatlarında Bilgi ve İletişim Teknolojileri (BİT) ürünlerinin payına bakıldığında Tarım 4.0 sürecine uyum sağlamış ülkelerin bu ürünlerin hem ihracatında hem de ithalatında yüksek değerlere sahip olduğu görülmektedir. Bu ülkeler

teknoloji ile verimliliklerini arttırabilmişlerdir (İTB, 2019). Tarımsal teknolojiler ise genel olarak tarım dışı sektörler tarafından üretilmektedir. Toprak işleme aletlerinden hasat makinelerine kadar çok değişik mekanik teknolojinin üretilmesinden kullanımında ülkemiz çok ciddi atılımlar yapmış ve ihracatın ithalatı karşılama oranı artmıştır. İthalatın özellikle 2010'da itibaren artış göstermesi tarım sektöründe teknoloji kullanımının çeşitlendiğini ve ihtiyaçların arttığını göstermektedir. Öte yandan tarım sektöründe yeni teknolojilerin benimsenmesinde en önemli faktör üreticilerin gelir düzeyidir. İşletme büyüklüğü verimliliği etkilerken yeni teknolojilerin benimsenmesi ve kullanılmasını etkiler. Küçük çaptaki aile işletmelerinde emek verimliliğinin düşük olması gelir düzeyini de etkilemektedir. Bu durum da yeni teknolojilerin benimsenmesi ve kullanılmasını geciktirmektedir. Ancak üreticinin eğitim düzeyi bazen küçük işletmelerde bile yeni teknolojinin kullanılmasını olumlu yönde etkilemektedir (UİB., 2017). Ülkemizde tarımda yaşanan bu teknolojik dönüşüm için atılması gereken adımlar; Üreticiler (çiftçiler), özel sektör (üreticiler, teknoloji tedarikçileri), birlikler ve kooperatifler, kamu ve üniversitelerden oluşan bir sektörün tüm paydaşlarının iş birliği ile gerçekleştirilebilir. Nitekim bu konuda yapılan bazı çalışmalarda bu paydaşların iş birliğini görmek mümkündür (İTB, 2019).

6.Ülkemizde Akıllı Tarım için Yapılan Çalışmalar

Günümüzde üzerinde önemle durulan hassas tarım kavramı, yerini hassas tarımın kendisini içeren yeni ve popüler bir kavram olan akıllı tarıma (SMART Farming) bırakmıştır (Türker vd., 2015). Türkiye'de akıllı ve dijital tarım adı altında projeler ve akademik çalışmalar vardır. Akıllı tarım konusundaki tüm bu hedeflerin anlamlı ve temelli olabilmesi için Ar-Ge ve İnovasyon çalışmalarına öncelik verilmelidir. Bu çalışmaların başarısında Ar-Ge harcamalarının milli gelir içindeki payı önemlidir. Vodafone Türkiye ve TABİT (Tarımsal Bilişim ve İletişim Teknolojileri) ortaklığında kırsal kalkınmaya destek olma amacıyla Aydın ilinde kurulan Vodafone Akıllı Köy, dünyanın ve Türkiye'nin uçtan uca dijital teknolojilerle donatılmış ilk akıllı köyü olma yolunda hızla ilerlemektedir. Geleneksel tarım yöntemlerinin ileri teknoloji ile birleştirildiği Vodafone Akıllı Köy 'ün başlıca amaçları arasında tarımsal üretimdeki verimliliği bilgi ve teknolojiler ile arttırmak, tarımda genç istihdamı arttırmak, teknolojinin diğer köylere de yayılmasını sağlamak bulunmaktadır. Bitkisel üretim maliyetlerinde minimum %20, hayvansal üretim maliyetlerinde minimum %22 ve sulamada minimum %20 tasarruf amaçlanmaktadır. (Tabit, 2019). 2020 Vodafone Akıllı Köy faaliyet raporunda 2,5 ayda kavun yetiştiriciliğinde %150 verim artışı, %85 gelir artışı sağlandığı belirtilmektedir. Ege Üniversitesi, Boğaziçi Üniversitesi, Ankara Üniversitesi ve Konya Gıda Tarım Üniversitesi olmak üzere bu alandaki çalışmalar ulusal ve uluslararası iş birlikleri ile artmaya başlamıştır. Ege Üniversitesi İİBF ve İzmir Ticaret Borsası ortaklığı ile yürütülen "Türk Tarımının Global Entegrasyonu: Tarım 4.0" projesi de bu alanda yapılan çalışmalardan biridir. Agritech (Tarım Teknolojilerinde İngiltere-Türkiye İşbirliğini Desteklemek için Kapasite Geliştirme ve Ağ Oluşturma Projesi, 2016-2017 Prosperity Fund, İngiltere Büyükelçiliği ve Boğaziçi Üniversitesi Eş Finansmanı), Turkcell Akıllı Tarım, Farmbot vb. yine özel sektör ve üniversite paydaşlarınca yapılan akıllı tarım çalışmalarındandır (Kaya., 2019). Tarla.io, Türkiye genelinde 8 yıldır hizmet veren, akıllı tarım alanında faaliyet gösteren başarılı bir firmadır. Firma hasat, zirai mücadele, sulama, planlama yazılımları, seracılık sistemleri, insansız araçlar ve dijital mekanizasyon teknolojilerinden yararlanarak hem bireysel çiftçiler hem de tarım ile ilişkili tüm kurumlar için bilgi hizmetleri sunmaktadırlar (Ercan vd.,2019). 2012 yılında kurulmuş, veri tabanına kayıtlı 500 bin kayıtlı üretici, 117 farklı ürün, 450 bin hektar tarımsal alan ve 1500 milyon TL değerinde zirai ürüne hitap eden tarım teknolojileri üreten "Doktar Tarım ve Hayvancılık Bilgi Sistemleri Araştırma ve Geliştirme Sanayi ve Ticaret Anonim Şirketi'dir. TUBİTAK destekli Ege Üniversitesinde kurulmuş tarım doktoru olarak da adlandırılan bu kuruluş, çiftçilere veya üreticilere tarım teknolojileri konusunda servis sağlamaktadır. 2015 Haziran ayında TUBİTAK Uzay Teknolojileri Araştırma Enstitüsü ve Ankara Üniversitesi Ziraat Fakültesi ortaklığıyla gerçekleştirilen Akıllı Tarım Fizibilite Projesi (AKTAR) ile İç Anadolu Bölgesi'nde yetişen ürünler için hassas tarım modelleri geliştirmesi hedeflenmektedir. Projenin öncelikli amacı, akıllı tarım uygulamaları için sulama ve gübreleme modellerinin gelişmesini sağlamaktır. Proje alanı 400 hektar olarak belirlenmiş ve çeşitli ürünlerin analizi yapılmaktadır.

AKTAR projesi ile uzaktan algılanan sistemler ile verim haritalama, sulama, gübreleme ve tarımsal hastalıkların tespiti gibi verilerin değerlendirilmesi amaçlanmıştır (ATP, 2019). Tarım ve Orman Bakanlığı, stratejik planlarında, mevzuat düzenlemelerinde ve raporlarında akıllı tarım teknolojileri kapsamında çalışmalardan ve hedeflerden bahsedilirken, teknoloji altyapısıyla ilgili birimlerde uygulama aşamasına geçmiştir.

Bunlardan bazıları;

Tarım Bakanlığı'nın 2018 yılı faaliyet raporunun Akıllı Tarım Ar-Ge çalışmaları başlığında bu konuya dikkat çekilerek şu ifadeler kullanılmaktadır; "Dünyanın Smart Farming (Akıllı Tarım) olarak tanımladığı uygulamalar Daire Başkanlığımız ve bağlı Enstitüler tarafından yakından izlenerek ülkemize uyarlanması ve teknoloji seviyesinin artırılmasına bu sayede tarımsal girdilerin optimize edilerek karlılık oranının artırılması hedeflenmektedir." Nitekim bu kapsamda buğday hasadında dane kayıplarının takip edilmesi ve takibine yönelik sistemin geliştirilmesi için biçerdövere bağlanan sensörler ve GPS sistemi ile bir ana modüle bağlı GSM/GPRS sistemi üzerinden uzaktan izleme merkezine veri aktarımı gerçekleştirilmiştir. Tarım Bakanlığı'nın 2018 yılı raporunda olduğu gibi bu yıldaki III. Tarım Orman Şurası'nın sonuç bildirgesinin 20. Maddesinde de "Tarımsal verimliliğin artırılması ve kaynakların daha etkin kullanılması için bilişim teknolojisini tarım sektörüne entegre

ederek Akıllı Tarım Uygulamalarının yaygınlaştırılması, Akıllı Tarım konusunda yetişmiş çiftçi/mühendis/ara eleman sayısının özel programlar uygulanarak artırılması” dile getirilmektedir. Ancak 2019-2023 Stratejik Planı’nda, akıllı/dijital/hassas tarım başlığı yer almazken, metot ve teknoloji geliştirmek amaç ve hedefler arasında gösterilmektedir. Ayrıca Tarım Reformu faaliyet alanı için Tarım Teknolojileri ve Mekanizasyon ürün/hizmet olarak yer almaktadır. Bunlara ek olarak aşağıdaki belgelerde de akıllı tarıma ilişkin vurgular bulunmaktadır: Türkiye’nin Stratejik Vizyonu 2023 Projesi’nde Tarım, Gıda ve Hayvancılık taslağında da “Uzaktan algılama ve erken uyarı sistemleri ile bilişim sistem ve yazılımları geliştirilmesi” geliştirilmesi hedeflenmektedir. Son olarak 11. Kalkınma Planı’nda tarım öncelikli gelişme alanları içinde birinci sırada yer alırken, “Akıllı tarım teknolojileri başta olmak üzere yenilikçi ve çevreci üretim teknikleri geliştirilecek ve desteklenecektir.” Maddesi de Politika ve Tedbirler arasında sayılmaktadır.

7. Tarım 4.0' da SWOT Analizi

Türkiye’de akıllı tarım teknolojileri sunan kuruluşların bulunması ve bazı üreticilerin bu teknolojileri geliştirmek için bu kuruluşlarla iş birliği içinde olması, Tarım 4.0’ın uygulanabilirliğindeki en güçlü yönleridir. Ancak bu teknolojilerin Türk tarımında kullanımındaki zaafıların giderilmesi için uzun yıllara ve tarım politikalarında önemli iyileştirmelere ihtiyaç olduğu söylenilebilir. Çünkü bu zaafıların başında Türkiye’de akıllı teknolojilerin bilinmemesi, üreticilerin yaş ortalamasının yüksek ve eğitim seviyesinin düşük olması nedeniyle bilgi teknolojileri okuryazarlığının yetersizliği ve teknolojik girdilerde dışa bağımlılığın neden olduğu yüksek yatırım maliyeti gelmektedir. Ancak Türkiye’de genç nüfus oranının yüksek olması, 'akıllı telefon' gibi teknolojik cihazların yaygınlaşması ve bu teknolojilere aşinalık göz önüne alındığında, genç nüfusu daha fazla tarım sektöründe almaya teşvik edecek politikalarla Tarım 4.0’ın uygulanabilirliği daha da mümkün hale getirilebilir. Bununla birlikte, Tarım 4.0 teknolojilerinin emek faktörünü aşarak tarımsal işgücünün istihdamı için bir tehdit oluşturabileceği endişesi de yaygındır.

Güçlü Yönler	Zayıf Yönler
- Türkiye’de akıllı tarım teknolojileri sunan kuruluşların bulunması - Faaliyet gösteren akıllı tarım kuruluşları ile iş birliği yapan üreticilerin olması - Üreticilerin faydalandıkları akıllı tarım teknolojilerinden olumlu dönüş sağlamaları - Öncü kuruluşlar ve kamu kurumları tarafından akıllı tarım çalışmalarının yürütülmesi - Akıllı tarım teknolojilerine yönelik sertifika programlarına ilginin artması	- Türkiye’de akıllı teknolojilere yönelik farkındalığın eksikliği - Ülke nüfusunun bilgi teknolojileri okuryazarlığı konusundaki yetersizliği - Tarım üreticilerinin yaş ortalamasının yüksekliği - Tarım işletmelerinin küçük ölçekli oluşu - Kırsal alanda teknolojik altyapı eksikliği - Teknolojik girdilerde dışarıya bağımlılık yaşanması
Fırsatlar	Tehditler
- Türkiye’de genç nüfusun fazla olması - Akıllı telefon vb. cihazların yaygın kullanımı - Tarım ve teknoloji kuruluşları tarafından Ar-Ge ve eğitim alanlarına yatırım yapılması yönündeki talepler - Akıllı tarım teknolojilerinin yeni istihdam olanakları sağlaması	- Tarım sektöründe köklü bir değişim yaratacak olması - Değişime uyum sağlanmasında zorluk yaşanması - Sektörler arası entegrasyonda karşılaşılacak güçlükler

(Ercan vd., 2019)

8. Sonuç ve Öneriler

Tüm dünyada olduğu gibi ülkemiz de gelişen ve değişen bir çağdadır. Türkiye, yer altı kaynakları, ürün çeşitliliği ve coğrafi konumu nedeniyle tarım için çok uygun bir ülkedir. Ancak, tarım arazileri ve tarım işletmelerindeki parçalanma ve daralma nedeniyle ülkemizde mülkiyet belirsizliği, üretimde verim düşüklüğü, işletmelerin rekabet gücü zayıf, işletmelerde süreklilik sağlanamaması, modern insan yaşamına ve hayvancılık üretim tesislerine yer verilmemesi, köylerde yaşamak istemeyen gençlerin köyleri terk etmeleri, mali zorluklar gibi kırsal alanlardaki yapısal sorunları içerir. SWOT analizi ışığında ülkemizin bir tarım ülkesi olduğu düşünüldüğünde mevcut zafiyetlerin azaltılması ve tehditlerin ortadan kaldırılması gerekmektedir.

Tarım sektöründe Ar-Ge çalışmaları artırılmalı, çiftçiler tarafından internet ve mobil cihazların erişilebilirliği ve kullanımı yaygınlaştırılmalı, ziraat mühendisleri ve teknikerlerinin yetiştirildiği üniversitelerin lisans ve ön lisans programlarında Tarım 4.0 konusu okutulmalıdır, Türkiye’nin bir tarım ülkesi olduğu, özel sektörle devlet-üniversite işbirliği, başarılı proje örneklerinin duyulması ve yaygınlaştırılması, küçük ölçekli tarım işletmelerinin

teknolojiden yararlandırılması, bilinçlendirme çalışmaları yapılması, üretim maliyetlerinin düşürülmesi için çalışılması unutulmamalıdır. İthal ürün almamak için tarım sektörünün stratejik önemi genç nesillere anlatılmalı ve bu alanda iş yapmaları teşvik edilmelidir. Üretimde teşvik vermek ve yeniliklere açık olmak gerekmektedir. Dünya nüfustaki artış eğilimine bağlı olarak tarım sektörünün önemi bir kez daha ortaya çıkmıştır. Bu nüfusun gıda ihtiyacını geleneksel üretimle karşılamak oldukça zordur. Bu nedenle akıllı tarım teknolojileri için altyapı sağlanması, araştırma ve geliştirme çalışmaları artırılmalı, üreticiler bilgilendirilmeli ve farkındalık artırılmalıdır.

Endomembrane trafficking pathways for the development of symbiotic membrane compartments during Rhizobium-legume symbiosis

Abdulrezzak Memon

Department of Molecular Biology and Genetics, Faculty of Arts and Science, Uşak University, Uşak, Turkey. Email: armemon@usak.edu.tr

Abstract

Legumes are a large family of plants that, because of their capacity to fix atmospheric nitrogen, are essential components of the agricultural ecosystem and an important source of production of food, feed, forage, and other compounds with industrial and commercial uses. The symbiosis between legume plants and soil-living rhizobia provides the most significant amount of organic nitrogen in the global nitrogen cycle. The rhizobia infection of the plant root triggers several important events in the root cell, ending in a nodule formation - a nitrogen-fixing compartment. Some signal molecules have been studied, like the Nod factor and genes related to nod factor synthesis, thread, and peribacteroid formation. Still, little is known about the genes and proteins involved in membrane and protein trafficking and targeting in the nodule, which is one of the most important processes in nodule formation and development. Here I will describe the use of different advanced molecular and cell biology techniques to understand the mechanisms involved in membrane and protein delivery to the symbiosomes for its development and maintenance in a model legume plant *Medicago truncatula*.

Keywords: Golgi-ER transport, Arf1, Sar1, Symbiosome, Root nodule, *Medicago truncatula*.

Rhizobium-baklagil simbiyozu sırasında simbiyotik membran bölmelerinin gelişimi için endomembran taşımacılığı yolları

Özet

Baklagiller, atmosferik nitrojeni sabitleme kapasiteleri nedeniyle tarımsal ekosistemin temel bileşenleri olan ve endüstriyel ve ticari kullanımları olan gıda, yem, kaba yem ve diğer bileşiklerin önemli bir üretim kaynağı olan geniş bir bitki ailesidir. Baklagil bitkileri ve toprakta yaşayan rizobi arasındaki simbiyoz, küresel azot döngüsünde en önemli miktarda organik azot sağlar. Bitki kökünün rhizobia enfeksiyonu, kök hücrede bir nodül oluşumu ile sonuçlanan birkaç önemli olayı tetikler - nitrojen sabitleme bölmesi. Nod faktörü gibi bazı sinyal molekülleri ve nod faktörü sentezi, iplik ve peribakteroid oluşumu ile ilgili genler üzerinde çalışılmıştır, ancak zar ve protein taşımacılığı ve nodülde hedefleme ile ilgili genler ve proteinler hakkında çok az şey bilinmektedir. nodül oluşumu ve gelişimindeki en önemli süreçlerden biridir. Burada, bir model baklagil bitkisi *Medicago truncatula*'da gelişimi ve bakımı için simbiyozomlara membran ve protein dağıtımında yer alan mekanizmaları anlamak için farklı gelişmiş moleküler ve hücre biyolojisi tekniklerinin kullanımını rapor edilmiştir.

Anahtar Kelimeler: Golgi-ER taşıması, Arf1, Sar1, Simbiyozom, Kök nodülü, *Medicago truncatula*

Introduction

The symbiosis between *Rhizobium* and the plant species in the Leguminosae family is of great interest to sustainable agriculture, and the *Medicago truncatula*, a model plant from this family, is a target for agronomists to understand the molecular biology of plant-microbe interactions (Ivanov et al. 2010, Bai et al. 2022). During the symbiosis process, plant roots get infected by *Rhizobium*, leading to cell division and the development of root nodules, specific organs built by the plant and colonized by the invading bacteria. The bacteria are released into the plant cells, surrounded by a membrane of plant origin, the so-called peribacteroid membrane. In a short time, these bacteria differentiate into bacteroids and fix atmospheric nitrogen, which is supplied as a nitrogen source to the plant, and in return, they are provided with assimilates by the plant (Hirsch, 1992, Tsyganova et al., 2021).

Rhizobia attach to emerging root hairs - possibly with the help of lectins - forming microcolonies. As a consequence of Nod-factor activity (host-specific lipo-Chito oligosaccharide signal molecules synthesized by bacteria), the root tips coil, entrapping the rhizobial colony within pockets formed by the walls of the curled root hairs. The hair walls adjacent to the microcolonies are degraded, and the rhizobia invade the underlying periplasmic space of the root hair. Plasma membrane-derived infection threads, originating from curled root hairs, act as a trigger for rhizobia to enter the root tissues and eventually progress toward the root cortex, where a nodule primordium has been initiated (Hirsch, 1992). The release of rhizobia from infection threads into the cytosol of nodule primordial cells and subsequent cellular localization of bacteria leads to the formation of fully functional nitrogen-fixing nodules. Large numbers of symbiosomes are formed and localized in each nodule, which means that enormous amounts of membrane material and proteins must be delivered to the symbiosome membrane for its development and efficient function. The ability of nodule cells to control protein trafficking and targeting to the symbiosome is essential for nodule development and function. The mechanisms by which proteins are targeted to

this novel sub-cellular compartment to accommodate its demand for membrane proteins are poorly understood. Protein targeting the symbiosome must rely on the plant secretory system; however, little is known about protein trafficking and targeting in symbiosomes and root nodules (Hanton *et al.*, 2007). Small GTP binding proteins (Rop, Rab, Arf, Sar) and cytoskeletal reorganization play a unique symbiotic role in infection thread formation and symbiosome development. In this communication, I would like to elucidate the role of these GTP binding proteins in nodule formation and development by using the model plant *Medicago truncatula*.

Material and Methods

Medicago truncatula cv. Jemalong seeds were surface sterilized in concentrated HCl (37%) for 10 min. After washing several times with sterile water, seeds were spread on agar plates with a plant minimal medium adjusted to pH 5.7 (Rolfe *et al.*, 1980) and germinated for two days in the dark at room temperature. Each seedling was inoculated on agar plates with 0.1 ml *Sinorhizobium meliloti* 2011 grown to an O.D. of 0.6 in YEP medium (5 g/L yeast extract, 10 g/L peptone, 5 g/L NaCl, pH 7.0) supplemented with 600 mg/L streptomycin. Mature root nodules were harvested four weeks after infection. Plants were grown under the following conditions: 25°C, 65% humidity, 200 µE/m²s, and 16 h light/8 h dark. Nodules, roots, and other plant parts were separated and were used for RNA isolation, cDNA synthesis, and R-T PCR. Control plants were grown without Rhizobium under the same conditions.

qPCR procedure and raw data analyses

Primers used for qPCR experiments were designed using Primer 3 software (Rozen and Skaletsky 2000) and are listed in Table 1. qPCR was performed using the Platinum SYBR Green qPCR SuperMix UDG Kit (Invitrogen, Karlsruhe, Germany) following the manufacturer's instructions on a Rotor-Gene 6000 (Corbett Research; <http://www.corbettlifescience.com/>) cycler. Raw data were analyzed with the CAmPER software tool (Blom, personal communication; http://www.cebitec.uni-bielefeld.de/groups/brf/software/camper_info/) implementing an algorithm based on a four-parametric logistic model (FPLM) (Tichopad *et al.* 2003) of the fluorescence curve. The FPLM algorithm was used to calculate efficiency-corrected crossing points (cCPs) that were subsequently analyzed using the REST software (Tichopad *et al.* 2003). Visualizations were created using Microsoft Excel 2007.

Table 1. Primer pairs were used for Quantitative Real-Time PCR.

Results and Discussion

Arf1 and Sar11 expression in the roots and nodules of *Medicago truncatula*

Not much work has been reported about the role of Arf1 and Sar1 in vesicular trafficking in root nodules. To find out the role of Arf1 and Sar1 in membrane trafficking in symbiosome formation and root nodule development in *M. truncatula*, it is important to establish the expression pattern of endogenous Arf1, and Sar1 in the roots of *Rhizobium* treated and nontreated plants grown under controlled culture conditions. To examine the possible involvement of intracellular vesicle trafficking in the early steps of symbiotic interactions, the expression of the *MtArf* and *MtSar* genes were analyzed, which are the key GTP binding proteins in the regulation of membrane trafficking between ER and Golgi in eukaryotes (Pimpl *et al.*, 2000; Jurgens, 2004).

Inoculation of *M. truncatula* roots with *S. meliloti* caused a strong induction of the *MtSar1* transcript (see Fig.1). We found that *MtSar1* expression was induced around 6 times in nodules compared to the roots of non-inoculated plants (Fig.1). *At ArfB1c* which is shown to be dominantly expressed in *A. thaliana* roots (Vernoud *et al.*, 2003), the expression of the similar transcript MtrIMGAAC144806_7.1 was also found to be nodule specific and highly expressed in *Rhizobium* inoculated plants, as predicted in our previous bioinformatics analysis (Fig 1, Yuksel and Memon 2008). Indeed, no *ArfB1c* transcript accumulation was observed in the roots of non-inoculated plants (Fig. 1). This indicates that this Arf is possibly nodule specific and expressed in host plant roots after rhizobium infection indicating its role in nodule development. Intriguingly another *MtArf 1* (MtrGB57486383) transcript was expressed both in roots and nodules of inoculated and non-inoculated plants suggesting its general role in vesicular trafficking in plant cells. Several isoforms of Arf1 have been identified in the *M. truncatula* genome (Yuksel and Memon 2008), but their exact function in root and nodules has not been defined. In our preliminary experiment with Arf1 protein expression, we observed a significant increase in Arf1 protein expression with rhizobial infection, and the main pool of the Arf1 in both nodules and roots is possibly present in the active form (Memon 2012).

Fig. 1. Expression levels of Arf1, Arl1, and Sar1 (at mRNA level) in the nodules and roots of *Medicago truncatula*. Ubiquitin was used as an internal control. Nodules and roots SM were harvested from the Rhizobium inoculated plants. N+ roots were harvested from un-inoculated plants, which were supplied with nitrogen fertilizer.

Expression of arf-like gene (Arl) in the roots and nodules of *Medicago truncatula*

Our previous bioinformatics analysis with EST database of *M. truncatula* and *L. japonicus* showed two *Arl* like genes expressed in nodules (Yuksel and Memon 2008). We designed the primers targeted to one of these genes (Mtr GB13780535) homologs to *AtArlA1d*. RT-PCR experiments showed that this transcript was highly expressed in nodules and to a lesser extent in roots of Rhizobium inoculated plants, but its expression was also observed in un-inoculated roots (see Fig.1). This could suggest the dual role of Arl in both early and late secretory pathway. These results clearly suggest that several Arf and Sar proteins are involved in early and late secretory pathways during rhizobium-legume interaction and nodule development. Further work will identify the components of trafficking in the early and late secretory pathway in legume roots and nodules and elucidate the mechanism of transport through the Golgi complex to the root nodule.

Abstract

Arabidopsis thaliana has eight genes encoding members of the type P_{1B} heavy metal-transporting ATPase, subfamily of the P-type ATPases. We focused our study on four ATPases, mainly HMA1, HMA2, HMA3, and HMA4, which are closely related and most similar in their sequences. We carried out the bioinformatics analysis of these metal ATPases and obtained their structure in *A. thaliana*, *A. halleri*, and other heavy metal accumulators in *Brassica* spp. *A. thaliana* is a model plant for research because of the duplications and other evolutionary events. These evolutionary events provided a chance to elucidate their regulation and function in the cell. All previous bioinformatics analyses have given some information about their regulation, but not much work has been done on their structural and interactome analysis. Experimental determination of 3D structures is essential to understand better these proteins' function, which is crucial for the proper functioning of all plant cellular processes. Especially, docking sites and domains need to be worked out to understand the role of these transporter proteins and their interaction in plant cells. These bioinformatic analyses will help the researcher understand these ATPases' role in detoxifying the toxic metals from the cells of accumulator plants. Further research on gene cloning, gene expression, and generating new accumulator plants for phytoremediation is needed for the reclamation of polluted soils from toxic heavy metals.

Keywords: Metal P-type ATPases, Protein Structure prediction, Interactome, hyperaccumulator plants, Brassicas

***Arabidopsis thaliana*, *Arabidopsis halleri*, *Brassica rapa* ve *Brassica juncea*'daki ağır metal ATPaz'ların karşılaştırmalı yapısal analizi**

Özet

Model bir bitki olan *A. thaliana*, P-tipi ATPaz'ın alt ailesi olan P_{1B}-tipi ATPazın sekiz üyesine sahiptir. *Arabidopsis thaliana*, duplikasyonlar ve diğer evrimsel olaylar nedeniyle HMA'ların ve diğer birçok proteinin araştırılmasında tercih edilmektedir. Bu evrimsel olaylar, HMA'ların düzenlenmesinde ve hücredeki işlevlerinin açıklanmasında önemli rol oynamaktadır. Önceki biyoinformatik araştırmalarda, HMA'ların bazı fonksiyonları hakkında bilgi mevcut olmasına rağmen, bunların yapıları ve interaktomları üzerinde yeterli çalışma bulunmamaktadır. Bu çalışmada, bu sekiz üye arasından yakın ilişkili ve yüksek benzerlik oranına sahip olan HMA1, HMA2, HMA3 ve HMA4 üzerinde detaylı biyoinformatik analizi gerçekleştirilmiştir. *A. thaliana* ile aynı familyaya ait *A. halleri* ve bazı *Brassica*'nın akümülatör türlerinden HMA1-HMA4 dizileri elde edilerek biyoinformatik veritabanları aracılığıyla karşılaştırılmıştır. Bu biyoinformatik çalışmalar, akümülatör bitki hücrelerinden toksik metalleri detoksifiye etmedeki HMA'ların rolü hakkında bilgi vermektedir. Ayrıca, bitkide hücresel süreçlerin aktif bir şekilde sürdürülebilmesi için bu taşıyıcıların 3D yapılarının deneysel olarak belirlemek oldukça önemlidir. Bu bağlamda, bu taşıyıcıların yapısal analizleri bazı protein veritabanları kullanılarak yapılmıştır. Bu sonuçlar, toksik ağır metallerce kirlenmiş toprakların ıslahı için mevcut akümülatör bitkilerin üretimine ve ayrıca gen klonlama, gen ekspresyon bilgileri ile fitoremediasyon için uygun yeni akümülatör bitkilerin geliştirilmesine katkı sağlayacaktır.

Introduction

Heavy metals (H.M.s) are functionally classified into two categories: i) essential metals such as copper (Cu), iron (Fe), and zinc (Zn), and ii) non-essential metals such as cadmium (Cd), lead (Pb), and mercury (Hg) (Ozturk et al., 2012; Pinto and Ferreira, 2015; Memon et al., 2021). Both of these classes are essential for plant growth. Recently, this requires more attention because heavy metals above their normal ranges are highly toxic to both plant and animal life (Van der Zaal et al., 1999; Dehkordi et al., 2010). The toxic amount of heavy metals in the soil adversely affects soil ecology, reduces agricultural production or product quality, deteriorates groundwater quality, and ultimately harms living organisms' health.

Plants are capable of various cellular mechanisms and can detoxify heavy metals by either compartmentalizing metals at the subcellular level or depositing them in leaf trichomes in innocuous form. Some plant species can accumulate and detoxify the large amounts of heavy metals present in the soil (Memon et al., 2001; Memon and

Schroder, 2009; Memon and Zahirovic, 2014). The natural phenomenon of heavy metal tolerance became of most significant concern and interest in plant research to study the gene expression and regulation in some well-known accumulator plants such as *Arabidopsis halleri*, *Noccaea caerulescens*, *Pteris vittata*, and *Brassica juncea*. In addition, heavy metal toxicity may block essential functional groups of enzymes, disrupt the structural appearance of biomolecules, generate oxidative stress, etc. (Hall, 2002; Mills et al., 2005; Kraemer, 2009; Meraklı et al., 2022).

Metal hyperaccumulator plants

A specific group of plants has shown a great potential to absorb and translocate metals from roots to shoots and are termed hyperaccumulators (Baker et al., 2002; Chaney et al., 2007; Sytar et al., 2021). Heavy metal accumulator plants have developed several detoxification mechanisms in the cell, such as metal chelation and sequestration, metal storage in the vacuolar compartment, and excreting metal in the trichomes of the leaves (Memon et al., 2001; Memon, 2020). The distinctive characteristic of hyperaccumulator plants is to translocate toxic metals from roots to shoots efficiently, sub-compartmentalize them in the cell and keep the metal away from the metabolic processes (Van der Ent et al., 2013; Sytar et al., 2021). A set of functional genes such as P-type ATPase, ZIP, and NRAMP are crucial in plant cell metal homeostasis (Hall and Williams, 2003; Williams and Mills, 2005; Memon, 2016). For instance, P_{1B}-ATPases, also known as heavy metal ATPases (HMAs), play a critical role in phytoremediation via the long-distance transport of various metals between plant organs (Colangelo and Gueriot, 2006). In recent years, significant scientific progress has been made in understanding the molecular mechanisms of metal uptake and transport in hyperaccumulator plants, including several members of the *Brassicaceae* family.

Heavy metal ATPases

Heavy metal transporting ATPases (HMAs) are membrane-bound proteins having 6–8 predicted transmembrane helices (Axelsen and Palmgren 2001; Smith et al. 2014). They contain 31 amino acids (aa) of heavy metal-associated domain featuring GMTCxxC, a short C-terminal domain, and a very long N-terminal domain (Bull and Cox, 1994).

Here we intend to elucidate the heavy metal tolerance and accumulation mechanisms in the plant species in the *Brassicaceae* family with the role of the HMAs (HMA1-HMA8) in response to heavy metal stress. The phylogenetic relationships of the HMA1-HMA8 proteins from *Brassica* spp., *A. thaliana*, *A. halleri*, *Noccaea caerulescens* (*Thlaspi caerulescens*) were assessed using multiple sequence alignment and phylogenetic tree construction (Fig. 1). Using different bioinformatics tools, we have identified eight heavy metal transporter genes (HMA1-8) in different plant species in *Brassicaceae* (three *Arabidopsis* spp., four *Brassica* spp., and *Noccaea caerulescens* (*Thlaspi caerulescens*)). The phylogenetic relationships among HMAs were established using the MEGA X program for phylogenetic tree construction, and the relative similarity rates among the genes and plant spp were estimated (Fig.1). HMA1-8 protein sequences from *Arabidopsis thaliana*, *Arabidopsis halleri*, *Arabidopsis lyrata*, *Brassica napus*, *Brassica rapa*, *Brassica juncea*, *Brassica oleracea*, *Noccaea caerulescens* (*Thlaspi caerulescens*) were retrieved from NCBI and UniProt, and a phylogenetic tree was constructed. The phylogenetic tree shows the evolutionary relationship of HMA1-8 transporters using a Neighbour-joining tree without distance corrections. In Fig. 1, we observe two sister groups, one group being AhHMA1 and NcHMA7, and the other one HMA1-8, each having a common ancestor. BoHMA5, AtHMA5, and AtHMA7 share a common ancestry with BnHMA5 and BrHMA5, and similarly, BrHMA3 and AtHMA3 share their ancestry with BoHMA3 and BnHMA3. NcHMA2 and BoHMA2 share a common ancestry with BnHMA2 and BrHMA2, and similarly, BrHMA3 and AtHMA3 share their ancestry with BoHMA3 and BnHMA3. On the other hand, AtHMA2 and AlHMA2 share a common ancestry with AtHMA6, BrHMA2, BnHMA2, BoHMA2, NcHMA2, BnHMA3, BoHMA3, AtHMA3, BrHMA3, NcHMA5, AtHMA7, AtHMA5, BoHMA5, BrHMA5, and BnHMA5.

HMA1-8 sequences from *A. thaliana* were compared to its homologs in other species in *Brassicaceae*; for example, *B. juncea*, *B. rapa*, *B. napus*, *B. oleracea*, *A. lyrata*, *A. halleri*, and *N. caerulescens*. Phylogenetic analysis showed a very close relationship of BnHMA1 to BoHMA1; AtHMA1 to NcHMA8; AtHMA2 to AlHMA2; BrHMA2 to BnHMA2; BnHMA3 to BoHMA3; AtHMA4 to AhHMA4; BoHMA4 to NcHMA4; BjHMA4 to BrHMA4; AlHMA4 to NcHMA3. HMA transporters are divided into the Cu/Ca/Zn/Cd/Co-ATPases group, the Zn/Cd/Pb/Co-ATPases group, and the Cu-ATPases group (Hermand et al., 2014). BnHMA2 and BnHMA4 are reported to belong to the Cu/Ca/Zn/Cd/Co-ATPases group. It is inferred from the phylogenetic tree analysis that HMA4 in *A. thaliana*, *A. halleri*, and *B. napus* are evolutionary closely related and are homolog to each other. HMA2 in *Brassica* and *Arabidopsis* phylogenetically were closely related, and HMA4 showed similar distribution patterns in the phylogenetic tree. NcHMA4 and BoHMA4, BjHMA4 and BrHMA4 were in the same group, and AtHMA4 and AhHMA4 were also placed in the same group.

Fig. 1. The protein sequences of HMA1-8 family transporters from different plant species from the *Brassicaceae* family were obtained from NCBI and UniProt. The protein sequence IDs are AtHMA1 (Q9M3H5), AhHMA1 (Q70IH7), AlHMA1 (XP_020875667), NcHMA1 (JAU82411), BrHMA1 (XP_009137459), BnHMA1 (XP_022573707), BoHMA1 (XP_013595810), AtHMA2 (Q9SZW4), AlHMA2 (XP_002867367), BrHMA2 (XP_009128090), BnHMA2 (XP_013748024), BoHMA2 (XP_013609995), NcHMA2 (JAU82907.1), AtHMA3 (P0CW78), AhHMA3 (AJ556182), AlHMA3 (XM_002867320), BrHMA3 (XP_009137892), BnHMA3 (XP_013752152), BoHMA3 (XP_013591300), NcHMA3 (A0A1J3HSX9), AtHMA4 (AT2G19110), AhHMA4 (ABB29495), AlHMA4 (XP_020869480), BrHMA4 (XP_009150707), BjHMA4 (AFJ94635), BnHMA4 (XP_022561353), BoHMA4 (XP_013629797), NcHMA4 (JAU89865), AtHMA5 (OAP12074), BrHMA5 (XP_009112946), BnHMA5 (XP_013748077), BoHMA5 (XP_013606061), NcHMA5 (JAU39366), AtHMA6 (AT4G33520), AtHMA7 (NP_199292), NcHMA7 (JAU79906), AtHMA8 (NP_001031920), NcHMA8 (JAU85510). The neighbor-joining phylogenetic tree was constructed using MEGAX after CLUSTALW alignment of the full-length amino acid sequences of heavy metal ATPases in different plant species in *Brassicaceae*. The tree is unrooted, and its branch length represents the relative evolutionary distances between the input proteins.

3D structure prediction and validation of HMA transporters

Using PyMol software, the 3D structure was generated and visualized. The confidence of the visualization was checked with respected Ramachandran plots (data not shown) (Van der Zaal et al. 1999). The results showed that there were 580 (88.8%) residues in the favored region for HMA1, 544 (81.3%) residues for HMA2, 409 (89.5%) residues for HMA3, and 544 (81.2%) for HMA4. The number of residues found in the outlier region is considered, further confirming the accuracy of the 3D structure prediction. The results are as follows: for HMA1, 25 (3.8%), for HMA2, 50 (7.5%), for HMA3, 6 (1.3%), and HMA4, 51 (7.6%) residues were found in the outer region. Analysis and prediction of the 3D structure of HMAs in plants are vital for a complete understanding of the function, interactions, possible ligands, conserved domains, their homologs, and many other functional properties. The 3D structures of HMA proteins are predicted by the Phyre2 tool and are shown in Figure 3. It is concluded that all HMAs (HMA1 to HMA4) in *Arabidopsis* cells have shown similarities in their secondary structural elements, including the number of alpha helices, beta sheets, and loops. The 3D structure of HMA2 and HMA4 is remarkably similar, and both are localized in the plasma membrane.

Fig. 2. Predicted 3D structures of proteins HMA1, HMA2, HMA3, and HMA4 in *Arabidopsis thaliana*.

In conclusion, HMA transporters are divided into the Cu/Ca/Zn/Cd/Co-ATPases group, the Zn/Cd/Pb/Co-ATPases group, and the Cu-ATPases group. HMA2 and HMA4 transporters are involved in metal transport from roots to shoots and belong to the Cu/Ca/Zn/Cd/Co-ATPases group.

The bioinformatics analysis of HMAs in *Brassica* species showed many similarities. HMA1-8 sequences from *A. thaliana* were compared to its homologs in other species in *Brassicaceae*; for example, *B. juncea*, *B. rapa*, *B. napus*, *B. oleracea*, *A. lyrata*, *A. halleri* and *N. caerulea*. Phylogenetic analysis showed a very close relationship among these ATPases. In the 3D structural composition of proteins, we have concluded that all HMAs have similarities in their secondary structural elements and play a similar role in metal transport in the cell. The present paper will help the researcher understand these ATPases' role in detoxifying the toxic metals from the cells of accumulator plants.

Abstract

Cadmium (Cd) is one of the toxic heavy metals not essential for the growth and development of plants and other organisms. *Brassica rapa* accumulates several heavy metals in its leaves and is reportedly suitable for phytoremediation. In this study, Cd uptake and accumulation in the leaves of *B. rapa* exposed to different cadmium levels (0, 5, 10, 20, 50, 100 µM CdSO₄) were analyzed; as well as the effect of Cd stress on HMA2 and HMA4 genes expression were investigated. The qRT-PCR results showed that HMA2 and HMA4 play a vital role in cadmium uptake and translocation in *B. rapa* at low Cd level (5-20 µM). However, exposure to high Cd levels (50 and 100 µM) significantly reduced the growth and biomass of *B. rapa*. Furthermore, high levels of Cd inhibit the expression of HMA2 and HMA4 genes in *B. rapa*. Our data show a multigenetic (co-acting of many transporter gene clusters) response in the signaling pathway associated with Cd accumulation and tolerance mechanism in *B. rapa*.

Keywords: Heavy metal ATPases, HMA2, HMA4, Cd, *Brassica rapa*

Kadmiyum Stresi Altında Yetiştirilen *Brassica Rapa*'da Bazı Metal Taşıyıcı Atpaz'ların Anlatım

Özet

Kadmiyum (Cd), bitkilerin ve diğer organizmaların büyümesi ve gelişmesi için biyolojik olarak gerekli olmayan toksik ağır metallerden birisidir. *Brassica rapa* yapraklarında bazı ağır metalleri biriktirebilme yeteneği sergilediği ve fitoremediasyon için uygun bir bitki olduğu bildirilmiştir. Bu çalışmada, farklı kadmiyum seviyelerine (0, 5, 10, 20, 50, 100 µM CdSO₄) maruz kalan *B. rapa* yapraklarında Cd alımı ve birikimi analiz edilmiş; Cd stresinin HMA2 ve HMA4 genlerinin ekspresyonu üzerindeki etkisi araştırılmıştır. qRT-PCR sonuçları, HMA2 ve HMA4'ün düşük Cd seviyesinde (5-20 µM) *B. rapa*'da kadmiyum alımı ve translokasyonunda önemli bir rol oynadığını göstermiştir. Bununla birlikte, yüksek Cd seviyelerine (50 ve 100 µM) maruz kalma, *B. rapa*'nın büyümesini ve biyokütlesini önemli ölçüde azaltmıştır. Ayrıca, yüksek Cd seviyeleri, *B. rapa*'da HMA2 ve HMA4 genlerinin ekspresyonunu inhibe etmiştir. Verilerimiz, *B. rapa*'da Cd birikimi ve tolerans mekanizması ile ilişkili sinyal yolağında multigenetik (birçok taşıyıcı gen kümesinin birlikte etkisiyle) bir yanıt olduğunu göstermektedir.

Evaluation of the Visual Landscape Quality of Parks: The Case of Serik/Antalya

Rifat Olgun¹

¹Department of Park and Horticulture, Serik G-S. Sural Vocational School of Higher Education, Akdeniz University, Antalya, Turkey

Abstract

The visual perception of landscapes is expressed as seeing the qualities of the landscape. For this reason, the relationship between landscape and perception is related to the level of people's perception of the landscape. This level of perception varies depending on the socio-cultural and economic structure of the people and the environment in which they live. The fact that the environment in which people live has a variable visual structure also constantly affects their landscape perception. Parks are one of the important urban landscape areas in cities. The existing structure of the parks located in the urban landscape areas affects the visual perception value of these areas on the users.

The aim of the research is to evaluate the visual landscape quality value of the parks in the city of Serik in the direction of user opinions. In this context, the photographs of the selected parks within the boundaries of the research area were taken from certain points. The questionnaire form prepared with these photographs was applied to the park users on a voluntary basis. The data obtained from the questionnaire forms were digitized and analyzed. Within the scope of the analysis, the data belonging to the socio-demographic structure of the participants and the answers they gave to the propositions about the parks were determined by descriptive analysis (frequencies and descriptives). Whether there was a statistically significant difference between the sociodemographic structure of the participants and their answers to the propositions was analyzed with parametric tests (independent sample t-test and one-way analysis of variance). At the same time, the relationship between the visual landscape quality assessment criteria of the parks was examined by Pearson Correlation Analysis. The results of the analysis show that the features of the parks due to their planning, design and maintenance affect the visual landscape quality values. In this direction, suggestions have been developed to increase the visual landscape quality value of the parks.

Parkların Görsel Peyzaj Kalitesinin Değerlendirilmesi: Serik/Antalya Örneği

Özet

Peyzajların görsel algısı, peyzajın sahip olduğu niteliklerin görülmesi olarak ifade edilmektedir. Bu nedenle peyzaj ile algı arasındaki ilişki insanların peyzajı algılama düzeyi ile bağlantılıdır. Bu algılama düzeyi kişilerin sosyo kültürel ve ekonomik yapısına, içerisinde yaşadığı çevreye bağlı olarak değişmektedir. Kişilerin içerisinde bulunduğu çevrenin değişken bir görsel yapıya sahip olması da onların peyzaj algısını sürekli etkilemektedir. Parklar kentler içerisinde yer alan önemli kentsel peyzaj alanlarından birisidir. Kentsel peyzaj alanları içerisinde yer alan parkların mevcut yapısı bu alanların kullanıcılar üzerindeki görsel algı değerini etkilemektedir.

Araştırmanın amacı, Serik kentindeki parkların görsel peyzaj kalite değerinin kullanıcı görüşleri doğrultusunda değerlendirilmesidir. Bu kapsamda araştırma alanı sınırları içerisinde seçilen parkların fotoğrafları belirli noktalardan çekilmiştir. Bu fotoğraflar ile hazırlanan anket formu gönüllülük esasına dayalı olarak park kullanıcılarına uygulanmıştır. Anket formlarından elde edilen veriler sayısallaştırılmış ve analiz edilmiştir. Analiz kapsamında katılımcıların sosyo demografik yapısına ait veriler ve parklara ait önermelere verdikleri cevaplar betimsel analizlerle, katılımcıların sosyodemografik yapısı ile önermelere vermiş oldukları cevaplar arasında istatistiksel olarak anlamlı bir fark olup olmadığı parametrik testlerle (bağımsız örneklem t testi ve tek yönlü varyans analizi) analiz edilmiştir. Aynı zamanda parkların görsel peyzaj kalite değerlendirme kriterleri arasındaki ilişki pearson korelasyon analizi ile incelenmiştir. Analiz sonuçları parkların planlanması, tasarımı ve bakımından kaynaklı sahip oldukları özelliklerin görsel peyzaj kalite değerlerini etkilediğini göstermektedir. Bu doğrultuda parkların görsel peyzaj kalite değerini arttırmaya yönelik öneriler geliştirilmiştir.

Atatürk Dam Lake's (Adıyaman, Türkiye) Planktonic Diatoms

Metin Caglar¹, Rzgar Farooq Rashid^{2*}, Zeliha Selamoglu³

¹Department of Fundamental Science, Faculty of Fisheries, Firat University, Elazig, Türkiye

²Department of Medical Laboratory Science, College of Science, Knowledge University, Erbil 44001, Iraq

³Department of Medical Biology, Faculty of Medicine, Nigde Ömer Halisdemir University, Nigde, Türkiye

*Presenter's Email: rzgar.faruq@knu.edu.iq

Abstract

In this study, the planktonic algae taken from stones at a station selected from Atatürk Dam Lake in Adıyaman province were investigated together with some physical and chemical parameters of the lake between March and November 2020. During this research, a total of 19 taxa belonging to the planktonic diatoms were recorded. The planktonic diatoms showed their best growth in summer when light and temperature are high.

During the study, *Cymbella* (4 taxa), *Gomphonema*, *Nitzschia* (3 taxa), *Navicula*, *Surirella* (2taxa) were the diatoms represented by the most species as well as being the most important ones in terms of the frequency of occurrence and the size of the populations they formed in the planktonic diatomic community.

Keywords: Planktonic, Diatom, Atatürk Dam Lake, Adıyaman-Türkiye.

A fundamental approach to the medicinal effects of walnut green husk (*Juglans regia* L.)

Sahebeh Hajipour ^{1*}, Ebrahim Alinia-Ahandani ², Zeliha Selamoglu ³

¹ Department of Biology, Golestan University, Gorgan, Iran

² Department of Biochemistry, Payame Noor University, Tehran, Iran

³ Department of Medical Biology Faculty of Medicine, Nigde Omer Halisdemir University, Nigde, Turkey

Abstract

Juglans regia L. is a tree species that has been of interest to humans since ancient times and is known as a species with important nutritional and therapeutic value. Wild stands of *J. regia* have been documented to occur in the temperate and semi-arid mountain areas of Central Asia, in east and south Asia, the Middle East and in the Caucasus region. Walnut was cultivated at commercial scales in 48 countries globally on a total area of 647,497 ha in 2016. China and the United States accounted for 47 and 31 percent of the total global walnut production, respectively. Further major producer countries include Chile, Iran and Ukraine. A review of recent studies shows Phenols actively partake in the physiological processes of walnut fruit growth and development, exerting various impacts on walnut fruits before and after harvest. Phenolic compounds are one of the most active antioxidant compounds total phenols essentially contribute to disease resistance. Phenolic contents vary in different parts and growth phases of the Persian walnut: total phenols increase in early and mid summer, followed by a decrease in late summer and a new increase before the harvest period. Stampar et al. (2006) identified a total of 13 phenolic compounds in walnut husks. Walnut green husks are rich in phenolic compounds such as juglone . Juglone (5-Hydroxy 1,4-naphthoquinone) is a specific phenolic compound that exists only in walnuts, especially in green walnut parts such as leaves, husks, stems and roots. Juglandin has exhibited cytotoxicity to different types of breast, lung and skin cancer cells. Vieira et al. (2020) showed the antibacterial effects of the antioxidant extract of green walnut shell against Gram-positive and Gram-negative bacteria. A growing concern for the environment, the desire to secure healthy food without synthetic chemical preservatives, as well as the increasing resistance of plant pathogens to fungicides are the main reasons for searching new effective, and more environmentally friendly plant protectors that green shell of walnut is one of the suitable candidates in this way. Research shows that green walnut skin extract had a special effect in inhibiting mycelium growth in *A. alternata*, *P. cactorum*, *F. culmorum*, *B. cinerea* and *A. apis* species. Walnut green husk (WGH) has been mentioned as a wound-healing agent in traditional Iranian medicine. Different parts of the Persian walnut have been used to treat a range of diseases, including skin disorders, cancer, infectious disease, diarrhea, hyperglycemia, anorexia, arthritis helminthiasis, sinusitis, eczema, asthma. Although different drug forms of the walnut green husk (WGH), the extract and burnt residues, were referred to as the wound-healing agents in the TIM/PM resources and previous reports indicated that the plant is a good source of phenolic compounds with high antioxidant potential. The researchers showed that the ethanol extract of WGH has the ability to heal wounds in mice, which was a promising result in this way. The obtained results are a step for the development of future applications using green walnut shell as a source of value-added compounds with bioactive potential.

A glimpse of the amazing effects of some effective medicinal plants on the skin

Ebrahim Alinia-Ahandani ^{1*}

¹ Department of Biochemistry, Payame Noor University, Tehran, Iran

Abstract

The skin is one of the sensitive parts of the body, the protection of which is effective in human beauty. Medicinal plants have less side effects than chemicals and chemical drugs, and they have effective pharmacological effects on the skin, which are widely used. For the following research, tools such as books, articles and electronic databases of Science of Web ISI, PubMed, Magiran and IranMedex were searched to determine the medicinal plants with positive effects on the skin, with an emphasis on healing and healing properties.

Some of the plants that played a role in the treatment of skin diseases and their effects were reported include avocado, thyme, *Aloe vera*, chamomile, almond, *Calendula*, olive, hofarikon, horsetail, *Eucalyptus*, rice bran, flax, tea and optional and reviewed. Therefore, many of the mentioned plants have been reported and proven to have very favorable properties either as a supplement in biochemical processes or as a coating on the skin, so the necessity of using them as much as possible is suggested.

Stage Reached in Broiler Breeding Studies in Turkey: We Have to Success

Musa Sarıca

Department of Animal Science, Agricultural Faculty, Ondokuz Mayıs University, Samsun, Turkey

Abstract

Although broiler breeding studies in Turkey went back to the 1960s, the desired goal could not be achieved. Initial studies are based on crosses between pure breeds. In the following periods, successful results were obtained by producing ATEBRO and ERBRO genotypes in studies on the production of sire and dam parents. However, since these studies were not supported in the 1990s, the studies were completely stopped in 2004. In 2011, it was decided to start the studies again within TAGEM (General Directorate of Agricultural Research and Policies), and in 2015, at EGKTAE (Eskişehir Transitional Zone Agricultural Research Institute) breeding studies were started with pure lines (3 dam and 2 sire lines). In these studies, commercial hybrids were produced by selection and hybridization and the material was registered as Anadolu-T in 2020.

The material has been shared with the private sector since 2018 and the field results are seen as positive. Especially nowadays, due to the capacity losses of commercial breeder companies, the reduction of the breeder amount they give to our country by 25% has increased the importance of the material.

Key Words: *Broiler breeding, Pure lines, Anadolu-T, Private sector, Performance*

Türkiye’de Etlik Piliç Islah Çalışmalarında Geline Aşama: Başarmak Zorundayız

Özet

Türkiye’de etlik piliç ıslah çalışmaları 1960’lı yıllara kadar gitmekle birlikte istenilen hedefe ulaşamamıştır. İlk çalışmalar saf ırklar arasında yapılan melezlemelere dayanmaktadır. Sonraki dönemlerde ana ve baba ebeveynleri üretimine dönük çalışmalarda ATEBRO ve ERBRO genotipleri üretilerek başarılı sonuçlar alınmıştır. Ancak 1990’lı yıllarda bu çalışmalar desteklenmediği için 2004 yılında çalışmalar tamamen durdurulmuştur. 2011 yılında TAGEM (Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğü) bünyesinde yeniden çalışmaların başlatılmasına karar verilmiş ve 2015 yılında EGKTAE (Eskişehir Geçit Kuşağı Tarımsal Araştırma Enstitüsü) saf hatlarla (3 ana 2 baba hattı) ıslah çalışmaları yeniden başlatılmıştır. Bu çalışmalarda seleksiyon ve melezleme ile ticari hibritler üretilmiş ve 2020 yılında Anadolu-T olarak tescil edilmiştir.

Materyal 2018 yılından itibaren özel sektör ile paylaşılmakta ve saha sonuçları olumlu görülmektedir. Özellikle günümüzde ticari damızlık firmaların kapasite kayıpları nedeniyle ülkemize verdikleri damızlık miktarını %25 azaltmaları materyalin önemini arttırmıştır.

Anahtar Kelimeler: *Etçi ıslah, Saf hatlar, Anadolu-T, Özel sektör, Performans*

Giriş

Günümüzde tavukçuluk üretimden tüketime kadar ilgili alanların da etkisiyle bir sektör halini almıştır. Genetik, ıslah, biyoteknoloji, yem ve yem katkı maddeleri üretimi, kesimhane ve ileri işleme uygulamaları, ekipman sanayi, yumurta ürünleri endüstrisi, kuluçkacılık, sağlık koruma, ilaç ve aşı endüstrisi, pazarlama, muhafaza ile yetiştirme sistemlerindeki hızlı gelişmeler belirli bir zaman diliminde en hızlı değişen bir yapıyı oluşturmuştur. Bu gelişme ve değişimlerin aynı hızda olmasa da gelecekte de süreceği beklenmektedir. Tavukçuluktaki gelişmelerde etkin olan diğer faktörler ise hızlı nüfus artışına gıda sağlamadaki avantajları, ucuz ve kaliteli gıda üretimine imkan vermesi, üretimin kapalı bir sistemde yapılabilmesi, tüm girdilerin ve elde edilen ürünlerin kolayca taşınabilmesi ve üretimin diğer hayvan türlerine göre daha hızlı gerçekleşmesidir.

Dünyada kanatlı eti üretimindeki büyümenin büyük kısmı Asya ülkeleri kaynaklıdır. Özellikle Çin, Hindistan, Japonya, Güney Kore ve Türkiye’deki üretim artışları önemli etki yaratmıştır. Tavuk eti üretiminde Kuzey Amerika ve Avrupa, pazar paylarında düşüş yaşarken Güney Amerika’da Brezilya üretimin önemli merkezlerinden biri haline gelmiştir.

Dünyada kanatlı etinin çoğunluğu piliç etinden kaynaklanmaktadır. Kanatlı eti tüketici tercihlerindeki değişimler ve olumsuz algılara rağmen artış eğilimi yıldan yıla devam etmektedir.

Piliç eti üretiminde kıtalara göre değerlendirmelerde, Asya’da düzenli bir artış eğiliminin ortaya çıktığı görülmektedir. Amerika kıtası hala tavuk eti üretimindeki üstünlüğünü korumakla birlikte, Asya üretim artışlarıyla üretim merkezi olma yolundadır. Avrupa özellikle hayvan refahı ve üretim sistemlerine getirilen standartlar nedeniyle üretim artışının sınırlandığı kıta konumundadır. Afrika ile Okyanusya üretimde önemli artışların ortaya çıkmadığı kıtalardır.

Dünya piliç eti üretiminde 1970 yılında ilk 10 sırada olan ülkelerin sadece ikisi (Brezilya ve Çin) gelişmekte olan ülkedir. Bu dönemde ABD dünya kanatlı eti üretiminin yaklaşık %31’lik kısmını sağlamıştır. 2005 yılında ilk 10 ülkenin beşi gelişmekte olan ülkeler (Çin, Brezilya, Meksika, Hindistan, İran) olup, üç tanesi Asya’da bulunmaktadır. ABD hala lider konumunu sürdürmekle birlikte Çin ve Brezilya 2. ve 3. sıraya yerleşmiştir. Bunun yanında 2005 yılından itibaren Türkiye ve 2010 yılından itibaren Rusya ciddi üretim potansiyeli yaratan ülkelerdendir.

Tablo 1. Dünya et üretimindeki değişimler (1000 ton)

(FAO, 2022)

Avrupa Birliği Ve Türkiye Tavukçuluğu

AB ülkelerinde piliç eti üretiminde yıllar itibarı ile kısmi artışlar olmasına rağmen, özellikle büyük üretim kapasitesine sahip olan ülkelerdeki artışlar tüketim dengesi ile sınırlı olduğundan 2005 yılından itibaren artış trendinde ciddi azalmalar görülmüştür. Polonya piliç eti üretiminde AB ülkeleri içerisinde 2017 yılına kadar en yüksek üretime sahip olmakla birlikte 2018 yılında İngiltere ilk sıraya çıkmıştır. İngiltere'nin birlikten ayrılması ile Polonya yine lider ülke konumuna gelmiştir. Polonya, İspanya, Fransa, Almanya, Hollanda ve İtalya başlıca etlik piliç üretim merkezlerini oluşturmaktadır. AB ülkelerinde etlik piliç üretiminde etiketlenmiş (Label Rouge) üretim sistemiyle, önemli seviyelerde yer alan Fransa diğer ülkelerden farklı bir üretim gerçekleştirmektedir. Zaman zaman bu üretim sistemi toplam piliç eti üretiminde %30'a kadar çıkabilmektedir. Yavaş gelişen genotiplerle serbest gezinmeli (free-range) sistemde gerçekleştirilen bu üretim İngiltere başta olmak üzere diğer AB ülkelerinde de giderek etkili olmaktadır. Bu konuda hayvan refahı ile ilgili toplumsal yönlendirmeler etkili olmaktadır.

Tablo 4. AB ülkelerinde tavuk eti üretimi (1000 ton)

¹: Kurucu üyeler, 1952; ²: 1973'te katılan ülkeler; ³: 1981'de katılan ülkeler; ⁴: 1986'da katılan ülkeler; ⁵: 1995'te katılan ülkeler; ⁶: 2004'te katılan ülkeler; ⁷: 2007'de katılan ülkeler; ⁸: 2013'te katılan ülkeler; ⁸: son katılan ülkeler. İngiltere 2022 yılı başında birlikten ayrıldığı için 2020 yılına kadar olan veriler tabloya dahil edilmiştir (FAO, 2022).

AB piliç eti ve yumurta üretimi, aynı üretim ve ticaret şartları uygulanması koşuluyla, ülkemiz tavukçuluk sektörü açısından bir risk taşımamaktadır. Ancak tavukçuluk sektörüne rekabet gücü kazandırmak ve Türkiye tavukçuluğunun sürdürülebilir gelişmesini devam ettirmek için önlemler alınmalıdır. AB ülkeleri ile entegrasyona hazırlanmak için öncelikle tarım politikası çerçevesinde AB ülkelerinkine benzer bir politika oluşturulmalıdır. Türkiye'ye AB karşısında rekabet kazandırmak için yapılacak devlet destekleri öncelikle üretim aşamasında ve maliyetlerin düşürülmesine yönelik olmalıdır. Sektörde önemli bir girdi olan yem maliyetleri dünya fiyatlarına yaklaştırılmalıdır. Bunun sağlanabilmesi için de yem bitkileri üretimi özendirilmelidir. Buna ilave olarak üreticiler eğitilmeli ve işletmelerin modernizasyonuna devam edilmeli, pazarlama hizmetleri iyileştirilmelidir.

Avrupa Birliği'ne son katılan ülkelerin tamamında tavukçuluk ve diğer kanatlı hayvanlar üretimi Türkiye'den daha geri durumdadır. Bu ülkelerden bir kısmının ithalatçı olduğu da düşünüldüğünde Avrupa Birliği'ne katılma çalışmalarını sürdüren ülkemiz açısından önemli bir dezavantaj oluşturmamaları düşünülmektedir. Avrupa

Birliğine katılma konusunda ortaya çıkacak olumlu sonuçlar özellikle ürünlerin dağıtımı ve pazarlama kanallarındaki bazı olumsuzlukların da ortadan kalmasına yardımcı olarak ülkemizde tüketicinin ürün kalitesi konusundaki seçeneklerini arttıracaktır. Ancak hayvan refahı konusunda ülkemizin uyum için koyduğu 2015 yılı sonuna kadar uygulanması gereken konuların süresiz olarak ertelenmesi AB ülkelerinin ihracat konusunda engel için bir alan olarak görülebilir. Ürünlerin AB ülkelerinde serbest dolaşımını sağlayabilmek için hayvan refahı uygulamaları ile ilgili AB mevzuatı en azından yeni kurulacak işletmeler için uygulamaya koyulmalıdır.

Türkiye Tavukçuluğu

Türkiye’de üretilen tavuk eti ve yumurtaya ait hibrit materyalin tamamına yakını ebeveyn veya kısmen büyük ebeveyn olarak ithal edilmektedir. Yumurta ve piliç eti üretiminde kullanılan hibritlerin üretimi amacıyla her yıl artan sayıda ebeveyn (parent stock) ve kısmen büyük ebeveyn (Grand parent stock) girişi olmaktadır. Türkiye ticari yumurta ve et tavukçuluğunda dünyada sayılı ülkeler arasında yer almasına rağmen damızlık üretiminde bugüne kadar önemli bir ilerleme sağlanamamıştır. Damızlık materyal yumurta tavukçuluğunda %95.0-97.5, et tavukçuluğunda ise %98.0 oranında yurtdışından sağlanmaktadır. Yumurtacı ıslah çalışmaları Ankara Tavukçuluk Araştırma Enstitüsünde 11 saf hat üzerinde kahverengi ve beyaz yumurtacılarla ulusal düzeyde sürdürülmektedir. Serbest gezinmeli üretim sistemlerinde yerli materyal kullanım oranı %50’lere kadar ulaşmıştır. Bu çalışmalardan elde edilen hibrit ebeveynlerinin ticarileştirilmesine çalışılmaktadır.

Etçi ebeveynlerde alternatif üretim sistemlerine yönelik yavaş gelişen etlik piliç ebeveynleri üretiminde başarılı sonuçlar alınmıştır. Ancak bunların çoğaltılarak ticarileştirilmesinde başarı sağlanamamıştır. Etlik piliç üretiminde kullanılmak üzere ebeveyn geliştirme çalışmaları Eskişehir Geçit Kuşağı Tarımsal Araştırma Enstitüsüne bağlı olarak 2015 yılında yeniden başlatılmış ve ilk ebeveyn üretimi 2018 yılında gerçekleştirilerek özel sektörle paylaşılmıştır. Bu çalışmalar halen 3 ana 2 baba hattı ile etkin olarak sürdürülmektedir. Çalışmalarda Anadolu-T olarak tescil edilen ebeveyn materyalinin 2022 yılında özel sektörle paylaşımına devam edilmektedir. Özellikle 2022 yılında damızlık firmalarının Türkiye’ye verdikleri materyali %25 azaltmaları bu materyalin ne kadar önemli olduğunu göstermektedir.

Islah Çalışmaları

Türkiye’de modern tavukçuluk Cumhuriyetin kuruluşundan sonra başlamış ve 1960’lı yıllardan sonra hızlı bir gelişme sağlanmıştır. Bugün ülkemizde yetiştiricilik başarıyla sürdürülmektedir. Piliç eti üretiminde entegre şirketlerin kurulması ve işletmelerin üretimle ilgili tüm ihtiyaçlarının karşılandığı sözleşmeli üretim modelinin gelişmesiyle 1990’lı yıllar boyunca %10’lara varan yıllık üretim artışları yaşanmıştır. Yumurta üretim ve pazarlama süreci ise piliç etinden bazı farklılıklar göstermektedir. Yumurta üretim işletmeleri, 2006 yılında yürürlüğe giren Tarımsal Üretici Birlikleri Kanunu hükümlerine göre, ‘Yumurta Üreticileri Merkez Birliği (YUM-BİR)’ adı altında bir araya gelmişlerdir. Ancak bu birliklerin üretim aşamasında etlik piliç üretiminde olduğu gibi entegrasyonu söz konusu değildir.

Ülkemizde tavukçuluğun geliştirilmesine yönelik ilk çalışmalar 1930’lu yıllarda Ankara’da Merkez Tavukçuluk Enstitüsünün kurulmasıyla başlamıştır. Bu Enstitüde teknik bilgi ve eleman yetersizliği nedeniyle ilk 20 yıl içerisinde önemli bir ilerleme olmamıştır. Bu dönemde üretilen tavuklar, verim düzeyleri düşük yerli ırklardan ve karışık sürülerden oluşmuş, bakım besleme ise serbest sistemde “köy tavukçuluğu” olarak nitelenen şekilde gerçekleştirilmiştir. Bu yıllarda yaklaşık 20 milyon olarak belirlenen ülke tavuk varlığından hayvan başına yıllık 50-60 yumurta elde edildiği belirtilmiştir.

1952 yılında Tarım ve Orman Bakanlığı’na bağlı Merkez Tavukçuluk Komitesi ile çalışmaların daha etkin yürütülebilmesi için Ziraat İşleri Genel Müdürlüğüne bağlı Küçük Evcil Hayvancılık şubesi kurulmuştur. Bu dönemde bakanlıkta danışmanlık yapan ABD’li bir uzmanın girişimleriyle ABD’den hibe olarak 10 bin kadar Leghorn, New Hampshire ve Beyaz Plymouth Rock civcivleri getirilerek Bakanlığa bağlı kuruluşlarda üretilmeye başlanmıştır. Sonraki yıllarda yapılan ithalatlarla saf ırkların (Rhode Island Red, Cornish, Çubuklu Plymouth Rock) sayısı artırılmış, bunlar kamu kuruluşlarında çoğaltılarak yetiştiricilere ve köylere dağıtılmıştır.

Getirilen saf ırklarda önemli bir araştırma ve ıslah çalışması yapılamamıştır. Buna rağmen üretim çalışmaları bir yandan ilgi uyandırmış, bir yandan da yeni tekniklerin gelmesini zorlamıştır. 1958 yılında Veteriner İşleri Genel Müdürlüğü bünyesinde Kümes Hayvanları Yetiştirme ve Hastalıkları Şubesi kurulmuştur. 1955-1956 yıllarında birisi İstanbul’da özel, diğeri de Ankara’da Et-Balık Kurumu bünyesinde büyük kapasiteli tavuk kesimhaneleri açılmıştır. 1956 yılında Yem Sanayi A.Ş. kurularak daha sonraki yıllarda ilave fabrikalarla karma yem üretimi artırılmıştır. Tavukçuluk uzmanı yetiştirmeye önem verilmiş ve çiftçi düzeyinde kurslar düzenlenmiştir. Ancak 1960 yılına kadar Türkiye tavukçuluğunda önemli bir gelişme olmamış, tavukçuluğun bir endüstri olarak geliştirdiği dünyadaki gelişmeler ülkemize transfer edilememiştir.

Saf ırklar ve melezleri ile yapılan çalışmalar

Ankara Tavukçuluk Araştırma Enstitüsüne saf ırkların getirilmesiyle dünyada tavuk eti üretimindeki uygulamalara benzer işlemlere başlanmış; kapsamlı-süreklili projeler olmasa da ıslah araştırmaları yürütülmüştür. Bu amaçla New Hampshire, Plymouth Rock, Rhode Island Red ve Beyaz Cornish ırkları ve bunların melezlerinin etlik piliç

üretiminde kullanımı amacıyla üretimi hedeflenmiştir. Irklar arası melezlemelerle et verimi düzeyi yüksek piliçler üretimi ile ilgili çalışmalar döneminde dünyadaki çalışmalarla benzerlik göstermiştir. Ancak çalışmaların etkin bir seleksiyonla desteklenmemesi nedeniyle, dünyada yapıldığı gibi hibrit üretimine geçiş sağlanamamıştır.

Hibrit ebeveynleri ile yapılan çalışmalar

Ülkemize 1963 yılında hibrit ebeveynlerinin ithali ile saf ırklar ve melezleri ile yürütülen çalışmalar ticari işletmeler açısından önemini kaybetmeye başlamıştır. Bu nedenle güncel teknolojilerin kullanıldığı projeler 1968 yılında Ankara Tavukçuluk Araştırma Enstitüsünde başlatılmıştır. Bu projeler, ıslah, çoğaltma ve üretimde kullanma amaçlarını ortaya koyan Ulusal Tavukçuluk Islah projesi olarak adlandırılmıştır.

Beyaz Cornish ve Beyaz Plymouth Rock gibi ırklarda melezleme ve seleksiyonla ana ve baba hatlarının geliştirilmesi ile başlanan çalışmalar, işlemin uzun süreceği düşünülerek Beyaz Cornish ve Plymouth Rock ırklarının ithal edilen etçi ebeveynlerden Hybro, Hubbard gibi hatlarla çiftleştirilmesiyle daha hızlı sonuçlar alınacağı için bu yöne kaydırılmıştır. Bu çalışmalarda G2 generasyonuna kadar yapılan üretimle ilk yerli etçi ebeveynler üretilebilmiştir.

Çalışmalarda T2xY2 melezlerinin etlik piliç üretiminde kullanımı amaçlanmıştır. Devamında ana ve baba hatları, döllerinin performansına göre ıslah edilmeye çalışılmış ve bu materyal önce ATE-BRO, sonra da çalışmaların Erbeyli Zirai Araştırma Enstitüsüne kaydırılmasıyla ERBRO olarak adlandırılmıştır. Sonraki yıllarda Erbeyli Zirai Araştırma Enstitüsünde kapasite arttırılmaya çalışılmış, elde edilen sonuçların ülke geneline yaygınlaştırılmasına gayret edilmiştir. Bu dönemde Enstitüde ERBRO hattında seleksiyon ve yeni hatlar üretmeye yönelik çalışmalara hız verilmiştir. Ebeveynlerin kafes koşullarında yapay tohumlama ile üretimi gerçekleştirilmiş, önemli bir kapasiteye ulaşılmıştır. Bu dönemde elde edilen etçi hibritlerden işletmelere verilebilen miktar itibarıyla ülke ihtiyacını karşılama oranı ancak %1-2.5 seviyesine ulaşılabilmiştir. Enstitüde ebeveyn ve hibrit üretiminde aşağıdaki sistem esas alınmıştır.

Tablo 5. Yerli ve yabancı hibritlerin etlik piliç performansları (Düzgüneş, 1985).

Hibritler	6. hafta canlı ağırlık (g)	8. hafta canlı ağırlık (g)	Yemden yararlanma oranı (8. hafta)
ERBRO	1610	2455	2.86
Yabancı 1	1630	2475	2.82
Yabancı 2	1530	2370	3.02
Yabancı 3	1428	2235	2.96

Bu çalışmalar, Erbeyli Tavukçuluk Araştırma Enstitüsünün adının değişmesi, uygulamaya koyulan politika ve hedeflerin değişmesiyle 1987 yılından itibaren yeterince desteklenmemiştir. Özellikle tarım politikalarında üretimin teşviki yerine ithalata dayalı uygulamalara ağırlık verildiği bu dönemde araştırma çalışmaları da ciddi anlamda gerilemiştir. 1998 yılında, ciddi araştırma ve üretim seviyesine geldiği, teknik personelde çok iyi bir deneyim ve birikim sağlandığı noktada çalışmalar durdurulmuştur.

Enstitüde 1994 yılında İsrail'den getirilen çıplak boyunlu, sıcağa toleranslı genotipler üzerinde çalışmalar yürütülmekle birlikte bu çalışmalar da 2000 yılında sona erdirilmiştir. 1995 yılında Ankara Tavukçuluk Araştırma Enstitüsüne Kanada'dan gelmiş olan saf hatlarla birlikte alınan bir etçi hat Enstitüye verilmiş, ancak bunun da muhafazası sağlanamamıştır. Bu hatta ait sonuçların verildiği bir çalışmada, materyalin ana hattına ait özellikleri taşıdığı ve elde edilen sonuçların ithal edilen birçok ebeveyn hatta ait performans değerlerini geçtiği belirtilmiştir. Enstitü İncir Araştırma Enstitüsü olarak isimlendirilmiş, bir süre organik tavukçuluk ve besleme amaçlı projelerin uygulandığı bir kurum haline gelmiştir. Zaman içerisinde bu işlevini de kaybederek tavukçuluk altyapısına rağmen, 2017 yılında tavukçuluk araştırmaları tamamen iptal edilmiştir.

İthal ebeveynlerden sentetik hat üretme çalışmaları

Baba ve ana ebeveyn olarak ticari firmalardan alınan civcivlerde cinsiyet ayrım hataları nedeniyle baba hattında dişi, ana hattında ise erkek civcivler %5-10 arasında olabilmektedir. Büyük kapasiteli işletmelerde bu sayı önemli bir miktar olarak görülmektedir. Bu materyalden yararlanılarak baba ve ana hatlarının kendi içerisinde üretilmeleri ile elde edilen sentetik hatların döl verim özellikleri ve etlik piliç performansının orijinal ebeveynlerle karşılaştırılmasından olumlu sonuçlar alınmıştır. Bu ebeveyn hatlarının ikili melez olmasına rağmen bir kuşak bunlardan üretim yapılması mümkün olabilmektedir. Benzer çalışmalar değişik ülkelerde yapılmış ve başarılı sonuçlar elde edilmiştir. Bu çalışmalar ticari bir etlik piliç damızlık şirketinde (Hatay) gerçekleştirilmiş, işletmenin 3 milyona varan kapasitesi nedeniyle cinsiyet hatası damızlık oluşturmada bir sıkıntısı olmamıştır. Çalışmada gerek ebeveyn düzeyinde gerekse hibrit düzeyinde elde edilen sonuçlar yeterli görülmüştür.

Buna karşın damızlık üretiminin ticari damızlık şirketlerin kontrolünde olması, bu tür üretimler için izin alma gerekliliği ve damızlık olarak alınan civcivlerin yılın değişik dönemlerinde üretime alınması, farklı yaşlarda küçük sürüler oluşturulmasını mecbur kılmaktadır. Bu durum damızlık işletmeler için ilave kümes, işgücü ve sağlık koruma önlemi olacağı için sürdürülmesinde zorluklar yaşanmıştır. Elde edilen sürülerin seleksiyonla verimlerinin artırılması ise damızlık işletmelerin yapabileceği bir uygulama olamaz.

Tablo 6. Ticari etlik piliç ebeveynlerinden üretilen sentetik etlik piliçlerin performansları (Yeter, 2010).

Özellikler	Ticari Etlik Piliç	Sentetik Etlik Piliç
Civciv ağırlığı (g)	39.7	37.7
Canlı ağırlık (42. gün, erkek-dişi karışık)	2481	2375
Yem tüketimi (g)	4429	4372
Yemden yararlanma oranı (YYO)	1.79	1.80
Ölüm oranı (%)	3.26	3.50

Alternatif etlik piliç materyali üretim çalışmaları

Dünya'da tavuk eti tüketiminde entansif üretimden elde edilen piliç eti ilk sıradadır. Buna karşılık tüketici taleplerine göre üretim sistemleri ve yeni ürünlere eğilimler artmaktadır. Özellikle yarı entansif, ekstansif, serbest gezinmeli ve organik üretimden elde edilen ürünler tercih edilebilmektedir. Bu ürünlerin sağlıklı ve hayvan refahına uygun üretildiği imajı talebi artırmaktadır. Bu üretimler ile ilgili kurallar Avrupa Birliği kaynaklı olup, birliğe katılma çalışmaları olan ülkemizde değerlendirme raporlarında gündeme gelen konulardandır.

Bu amaçla yavaş gelişen, geç kesim yaşına ulaşan, düşük kaliteli yemlerle beslenen, renkli veya karışık tüylü, et tipi tavuk üretimi artmaktadır. Bu tavukların et ve deri renginin koyu olması ve tüketicilerin daha lezzetli bulması yaygınlaşmada etkindir. Yavaş gelişen tavuklar, organik ve serbest gezinmeli sistemlere daha uygundur ve 80-120 gün arasında 2.2-2.5 kg ağırlığa ulaşırlar. Organ ve kaslar dengeli geliştiğinden, ani gelişme kaynaklı metabolik bozukluklar daha az görülür. Çin'de Three Yellow (3Y) olarak bilinen bu tavuklar, yerel tavukların saf hatlarla melezlenmesi ile geliştirilmiştir. İngiltere'de "Assured chicken", Almanya'da "Qualitat und Schereit", Hollanda'da "IKB chicken", Belçika'da "Label de Qualite Wallon ve Belplume", İspanya'da "Polo corral", Fransa'da "Label Rouge" olarak bilinen piliçler bu gruptadır. Label Rouge'lar, etlik piliçlere göre iki kat yüksek fiyatla pazarlanmasına rağmen Fransa'da %30'luk bir paya ulaşmıştır. Avrupa, yavaş gelişen hibrit üretiminde etkin olup HUBBARD ve SASSO, bu konuda en çok bilinen uluslararası şirketlerdir.

Ülkemizde de son yıllarda tüketicilerin organik ürünlere talebi artmıştır. Organik ve serbest gezinmeli sistem ile kafeste etlik piliç üretiminde yavaş veya orta düzeyde gelişen, kesim yaşı 56-84 gün olan piliçler kullanılmaktadır. İhtiyaç duyulan genotiplerin ithalinden başka yol bulunmamaktadır. Daha kolay ıslah çalışmalarıyla üretilebilen yavaş gelişen genotipler, ülke ekonomisi ve araştırmalar açısından açılım sağlayacaktır. Bu amaçla bir proje kapsamında; yavaş gelişen etçi ebeveyn üretimi için Ankara Tavukçuluk Araştırma Enstitüsü'nde bulunan iki yumurtacı hat (BAR II ve RIR II) ile ROSS ebeveynlerinden yararlanılarak baba ve ana ebeveyn hatları geliştirilmiştir. Çalışmada elde edilen bazı sonuçlar Tablo 1.16'da verilmiştir.

Tablo 7. Yavaş gelişen genotiplerde elde edilen canlı ağırlıklar (Yamak ve ark., 2014).

Genotip	Yetiştirme Sistemi	Yaş (hafta)				
		8	9	10	11	12

OSH		15.185	14.285	19.580	16.763	24.734
Genotip		**	**	**	**	**
Yetiştirme sistemi		ÖNSZ	ÖNSZ	ÖNSZ	ÖNSZ	ÖNSZ
Cinsiyet		**	**	**	**	**

OSH: Ortalama standart hata; A: Serbest gezinmeli, K: Kapalı sistem; E: Erkek, D: Dişi, K: Erkek-Dişi karışık.

** : P<0.01; ÖNSZ: Önemsiz; a, b, c: Duncan testi sonuçlarına göre her hafta için ayrı harfle gösterilen genotipler arasındaki farklılıklar önemlidir.

Bu veriler ebeveyn üretimi amacıyla gerçekleştirilen ikili melez grupların tamamının orta veya yavaş gelişme özelliğine sahip olabileceğini göstermektedir. Son üretim materyali olan genotip gruplarında da aynı şekilde canlı ağırlık açısından orta ve yavaş gelişme özelliğine sahip üçlü melez genotiplerin üretimi uygun görülmektedir.

Saf hatlarla yapılan çalışmalar

Dünyada damızlık etlik piliç veya yumurtacı tavuk üretimi yaparak ülkelerin ihtiyacını karşılayan az sayıda firma bulunmaktadır. Bu firmaların ürünleri tüm ülkelerde olduğu gibi ülkemizde de kullanıldığı için damızlık materyalde tam dışa bağımlılık söz konusudur. Gelecekte de bu durumun devam etmesi beklenmekle birlikte hastalık riskleri ve araştırma faaliyetleri amacıyla 2011 yılında Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğü etlik piliç ebeveyn üretimi için ıslah çalışmaları başlatılmasına karar vermiştir (Sarıcı ve ark., 2016). Bu araştırmalar için Eskişehir Geçit Kuşağı Tarımsal Araştırma Enstitüsünde bir araştırma birimi kurulmuş ve bir ıslah firmasından 3 ana ve 2 baba ebeveyn hattı alınarak çalışmalara başlanmıştır. Bu ebeveyn hatlarının yumurtlama dönemine ait verim özellikleri ile saf hat ve ikili melez döllerinin etlik piliç performansları olumlu bulunmuştur. Bu amaçla 2018 yılından itibaren ticari işletmelere bu materyale ait ebeveyn sürüler verilerek ebeveyn performanslarının ticari işletmelerde değerlendirilmesi amaçlanmıştır. Hatlarda canlı ağırlık, yem tüketimi ve yemden yararlanma düzeyi ile yumurta verimlerinin kabul edilebilir seviyede sürmesi için aile düzeyinde seleksiyon çalışmaları yapılmakta, bir yandan da en iyi ebeveyn ve hibrit performansı sağlayacak üretim çalışmaları devam etmektedir. 2018 yılında bu materyalden 5 firmaya 36.000, 2020 yılında 2 firmaya 25.000 damızlık ebeveyn verilmiştir. 2021 ve 2022 yıllarında damızlık paylaşımı devam etmiş, 12 firmaya 120.000 damızlık verilmesi işlemleri sürmektedir. Toplam damızlık sayısı 181.000, sağlanan katma değer 181.000 x 4.5 Avro=814.500, 14.661.000 TL). Bu hatlar ve hatlardan üretilen hibritler Anadolu-T olarak isimlendirilmiş ve test çalışmaları yapılan özellikler doğrultusunda 2019 yılında TAGEM tarafından tescil edilmiştir.

Tablo 8. Etlik piliç saf hatları, ticari hibritler (Ross-308 ve Anadolu-T) ile dörtlü melez genotiplere ait verim indeksi değerleri (Sarica ve ark., 2021)

Ülkemize araştırma projeleri kapsamında kazandırılan bu ebeveynler ve melez döllerinin gelişme ve karkas özelliklerinin ticari hatlarla benzerlik gösterdiği görülmektedir. Mevcut seviye korunarak bu hatların çoğaltılması, ikili melez ana ve baba ebeveynlerin geliştirilmesi, dörtlü melezlemeyle hibrit üretilmesi ile daha etkin sonuçlar elde edilmektedir. 2022 yılından itibaren pedigrili üretimle ıslah çalışmalarına devam edilen saf hatlarda özellikle yemden yararlanmanın ve göğüs eti miktarının iyileştirilmesi temel ıslah hedeflerine alınmıştır.

Türkiye Tavuk Islah Çalışmaları İçin Öneriler

Dünya tavukçuluk sektörünün, başta damızlık olmak üzere birçok halkasında tekelleşme görülmektedir. Yumurta ve piliç eti üretiminde ticari nitelikli hayvanların payı, gelişmiş ülkelerde oldukça yüksektir. Gelişmekte olan ülkelerde de benzer bir yapı bulunmaktadır. Ticari üretimin yaygınlaşması ve üretimde genotip çeşitliliğinin azalması, damızlık fiyatlarının piyasa koşulları dışında belirlenmesine neden olacak, diğer yandan da tavuk popülasyonları hastalık riskine açık hale gelecektir. Bu sorunlardan ikincisi çeşitli yollarla aşılsa bile, kaynak ülke ya da şirketlerin çeşitli nedenlerle hayvan satamama riski olabilecektir. Nitekim 2003, 2004, 2005 ve 2011 yıllarında çıkan Kuş Gribi, 2020 yılında ortaya çıkan Corona-19 pandemisi nedeniyle konulan kısıtlama ve yasaklamalar damızlık üretimi olmayan ülkeleri ne tür olumsuzlukların beklediğinin göstergesidir. 2014, 2015, 2016, 2017 ve 2018 yıllarında tüm dünyada kuş gribi vakaları ticareti ciddi boyutlarda etkilemeye devam etmiştir. Daha kötüsü, 2022 yılında Uluslararası etlik piliç damızlık şirketlerinin ikisi, yaşanan kuş gribi vakaları nedeniyle Türkiye'ye verecekleri damızlık sayısında %25 azaltma yapmıştır. Bu yüzden tavuk ürünleri üretim potansiyeli giderek artan ülkemiz için, nitelikli damızlık yetiştirme, tanıtım ve dağıtımını yapmayı göze alacak uygulamalara girilmesi ve özel sektörle paylaşılması kaçınılmazdır.

Üretimde ticari ıslah firmaları etkinliklerini sürdürmekle birlikte, her ülkede devlet ve özel sektör katkılı araştırmalar devam etmektedir. Üretilen genotipler uluslararası şirketlerin ürünüdür. Dolayısıyla Türkiye’de kullanılanların genetik kapasitesi diğer ülkelerdekilerden farklı değildir. Bu alanda çalışan firmaların sayısı hızla azalmaktadır. Bundan 10 yıl önce 10-12 olan firma sayısı, günümüzde yumurta tavukçuluğunda 4, et tavukçuluğunda 3’e düşmüştür. Bu durum bir süre sonra, tavukçulukta da tekelleşmeye neden olacaktır. Islah firmaları büyük masraf ve emekle geliştirdikleri saf hat ve ebeveynleri, hastalıklara karşı korumak ve sürdürülebilir üretimi garanti altına almak için değişik bölgelerde yedeklerler. Yedeklenen sürüler seleksiyon yapılmadan korunabildiği gibi, ıslah firmasının uyguladığı yöntemlerin paralelinde ıslah da yapılabilir. İkinci durumda firmanın geleceğe dönük ebeveynleri de bir yanda hazır hale getirilmektedir. Her iki durumda da sürülerde çoğalmaya engel olmayacak düzeyde horoz ve tavuğun yedeklenmesine ihtiyaç vardır.

Bütün ele alınan konular tavukçuluk ıslah organizasyonunun bir parçası olup biri diğerine tercih edilemeyecek kadar önemlidir. Bu yüzden Ankara Tavukçuluk Araştırma Enstitüsü ile Eskişehir Geçit Kuşağı Tarımsal Araştırma Enstitülerinde elde edilen ebeveyn materyalin hızla özel sektör tarafından kullanımını sağlayacak teşviklerle yapılan büyük masraf ve birikimin ülke ekonomisine katkı sağlar hale getirilmesine ihtiyaç vardır. Etçi ebeveyn üretimi konusunda organik piliç eti üretiminde kullanılan yavaş gelişen genotiplerde dışa bağımlılığı önleyecek çalışmalara önem verilmelidir.

Abstract

Optimization of irrigation water is the main strategy for the adaptation to the effects of climate change in the agricultural industry. For the determination and efficient use of irrigation water in agriculture, it is crucial to calculate the reference crop evapotranspiration (ET_o). Niğde is defined as a region where irrigated agriculture is carried out due to located in the semi-arid climate zone. In this context, the temporal changes of ET_o values is extremely remarkable in terms of determining the effects of global climate change on the irrigation water requirement for Niğde Province. In this study, monthly climatic data of the Niğde were used to calculate ET_o values for a period of 30 years (1992–2021) using the FAO Penman–Monteith method, and then annual ET_o values were determined. Trends of ET_o, temperature and precipitation data of the years and growing season (May–September) were examined using Mann-Kendall Test and Sen Method. The results show that the annual ET_o values ranged from 783.6 mm to 970 mm, while the value range identified for the growing period was 511.4 mm to 642.7 mm. It has been determined that the total ET_o values of both the annual and the growing season have a statistically significant tendency to increase, and that the irrigated farming activities in the region need adaptation to this increase. Additionally, it was stated that annual and seasonal average temperature values tend to increase statistically significantly, while the increasing trends in annual and seasonal total precipitation values are insignificant.

Key Words: *Reference crop evapotranspiration, Mann-Kendall, Sen test, Trend analysis*

Introduction

The hydrological cycle has been significantly impacted by the rise in greenhouse gases emitted into the atmosphere as a result of population expansion, industrialization and acceleration of urbanization. Turkey will experience drought due to global warming brought on by greenhouse gas emissions, which have a considerable influence on the climate system (Türkeş, 2012). One of the natural resources that this expected drought will have the most impact is water resources (Turan, 2018). The depletion of water sources will eventually reach levels that will make life unsustainable and have an adverse effect on the ecosystem. Water resources should be utilized in the most efficient manner possible to satisfy present and future requirements. Thus, the natural balance and sustainable development of human populations would be ensured.

The variations in temperature and precipitation parameters provide important clues for understanding the general structure of the climate. Therefore, studies on climate change have focused on trend analysis of these two parameters (Türkeş et al., 2002; Weltzin et al., 2003; Beniston, 2005; Soydan et al., 2016; Coşkun and Akbaş, 2017; Aktaş et al., 2018; Coşkun, 2020). These evaluations do not directly indicate how irrigation water requirements have changed in cultivation. In this respect, assessing the impacts of global warming or other variables on climatic parameters by reference crop evapotranspiration (ET_o) values would enable us to make more direct evaluations of the variation of irrigation water requirements in agriculture. Reference crop evapotranspiration is used in the estimation of crop water consumption expresses the change in atmospheric conditions. Tabari (2010) stated that ET_o shows the evaporation demand of the atmosphere and allows to make comparisons between different regions as well as different periods of the year. Yürekli et al. (2017) investigated the trend analysis of ET_o values for five different regions and reported the monotonic trend for many seasons of the regions according to Holt's and Mann-Kendall methods. Anlı (2014) reported significant increasing trends for reference evapotranspiration in the arid Southeastern Anatolia region. Ünlükara et al. (2011) examined the monthly ET_o changes for Konya and Karaman and determined that there were trends in some months of the year and no significant changes in some months of the year.

In this study, monthly climatic data of the Niğde were used to calculate ET_o values for a period of 30 years (1992–2021) using the FAO Penman–Monteith method, and then annual ET_o values were determined. Trends of ET_o, temperature and precipitation data of the years and growing season (May–September) were examined using Mann-Kendall Test and Sen Method.

Materials and Methods

Niğde Province (latitude 37°57'56" N, 34°40'45" E; altitude 1229 m) was chosen as the research area and a semi-arid climate prevails in the region. The long-term climate data of the study area are given in Table 1 (TSMS, 2022). Table 1. The long-term (1935–2021) climatic data of Niğde Province

	Mean temperature (°C)	Mean relative humidity (%)	Wind speed (m/s)	Mean daily sunshine (h)	Precipitation (mm)
January	-0.3	73.1	3.5	3.7	35.9
February	1.1	68.7	3.7	4.9	33
March	5.1	61.7	3.7	5.8	35.9
April	10.6	56.3	3.7	6.9	41.3
May	15.2	55.1	3.2	8.5	48.3
June	19.2	50.2	3.1	10.3	28.2
July	22.5	42.7	3.6	11.5	5.1
August	22.3	43.6	3.4	11.1	6.7
September	18.1	47.7	3.1	9.9	10.5
October	12.5	57.2	2.9	7.3	26.2
November	6.5	66.0	3.1	5.4	31.3
December	1.8	73.0	3.3	3.7	41.3
<i>Average/Total</i>	<i>11.2</i>	<i>58.0</i>	<i>3.4</i>	<i>7.4</i>	<i>343.7</i>

Monthly average temperature (°C), relative humidity (%), wind speed (m/s), sunshine duration (hours) and total precipitation (mm) data of the 30 years between 1992-2021 were used as climate data in the study. The climatic data of Niğde were obtained from the Turkish State Meteorological Service (TSMS, 2022). Evaluations were carried out annually and for the growing season covering the period between May and September. The daily ETo values for Niğde were calculated using the FAO ETo Calculator program. The ETo Calculator is use FAO Penman-Monteith method and is based on Equation 1 (Allen et al., 1998; Raes and Munoz, 2012).

$$ET_o = \frac{0.408\Delta(R_n - G) + \gamma \left(\frac{900}{T + 273} \right) u_2 (e_s - e_a)}{\Delta + \gamma(1 + 0.34u_2)} \quad (1)$$

Where R_n is the net radiation at the plant canopy ($\text{MJ m}^{-2} \text{ day}^{-1}$), G is the soil heat flux density ($\text{MJ m}^{-2} \text{ day}^{-1}$), T is the average daily air temperature at 2 m height (°C), u_2 is the wind speed (at 2 m height (m s^{-1})), e_s is the saturation vapor pressure (kPa), e_a is the actual vapor pressure (kPa), $e_s - e_a$ is the saturation vapor pressure deficit (kPa), Δ is the slope vapor pressure curve ($\text{kPa } ^\circ\text{C}^{-1}$) and γ is the psychrometric constant ($\text{kPa } ^\circ\text{C}^{-1}$).

In the study, the non-parametric Mann-Kendal test was applied to determine the trends of annual and seasonal ETo and average temperature values and annual precipitation values for the period of 30 years, and Sen's slope test was used to estimate the trend by Makesens 1.0 computer sotware (Salmi et al., 2002). The Mann-Kendall test, a particular application of Kendall's test known as Tau, is non-parametric. Instead of focusing on the volume of the data, this approach focuses on the rows. According to the H_0 hypothesis, the time-ordered ($X_1, X_2, \dots, X_n$) series are time-independent and equally distributed random variables in this test. The H_1 alternative hypothesis states that there is no similarity between the distribution of X_k and X_j successive data values in the series as $k \neq j$ and $n \geq k, j$ (n data recording duration). The fact that this test is simple to use, relies on sequences, and avoids the impact of serial correlation is its most crucial feature. In order to assess the potential trend component of the annual and seasonal parameters as well as if there is a statistically significant rise or decrease trend, the Mann-Kendall trend test was performed to the ETo, average temperature and precipitation data of the research region (Mann, 1945). Sen's trend test is distribution independent and has a structure that is not affected by seasonal events (Van Belle and Hughes, 1984).

Results and Discussion

The annual and seasonal mean temperature variations of Niğde Province for the 30-yr period are given in Figure 1. As shown in Figure 1, the annual average temperatures varied between 8.52 °C and 13.94 °C- and seasonal average temperatures ranged from 17.78 °C to 21.74 °C. While the maximum average temperature values were determined in the year of 2010, the minimum values were in the year of 1992. The average temperatures of the 30-yr period were calculated as 11.78 °C and 20.12 °C for the annual and growing season, respectively.

Figure 2 shows the annual and seasonal ETo values for the years between 1992 and 2021. The range of the annual values ETo was between 783.6-970 mm and the seasonal ETo values were between 511.4 and 642.7 mm. Average ETo over 30 years was determined as 863.99 mm and the seasonal as 546.10 mm. The lowest value for the annual ETo was obtained in the year of 2002 and the highest value in 2010. Similar to the annual ETo values the lowest seasonal ETo value was calculated in the year of 2002, while the highest value was in the year of 2014.

Fig. 1. Annual and seasonal mean temperature changes for the period of 1992-2021

Figure 2. The annual and seasonal ET₀ values for the years between 1992 and 2021

Trend analysis for the annual and seasonal mean temperature results are given in Figure 3. When the temperature changes of 30 years were examined, the increase in the annual average temperatures was found to be statistically significant at the level of $\alpha=0.001$. The average of the first 5 years (1992-1996) of the research years and the average of the last 5 years (2017-2021) were compared to evaluate the temperature increases in the province of Niğde over 30 years. The annual average of the first five years was determined as 10.81 °C and the last five years as 12.68 °C. It was concluded that the average temperature in Niğde increased by 17% (1.87 °C) in a 30-year period. On the other hand, significant increasing trends were encountered for the seasonal average temperatures of Niğde Province ($\alpha=0.01$). Temperatures around the world are changing with the effect of climate change (Karl and Trenberth, 2003). Kızılelma et al. (2015) evaluated the temperature increases in the Central Anatolia Region and determined that there were increases in the 95% confidence interval at all stations except Ürgüp. Cosun and Karabulut (2009) reported that statistically significant increases occurred in average temperatures for Kahramanmaraş and Elbistan regions. Demir et al. (2017) stated that the annual temperatures -increased in the province of Bingöl but this increase is not statistically significant. Jain and Kumar (2012) reported significant rising trends at most of the stations in India.

Figure 3. Trend analysis results for the annual and seasonal mean temperatures

The 30-year trends of ETo values calculated annually and seasonally are shown in Figure 4. The annual ETo tended to increase statistically at the 5% significance level ($Z=2.07$). The average ETo of the first five years (1992-1996) was found to be 844.58 mm and the last five years was 878.86 mm. Annual ETo values increased by an average of 34.28 mm over a 30-year period. The seasonal ETo trend also showed an increase of 5% ($Z=2.00$) just like the annual values. Global climate change has a considerable impact on reference crop evapotranspiration and, in turn, crop water requirements (Fan et al., (2016). Koffi and Komla (2015) reported that The Mann–Kendall test revealed significant increase in annual ETo at Tabligbo ($Z = 2.89$) and Sokode ($Z = 2.29$) and non-significant decrease at Lomé. Eser et al. (2015) reported that there were statistically significant increasing trends in reference crop evapotranspiration in summer season in Menemen Plain. Cömert et al. (2019) examined the monthly ETo series of Tokat province and reported that there were significant increases in July, August and October according to the Mann-Kendall test results. Çitakoğlu et al. (2017) stated that as a result of the analysis of Linear Regression and Mann-Kendall methods, there was an increasing trend in Uşak and Afyonkarahisar stations in July and August months. When the results of this study are evaluated together with previous studies, the effect of increasing temperatures on climate change changes the ETo values.

Figure 4. Trend analysis results for the annual and seasonal ETo values

The trend of precipitation was positive, but it was not statistically significant (Figure 5). It has been revealed in previous studies that the effect of climate change on precipitation makes it irregular rather than increasing or decreasing it (Givati and Rosenfeld, 2003; Berbet and Costa, 2003; Trenberth, 2011; Dai et al., 2018). Karabulut and Cosun (2009) evaluated the annual data of Kahramanmaraş and stated that despite the decrease in the amount of precipitation, there was no statistically significant positive or negative trend. Keskin et al. (2018) examined precipitation trends at 14 different stations and the changes were significant in Kars and Ardahan, but not in the other 12 provinces. Büyükyıldız and Berktaş (2004) investigated the precipitation values of 25 meteorological stations in the Sakarya basin and reported that 12 of them showed statistically significant decreases, while the increases and decreases in the others were not significant. Dalkılıç (2019) stated that the annual precipitation changes of Gümüşhane, Erzincan and Bayburt provinces were not a significant trend.

Figure 5. Trend analysis result for the annual precipitation

Conclusions

In the study, the trends of reference crop evapotranspiration, average temperature and precipitation of Niğde Province for a 30-yr period were investigated. Examining the change in ETo values is very important in terms of evaluating the effects of climate change on agriculture and water resources and contributing to water management. According to the results of the study, the annual ETo values ranged from 783.6 mm to 970 mm, while the value range identified for the growing period was 511.4 mm to 642.7 mm. It was determined that the total ETo values of both the annual and the seasonal had a statistically significant ($\alpha=0.05$) tendency to increase. Similarly, annual and seasonal mean temperature changes showed statistically significant increases at $\alpha=0.001$ and $\alpha=0.01$ levels,

respectively, for the 30-year period. On the other hand, trend in annual total precipitation values was statistically insignificant. In the last 30 years, there has been an increase in evapotranspiration in Niğde due to the effects of climate change, and irrigated agriculture activities need adaptation to this increase. Results can be a guide for planning, investing and developing the effects of climate change for Niğde farmers, industry and decision-makers.

Analysis of Accessibility of Primary Schools in Niğde Using GIS

Orhun Soydan¹

¹Landscape Architecture Department, Faculty of Architecture, Niğde Ömer Halisdemir University, Niğde, Turkey

Abstract

Education is one of the most basic needs for human beings. With the child's growth, the educational environment expands according to the expansion of the environment in which he interacts. School is the place where education takes place formally. It is aimed to provide the same content and level of education to everyone included in the system within the framework of a certain plan and program. The process starts from preschool (kindergarten), primary school, secondary school, high school, associate degree, undergraduate, and graduate. Non-formal education is a system in which the person participates voluntarily. In accordance with the principle of equal opportunity in education, various measures are tried to be taken by the state in order to minimize the effect of external factors. One of them is the regulation on the distances to be considered in the construction of public buildings in settlements. One of the most important features of urban settlements is the accessibility of the places where the needs will be met, especially the public buildings. Accessibility of the places where we meet many of our needs, from hospital to market, from pharmacy to school, is one of the most important advantages that can be achieved in city life. The increasing urban population has led to the spread of urban settlements to larger areas. For this reason, it is important to know the current situation regarding the functional characteristics of the city in order to provide better service to the people living in the cities and to make better plans for the future. In this study, it is planned to make a spatial analysis of the accessibility function of a city using GIS. The main purpose of this study is to reveal the spatial accessibility of primary schools, which are among the educational institutions in the central district of Niğde province. The Spatial Plans Building Regulation was used as a criterion for accessibility. The current number of students and teachers in the schools and the number of classrooms were obtained from the Niğde Provincial Directorate of National Education, and the obtained data were analyzed by transferring them to ArcGIS software. In the study, the Zoning Plan from the Niğde Municipality, the road and housing data obtained from OpenStreetMap, the location information of the schools and the number of students obtained from the Niğde Provincial Directorate of National Education, and the population data obtained from TÜİK were used. According to the results of the study, there are problems in accessibility the primary schools in some neighborhoods in the Central district, and this problem is increasing especially in rural areas. It should not be forgotten that accessibility is important for everyone, school and settlement plans should be made with reference to the values specified in the spatial plans regulation.

Niğde Şehrinde Okullara Erişilebilirliğin CBS ile Analizi

Özet

Eğitim insanoğlunun en temel ihtiyaçlarından biridir. Örgün eğitim ailede çocuğun doğumuyla başlar ve yaşam boyu devam eder. Çocuğun büyümesiyle birlikte etkileşimde bulunduğu çevrenin genişlemesine göre eğitim ortamı da genişler. Okul, eğitimin resmi olarak gerçekleştiği yer olarak tanımlanır. Belli bir plan ve program çerçevesinde sisteme dahil olan herkese aynı içerik ve düzeyde eğitim verilmesi hedeflenir. Süreç okul öncesi (anaokulu), ilkököl, ortaokul, lise, önlisans, lisans ve yüksek lisanstan başlar. Yaygın eğitim, kişinin gönüllü olarak katıldığı bir sistemdir. Eğitimde fırsat eşitliği ilkesi gereği dış faktörlerin etkisinin en aza indirilmesi için devlet tarafından çeşitli önlemler alınmaya çalışılmaktadır. Bunlardan biri de yerleşim yerlerinde kamu binalarının yapımında dikkat edilecek mesafelere ilişkin yönetmeliktir. Kentsel yerleşimlerin en önemli özelliklerinden biri, başta kamu binaları olmak üzere, ihtiyaçların karşılanacağı yerlerin erişilebilirliğidir. Hastaneden markete, eczaneden okula birçok ihtiyacımızı karşıladığımız mekanların erişilebilirliği şehir hayatında elde edilebilecek en önemli avantajlardan biridir. Artan kentsel nüfus, kentsel yerleşimlerin daha geniş alanlara yayılmasına neden olmuştur. Bu nedenle kentlerde yaşayan insanlara daha iyi hizmet verebilmek ve geleceğe yönelik daha iyi planlar yapabilmek için kentin işlevsel özelliklerine ilişkin mevcut durumun bilinmesi önemlidir. Bu çalışmada, bir şehrin erişilebilirlik fonksiyonunun CBS kullanılarak mekansal analizinin yapılması planlanmıştır. Bu çalışmanın temel amacı, Niğde ili Merkez ilçesinde bulunan eğitim kurumları arasında yer alan ilköğretim okullarının mekansal erişilebilirliklerini ortaya koymaktır. Erişilebilirlik kriteri olarak Mekânsal Planlar Yapı Yönetmeliği kullanılmıştır. Okullardaki mevcut öğrenci ve öğretmen sayıları ile derslik sayıları Niğde İl Milli Eğitim Müdürlüğü'nden alınmış ve elde edilen veriler ArcGIS yazılımına aktararak analiz edilmiştir. Çalışmada Niğde Belediyesi'nden alınan İmar Planı, OpenStreetMap'ten alınan yol ve konut verileri, Niğde İl Milli Eğitim Müdürlüğü'nden alınan okulların konum bilgileri ve öğrenci sayıları ile TÜİK'ten alınan nüfus verileri kullanılmıştır. Araştırmanın sonuçlarına göre, Merkez ilçedeki bazı mahallelerde ilköğretim okullarına erişimde sorunlar yaşandığı ve bu sorunun özellikle kırsal kesimde giderek arttığı belirlenmiştir. Erişilebilirliğin herkes için önemli olduğu unutulmamalı, okul ve yerleşim planları mekansal planlar yönetmeliğinde belirtilen değerler referans alınarak yapılmalıdır.

Traditional Fermented Camel Milk Products

Derya Saygili¹, Nural Karagözlü², Cem Karagözlü³

¹ Culinary Program, İzmir Kavram Vocational School, Konak-İzmir, Türkiye

² Food Engineering Department, Engineering Faculty, Manisa Celal Bayar University, Manisa, Türkiye

³ Department of Dairy Technology, Faculty of Agriculture, Ege University, Bornova- İzmir, Türkiye

Abstract

Camel milk which is an important protein source for people living in the arid regions of the world, also gains importance with the detected therapeutic effects. Camel milk products, which are obtained by regional camel milk production and consumed in the regions, are gradually expanding their product range. In addition to consumption as drinking milk, fermented dairy products like cheese, butter, yogurt and yoghurt as well as drinking milk are included in the first row of camel milk products. It is also possible to find products such as ice cream, milk powder and cream produced in the Middle East and North African countries from camel milk and other milks. Domiati cheese which a soft cheese like white cheese is commonly produced in Egypt, while Caravane is another camel milk cheese produced in Mauritania. While the fermentation of the butter produced from the camel milk is carried out in the goat's wool, Zabadi is consumed in various regions in Sudan. Suusac, which produced mainly by probiotic bacteria of *Lactobacillus acidophilus* and / or *Bifidobacterium longum* species, is the first beverage in fermented camel milk drinks in Kenya. Chal which is produced in Kazakhstan and Turkmenistan is consumed with the name of Shubat in some regions. A traditional dairy product Tarag, is a fermented drink which is a combination of lactic acid and alcohol fermentation. Laghsi is a camel milk drink which is made up of lactic acid bacteria and alcohol-producing yeast. Khoa is produced by darkening the camel milk and consumed by adding sugar while Kulfes is consumed with the addition of sugar and starch at a certain percentage. Khoa in other words Mawa is cured white flour in some proportions and take a other name is Jamun. In our country, although camel milk and its products don't found on the market shelves, it has a great importance with rich and nutritive composition and its therapeutic effects for the people of the region where it is produced. This study, in addition to the nutritional properties of camel milk products, it is aimed to introduce these products to the consumer audience by emphasizing their therapeutic effects. In light of the researchs done with camel milk, local producers have the mission to meet the camel with the consumer.

Key Words: Camel milk, fermented camel milk, camel milk products

Geleneksel Fermente Deve Sütü Ürünleri

Özet

Dünyanın kurak bölgelerinde yaşayan insanlar için önemli protein kaynağı olan deve sütü, tespit edilen teröpatik etkileri ile de önem kazanmaktadır. Bölgesel deve sütü üretimi ile elde edilen ve genellikle elde edildiği yörelerde tüketilen deve sütü ürünleri ise gün geçtikçe farklı çeşitler kazanarak ürün yelpazesini genişletmektedir. İçme sütü olarak tüketiminin yanı sıra peynir, tereyağ, yoğurt ve yoğurt benzeri fermente süt ürünleri deve sütü ürünleri içerisinde ilk sıralarda yer alırken Ortadoğu ve kuzey Afrika ülkelerinde deve sütü ve diğer sütlerin karışımlarından üretilmiş dondurma, süt tozu ve krema gibi ürünlere de rastlamak mümkündür. Beyaz peynir benzeri yumuşak bir peynir olan Domiati peyniri Mısır'da yaygın olarak üretilirken, Caravane Moritanya'da üretilen bir diğer deve sütü peyniridir. Az miktarda olsa da deve sütünden üretilen tereyağların fermentasyonu keçi tulumu içerisinde gerçekleştirilirken, Sudan'da üretilen Zabadi deve sütü yoğurdu olarak çeşitli bölgelerde tüketilmektedir. Daha çok *Lactobacillus acidophilus* ve/veya *Bifidobacterium longum* türü probiyotik bakteriler ile fermente edilerek üretilen fermente deve sütü içeceklerinin başında Kenya'da yaygın olan Suusac gelmektedir. Kazakistan ve Türkmenistan'da üretilen Chal bazı bölgelerde Shubat adı ile tüketilmektedir. Geleneksel süt ürünlerinden Tarag, laktik asit ve alkol fermentasyonunun bir arada gerçekleştiği fermente bir içecektir. Laghsi ise, laktik asit bakterileri ve alkol üreten mayalar tarafından yayık altının fermente edilmesi ile üretilen bir deve sütü içeceğidir. Khoa, deve sütünün koyulaştırılması ile üretilip içerisine şeker ilave edilerek tüketilirken, Kulfes deve sütünün yarı yarıya koyulaştırılıp belli oranlarda şeker ve nişasta ilavesi ile tüketilmektedir. Khoa ya da bir diğer adı ile Mawa'nın beyaz un ile belli oranlarda koyulaştırılmış haline ise Jamun adı verilmektedir. Ülkemizde deve sütü ve ürünleri market raflarında bulunmasa da üretildiği bölge halkı için hem zengin ve besleyici bileşimi hem de teröpatik etkileri ile büyük öneme sahiptir. Bu çalışmada deve sütü ürünlerinin besleyici özelliğinin yanı sıra teröpatik etkileri vurgulanarak tüketici kitlesine bu ürünlerin tanıtılması hedeflenmiştir. Deve sütü ile yapılan çalışmaların ışığında deve sütünün tüketici ile buluşması konusunda yerel üreticilere büyük görev düşmektedir.

Anahtar Kelimeler: Deve sütü, fermente deve sütü, deve sütü ürünleri

Giriş

Yeterli ve dengeli beslenmenin temelinde yer alan süt ve süt ürünleri, yediden yetmişe her yaşta birey için sağlıklı beslenmeyi destekleyen gıdalar olarak karşımıza çıkmaktadır. Bebeklikte anne sütü ile başlayan süt tüketim alışkanlığı ilerleyen dönemlerde süt şekeri olan laktozun intoleransı gibi sebepler ile yerini fermente süt ürünleri tüketim alışkanlığına bırakmak durumunda kalabilmektedir. Ülkemizde fermente süt ürünlerinin başında yoğurt, ayran, kefir gelirken uluslararası literatürde fermente süt ürünlerinin farklı tip sütlerden üretimine yönelik pek çok çalışma bulunmaktadır. Koyun, keçi, deve ve/veya at sütünün fermentasyonu ile elde edilen fermente süt ürünleri de sağlıklı beslenme olgusuna destek veren ürünler grubunda literatürde yerini almaktadır. Bu süt çeşitleri arasında deve sütü ile üretilen ürünlerin Dünya genelinde farklı isimlerle anılan çeşitleri olmasına rağmen ülkemiz için endüstriyel boyutta bir deve sütü ürünü üretiminden bahsetmek mümkün değildir. Ancak yerel olarak üretilen deve sütü yoğurdu, peyniri, dondurması gibi ürünler Aydın, Çanakkale ve İzmir başta olmak üzere kıyı şehirlerde rastlanan ürünler arasında sıralanabilir.

Deve Sütü ve Önemi

Deve sütü, kendine has kokuya sahip opak beyaz rengine ve hafif tuzlu tadı ile özgün bir bileşime sahiptir. Toplam % 9.85-11.45 kuru madde içeriği ile diğer süt çeşitleri arasında yerini almaktadır (Tablo 1).

Tablo 1. Deve, inek ve insan sütü bileşimi (Konuspayeva 2020; Ho ve ark., 2022)

Süt tipi	Bileşimi (%)			
	Protein	Yağ	Laktoz	Kül
Deve sütü	3,27±0,58	3,61±0,90	4,44±0,66	0,77±0,70
İnek sütü	3,20-3,80	3,70-4,40	4,80-4,90	0,70-0,80
İnsan sütü	1,10-1,30	3,30-4,70	6,80-6,90	0,20-0,30

Bileşiminde yer alan enzimler, serbest yağ asitleri, vitaminler ve mineraller deve sütünü diğer sütlerden ayıran önemli bileşenler olarak ifade edilmektedir. Yüksek konsantrasyonda immünoglobülin ve insülin içeriği, vitamin (A, B₂, C ve E) açısından zengin bileşimi, mineraller (Na, K, Zn, Cu, Mg ve Fe) ve düşük laktoz ve kolesterol miktarı ile diğer sütler arasında farklı tanımlanmaktadır (Omer ve Eltinay, 2009; Al-Humaid ve ark., 2010; Saygılı ve Karagözlü, 2017). Deve sütü ayrıca yüksek vitamin ve mineral içeriği ile anti-kanser, anti-diyabetik ve antibakteriyel özelliklere sahip birçok koruyucu protein (örneğin immünoglobulinler, laktoferrin, lizozim ve laktoperoksidaz) içerir (Barłowska ve ark., 2011; Konuspayeva ve ark., 2009; Zou ve ark., 2021a, 2021b).

Ülkemizde süt ve süt ürünleri üretiminde inek, koyun ve keçi sütü üretimine ait rakamlar belirleyici olurken, deve yetiştiriciliğinin yapıldığı bazı bölgelerde deve sütü üretimi ve deve sütü ürünleri yerel halk tarafından tüketilmektedir. Ülkemizde endüstriyel üretime henüz dahil olmayan deve sütü ve ürünleri için sağlık destekleyici özelliklerini vurgulayan bilimsel araştırma sayısı gün geçtikçe artmaktadır.

Geleneksel Deve Sütü Ürünleri ve Teröpatik Etkileri

Dünya genelinde pek çok amaca yönelik tercih edilen develer daha çok süt verimi açısından önemli görülmekte ve özellikle göçebe halkların beslenme ihtiyacının büyük kısmını karşılamaktadır. Dünya deve varlığı hakkındaki veriler sınırlı kalıyor olmasına rağmen sayıca sürekli artış olan ülkeler Ortadoğu ve Afrika ülkeleri belirtilmektedir (Faye ve Bonnet, 2012).

Mısır'da yaygın olarak tüketilen hafif tuzlu bir beyaz peynir çeşidi olan Domiati birçok Ortadoğu ülkesinde tercih edilmektedir. Standart peynir üretim metodundan farklı olarak süte peynir mayası ilave edilmeden tuz ilavesi ile üretiliyor olması en temel özelliğidir. İnek, manda, keçi ve deve sütü gibi çeşitleri de bulunan peynir üretiminde yine bu sütlerin karışımları da kullanılmaktadır.

Afrika kıtasının batısında yer alan Moritanya'da yerel bir üretici tarafından deve sütüne bitkisel enzim ilavesi ile Caravane peyniri üretilmektedir. Hafif tuzlu, yumuşak dışı beyaz kabuklu bir yapıda olan peynir görsel olarak Camembert peynirine benzerliği ile anılmakta ve markası olan Caravane adı ile tanınmaktadır. Yerel halk tarafından severek tüketilen peynir, kremli yapısı ile keklerde, soslarda, meze ve salata çeşitlerinde sıklıkla tercih edilmektedir.

Sudan'da deve sütünden üretilen bir yoğurt çeşidi olan Zabadi, laktik asit fermentasyonu ürünüdür. Yerel halkın severek tükettiği Zabadi farklı süt çeşitlerinden de üretilmektedir.

Deve sütü ve fermente deve sütü ürünleri Kenya'da yaygın olarak tercih edilen ürünler arasındadır. Fermente deve sütü üretiminde dumanla işlenerek üretilen Suusac için son üründe belirgin duman kokusu tüketen bireylerce buruk tat şeklinde tanımlanmaktadır.

Taze süte ekşitilmiş süt ilavesi ile üretilen Chal (Shubat), ekşi tada sahip köpüklü yapısı ile sevilerek tüketilen fermente süt ürünleri arasında yerini alır. Chal üretiminde seramik kavanozlarda 3-4 gün kadar fermentasyona devam eden süte her gün yeni süt eklenerek ekşimesi sağlanmaktadır. Son üründe başlangıç miktarının yaklaşık 5 katına kadar ulaşan fermente süt ekşiliği ile tanınan bir deve sütü ürünüdür.

Fermente deve st rnleri arasında Tarag Moğolistan'da retilen nemli bir rn iken Laghsi yağı azaltılmış su ieriğı daha yksek bir fermente st rn olarak bilinir. Bileşiminde laktik asit bakterilerinin yanı sıra mayaların da yer alıyor olması laktik asit fermentasyonuna ek olarak alkol fermentasyonunun da gerekleştiğini gstermektedir. Bu şekilde son rnde artan CO₂ seviyesi daha ferahlatıcı bir lezzet sunmaktadır.

Stn dşk sıcaklıkta ısıtılarak koyulaştırılması şeklinde elde edilen bir rn de Khoa'dır. Kurumadde oranı % 65-70'e ulařıncaya kadar suyu uzaklaştırılarak retilen st rn, Hint tatlılarının en temel bileşeni olarak kullanılmaktadır.

Deve st ve rnleri zerine sağık destekleyici zelliklerini vurgulayan alıřma sayısı gn getike artmaktadır. Yksek oranda inko ieriğı ile bağıřıklık sistemini destekleyici zelliğı yanı sıra bileşimindeki antimikrobiyal bileşenler ve antioksidan kapasitesi ile deve st her geen gn bir adım daha ne ıkmaktadır. Diğerk memeli canlılar arasında bileşimindeki yksek demir konsantrasyonu ile anemi bireylere terpatik etkisi ile alternatif olarak sunulmaktadır (Sakandar ve ark., 2018).

Djangabilov ve ark. (2000) tarafından fermente deve st rn olan Shubat tketiminin akut ve kronik gastrointestinal sindirim sistemi rahatsızlıklarının tedavisinde olumlu ynde etkili olduėu bildirilmiştir.

Diyabetli hastalarda deve st tketimine ynelik yapılan arařtırmalar inslin tedavisinde deve stnn alternatif bir ajan olarak kullanımına ynelik bulguları ortaya koymaktadır. Bileşimindeki yksek inslin miktarının gastrointestinal sistemde korunduėu ve diyabet bireylerde tedavi destekleyici olması nedeni ile deve st ve deve st rnlerinin tketimi dikkat ekmektedir (Mohammad ve ark., 2009; Saygılı ve Karagzl, 2017). Agrawal ve ark. (2007) tarafından yapılan arařtırmada Tip 1 diyabet bireylerde iğ deve st tketimi ile gnlk inslin gereksiminde %30-40 oranında azalma sağılandığı bildirilmiştir. Diyabet tedavisinde deve stnn potansiyel kullanımı Ashraf ve ark., (2021) tarafından ortaya konmuřtur. alıřmada daha nceleri birok arařtırmada ortaya konan deve stnn antidiyabet zelliğine ait molekler temelini aıklanarak etkili olan aktif ajanlar ifade edilmiştir. Bylece deve stnn antidiyabet zelliğini ortaya koyan bileşenlere ışık tutulmuřtur.

Sudan'da fermente deve st rnleri arasında severek tketilen bir iecek olan Gariss ile yapılan bir arařtırma in vivo ortamda gerekleştirilmiştir. alıřmada etki mekanizması tam olarak aıklanamamış olmasına raėmen deve stnn zengin biyoaktif peptid ieriğı ile hipokolesterolemik etki gsterdiği bildirilmiştir (Elayan ve ark., 2008). Halen sayıca az olmasına raėmen bilimsel alıřmalar deve st ve rnleri tketiminin tberkloz, mide rahatsızlıkları ve eřitli kanser trleri zerine olumlu etkileri olduėunu bildirmektedir. Hesham ve ark., (2012) deve st ve inek stnn insan kanser hcrelerinin oėalması zerine etkisini inceledikleri arařtırmada deve stnn kanser hcrelerinin oėalmasını nemli lde inhibe ettiğı rapor edilmiştir. Arařtırma bulguları insanlar iin potansiyel klinik neme sahip veriler olup deve st ile yapılan daha fazla in vivo alıřmaya ihtiya olduėunu gstermektedir.

Farklı *Lactobacillus* spp. probiyotik suřlar ile fermente edilen deve stnn antikanser aktivite, antioksidan, ADE inhibisyon aktivitesi ve proteolitik aktivitesi incelenmiştir. Arařtırmada fermente deve stnden elde edilen ekstraktların zellikle antioksidan, ACE-inhibisyonu ve antiproliferatif aktivitesinin sağığı geliřtirici faydalarının, fermente sığır stnden elde edilenlerden belirgin şekilde daha yksek olduėunu gstermiştir (Ayyash ve ark., 2018). Benzer şekilde fermente deve st rnlerinin sağık destekleyici zelliklerini vurgulayan alıřmaların sayısı gn getike artmaktadır.

Dharmisthaben ve ark., 2021 tarafından yapılan alıřmada *L. plantarum* ile fermente edilen deve stnn umut verici antioksidan aktivite ve anti-inflamatuar aktivite sergilediğı bildirilmiştir. alıřmada elde edilen veriler ışığında laktik asit bakterileri ieren fermente deve stnn sağığı faydalarını belirlemek ve fermente deve stnden tanımlanan peptitlerin diğerk biyolojik aktivitelerinin gsterilmesi amacı ile gelecekte klinik alıřmalara ihtiya olduėu ifade edilmiştir.

Deve stnn sığır stnden daha stn ve insan stne benzer bir besin ieriğine sahip olması sebebi ile anne st alımının sınırlı olduėu durumlarda alternatif olarak kabul edilebileceğı bildirilmiştir. Bunun yanı sıra deve st, insan diyetleri iin tatmin edici bir esansiyel amino asit dengesine sahip olması, yksek oranda β -kazein iermesi ve hassas bireylerde alerjiye neden olan β -laktoglobulin'e yoksun olması sebebi ile alternatif bir st eřidi olarak bildirilmiştir (El-Agamy, 2009; Hinz et al., 2012; Ho ve ark., 2022).

Sonuç

Terpatik zelliklerine her geen gn bir yenisi eklenen ve sayıca desteklenen deve st rnlerine ynelik alıřmalar blgesel dzeyde devam etmektedir. Deve st ve fermente deve st rnleri lkemiz de dahil Dnya'nın pek ok lkesinde yerel halk tarafından tketilmektedir. Endstriyel boyutta retim kısıtlı kalması, geleneksel fermente deve st rnlerinin zengin bileşimi ve sağık destekleyici zellikleri zerine glge dřrmemelidir. Deve yetiřtiriciliğı ve bakıcılığının yoėun olduėu blgelerde yerel iřletmelere destek sağılanması deve stnn fermente rnlere iřlenmesini ve daha fazla tketicie ulařtırılmasını sağılayacaktır.

Detection of Burned Areas by Remote Sensing Techniques: Antalya Manavgat Forest fire case study

Orhun Soydan¹

¹Landscape Architecture Department, Faculty of Architecture, Niğde Ömer Halisdemir University, Niğde, Turkey

Abstract

Forests are the protectors of earth's ecological balance. Unfortunately, the forest fire is usually only observed when it has already spread over a large area, making its control and stoppage arduous and even impossible at times. The result is devastating loss and irreparable damage to the environment and atmosphere in addition to irreparable damage to the ecology. Among other terrible consequences of forest fires are long-term disastrous effects such as impacts on local weather patterns, global warming, and extinction of rare species of the flora and fauna. The problem with forest fires is that the forests are usually remote, abandoned/unmanaged areas filled with trees, dry and parching wood, leaves, and so forth that act as a fuel source. These elements form a highly combustible material and represent the perfect context for initial-fire ignition and act as fuel for later stages of the fire. The fire ignition may be caused through human actions like smoking or barbecue parties or by natural reasons such as high temperature in a hot summer day or a broken glass working as a collective lens focusing the sun light on a small spot for a length of time thus leading to fire-ignition. Fire is recognized as one of the most important ecosystem disturbances, as it contributes to determining vegetation structure, biodiversity and carbon balance. In Turkey, fires burn extensive areas annually, and account for a large proportion of the global extent of burned areas. In addition, fires in Turkey are driven by factors such as rainfall, tree cover and population density. Therefore, accurate mapping of burned areas in fires is crucial for social and environmental applications. Remote sensing plays a key role in monitoring burned area at regional and global scales. Due to the high temporal resolution and large spatial coverage, the current burned area products rely on coarse spatial resolution satellite data. In this study, the forest fire that occurred in Manavgat district of Antalya province on 28 July 2021 and lasted for 15 days was analyzed by remote sensing techniques using Landsat 5-7 satellite images. The difference obtained by using the Normalized Burned Ratio-NBR and Normalized Vegetation Index (NDVI) indices and the differences of these indices by taking images of the study region dated July 2021 before the forest fire and August 2021 after the forest fire. By using Normalized Burned Intensity (Difference Normalized Burned Ratio-Dnbr) and Difference Normalized Vegetation Indices, areas destroyed by fire were determined. The maximum similarity algorithm of pixel-based controlled classification was also applied to the data set. The area destroyed by burning after the forest fire was tried to be calculated with these two indexes. It was investigated whether the results of three different methods were compatible and consistent with the results of the General Directorate of Forestry. Although there are differences between the results, it was determined that the selected method and the materials used were suitable for such studies.

Uzaktan Algılama Teknikleri ile Yanmış Alanların Tespiti: Antalya Manavgat Orman Yangını Örneği

Özet

Ormanlar, dünyanın ekolojik dengesinin koruyucularıdır. Ne yazık ki, orman yangını genellikle sadece geniş bir alana yayıldığında görülür, bu da kontrolünü ve durdurulmasını zor ve hatta zaman zaman imkansız hale getirir. Sonuç, ekolojide onarılmaz hasara ek olarak, çevreye ve atmosfere yönelik yıkıcı kayıplar ve onarılmaz hasarlardır. Orman yangınlarının diğer korkunç sonuçları arasında yerel hava düzenlerini etkiler, küresel ısınma ve flora ve faunanın nadir türlerinin neslinin tükenmesi gibi uzun vadeli onarılmaz etkileri vardır. Orman yangınlarıyla ilgili sorun, ormanların genellikle uzak, terk edilmiş/yönetilmeyen ağaçlarla, kuru odunlarla, yapraklarla ve yakıt kaynağı görevi gören benzerleriyle dolu olmasıdır. Bu elementler oldukça yanıcı bir malzeme oluşturur ve ilk ateşleme için mükemmel bağlamı temsil eder ve yangının sonraki aşamaları için yakıt görevi görür. Yangının tutuşması, sigara içmek gibi insani eylemlerden veya sıcak bir yaz gününde yüksek sıcaklık veya güneş ışığını küçük bir noktaya uzun süre odaklayan toplu bir mercecek gibi çalışan kırık bir cam gibi doğal sebeplerden kaynaklanabilir. Yangın, bitki örtüsü yapısının, biyolojik çeşitliliğin ve karbon dengesinin belirlenmesine katkı sağladığı için en önemli ekosistem rahatsızlıklarından biri olarak kabul edilmektedir. Türkiye'de yangınlar her yıl geniş alanları yakar ve küresel yanan alanların büyük bir bölümünü oluşturur. Ayrıca Türkiye'deki yangınlar yağış, ağaç örtüsü ve nüfus yoğunluğu gibi faktörlerden kaynaklanmaktadır. Bu nedenle, yangınlarda yanan alanların doğru bir şekilde haritalanması, sosyal ve çevresel uygulamalar için çok önemlidir. Uzaktan algılama, bölgesel ve küresel ölçekte yanan alanın izlenmesinde önemli bir rol oynamaktadır. Yüksek zamansal çözünürlük ve geniş uzamsal kapsama nedeniyle, mevcut yanmış alan ürünleri kaba uzamsal çözünürlüklü uydu verilerine dayanmaktadır. Bu çalışmada 28 Temmuz 2021 tarihinde Antalya ili Manavgat ilçesinde meydana gelen ve 15 gün süren orman yangını, Landsat 5-7 uydu görüntüleri kullanılarak uzaktan algılama teknikleri ile analiz edilmiştir. Çalışma bölgesine ait orman yangını öncesi Temmuz 2021 ve orman yangını sonrası Ağustos 2021 tarihli görüntüler alınarak Normalize Edilmiş Yanma Şiddeti (Normalized Burned Ratio-NBR) ve Normalize Edilmiş Vegetasyon İndeksi (Normalized Differenced Vegetation Index - NDVI) indeksleri ile bu indekslerin farkları kullanılarak elde edilen Fark Normalize Edilmiş Yanma Şiddeti (Difference Normalized Burned Ratio-Dnbr) ve Fark Normalize Edilmiş Vegetasyon İndeksleri kullanılarak yanarak tahrip olmuş alanlar tespit edilmiştir. Veri setine ayrıca piksel tabanlı kontrollü sınıflandırmanın maksimum benzerlik algoritması uygulanmıştır. Orman yangını sonrası yanarak tahrip olan alan belirlenen bu iki indeks ile hesaplanmaya çalışılmıştır. Üç farklı yöntemin sonuçlarının Orman Genel Müdürlüğü sonuçları ile uyumlu ve tutarlı olup olmadığı araştırılmıştır. Sonuçlar arasında farklılıklar olmasına rağmen, seçilen yöntem ve kullanılan materyallerin bu tür çalışmalar açısından uygun olduğu belirlenmiştir.

Redesigning Landscape Equipment's with Parametric Design: The Case of Konyaaltı Expo 2016 Park

Orhun Soydan¹, Ahmet Benliay²

¹Landscape Architecture Department, Faculty of Architecture, Niğde Ömer Halisdemir University, Niğde, Turkey

²Landscape Architecture Department, Faculty of Architecture, Akdeniz University, Antalya, Turkey

Abstract

Parametric design is a process based on algorithmic thinking that allows the expression of parameters and rules that together define, encode, and explain the relationship between design intent and design response. It is the production process of a parametric model based on certain variables, and the variables involved in this process can be; size, quantity or geometry. This means that different inputs produce different designs in the parametric design process. There are parameters, constraints and relationships that make up the parametric model. Parametric modeling concepts range from a simple box of parameters (length, width, and height) and constraints to a complex architecture with thousands of variables, including parameters and geometries. Today, parametric design methods and software have started to become widespread, studies on the parametric design method, especially on facade system solutions, form-geometry searches, the relationship of land and design, different geometry building productions and conceptual relations are widely carried out. It is thought that it is one of the most up-to-date methods that can be used in design and that it is more aesthetic, functional, appropriate, and acceptable than traditional reinforcement elements. Within the scope of this study, it is aimed to redesign some of the landscape equipment of Konyaaltı Expo 2016 Park with a parametric design approach and to compare the park with the existing ones. For this purpose, the landscape equipment's in Konyaaltı Expo 2016 Park, which was determined as the study material, were photographed, and analyzed. Using these data, opinions were taken from a group of 10 experts, and it was determined which equipment should be redesigned. By targeting the redesigns to be made within the scope of the study, a literature search was made on the concept of Parametric Design and the examples made with parametric design were examined. Models of the new reinforcement elements proposed for Konyaaltı Expo 2016 Park were prepared with the Grasshopper tool and rendered images taken with the help of Lumion software. The evaluation of these designs in terms of aesthetics, economics and functionality, their suitability and how acceptable they are, was determined by asking the experts through a questionnaire. In line with the results of the survey, existing reinforcement elements and parametric design reinforcement elements were compared, and the possibilities and possible restrictions were examined.

Parametrik Tasarımla Donatı Elemanlarının Yeniden Tasarlanması: Konyaaltı Expo 2016 Parkı Örneği

Özet

Parametrik tasarım, tasarım amacı ve tasarım yanıtı arasındaki ilişkiyi birlikte tanımlayan, kodlayan ve açıklayan parametrelerin ve kuralların ifadesine izin veren algoritmik düşünceye dayalı bir süreçtir. Belirli değişkenlere dayalı bir parametrik modelin üretim sürecidir ve bu sürece dâhil olan değişkenler; boyut, miktar veya geometridir. Bu, parametrik tasarım sürecinde farklı girdilerin farklı tasarımlar ürettiği anlamına gelir. Parametrik modeli oluşturan parametreler, kısıtlamalar ve ilişkiler vardır. Parametrik modelleme kavramları, basit bir parametre kutusundan (uzunluk, genişlik ve yükseklik) ve kısıtlamalardan, parametreler ve geometriler dâhil binlerce değişkenli karmaşık bir mimariye kadar uzanır. Günümüzde parametrik tasarım yöntemleri ve yazılımları yaygınlaşmaya başlamış, parametrik tasarım yöntemi başta olmak üzere cephe sistem çözümleri, form-geometri arayışları, arazi ve tasarım ilişkisi, farklı geometriyi yapı üretimleri ve kavramsal ilişkiler üzerine çalışmalar yaygın olarak yapılmaktadır. Tasarımda kullanılacak en güncel yöntemlerden biri olduğu ve geleneksel donatı elemanlarına göre daha estetik, işlevsel, uygun ve kabul edilebilir olduğu düşünülmektedir. Bu çalışma kapsamında Konyaaltı Expo 2016 Parkı'nın bazı peyzaj elemanlarının parametrik bir tasarım yaklaşımıyla yeniden tasarlanması ve parkın mevcut olanlarla karşılaştırılması amaçlanmaktadır. Bu amaçla çalışma materyali olarak belirlenen Konyaaltı Expo 2016 Parkı'ndaki peyzaj elemanları fotoğraflanmış ve analiz edilmiştir. Bu veriler kullanılarak 10 kişilik uzman bir gruptan görüş alınmış ve hangi ekipmanların yeniden tasarlanması gerektiği belirlenmiştir. Çalışma kapsamında yapılacak yeniden tasarımlar hedeflenerek Parametrik Tasarım kavramı üzerine literatür taraması yapılmış ve parametrik tasarım ile yapılan örnekler incelenmiştir. Konyaaltı Expo 2016 Parkı için önerilen yeni donatı elemanlarının modelleri Grasshopper aracı ile hazırlanmış ve Lumion yazılımı yardımıyla render görüntüleri oluşturulmuştur. Bu tasarımların estetik, ekonomik ve fonksiyonel açıdan değerlendirilmesi, uygunluğu ve ne kadar kabul edilebilir olduğu uzmanlara sorulan bir anketle belirlenmiştir. Anket sonuçları doğrultusunda mevcut donatı elemanları ile parametrik tasarım donatı elemanları karşılaştırılmış, olasılıklar ve olası kısıtlamalar incelenmiştir.

Determination of Hay Yield and Quality of Different Alfalfa (*Medicago sativa* L.) Varieties in Bilecik Ecological Conditions

Ali Baran Yılmaz^{1,2} Hanife Mut^{3*}

¹Tohumluk Tescil ve Sertifikasyon Merkez Müdürlüğü, Ankara, Türkiye

²Bilecik Şeyh Edebali Üniversitesi, Lisansüstü Eğitim Enstitüsü, Bilecik, Türkiye

³Bilecik Şeyh Edebali Üniversitesi, Ziraat ve Doğa Bilimleri Fakültesi, Tarla Bitkileri Bölümü, Bilecik, Türkiye

*Sorumlu yazar: hanife.mut@bilecik.edu.tr

Abstract

This research was conducted to determine hay yield and some quality properties of different alfalfa (*Medicago sativa* L.) cultivars during two years between 2020-2022 in Bilecik ecological conditions. In the experiment, 23 alfalfa varieties ranging from 3 to 8 in the dormancy group were used as material. The experiment was arranged in randomized blocks design with three replications. In the study, the cleaning cutting was made in the first year, and the observations were taken over 3 cutting in the second year. Plant height, hay yield, protein yield, ADF, NDF, and mineral content (Ca, Mg, P, K) were determined in cultivars. According to the average of the cutting, plant height and hay yield ranged between 61.07-78.37 cm and 504.77-1066.5 kg/da, respectively. The Ca, Mg, P, and K contents of alfalfa varieties were sufficient for animal nutrition. According to the results obtained from the research; It has been determined that varieties with dormancy group between 5 and 8 can be grown successfully in Bilecik ecological conditions.

Key Words: *Alfalfa, hay yield, ADF, NDF, mineral nutrition.*

Bilecik Ekolojik Koşullarında Farklı Yonca (*Medicago Sativa* L.) Çeşitlerinin Ot Verimi ve Kalite Özelliklerinin Belirlenmesi

Özet

Bu araştırma, Bilecik ekolojik koşullarında farklı yonca (*Medicago sativa* L.) çeşitlerinin kuru ot verimi ve bazı kalite özelliklerini belirlemek amacıyla 2020-2022 yılları arasında iki yıl süreyle yürütülmüştür. Denemede dormansi grubu 3 ile 8 arasında değişen 23 adet yonca çeşidi materyal olarak kullanılmıştır. Araştırma Tesadüf Blokları Deneme Desenine göre 3 tekerrürlü olarak yürütülmüştür. Çalışmada ilk yıl temizleme biçimi yapılmış olup, gözlemler ikinci yılda ve 3 biçim üzerinden alınmıştır. Çeşitlerde bitki boyu, kuru ot verimi, protein verimi, ADF, NDF ve mineral madde içerikleri (Ca, Mg, P, K) belirlenmiştir. Biçimler ortalamasına göre bitki boyu ve kuru ot verimi sırasıyla 61.07-78.37 cm ve 504.77-1066.5 kg/da arasında değişmiştir. Yonca çeşitlerinin Ca, Mg, P, K içerikleri hayvan besleme açısından yeterli seviyede olduğu tespit edilmiştir. Araştırmadan elde edilen sonuçlara göre; dormansi grubu 5-8 arasında olan çeşitlerin Bilecik ekolojik koşullarında başarı ile yetiştirilebileceği tespit edilmiştir.

Anahtar Kelimeler: *Yonca, kuru ot verimi, ADF, NDF, mineral madde*

Giriş

Türkiye'nin hemen her bölgesinde doğal olarak görülen yoncanın tarımı son yıllarda giderek artmaktadır. Bu durum mevcut yonca çeşitlerine ek olarak ülkemize ve bölgemize uygun yeni çeşitlerin araştırılması ve adaptasyonlarının sağlanmasını zorunlu hale getirmektedir. Ayrıca bu durum bölge meralarının ıslahında kullanılabilecek mera tipi yoncaların ortaya konulması açısından da büyük önem arz etmektedir (Kır ve Soya, 2008).

Yonca kendisinden sonra ekilen bitkiler için organik madde sağlarken, aynı zamanda azotça zengin iyi bir tarla toprağı bırakır. Yoncanın hem ilkbahar hem de sonbaharda ekimi yapılabilmektedir. Kışları sert geçen yerlerde ilkbahar, ılıman bölgelerde ise sonbahar aylarında ekim yapılabilir. İlkbaharda ekilen yoncadan ilk yıl fazla ürün alınmazken, sonbahar ekilenden ise bir sonraki yaz başından itibaren ürün alınabilmektedir. Yoncadan en yüksek verim üçüncü yılda alınmakta olup, daha sonra verim düşmektedir. Ot verimi, toprağın verimi ile birlikte çeşit ve uygulanan kültürel işlemlere göre değişmekle beraber sulanan koşullarda bir yonca tesisinden yılda 1200-1800 kg/da arasında kuru ot alınabilmektedir (Engin, 2016).

Bilecik'te 430.700 ha toplam arazinin; %53.09'unu orman alanları, %29.04'ünü ise tarım alanları oluşturmaktadır. Çayır-mera alanları ise 6.342 ha ile toplam arazinin %1.47'sini oluşturmaktadır. İlde toplam tarım alanının içerisinde Keleme alan olarak geçen %32,73 oranında boş alan yer almaktadır. Bilecik'te işlenebilir tarım alanları içerisindeki yem bitkileri ekim oranı %5.29 olup, yonca, fiğ, yulaf, korunga ve silajlık mısır en fazla tarımı yapılan yem bitkileridir.

Bu çalışma, Bilecik ekolojik koşullarında farklı yonca çeşitlerinin verim ve bazı kalite özelliklerinin belirlenerek bölgemize uygun yonca çeşitlerinin belirlenmesi amacıyla yürütülmüştür.

Materyal ve Metot

Araştırma, Bilecik ili Merkez ilçesinde yer alan Bilecik Şeyh Edebali Üniversitesi Tarımsal Uygulama ve Araştırma Merkezine ait deneme alanında 2 yıl süreyle (2020-2012) yürütülmüştür.

Denemede materyal olarak dormansi gurubu 3 ila 8 arasında yer alan 23 adet yonca çeşidi (Ranger, Savaş, Toros, Blue Moon, SW 6330, Frigos, Galaxie, Timbale, Prosomenti, Kalender, Nimet, Özpınar, Queen, Planet, Gea, Safkan, Alphil, Verdor, Gözlü 1, Artemis, Tomris, Selta ve Azura) kullanılmıştır.

Deneme alanı toprağı, killi tınlı, hafif alkali (7.68), orta seviyede kireçli (%7.23) ve hafif tuzlu (%0.031) bir yapıya sahiptir. Deneme toprağının fosfor içeriğı (23.67 kg/da) ve potasyum değeri fazla olup (113.5 kg/da), organik madde miktarı ise az (%1.61) olarak belirlenmiştir. Çalışmanın yürütüldüğü Bilecik lokasyonunda vejetasyon süresince, uzun yıllar yağış toplamı 459.3 mm, 2021 yılında 478.5 mm ve 2022 yılı ilk sekiz aylık dönemde 311.5 mm olmuştur. İlin uzun yıllar sıcaklık ortalaması 12.5 °C, 2021 yılında 13.28 °C ve 2022 yılında ise 13.04 °C olmuştur. Uzun yıllara ait ortalama nispi nem % 67.0 iken, deneme yıllarına ait ortalama nispi nem sırası ile % 67.1 ve % 67.2 olarak tespit edilmiştir.

Deneme, Tesadüf Blokları Deneme Desenine göre 3 tekrarlamalı olarak kurulmuştur. Denemede parsel boyu 5 m ve sıra arası 20 cm olacak şekilde 6 sıra ekim yapılmıştır. Ekimler sonbaharda 12.11.2020 tarihinde dekara 2 kg tohum olacak şekilde el ile yapılmıştır. Ekimden önce deneme yerlerinin toprak analizleri yapılmış ve dekara 5 kg N ve 8 kg P₂O₅ olacak şekilde ekimle birlikte gübreleme yapılmıştır. Fosfor kaynağı olarak DAP, azot kaynağı olarak Amonyum Sülfat gübresi kullanılmıştır.

Çalışmada biçimler bitkilerin % 10 çiçeklendiği dönemde yapılmıştır. İlk yıl ekimden sonra, temizleme biçimi takiben ve ikinci yıl da ise her biçimden sonra sulama yapılmıştır. Denemenin tesis yılında temizleme biçim yapılmış olup veriler ikinci yılda alınmıştır. Çalışmada bitki boyu, kuru ot verimi, protein verimi, ADF, NDF, Fosfor ve Kalsiyum Oranları belirlenmiştir. Bitki boyu her hasattan önce cetvelle ölçülerek yapılmıştır. Hasatta kenar tesiri çıkarıldıktan sonra geri kalan alandan elde edilen yeşil ot verimleri kullanılarak dekara yeşil ot verimi belirlenmiştir. Parsellerden alınan örnekler etüvde kurutulduktan sonra elde edilen kuru madde oranlarından yararlanılarak örneklerin dekara kuru ot verimleri, kuru ot verimleri ile protein oranları çarpılarak ise dekara protein verimleri hesaplanmıştır. Kurutulan ve öğütülen örneklerde Foss NIR Systems Model 6500 Win ISI II v1.5 cihazında IC-0904FE kalibrasyon programı kullanılarak protein, ADF, NDF, Fosfor ve Potasyum oranları belirlenmiştir.

Elde edilen sonuçlar Tesadüf Blokları Deneme Desenine göre istatistiki analize tabi tutulmuştur. Aralarında farklılık belirlenen işlemlerin ortalamaları Duncan çoklu karşılaştırma testine göre değerlendirilerek gruplandırma yapılmıştır.

Bulgular ve Tartışma

Bilecik koşullarında 23 farklı yonca çeşidi ile yürütülen bu çalışmada, bitki boyu bakımından çeşitler arasında ve biçimler arasında istatistiksel olarak farklılık belirlenmemiştir. Çalışmada üç biçimin ortalamasında bitki boyu değerleri 61.07 (Ranger) ile 78.37 cm (Nimet) arasında değişim göstermiştir. Frigos, Timbale, Prosomenti, Kalender, Nimet, Özpınar, Queen, Gea, Alphil, Verdor, Gözlü 1, Delta ve Azura çeşitlerinde belirlenen bitki boyu değerleri, üç biçimin ve çeşitlerin ortalaması olarak belirlenen ortalama bitki boyu değeri olan 71.07 cm'den yüksek olmuştur (Grafik 1). Töngel ve Ayan (2010) Samsun ekolojik koşullarında farklı yonca çeşitlerinin bitki boyunun, 60.21-77.98 cm arasında değiştiğini bildirmiştir.

Grafik 1. Çalışmada ele alınan yonca çeşitlerinde belirlenen ortalama bitki boyu değerleri (cm).

Tablo 1. Çalışmada ele alınan yonca çeşitlerinde belirlenen kuru ot ve protein verimleri (kg/da).

**Aynı harflerle gösterilen ortalamalar arasında $p < 0.01$ düzeyinde farklılık yoktur. B: Biçim.

Tablo 1’de farklı yonca çeşitlerinin kuru ot ve ham protein verimleri görülmektedir. Buna göre her iki özellik bakımından 2. biçimde ve biçimler toplamında çeşitler arasında çok önemli ($P < 0.01$) farklılık olmuştur. Toplam verimlere göre en yüksek kuru ot ve protein verimi sırasıyla 504.8-1066.6 ve 103.73-210.80 kg/da arasında değişmiştir. Farklı yonca çeşitleri üzerinde yapılan çalışmalarda kuru ot ve protein verimi 787-4330.5 kg/da (Gülcan ve Anlarsal, 1992; Şengül ve ark., 1992; Şilbir ve ark., 1994; Engin ve Mut, 2017) ve 37.2-590.6 kg/da (Kır, 2010; Töngel ve Ayan, 2010; Turan, 2010; Engin, 2016) arasında değişmiştir.

*Aynı harfle gösterilen ortalamalar arasında $p < 0.05$ düzeyinde farklılık yoktur; B: Biçim

ADF yemin sindirilebilirliğini, NDF ise hayvanlar tarafından alınabilirliğini ifade etmektedir (Markovic ve ark., 2007; Ateş, 2012; Öztürk ve ark., 2020). Yem içerisinde lif miktarı fazla ise yemin sindirilebilirliği ve alınabilirliğini zorlaştırmaktadır. Buna göre, yem içerisinde söz konusu her iki içeriğin de düşük olması istenen bir durumdur. Çalışmada yonca çeşitlerinin ADF ve NDF içerikleri sırasıyla %31.90-36.97 ve %42.67-49.50 arasında olmuştur (Grafik 2). Isparta ekolojik koşullarda farklı yonca çeşitlerinde en düşük ADF ve NDF oranı sırasıyla %30.32 ve %42.27 olmuştur (Yılmaz, 2011).

Yonca çeşitlerinin P ve K içerikleri Tablo 2’de verilmiştir. Biçim ortalamalarına göre çeşitlerin P ve K içerikleri sırasıyla %0.329-0.370 ve % 2.59-2.80 arasında değişmiştir. Hayvan beslenmesinde en önemli makro besin elementlerinin başında gelen P ve K hayvanların sağlığı açısından çok önemlidirler. Dua ve Care (1999) fosforun hayvanların iskelet yapısında ve döl veriminde etkili olduğunu, Başbağ ve ark. (2011) ile Gürsoy ve Macit (2017) ise potasyumun vücudun asit-baz dengesini sağladığını bildirmişlerdir. Yem içerisinde P oranının en az %0.21, K oranının ise %0.8 olması gerekmektedir (Kidambi ve ark., 1989) Çalışmada yonca çeşitlerinin P ve K içerikleri söz konusu değerlerin üzerinde olmuştur (Tablo 2). Van ekolojik koşullarında bazı yonca çeşitlerinin adaptasyonu üzerine yapılan çalışmada çeşitlerin P ve K içerikleri sırasıyla %0.11-0.17 ve %2.01-2.08 arasında değişmiştir (Turan, 2010).

Sonuç

Yem bitkileri arasında en önemli bitkilerin başında yonca gelmektedir. Gerek içermiş olduğu protein ve besin elementleri gerekse toprağa kazandırmış olduğu organik madde içeriği bakımından bitki ön plana çıkmaktadır. Diğer taraftan yonca ülke ve bölgemizin kaliteli kaba yem açığının kapatılmasında önem teşkil etmektedir. Özellikle ilimizde yer alan keleme alanlarının değerlendirilmesinde başarıyla kullanılabilir. Buna göre Bilecik ekolojik koşullarında farklı yonca çeşitlerinin verim ve kalite özelliklerinin belirlenmesi amacıyla yürütülen çalışma sonucunda, dormansi grubu 5-8 arasında olan çeşitlerin başarı ile yetiştirilebileceği tespit edilmiştir.

Özet

Türkiye’de 2 milyon ha yem bitkileri ile 14 milyon ha çayır ve mera alanlarından toplam 33 milyon ton kaliteli kaba yem üretimi sağlanmaktadır. Ülkede 19 milyon büyükbaş hayvan birimi (BBHB) bulunmakta olup, bu hayvan varlığının ise yıllık 86 milyon ton kaliteli kaba yem ihtiyacı olduğu düşünüldüğünde, yıllık 53 milyon ton kaliteli kaba yem açığı göze çarpmaktadır. Türkiye ile Avrupa ülkeleri kıyaslandığında mevcut hayvan varlığımızın kaliteli kaba yem ile beslenememelerinden dolayı verim ve kaliteleri düşüktür. Avrupa ülkelerinde 278 kg civarında olan karkas ağırlığı, Türkiye’de 183 kg civarındadır. Buna göre, mevcut yem açığının kapatılması ve hayvansal verimin iyileştirilmesi için tarımı yapılan yem bitkilerine ilaveten alternatif kaba yem kaynaklarının da rasyonlara dâhil edilmesi yadsınamaz bir gerçektir. Türkiye’de yılda atmosfere 506.1 milyon ton kadar CO₂ salınımı mevcuttur. Toplam sera gazı emisyonlarında en büyük payı ise %72 ile enerji kaynaklı emisyonlar alırken, bunu sırasıyla %13.4 ile tarım ve %11.2 ile endüstriyel işlemler ve %3.4 ile atık sektörü takip etmektedir. Küresel ısınmaya neden olan tarımsal faaliyetler arasında ruminantların sindirim sisteminden salınan metan gazının oranı ise %32’dir. Bazı bitkiler bünyelerinde kondanse tanen ve saponin olarak adlandırılan ikincil bileşikler barındırmaktadır. Bu bileşikler rumende bazı hidrojen üreten protozoalar ve doğrudan hidrojen kullanan metan üretici organizmaları engelleyerek sera gazı salınımını azaltmaktadır. Ayrıca söz öz konusu bileşikler antihelmintik etki göstererek hayvan iç parazitlerini azaltmakta ve hayvanlarda verim artışı sağlamaktadır. Bu derlemede hayvan beslemede kullanılabilecek bitkiler ve bu bitkilerin küresel ısınmaya olan etkileri hakkında bilgiler verilmesi amaçlanmıştır.

Anahtar Kelimeler: Hayvan besleme, kaba yem, kondanse tanen, saponin, küresel ısınma.

Global Warming and Forage Crops

Abstract

In Turkey, a total of 33 million tons of quality roughage is produced from 2 million ha of forage crops and 14 million ha of meadow and pasture areas. There are 19 million bovine animal units (BBHB) in the country, and when it is considered that this animal population needs 86 million tons of quality roughage annually, there is an annual deficit of 53 million tons of quality roughage. When Turkey and European countries are compared, the yield and quality of our existing animal is low due to the fact that they cannot be fed with high quality roughage. Carcass weight, which is around 278 kg in European countries, is around 183 kg in Turkey. Accordingly, it is an undeniable fact that alternative roughage sources should be included in the rations in addition to the forage crops cultivated in order to close the current feed deficit and improve animal productivity. In Turkey, there are 506.1 million tons of CO₂ emissions to the atmosphere annually. The biggest share in total greenhouse gas emissions is energy-based emissions with 72%, followed by agriculture with 13.4%, industrial processes with 11.2%, and waste sector with 3.4%. . Among the agricultural activities that cause global warming, the rate of methane gas released from the digestive system of ruminants is 32%. Some plants contains a secondary compound called condensed tannin and saponin. This compound reduce greenhouse gas emissions by inhibiting some hydrogen-producing protozoans and methane-producing organisms that use hydrogen directly in the rumen. Besides, these compounds show an anthelmintic effect, reduce animal internal parasites and increase productivity in animals. In this review, it is aimed to give information about the plants that can be used in animal nutrition and their contribution to global warming.

Key Words: Animal nutrition, roughage, condensed tannin, saponin, global warming.

Giriş

Geride bıraktığımız yüzyılda ve özellikle 1950’li yıllardan sonra tarımsal alanda bilimsel gelişmeler ve mekanizasyonun yaygınlaşmasına paralel olarak önemli düzeyde üretim artışı sağlanmıştır. Ancak, bütün bu gelişmelere rağmen gelecekte gıda arzı konusunda sorunlar yaşanması beklenmektedir. Son yıllarda tüm dünyada meydana gelen iklim değişikliği, tarım alanlarının azalmasına, üretim maliyetlerinin artmasına, sosyo-kültürel değişimlere ve kırsaldan kente göçün artmasına neden olurken, tarımsal üretimin de sürdürülebilirliğini tehdit altına almaktadır. Bu sürecin orta ve uzun dönemde tüm insanlığı tehdit etmesi kaçınılmazdır. Ancak, özellikle geri kalmış ve gelişmekte olan ülkelerde yeterli gıdaya ulaşım günümüzde dahi ciddi bir sorun halindedir.

Yeterli düzeyde ve dengeli bir şekilde beslenebilmek için bitkisel ve hayvansal proteinler çok önemlidir. Nitekim sağlıklı bir birey günlük 70 gram protein tüketmesi gerekmekte olup, bu miktarın yarısı hayvansal diğer yarısının da bitkisel gıdalardan karşılanması gerekmektedir. Bitkisel kökenli aminoasitler hayvansal kökenlilere oranla daha zor sindirilmektedir. Bu nedenle hayvansal gıdalar bitkisel gıdalara göre daha önemlidir (Gündüz, 2010). Türkiye kişi başına tüketilen günlük protein miktarı bakımından dünya ve gelişmekte olan ülkeler ile aynı seviyededir (Ergün ve Bayram, 2021). Ancak, ülkemizde bitkisel kökenli proteinler hayvansal kökenlilere oranla daha çok tüketilmektedir. Bu nedenle, toplumun çoğunda hayvansal ürünlerin yetersiz tüketiminden kaynaklı Ca ve Fe gibi besin elementi ile A vitamini eksikliklerinin olduğu bilinmektedir (Gürer, 2010).

Son 140 yılda küresel iklimde en belirgin değişim hava sıcaklıklarında meydana gelmiştir. Meteorolojik kayıtlar küresel hava sıcaklıklarının 2020 yılında Sanayi Devrimi öncesine (1880-1900) göre 1.23 °C arttığını gösterirken, 2025'e kadar 1.5 °C daha artacağı söylenebilir. En fazla ısınan yerler kutuplar ve Türkiye'nin içinde yer aldığı Akdeniz Havzası'dır. Atmosferin yanı sıra yeryüzünün %71'ini kaplayan okyanus/deniz suları da ısınmaktadır. Bu ısınma eğilimi kar/buz örtüsünün erimesine, küresel ölçekte deniz seviyesinin yükselmesine, aşırı hava olaylarının görülme sıklığının değişmesine, okyanus sularının asitleşmesine yol açmıştır (Anonim, 2022a).

Hayvancılık faaliyetler, tarımsal kimyasallar, çeltik tarımı, tarımda kullanılan makineler ve anız yakma gibi bazı tarımsal faaliyetler önemli düzeyde sera gazı salınımına neden olmaktadır. Dünya genelinde antropojenik CH₄ salınımının yaklaşık % 21-25'i hayvan sindirim sisteminde üretilmektedir (Lascano ve Cardenas, 2010). Bu sera gazları sindirim sistemi fermantasyonu (enterik fermantasyon), hayvan dışkı ve idrarı, solunum ve diğer faaliyetler sonucu oluşmaktadır (Hristov ve ark., 2013). Örneğin Kanada'da 1 kg karkas sığır eti üretimi için C ayak izinin 22 kg CO₂ -eq olduğu ve bunun %63'ünün sindirim sisteminde üretilen metandan, %27'sinin de gübreden ve topraktan atmosfere geçen N₂O'dan kaynaklandığı tahmin edilmiştir (Beauchemin ve ark., 2010). Bazı yem bitkileri bünyelerinde biyolojik bileşenler (tanen, fenolik, saponin, vb.) barındırmaktadır. Bu bileşenler hayvan sağlığı, verimi ve kalitesinde iyileştirme sağlarken, sindirim sisteminde metan gazı oluşumunu ve dolayısıyla da salınımını azaltmaktadır.

Bu derleme ile alternatif olarak kullanılabilecek yem bitkileri ile bu bitkilerin küresel ısınma üzerindeki etkileri hakkında bilgiler verilerek, ulusal literatüre katkı sağlanması amaçlanmıştır.

Türkiye'de Yem Bitkileri

Türkiye'de toplam işlenebilir tarım alanı 23.185 milyon hektardır. Tahıllar ve diğer bitkisel ürünler toplam işlenen tarım alanların %66'sını (15.421 milyon ha), nadas alanları ise %15'ini (3.513 milyon ha) oluşturmaktadır. Çayır-mera alanları 14.167 milyon ha iken, yem bitkileri üretim alanı ise 2 milyon ha civarındadır (Acar ve ark., 2020). Türkiye'de son verilere göre tarla tarımından (18 milyon ton) ve çayır meralardan (15 milyon ton) elde edilen kaliteli kaba yem miktarı 33 milyon tondur. Ülkede 19 milyon büyükbaş hayvan birimi (BBHB) bulunmakta olup, bu hayvan birimi için ihtiyaç duyulan kaliteli kaba yem miktarı 86 milyon, kaliteli kaba yem açığı ise 53 milyon tondur (Anonim, 2022b). Diğer taraftan sap, saman gibi tarla bitkileri atıkları 30 milyon tondur. Bu hesaplama göre toplam kaba yem ihtiyacı 23 milyon ton olarak karşımıza çıkmaktadır (Çomaklı ve Tufan, 2022).

Türkiye'de hayvan sayısı yeterli olmasına rağmen, verimleri oldukça düşüktür. Avrupa ülkelerinde 278 kg civarında olan karkas ağırlığı, Türkiye'de 183 kg civarındadır (Kale, 2008). Hayvanların canlı ağırlıklarının bu derece düşük olmasının sebebi ise rasyonlarda kaliteli kaba yemin yeterince bulunmamasından kaynaklanmaktadır.

Küresel Isınma

Sanayi devriminden sonra artan fosil yakıt kullanımı, fabrikalardan doğaya bırakılan atıklar, nüfus artışı, kentleşme ve bilinçsiz tarımsal üretim çevresel sorunları beraberinde getirmiştir. Bu sorunların en önemlisi ise küresel ısınmadır.

Küresel ısınmanın olumsuz etkisi en çok iklim değişikliği üzerine olmuştur. Nitekim sıcaklıkların artması buzulların erimesine ve deniz suyu seviyesinin yükselmesine neden olmuştur. Küresel ısınma Dünyanın farklı bölgelerinde etkisini aynı zamanda kuraklık, soğuk ve aşırı yağışlar şeklinde de göstermektedir. Bu durumlar doğal afetleri (sel, fırtına, kasırga gibi) meydana getirmektedir. Diğer taraftan küresel ısınma farklı hastalık türlerinin ortaya çıkmasına da neden olmaktadır (Şanlı ve ark., 2017; Temur, 2017).

İnsanoğlunun neden olduğu küresel ısınma yine insan hayatında ekonomik, çevresel ve sosyal alanlarda çok fazla zarara neden olmuştur. Bunları Temur (2017) şöyle sıralamıştır;

- Gece ve gündüz sıcaklık arasında farklar azalmaya başlamıştır.
- Tarımsal ve orman alanlarında azalmalar meydana gelmiştir.
- Sıcaklık artışı ile yağışlar azalırken, kuraklık ve çölleşme meydana gelmiştir.
- Turizm alanları özelliklerini yitirmeye başlamıştır.
- Hava olaylarındaki aşırı değişimler canlıların mutasyona uğramasına ve kalıtsal yapılarının değişmesine neden olur.
- Kutuplarda eriyen buzullar deniz seviyesinde yükselmelere neden olmuştur.
- Sıcak hava, yeryüzü ve okyanusların ısınmasına ve dolayısıyla da buralarda yaşayan canlıların (hayvan, bitki vb) ölmelerinde neden olmuştur.

- Çeşitli doğal afetler (heyelan, erozyon ve asit yağmurları, vb) meydana gelmiştir.
- Ekonomik alanda olumsuz etkilere neden olmuştur.
- Artan sıcaklıklar gerek insan gerekse hayvan göçlerine neden olmuştur.

Tarımsal Üretim Küresel Isınma Üzerindeki Etkisi

Tarımsal üretim insanoğlunun gıda ihtiyaçlarını karşılaması nedeni ile vazgeçilmez bir sektördür. Gelişmekte olan ülkelerin Gayrisafi millî hasılası (GSMH) içinde tarım sektörünün payı çok fazladır. 1950'li yıllardan sonra kimyasal gübre ve tarımsal ilaçların yoğun bir şekilde kullanılması ve sulamanın artırılması ile tarımsal üretimde verim artışı yaşanmıştır. Ancak bu durumun bazı olumsuz etkileri de olmuştur. Özellikle 1970'li yıllardan sonra yoğun gübre, ilaç ve sulama tüm çevresel sorunları ilgilendiren bir konu haline gelmiştir. Tarım alanlarının üretkenliği düşerken, yer altı sularının da kirlenmesine neden olmuştur. Bu durum çevre için daha az sorun teşkil eden tarımsal üretim tekniklerinin geliştirmesini zorunlu hale getirir de, artan nüfus ile birlikte üretimde verim artışının amaçlanması, üreticileri daha yoğun ve bilinçsiz girdi kullanımına itmiştir. Dolayısıyla da atmosfere tarım sektörü vasıtası ile salınan sera gazlarının oranı daha da artmıştır.

Tarımsal üretimin neden olduğu küresel ısınmada en fazla payı %48 ile toprak içerisinde mikroorganizmalar tarafından üretilen diazot oksit (N_2O) oluşturmaktadır. Bunu sırasıyla %32 ile ruminantların sindirim sisteminden çıkan metan gazı (CH_4) ve %12 ile çeltik üretimi takip etmektedir. Gübreleme faaliyetlerinin sonucunda ortaya çıkan diazot oksit (N_2O) ve metan (CH_4) gazları ise tarımsal kaynaklı küresel ısınma içerisinde %8'lik paya sahiptir (Şekil 1).

Şekil 1. Tarımsal üretimin neden olduğu küresel ısınma emisyonları (Anonim 2022c)

Hayvansal Kaynaklı Üretimde Küresel Isınma

Nüfusun artması et, süt ve yumurta gibi hayvansal ürünlere olan taleplerin de artmasına neden olmuştur. Özellikle de ülkemiz için büyük bir sorun haline gelen köyden kente göç hayvanlar için yem kaynağı olan çayır-meralar ile yem bitkileri alanlarının azalmasına neden olmuştur. Bu durum ise endüstriye dayalı hayvancılığın artmasına neden olmuştur. Dolayısıyla işletme masraflarının %70'ini oluşturan yem maliyetlerinin ve küresel ısınmanın artması kaçınılmaz olmuştur. Verge ve ark. (2007) endüstriyel hayvancılığın sera gazı salınımının kaba yem üretim sistemlerine göre 2 kat, mera bazlı üretim yapan sistemlere göre ise 6 kat daha fazla olduğunu bildirmişlerdir. Küresel ısınmaya neden olan hayvansal kaynaklı gazlardan en etkili olanlar metan (CH_4) ve diazot oksit (N_2O). Bu gazların küresel ısınmaya 2 farklı şekilde etkileri bulunmaktadır. Bunlardan birincisi sindirim sürecindeki etkileridir ve yemin öğütülmesi sürecinde ortaya çıkmaktadır. Şahin ve Onurbaş Avcıoğlu (2016) ruminantların sindirim sırasında ortaya çıkardıkları metan gazının yıllık 1 milyon ton olduğunu bildirmişlerdir. İkinci etki ise hayvan atıklarıdır. Hayvan gübrelerinin çürümesi sırasında gerçekleşen gaz çıkışı küresel ısınmayı tetiklemektedir (Demir ve Cevger, 2007). Scheehle (2002) Çiftlik hayvanlarının gübrelerinden çıkan metan gazının yıllık 9.3 milyon ton olduğunu, bunun da toplam metan salınımının %5'ine denk geldiğini bildirmiştir.

Açığa çıkan metan ve azot oksit hayvansal kaynaklı ürünlerin verim ve kalitesini düşürmektedir. Diğer bir deyişle hayvansal ürünlerin verim ve kalitesinin artması ya da azalması açığa çıkan metan ve diazot oksite bağlıdır. Çünkü açığa çıkan metan ve azot oksit üretime (et, süt vb.) dönüşmeyen enerji anlamına gelmektedir. Johnson ve Johnson (1995) ile Hristov ve ark. (1997) biyoaktif bileşen içermeyen bitkiler ile beslenen hayvanların rumende anaerobik fermentasyon sırasında %2-12 arasında metan (CH_4) ürettiğini, bunun da hayvanlarda yaklaşık olarak 77 brüt enerji kaybına denk geldiğini açıklamışlardır. Ruminantların rasyonlarına baklagiller ile biyoaktif bileşen (sekonder metabolit) içeren bitkilerin katılması verim potansiyelini artırmanın yanı sıra, et ve süt üretiminde amonyak ve azot oksit salınımını düşürerek karbon tutumunu artırmaktadır (Undi ve ark., 2016).

Küresel ısınmaya etkileri bakımından hayvan türleri arasında da farklılık bulunmaktadır. Buna göre, sığırlar toplam emisyonun yaklaşık %65'ini, mandalar %9'unu, koyun ve keçiler %6.5'ini oluşturmaktadır. Tavuklar ve domuzlar ise sırasıyla salınan CO₂'in %8 ve %9'unu oluşturmaktadırlar.

Yem Bitkilerinin Küresel Isınma Üzerindeki Etkileri

Hayvansal kaynaklı metan gazı salınımının azaltılmasının en etkili yöntemlerinin başında kaba yem kalitesinin iyileştirilmesi gelmektedir (Chung ve ark., 2013). Örneğin buğdaygiller baklagillere nazaran daha zor sindirilmektedir. Bu durum hayvandan yemin daha uzun sürede atılması ve hayvanın daha fazla enerji harcaması anlamına gelmektedir. Beslenme süresi ne kadar kısa olursa, sindirim sistemi de daha az çalışmakta ve daha az gaz çıkışı yaşanmaktadır. Dolayısıyla baklagiller hayvansal üretimin iyileştirilmesine katkıda bulunmaktadırlar (Hristov ve ark., 2013). Iwaasa ve Lemke (2014) hayvanın sindireceği lif oranının azalması ile sindirim hızının artacağını, rumen fermantasyonunun daha çok propiyonik asit üreteceğini dolayısıyla da gaz salınımının azalacağını bildirmişlerdir.

Bazı bitkiler yapılarında çözünebilir bir enzim olan Polifenol Oksidaz bulundurmaktadır. Polifenol Oksidaz hem substrat hem de proteazlar proteinleri ile birleşerek, rumende yavaş parçalanmış bir yapı meydana getirmektedir. Baklagiller (gazel boynuzu, taç otu) ile alternatif (karahindiba) yem bitkileri bünyelerinde kondanse tanen ve saponin bulundurmaktadırlar. Bu bileşikler proteaz ve substrat proteinlerine bağlanarak rumende zor parçalanmış bir yapı oluşturmaktadırlar (Archimede ve ark., 2011). Böylece sindirim sisteminde üretilen metan miktarı da azalmaktadır. Waghorn ve Woodward, (2006) yaptıkları çalışmada, sadece çok yıllık çimle beslenen hayvanlara oranla, çok yıllık çimle birlikte kondanse tanen içeren gazal boynuzu ve İspanyol korungası karışımı ile beslenen sığırların, tüketilen her kg kuru madde için %13-25 daha az metan çıkardıklarını saptamışlardır. İnce bağırsaklardan parçalanmadan geçen azot, tanenlerin etkisiyle, idrara değil dışkıya yönlendirilmektedir. İdrardaki N hızlı bir şekilde sera gazları olan amonyak ve azot oksite dönüşerek atmosfere geçmektedir. Dışkıdaki N ise toprak organik maddesine dönüşmektedir. Tanenlerin ayrıca, rumende bazı hidrojen üreten protozoolar ve/veya doğrudan hidrojen kullanan metan üretici organizmaları engellediği tahmin edilmektedir (Martin ve ark., 2016). Böylece, hem sera gazı salınımı azalmakta, hem de hayvansal verimlilik artmaktadır.

Kondanse Tanen ve Saponin İçeren Bitkiler

Tablo 1'de bazı bitkiler ve içermiş oldukları kondanse tanen içerikleri verilmiştir. Bitkiler aksamaları itibariye kondanse tanen içeriği bakımından farklılık gösterebilmektedir. Tabloda en yüksek kondanse tanen içeriği %3.85 ile korunga bitkisinde olduğu görülmektedir. Baklagillerin kondanse tanen içeriği bakımından zengin olduğu bilinmektedir. Ancak diğer diğer familyalara ait kondanse tanen içeriği yüksek olabilmektedir. Bu durum hayvan beslemede alternatif türler açısından önem teşkil etmektedir. Kondanse tanen metan gazı salınımını azaltırken hayvan sağlığı açısından da önem teşkil etmektedir. Ancak bu içeriğin belli bir düzeyde olması gerekmektedir. Bary (1987) düşük tanen içeriğine (% 2-3) sahip bitkilerin rumendeki protein bozulmasını azalttığı için yararlı bir etkiye sahip olduğunu bildirirken, Kumar ve Singh (1984) ise yüksek miktardaki tanenin protein sindirimi ile mikrobiyal ve enzim faaliyetlerini olumsuz şekilde etkilediğini belirtmektedir.

Tablo 1. Yem bitkisi olarak kullanılacak bazı bitkilerin kondanse tanen içerikleri

Bitki isimleri		Kondanse tanen içeriği (%)	Bitki aksamı
Latince	Türkçe		
<i>Viscum album</i>	Ökse otu	%0.98	Yaprak
<i>Melilotus alba</i> Desr.	Aktaş yoncası	%0.61	Tüm bitki
<i>Lathyrus sativus</i> L.	Mürdümük	%0.55	Tohum
<i>Brassica rapa</i> L.	Yem şalgamı	%2.17	Tüm bitki
<i>Hordeum vulgare</i> L.	Arpa	%2.84	Tüm bitki
<i>Triticum aestivum</i> L.	Buğday	%2.80	Tüm bitki
<i>Avena sativa</i> L.	Yulaf	%2.70	Tüm bitki
<i>Lotus corniculatus</i>	Gazalboynuzu	%0.70	Tüm bitki
<i>Chichorium intybus</i>	Hindiba	%0.14	Tüm bitki
<i>Sangiosorba minor</i>	Küçük çayırduğmesi	%0.10	Tüm bitki
<i>Coronilla varia</i>	Alaca taçotu	%1.60	Tüm bitki
<i>Onobrychis sativa</i>	Korunga	%3.85	Yaprak

Son yıllarda yapılan araştırmalar saponinlerin metan emisyonunu baskılayıcı özelliklere sahip olduğunu göstermiştir. (Santoso ve ark., 2006; Holtshausen ve ark., 2007). Tablo 2'de saponin içeren bitkiler yer almaktadır. Baklagillerin söz konusu içerik bakımından daha zengin olduğu görülmektedir.

Tablo 2. Saponin içeren bazı yem bitkileri

Bitki isimleri		Bitki isimleri	
Latince	Türkçe	Latince	Türkçe
<i>Beta vulgaris</i>	Şeker pancarı	<i>Trifolium repens</i>	Ak üçgül
<i>Lupinus spp.</i>	Acı bakla	<i>Trifolium pratense</i>	Çayır üçgülü
<i>Medicago sativa</i>	Yaygın yonca	<i>Avena sativa</i>	Yulaf
<i>Melilotus alba</i>	Aktaş yoncası	<i>Trigonella foenum</i>	Çemen

(Önal Aşçı ve Acar, 2018)'den yararlanılmıştır.

Sonuç

Gerek dünyada gerekse ülkemizde hayvanların kaliteli kaba yem ile beslenememeleri hayvan sağlığı, verim ve kalitesi açısından önem teşkil etmektedir. Bu durum kaliteli kaba yemlerin üretiminin artırılması ve rasyonlara dahil edilmesini kaçınılmaz kılmaktadır. Sekonder metabolit içeriğine sahip bitkilerin hayvan verimi ve kalitesini artırdığı bilinen bir gerçektir. Ancak bu bitkiler ile yapılan son dönemdeki araştırmalar sekonder metabolitlerin hayvan hastalıklarının tedavisinde alternatif bir rol üstlendiğini göstermiştir. Bitkiler sahip oldukları sekonder metabolitler sayesinde süt ineklerinin anti-oksidatif yanıtını geliştirirken, stres altındaki koyunlarda da tüm vücut protein sentezini geliştirerek insülin aktivitelerini etkilediği belirlenmiştir. Diğer taraftan sekonder metabolitler hayvansal kaynaklı metan gazı salınımını azaltılmasına katkı sağlamaktadır. Sonuç olarak biyoaktif bileşen içeren bitkilerin hayvanların beslenmelerinde kullanılması hem hayvan sağlığı, hem verimi hem de metan gazı salınımını azaltacağını göstermektedir. Hayvansal metan emisyonunu azaltmak için alınması gereken diğer tedbirleri Naqvi ve Sejian (2011) ile Koyuncu ve Akgün (2018) şu şekilde sıralamıştır;

- Genetik seleksiyonda düşük metan üreten hayvanlar geliştirmek.
- Hayvan beslemenin kaliteli ve stratejik temel besin maddeleri takviyesiyle iyileştirilmek
- Mera yönetimi ve kullanımını geliştirmek
- Hayvanlara uygun bakım ve sağlık koşulları sağlamak
- Rasyonda amonyak ve melas yönünde yapılan değişikliklerle metan üretimini azaltmak
- Rumende protozoonların yok edilmesi ve rumene mikrobiyel müdahale etmek
- Rekombinant ve bağışıklık teknolojileri geliştirmek
- Hayvanlarda verimliliğin artırılarak hayvan sayısının azaltmak
- Uçucu yağlar gibi ikincil bitki bileşenlerinin hayvan beslemede kullanmak
- Rasyona bitkisel yağları eklemek
- Metanojen mikroorganizmaları baskılayacak ve onla yarışabilecek probiyotikleri kullanmak.

Reproductive Characteristics of the Common Cuttlefish (*Sepia officinalis*, Linnaeus, 1758) Population Distributed in the Antalya Bay

Güven, O¹.ve Özbaş, M.¹

¹Su Ürünleri Fakültesi, Akdeniz Üniversitesi, Antalya, Türkiye (Faculty of Fisheries, Akdeniz University, Antalya, Türkiye)

Abstract

Cuttlefish are members of the cephalopod class, that die en masse following a single breeding season (monocyclic spawning). In line with changes of environmental factors, they spent their live in coastal areas at a depth range of 0-200 m. Although adults prefer deep areas before breeding season, they migrate to coastal areas again for breeding activity and die as a result of natural factors at the end of the breeding period. Knowledge on the life cycle and especially reproduction phase of their life is a crucial information to be able to sustainably exploit these species. Even through the coastline of Turkey, due to the variations of the environmental conditions its known that there are differences in reproductive characteristics among the subpopulations of the species.

In order to determine reproductive characteristics of Antalya Bay sub population of the species, total of 490 individuals (244 male and 246 female individuals) were examined. Mantle length of the examined individuals were range between 45 – 177 mm. By using the morphologic characters 4 stages of sexual maturity could be observed for both sexes. Within the scope of our study, the relationship between height and weight, gonad development status (sexual maturity indices) and the number of eggs in female individuals with biometric characters were determined for the population in the sampling area.

Antalya Körfezi'nde Dağılım Gösteren Mürekkep Balığı (*Sepia officinalis*, Linnaeus, 1758) Türü Popülasyonunu Üreme Özellikleri

Özet

Mürekkepbalıkları tek bir üreme dönemi sonrasında kitlesel olarak ölen (monosiklik yumurtlama) kafadan bacaklı sınıfı mensubu banlılardır. Çevresel faktörler doğrultusunda şekillenen yaşam süreleri boyunca 0-200 m derinlik aralığında genellikle sahil kesimlerinde yaşamlarını sürdürdükleri bilinmektedir. Ergin bireyler üreme dönemleri öncesine derin alanları tercih etseler de üreme faaliyeti için yeniden sahil bölgelerine göç yapmakta ve üreme dönemi sonunda da doğal etkenler neticesinde ölmektedir. Ekonomik olarak önem taşıyan ve zengin bir gıda olan bu canlıların sürdürülebilir şekilde avcılığının yapılabilmesi için yaşam döngülerinin bilinmesi önem taşımaktadır. Ülkemizde dağılım gösterdiği farklı coğrafyalarda var olan çevresel koşullar altında yaşamını sürdüren türün alt popülasyonları arasında üreme karakterinde değişim olduğu düşünülmektedir.

Gerçekleştirilen bu çalışma kapsamında, türün Antalya Körfezi'nde dağılım gösteren popülasyona ait toplamda 490 birey (244 Erkek ve 246 dişi birey) üreme özelliklerinin tespiti amacıyla değerlendirilmiştir. İncelenen bireyler 45 – 177 mm manto boyu aralığında dağılmaktadır. İncelenen numunelerde her iki cinsiyet için de 4'er eşeysel olgunluk safhasını gözlemlenebilmiştir. Çalışmamız kapsamında örnekleme alanındaki popülasyona dair boy-ağırlık ilişkisi, gonad gelişim durumu (eşeysel olgunluk indeksleri) ve dişi bireylerde yumurta sayısının biyometrik karakterlerle ilişkisi tespit edilmiştir.

Abstract

Honey, which is an apitherapy product; It is a valuable food rich in vitamins and minerals, obtained by collecting the nectar formed on the plant by insects, and containing substances of great importance for human health. Different colors, tastes and compositions can be observed in honey obtained from different plants. Honey, which is among the most consumed bee products in Turkey, is among the foods that are mixed with honey. At the same time, fake honey is produced by adding some substances such as sugar syrup and starch adulteration to honey, and it is reported that the production of GMO honey, which also puts consumers at risk, has increased all over the world. In order to prevent this situation, it is stated in the Turkish Food Codex Honey Communiqué that honey should be free from additives (including food additives) and free from organic and/or inorganic substances that are not in its natural composition. As stated in the honey communiqué, there are some quality criteria for honey in order to produce honey. These criteria are the chemical content of honey (phenolic compounds, fructose / glucose ratio, humidity, ash, pH value, Hydroxymethyl furfural, etc.), factors affecting the raw material of honey (i.e. nectar), temperature values during honey heat treatment, raw and fresh honey. specified as the quality criteria of honey. In this study, the effects of the compounds in the chemical structure of honey according to the Turkish Food Codex, the heat treatment application and the nectar structure of honey on the quality were prepared as a review.

Önemli Bir Arı Ürünü Olan Balın Kalite Parametreleri

Özet

Bir apiterapi ürünü olan bal ise; vitamin ve mineral bakımından zengin, böcekler tarafından bitki üzerinde oluşturulan nektarı toplayarak elde edilen, insan sağlığı açısından büyük önem ihtiva eden maddeleri içeren değerli bir besindir. Farklı bitkilerden elde edilen ballarda farklı renk, tat ve kompozisyonlar gözlelenebilmektedir. Türkiye’de en çok tüketilen arı ürünleri arasında yer alan balda hillendirilen gıdaların arasında yer almaktadır. Aynı zamanda bala şeker şurubu, nişasta taşı gibi bazı maddelerin katılması ile sahte bal üretimi gerçekleştirilmekte olup, tüketicileri de tehlikeye sokan GDO’lu balların üretiminin de dünya üzerinde artış gösterdiği bildirilmektedir. Bu durum önüne geçmek adına ise Türk Gıda Kodeksi Bal Tebliği’nde balın katkı maddelerinden uzak (gıda katkı maddeleri dahil olmak üzere), doğal bileşiminde bulunmayan organik ve/veya inorganik maddelerden arı olması gerektiği belirtilmiştir. Bal tebliğinde belirtildiği gibi bal üretimi yapabilmek için balın bazı kalite kriterleri mevcuttur. Bu kriterler ise balın kimyasal içeriği (fenolik bileşikler, fruktoz / glikoz oranı, rutubeti, kül, pH değeri, Hidroksimetil furfural gibi), balın hammaddesine (yani nektarı) etki eden faktörler, bala ısıtma işlemi uygulanması sırasındaki sıcaklık değerleri, balın çiğ ve taze olması balın kalite kriterleri olarak belirtilmiştir. Bu çalışmada, balın kimyasal yapısında bulunan bileşiklerin Türk Gıda Kodeksi’ne göre bulunma oranlarının, ısıtma işlemi uygulanmasının ve balın nektar yapısının kalite üzerine etkileri derleme olarak hazırlanmıştır.

Anahtar Kelimeler: *Apiterapi, balın kalite kriterleri, arı ürünü*

Giriş

Türkiye, en çok bitki türü barındıran ülkedir. Avrupa Kıtası, Türkiye'nin yaklaşık 15 katı büyüklüğüne sahip olmasına rağmen, tüm Avrupa Kıtası’nda yaklaşık 12.000 bitki türü yer alırken Türkiye’de 12.000’den fazla bitki türü bulunmaktadır. Bu kadar bitki türünü içinde barındıran ülkemizde arıcılık faaliyetlerine oldukça elverişlidir. Son yıllarda ise dünya genelinde arıcılık konusunda üst sıralarda yer aldığı bildirilmektedir (Anonim,2016).

2020 yılında dünyada yaklaşık 1,8 milyon ton bal üretimi gerçekleştirilmiştir. 2020 yılı dünya bal üretiminde %25,9’luk paya sahip olan Çin, 458 bin ton üretimi ile ilk sırada yer alırken, bal üretiminde %5,9’luk paya sahip Türkiye 104 bin ton ile ikinci, %4,5’lik pay ile İran ise 80 bin ton üretimi ile üçüncü sırada yer almaktadır (Anonim,2022). Türkiye 2020 yılında bal üretimi 104 ton olarak gerçekleştirilmiştir. 2019 yılı bal üretimine bakıldığında ise 109 bin ton bal üretimi gerçekleştirilmiş olup 2020 yılında bal üretiminde %4,8’lik bir azalma meydana gelmiştir (Şekil 1). 2000 yıllarından bal üretimi ülkemizde 6.091 ton iken 2020 yılında üretim 104.077 tona ulaşmıştır. Yıllar bazında üretimde bir dalgalanma mevcuttur. Ülkemizde bal üretimi bakımından, Ordu ilinin yaklaşık 16278 ton ile birinci sıra olduğu, bunu daha sonra Muğla, Adana ve Aydın illerinin izlediği görülmektedir (Çizelge 2).

Çizelge 1:Ülkeler bazında bal üretimi (ton)

Ülkeler	2016	2017	2018	2019	2020

2020 yılında Ordu ili üretimini bir önceki yıla göre %0,9 oranında arttırmıştır. Adana ili ise bal üretimini bir önceki yıla göre %9,9 oranında arttırmış olup Muğla ili ise bir önceki yıla göre üretimin de %58,4 oranında azalma olmuştur (Burucu,2021).

Arıcılık faaliyetleri sonucu, insan sağlığı açısından önemli ürünler üretilmektedir. Arıcılık ürünlerinin tedavi amacıyla kullanılması çok eski zamanlara dayanmakta olup bu konuda araştırmaların yapılması ve apiterapi merkezlerinin kurulmasıyla günümüzde de güncelliğini korumaktadır. Dünyada özellikle Çin’de “Apiterapi” adı verilen arı ürünleri ile tedavi yöntemleri hızlı bir gelişme göstermiştir. Ülkemizde ise arı ürünlerinin tıbbi

araştırmaları yapılmaktadır. Bal, polen, propolis, arı sütü, arı zehri gibi arıcılık ürünleri çeşitli hastalıkların tedavisinde kullanılmaktadır (Şahinler,2000;Aslan ve ark.2007;Soylu ve ark.2008).Arı ürünlerinden olan ve apiterapide de kullan bal ise şöyle tanımlanabilir: Bitki nektarlarının, bitkilerin canlı kısımlarının salgılarının veya canlı kısımları üzerinde yaşayan bitki emici böceklerin salgılarının bal arısı *Apis mellifera* tarafından toplandıktan sonra bal arısının kendine özgü maddelerle birleştirerek değişikliğe uğrattığı, su içeriğini düşürdüğü ve petekte depolayarak olgunlaştırdığı doğal bir üründür (Karadal ve Yıldırım,2012; Şahinler ve ark.2004;).İşlem görmeden insanlar tarafından tüketilebilmesi, besleyici özelliği ve sağladığı tıbbi yararlar yönünden üstün bir gıda maddesi olarak değerlendirilir (Aydın ve ark.,2008).

Üretilen ballara kaynak teşkil eden ballı bitkiler arasında; kırmızı üçgül, beyaz üçgül, ayçiçeği, yonca, adaçayı, kekik, peygamber çiçeği, geven, engerek otu, sığırdili, uyuz otu, karabaş otu, erik otu, adaçayı, hindiba, ballıbaba, korunga, lavanta, muhabbet çiçeği, nane ve fig gibi doğada kendiliğinden yetişen türler en yoğun olanlarıdır. Bunlar dışında akasya, ıhlamur, okaliptus, çam, funda, çeşitli meyve ağaçları, söğüt, yalancı akasya, akça ağaç, böğürtlen, muz, kestane, koca yemiş, püren, erguvan ve meşe bal arılarının üretimde yararlandıkları nektarlı ağaçlardır (Gül,2008).

1. Balın Yapısı

Balların bileşimi arının özünü topladığı bitkilerin türüne, çevresel ve iklimsel koşullara göre değişim göstermektedir (Anklam, 1998). Balın şifa niteliği taşıması açısından önemi ve tüketimi son zamanlarda artış göstermiştir , bileşiminde yaklaşık 200 bileşiğin bulunduğu ve balın bileşiminin çeşitlilik gösterdiği bildirilmiştir (White,1979). Normal bir bal ortalama %20 oranında nem, %76 oranında şeker, %0,18 oranında kül ve %1 oranında polifenol, protein gibi bileşenlerin yanı sıra koruyucu olarak askorbik asit, α -tokoferol, flavonoidler ve diğer fenolikler, katalaz, glukoz oksidaz ve peroksidazgibi ptiyalinleri içermektedir (White,1979).Balın temel yapısının aslında karbonhidrattan oluşmakta, ayrıca sakkaroz, maltoz, isomaltoz, melezitoz ve laktoz gibi şekerler bulunmaktadır. Balın yapısında karbonhidratlardan başka organik asitler, amino asitler (lisin, histidin, arginin, aspartik asit, serin, glutamik asit, prolin, glisin, alanin, valin, metionin, lösin, izolösin, triosin, fenilalanin, triptofan), mineral maddeler (potasyum, sodyum, kalsiyum, magnezyum, demir, bakır, mangan, klor, fosfor, kükürt, kükürt dioksit, iyot) vitaminler (riboflavin, pantotenik asit, niasin, tiamin, piridoksin, askorbik asit), Enzimler (amilaz, sakkaroz, invertaz, fosfotaz, katalaz, glukozoksidaz) ve aroma maddeleri bulunmaktadır (Crane, 1975; YanivandRudich, 1996; Sunay ve Ark. 2003; Şahinler ve ark, 2004;Şahinler ve ark, 2001).Ayrıca asidik bir yapıya sahip olup,PH'ı 3.5-5.5 arasında değişir. Yapısında en fazla glukonik asit bulundurur. Asetik asit ise muhafaza sırasında mayalar, bazı bakteriler tarafından üretilir ve balda asitlik derecesinin yükselmesine neden olur (Anonim,1990). Ayrıca balda diyastaz sayısının fazla olmasının da asitlik artışı ile sonuçlandığı bildirilmektedir. (Tolon,1999).

2. Balın Kalite Kriterleri

İnsan sağlığının ön plana çıkmasıyla, ithalat ve ihracata konu olan balların gerek üretim, gerekse hasat ve depolama döneminde kontamine olmuş zararlı bileşikler ve katkıların kalite testlerinin yapılmasını da zorunlu kılmaktadır. Bitkisel üretimde kullanılan bazı pestisitler ile bal arılarının (*Apismellifera*L.) sağlığı için kullanılan bazı veteriner ilaçları Dünyada arı ürünlerinin ve özellikle balın tüketimi ve ihracatında büyük sorunlar teşkil etmektedir. Bu doğrultuda yapılan bilimsel çalışmalarda da ilaç kalıntılarının önemi ortaya konulmuştur (Tolon ve Wallner, 1999;

Kalpaklıoğlu, 2000; Sunay ve ark., 2003; SzerleticsTuri ve SzalaiMatray, 2003; Posyniak ve ark., 2003; Kumova, 2005).

Ülkemiz çok çeşitli bir bitki örtüsüne sahiptir, bu sebeptendir ki her balın farklı renk, tat kompozisyonları ve kalite kriterleri vardır (Karadal ve Yıldırım,2012). Bunu belirleyen farklı kriterler ise balın kimyasal içeriği (fenolik bileşikler, fruktoz / glikoz oranı, rutubeti, kül, ph değeri, Hidroksimetil furfural gibi), balın hammaddesine (yani nektarı) etki eden faktörler, balın ısıtılması işlemindeki sıcaklık değerleri, balın taze olması kalite kriterleri olarak belirtilmiştir.

TSE ye görede balın kalitesi içerdiği nem, toplam şeker, invert şeker, hidroksimetil furfural (HMF), diastaz sayısı (DA), kül gibi parametreler ile ticari şeker miktarları tayin edilmektedir. Ancak bu parametreler balın gerçek kalitesinden daha çok tazeliği, kristallenme yapıp yapmadığı, arılara ticari şeker yedirilip yedirilmediği gibi işlemleri göstermektedir. Oysa balın esas kalitesini belirleyen faktör balın biyolojik değeri olup bundan sorumlu bileşikler ise balda ancak %1–2 oranında bulunabilen, ikincil metabolit ürünler olarak adlandırılan çeşitli uçucu bileşenler ile fenolik maddelerdir (Ateş,2014). Balda kalite kriterini belirlerken dikkat edilecek parametreler ise şöyle sıralanabilir;

Renk

Balın normal rengi, açık sarıdan koyu esmere kadar değişiklik göstermektedir (Şahinler,2000).Bu renk değişimi balın içinde bulunan mineralden kaynaklıdır. Yani bakıldığında koyu renkli balların açık renkli ballardan daha fazla mineral madde içeriğine sahip ve asidik yapıya sahiptir. Yine yapısında yer alan öze görülebilen aralıktaki ışığı absorbe edebilen polifenoller, flavonoidler, terpenler ve karotenoidler gibi bileşiklerden kaynaklı olarak renk değişimleri gözlenmektedir .Birde tüketiciler açısından istenmeyen bir özellik olan esmerleşme olarak da bilinen Maillard reaksiyonu da balın rengine etki etmektedir. Bu reaksiyon da ise, amino asitlerin amino grupları ile indirgen şekerler arasında oluşur ve bal muhafazasının yaygın bir yan etkisidir (Türkmen ve ark.,2006). Yapılan bir araştırmada ise balın 37 °C (90 Gün) 35- 40 °C’de (4 yıl) muhafaza edildiği muhafaza süresinin artışına bağlı olarak renkte koyulaşma gözlemlendiği bildirilmiştir (Brudzynski ve ark.,2011). Başka bir araştırmada ise muhafaza edilen balların renginin koyulaştığı ve UV absorbe eden bileşiklerin yanısıra melanoidinlerin miktarının arttığı bildirilmiştir (Nombre ve ark.,2010). Bileşimi alındığı kaynağın cinsine, -üretim dönemine ve üretim yöntemine göre farklılık gösterebilir (Genç, 1993; White, 1984). Balın rengi ise Türk Gıda kodeksi bal tebliğine göre su beyazından koyu amber rengine kadar değişebilir. Salgı balının renginin pfund skalasına göre en az 60 olması gerektiği bildirilmiştir.

Birde bu renk farklılığının kül miktarı ile ilişkisi vardır.Balın külünün fazlalığı renginin koyuluğu ile doğru orantılıdır. Oranı ise Çiçek balında %0,6’dan fazla; salgı balında ise %1,2’den fazla kül seviyesi bulunması uygun değildir (Anonim 2002).

Elektriksel İletkenlik

Balın fiziksel parametreleri arasında yer alan elektriksel iletkenlik bal da ki mineral ve asit içeriğine göre değişiklik göstermektedir. Mineral madde konsantrasyonları yüksek olan ballarından elektriksel iletkenlikleri yüksektir (Solayman ve ark. 2016).

Türk Gıda Kodeksi Bal Tebliğine göre ballarda bulunması gereken elektiriksel iletkenlik oranları ise en fazla 0,8 mS/cm olarak belirlenmiştir Anonim,2020).

Viskozite

Viskozite ballarda akmaya karşı direnci demektir. Yani akıcılığı yüksek olan ballar viskozite düşük iken akıcılığı alçak olan ballarda viskozite yüksektir (Çapar,2010). Balın viskozite özelliği ise balın kompozisyonun, yapısında yer alan hava kabarcığı miktarına,nem miktarına,içerdiği küçük kristallere bağlı olarak değişiklik göstermektedir.Viskozitenin önemi ise kullanılan ekipmanların dizayn edilmesinde ve kullanılmasında göz önünde bulundurulur (Karadal ve Yıldırım,2012).

Asitlik ve ph

Asitlik oluşumu balda istenmeyen bir özellik olan fermentasyonun bir sonucu olarak meydana gelir (Esti ve Ark., 1997). Kaliteli ballarda fermentasyon ya da gaz oluşumu başlamamış olmalıdır (Ruof ve Bagdonow,2004). Bal da asitliği ise serbest asitlerin, laktonların ve esterlerin toplamı belirlemektedir. Balın asitliği ise glukonik asit, eşitli organik asitlerden ve fosfat ve klorid gibi inorganik iyonlardan kaynaklandığı bildirilmiştir (Cavia ve ark.,2007). Balda bulunana serbest asitlerin miktarının artması ise balın fermente olduğunun bir göstergesidir. Bu durumda ise bal da ki şeker ve alkoller balda yer alan mayalar tarafından asitlere dönüştürülmektedir (Kahraman ve ark.,2010; Mandal ve Mandal,2011). Kaliteli bir bal da ise Türk Gıda Kodeksi Bal tebliğine göre serbest asitlerin miktarının 1000 g balda 50 meq’dan fazla olmamalıdır (Anonim,2020). Yapılan çalışmalar, serbest asit ve lakton miktarı açısından balın açılmadan önce, oda sıcaklığında 20 ay muhafaza edilebileceğini göstermektedir.

Balda fermentasyonu önlemek içinde işlenmesi sırasında, balı kriticalizasyon ve fermentasyondan korumak, ekstraksiyon ve filtrasyonu kolaylaştırmak, balın viskozitesini arttırmak için ısıtma işlemi uygulanması gerekmektedir. Balın kalitesini yüksek tutmak için ısıtma işleminin süresi ve derecesi kontrol edilmelidir. Isıtma işlemi baldaki enzimlerin kaybına ve HMF miktarının artmasına, dolayısıyla balın tazeliğini kaybetmesine sebep olmaktadır (Falico ve Ark.,2004).HMF miktarı artmış bir bal tazeliğini yitirmiş düşük kaliteli bir ürün olur.

Balın pH'sı ise yapısında ki iyonize asitlere ve mineral maddelere bağlıdır. Hayvansal kökenli patojen bakterilerin ve daha birçok bakterinin oluşumunu engellemede pH değerinin düşük olması etkilidir. Keza yaklaşık olarak %15-25 arasında su içermesi, mikroorganizmaların hemen hepsinin üreme yeteneğini kısıtlar. (Aydın ve ark., 2008; Estupinan ve Sanjuan, 1998). Balın pH'sı 3.9 (3.5- 5.5 arasında) 'dur (Karadal ve yıldırım, 2012).

Nem

Kovandaki balın doğal nemi nektardan kaynaklanmaktadır. Balda yer alan nektarı miktarı iklim koşulları, üretim yılı ve mevsimi gibi etkenlere göre değişkenlik gösterirken, nektarın salgılanma hızı, koloni büyüklüğü gibi olgunlaşma üzerine etkili faktörler ile balın işlenmesi sırasında uygulanan sıcaklık ve depolama koşulları balın nem miktarı üzerinde etkili olmaktadır (Kahraman, 2012). Nem içeriği, kalitesinin değerlendirilmesinde bir gösterge olup raf ömrünü etkileyen önemli bir parametredir (Bogdanov ve ark., 2004; Gómez-Díaz ve ark., 2005). Nem değerinin düşük olması balın uzun süre korunması ve pazarlaması için uygun olduğunu göstermektedir. Balın hasat zamanıyla ilişkili olan nem değerlerinin Türk Gıda Kodeksi Bal Tebliğine göre nem miktarı Çiçek ve salgı ballarında en fazla %20 oranında olmalıdır. (Çizelge 4; Anonim, 2020)

Çizelge 4: Türk Gıda Kodeksi Bal Tebliği Nem Değerleri

Nem değeri En fazla	Çiçek Balı	Salgı Balı	Çiçek ve Salgı Balı Karışımı	Fırıncılık Balı
	%20	%20	%20	%23
	%23 Püren(<i>Calluna vulgaris</i>) ve Funda(<i>Erica spp.</i>) ballarında			%25 Püren ve Funda kaynaklı fırıncılık balı

Kaynak; Anonim, 2020

HMF düzeyi

HMF(hidroksimetilfurfural), düzeyi balın kalitesini belirlemek için yıllardır kullanılmaktadır. HMF pişirme ya da sterilizasyon esnasında gıdalara uygulanan ısı işlem sonucu, indirgen şekerlerin aminoasitlerle oluşturduğu, enzimatik olmayan esmerleşme (Maillard) reaksiyonu ya da heksozların asit katalizörlüğünde dehidrasyonu sonucunda oluşmaktadır (Karadal ve Yıldırım, 2012). Balda pastarizasyon ve kristalizasyonun önlemek için bala uygulanan sıcaklık işlemi sonucu bu değerde yükselmeler meydana gelmektedir. Uygulanan sıcaklığın süresine bağlı olarak da balın yapısında ki besin değerlerin, ve diastaz enziminin aktivitesi azaltarak, HMF değerinin yükselmesine neden olmaktadır (Tosi ve ark. 2002). Yapılan bir araştırmada ise başlangıçta serbest asit ve lakton miktarı fazla olan ballarda ısı işlemi ve muhafaza sonrası daha fazla HMF oluştuğu, başlangıç protein, prolin ve katalaz miktarı ile diastaz sayısı yüksek olan ballarda ısı işlemi ve muhafaza sonrası daha az HMF oluştuğu bildirilmiştir (Karadal ve Yıldırım, 2012; Tosi 2002). Ayrıca HMF taze ballarda çok az miktarda bulunur ve balda yüksek miktarlarda bulunması istenen bir kalite kriteri değildir (Yıldız ve ark. 2010). Türk gıda kodeksi bal tebliğine göre ise HMF değeri 40 mg/kg 'dan fazla olmamalıdır (Anonim, 2020).

Şeker Profili

Su aktivitesi, orijin, muhafaza süresi ve muhafaza şartlarının yanında içerdiği glikoz miktarı, balın raf ömrü ve kristalleşme durumu üzerine son derece etkilidir. Balda sakkaroz miktarının yüksek olması, arıların sakkarozla beslendiğini veya bala direkt sakkaroz katıldığını gösterir (Aydın ve ark., 2008).

Bal da en fazla olarak glikoz ve fruktoz bulunur ve bu monosakkaritlerin tadının oluşmasında etkilidir. Sakkarozun invertaz enzimi ile inversiyona uğraması neticesinde meydana gelirler. Balın bazı özelliklerini veren (tadı, viskozite, enerji değeri gibi) bu iki monosakkarit aynı zamanda balın şeker profili hakkında bilgi verirken, şeker profili analizi ile belirlenen melezitoz ve erloz gibi oligosakkaritlerin miktarı salgı balını çiçek balından ayırt etmek amacıyla kullanılmaktadır (Şahinler ve ark., 2009; Turan, 2012).

Kristalizasyon

Balın kalitesini belirlemede ki önemli fiziksel kriterlerdendir. Balın içindeki glikozun sudan ayrılıp balın içindeki diğer partiküller ile birleşerek küçük kristaller halinde akışkan özelliğini kısmen kaybederek çökmesidir. Halk arasında şekerlenme olarak da bilinir (Ateş, 2014). Diğer bir deyişle ise balın fruktoz oranının düşerek glikoz oranının artması kristalizasyonunda artmasıdır.

Kristalizasyona etki eden faktörler ise: Balın nem ve dekstrin içeriği, su aktivitesi, bal içinde mikrokristallerin varlığı, muhafaza sıcaklığı ve önceden uygulanan ısı işlemleri, Süzme sırasında bal içerisinde kalan partiküller ve hava kabarcıkları, Glukoz/su oranı ve fruktoz/glukoz oranı olarak sıralanabilir (Doğaroğlu 2009, Çınar 2010).

Doğal kristalizasyon, bal tekstüründe bozulmaya yol açtığı için tüketiciler tarafından istenmeyen bir durumdur. Ayrıca şekerden ayrılmış zayıf likit faz, fermentasyonu başlatabilir. Arıcılarımız tarafından dikkat edilmesi gereken noktalardan biri ise balın hasat edilmesi sırasında ise petek yüzeyinin sırlama oranıdır. Bal hasadın da balın petek yüzeylerinin 1/2-2/3'ünün sırlanmasından sonra, yani balın yeterince olgunlaşmadan erken hasat

edilmesi sonucunda bal içermesi gerekenden fazla su içerdiği bildirilmiştir. Fazla su içeriği ise balın erken kristalleşmesine ve depolama esnasında erken fermentasyona uğramasına neden olmaktadır (Ferek,2016). Kristalize olmuş ballara ise ısıtma işlemi uygulanması yapılmaktadır. Bu ısıtma işlemi su banyosunda ısıtma, hava ile ısıtma, elektrikli tabakalar ile ısıtma, pastörizasyon: 70-78 °c’de kısa sürede ısıtıp hemen soğutma, ultrason dalgaların kullanılması, mikrodalga fırınlarda ısıtma, infrared fırınlarda ısıtma olarak sıralanabilir.

Veteriner kalıntı ilaç kalıntı sınırları

Türk Gıda Kodeksi Hayvansal Gıdalarda Bulunabilecek Farmakolojik Aktif Maddelerin Sınıflandırılması ve maksimum Kalıntı Limitleri tebliğine göre balda Fluvalinate ve Naphtalene bulunmamalıdır, ayrıca balda Amitraz 200 ppb, Coumaphos 100 ppb kalıntı limitleri içinde olmalıdır (Anonim,2017).

Çizelge 5:Türk Gıda Kodeksi Bal Standardı İçin Belirlenen Veteriner ilaçlar Maksimum Kalıntı Limitleri (Anonim,2017)

Veteriner ilaçlar maksimum kalıntı limitleri (MRL) µg/kg	Türk Gıda Kodeksi
Amitraz	200
Coumaphos	100
Fluvalinate	Bulunmamalı
Naphtalene	Bulunmamalı
Sulfamethazin	10
Kaumafos	100
Tetracycline	10
Streptomycin	20

Prolin Değeri

Bal arıları tarafından toplanılan nektarın bala dönüşmesi sırasında, balın yapısına katılan aminoasitlerin prolin denilmektedir. Balın yapısında yer alan aminositlerin yaklaşık olarak %50-85 ‘ni prolin oluşturmaktadır. Yani balın protein içeriğini prolin miktarı olarak belirlenmektedir(Çınar,2010,; Bayrambaş, 2012). Prolin miktarı balın saflığının bir parametresidir. Piyasada bulunana taşış balların analizleri gerçekleştirildiğinde bu ballarda prolin değeri daha düşük çıkmaktadır. Türk Gıda Kodeksi Bal Tebliğ TEBLİĞ NO: 2020/7 göre salgı ve çiçek ballarında bulunması gereken miktar 300 mg/kg olarak belirtilmiştir (Anonim,2020).

Prolin değeri En az	Çiçek Balı	Salgı balı	Çiçek ve Salgı Balı Karışımı	Fırıncılık Balı
	300 mg/kg	300 mg/kg	300 mg/kg	180 mg/kg
	180 mg/kg Kanola, ıhlamur, narenciye, lavanta, okaliptus			
	120 mg/kg Biberiye, akasya ballarında			
	500 mg/kg Kestane ballarında

Sonuç

Ülkemiz nektarlı bitkiler bakımından oldukça zengin bir bitki örtüsüne sahiptir. Bu sebeptendir ki arıcılığa uygun ülkelerden biridir. Yapısında bulunan özel bileşikler ve doğallığı ile sağlık üzerine de faydaları göz ardı edilemez. Yara ve yanıkları tedavisinde, sindirim sistemi rahatsızlıklarında, ağız enfeksiyonu ve bronşial rahatsızlıklarda, cildi besleyici ürün olarak kullanılması vb. balın apiterapi ürünü olarak yaygınlaştığının göstergesidir. Arılarda elde ettiğimiz bu muhteşem ürünün bizim sofralarımıza gelene kadar geçirdiği aşamalar vardır. Bu aşamalar kovan ve bal çıkarma, çerçevesi balın taşınması, kapağın açılması ,yerleştirilmesi, filtrasyon, depolama ,dolma hazırlık ve dolma aşamaları olarak ayrılır. Bu aşamalarda bal bir çok tehlikeye maruz kalır. Bu aşamalarda da gerekli kontrol ve düzenleyici faaliyetler yapılmalıdır. Kovan ve bal işlemlerinde toprak ve bikri maddeleri, koruyucular, haşereleler, boya maddeleri gibi tehlikeler oluşabilir. Eğer elde edilen ürün bunlardan birine maruz kaldıysa yakma işlemi uygulanarak bal imha dilmelidir.Bu ürünler ambalajlanırken son kontrolleri dikkatli yapılmalıdır. Kavonuzu çatlamış kırılmış ürünler kullanılmamalı, ısı uygulamaları bal tebliğine göre yapılmalı, depolama aşamasında su çekme ihtimaline karşı refraktometre ile ölçümleri yapılmalıdır.

Kaliteli bir bal için ısı uygulamalarına oldukça dikkat edilmelidir fazla bir ısıya maruz bırakılarak fermentasyona sebebiyet verilir. Eğer uygun olmayan şartlarda bu işlem gerçekleştirilirse balda kristalizasyona neden olabilir. Pazarlama kalitesini arttırmak amacıyla balların fermentasyona uğramaması ve uzun süre kristalleşmeden muhafaza edilebilmesi için fabrikalarda uygulanan yüksek ve uzun süreli sıcaklık işlemi ile kontrolsüz şekilde arttığı bilinmektedir. Yapılan bu işlem balların başlangıç HMF değerlerini yükseltip diastaz enzimlerini yıkılmayarak uygun olmayan muhafaza koşullarının da etkisiyle kalite kaybına ve besin değerinin azalmasına neden olmaktadır.

Balın uzun süre depolanması da kalite düşüklüğüne sebep olur. Bal yapısı gereği kokuları çekebilir ve korozyona dayalı kaplarda saklaması gerçekleştirilmelidir. Yine uzun süre depolama ,balın ısıya ve ışığa maruz kalması HMF miktarının artmasına sebep verebilir. HMF miktarı ne kadar az bulunursa bu miktar balın kalitesini o kadar yükseltir.

Abstract

The present study was conducted to evaluate the water quality of the inlet, irrigation outlet, and edges linked to Nuwarawewa reservoir, Mahakanadarawa reservoir, Hurulu wewa reservoir, Sangilikandarawa reservoir, and Nachchaduwa perennial reservoir in Anuradhapura, Sri Lanka. Water samples were taken from a designated position of each inlet, irrigation output, and edges in the second inter-monsoon, northeast monsoon, and first inter-monsoon seasons. Water quality indicators such as pH, electrical conductivity (EC), total dissolved solids (TDS), Na, K, Ca, Mg, Sodium Adsorption Ratio (SAR), NO_3^- -N, NH_4^+ -N, dissolved reactive phosphorus (DRP), and heavy metals (Cd, As, Pb, and Hg) concentrations were measured in each water sample. Data was analyzed using SPSS statistica software. Considerable temporal fluctuations in water quality indicators were detected in inlets, irrigation outflows, and edges over the research period. The findings revealed that NO_3^- -N, NH_4^+ -N, and DRP in Sangilikandarawa reservoir during the northeast monsoon were close but not above the FAO maximum levels guidelines for irrigation water. pH, EC, TDS, and heavy metals (Cd, As, Pb, and Hg) in all the other tanks were within permitted values according to WHO drinking water quality standards and FAO guidelines for irrigation water. This finding further demonstrated that the consequences of surrounding land use on water pollution in inlet water canals linked to Sangilikandarawa and Nuwarawewa are greater. It could be concluded that a pollution management plan needs to be implemented in order to stop further pollution.

Key words: *Anuradhapura reservoirs, Heavy metal, Temporal variation, Water pollution*

Importance for Queen Bee and Colony

Nuray Şahinler¹, Nesibe Özge Toy^{2*}

¹Uşak Üniversitesi Ziraat ve Doğa Bilimleri Fakültesi Zootečni ABD

^{2*}Uşak Üniversitesi Fen Bilimleri Enstitüsü/Zootečni ABD

Abstract

Bees are social creatures that live in colonies. The individuals forming the colony are one queen, 1000-2000 drones in the swarming season, and between 80,000 and 20,000 worker bees, the numbers of which vary according to the season. All individuals in the colony carry out all the work necessary for the continuity of the colony by sharing regularly. Many genetic characteristics of the colony, such as being calm or aggressive, being resistant to diseases or being susceptible to diseases, depend on the queen and the drone mating with the queen. The presence of the queen bee in the colony is important thanks to the pheromones secreted by the worker bees in fulfilling their duties. For this reason, it is important to replace the queen bee every two years, if possible, if possible, for the productivity of the colony. Since the queen bee bred with technical methods cannot meet the needs of our country, producers continue to produce with poor quality queens produced by natural methods. In order to increase honey yield per colony in our country, it is important for the queen to continue production with quality queens, which is one of the most important factors. For an efficient beekeeping, the importance of the queen and the queen in the colony should not be ignored.

Keywords: Honey Bee, queen Bee, quality, honey bee colony

Ana Arı ve Koloni İçin Önemi

Özet

Arılar Koloniler halinde yaşayan sosyal canlılardır. Koloniyi oluşturan bireyler ise bir tane ana arı, oğul sezonunda 1000-2000 erkek arı ve sayıları mevsime göre değişen 80.000 ile 20.000 arasında işçi arı bulunmaktadır. Kolonide yer alan tüm bireyler koloninin sürekliliği için gerekli olan tüm işleri düzenli bir şekilde paylaşarak yerine getirmektedirler. Koloninin verimliliği, sakin veya hırçın oluşu, hastalıklara dayanıklı veya duyarlı olması gibi birçok genetik özelliği ana arı ve ana arı ile çiftleşen erkek arıya bağlıdır. İşçi arıların görevlerini yerine getirmede salgıladığı feromonlar sayesinde ana arının kolonide varlığı önem taşımaktadır. Bu nedenle de koloninin verimliliği için ana arının mümkünse her yıl değilse en fazla iki yılda bir ana arının değiştirilmesi önemlidir. Teknik yöntemler ile yetiştirilen ana arı ülkemizin ihtiyacını karşılayamadığı için üreticiler doğal yöntemlerle üretilen kalitesiz ana arılar ile üretime devam edilmektedir. Ülkemizde koloni başına bal verimini artırmak için, ana arının en önemli faktörlerden biri olan kaliteli ana arılar ile üretime devam etmeleri önemlidir. Verimli bir arıcılık için de ana arı ve ana arının kolonideki öneminin göz ardı edilmemesi gerekmektedir.

Anahtar Kelimeler: Bal Arısı, ana arı, kalite, bal arısı kolonisi

Giriş

Bal arısı kolonisini; bir adet ana arı; on binlerce işçi arı ve yüzlerce işçi erkek arılar oluşturmaktadır. Kolonideki işçi arı sayısı kış aylarında 10.000-15.000 arasında değişirken; ilkbahara doğru sayıları daha da azalır. Baharın ilerleyen dönemlerinde sayıları giderek artar ve yaz aylarında çeşitli faktörlere bağlı olarak, bir kolonide 60.000-80.000 adet işçi arı bulunabilir. Yani işçi arı sayısı mevsime, ana arının yumurtlama kapasitesine, nektar ve polen kaynaklarının zenginliğine, stres faktörlerine, kolonide hastalık ve zararlı bulunma durumuna göre değişiklik göstermektedir (Önder, 2006). Koloniyi oluşturan Erkek arılar haploid ($n=16$) olan yumurtalardan gelişirler ve koloninin en iri birey grubunu oluştururlar. Dölsüz yumurtalardan geliştikleri için sadece ana arının kromozomlarını taşırlar. Bu nedenle koloninin babasız bireyleridir. Ana arı; arı ailesinin en önemli ferdidir. Özel durumlar dışında her kovanda bir tane bulunur. Koloniyi oluşturan bu bireyler koloninin sürekliliği için koloni içerisinde çeşitli görevleri bir düzen içerisinde paylaşarak sağlamaktadırlar (Korkmaz ve Öztürk, 2004; Doğaroğlu ve Doğaroğlu, 2015).

Koloni bireylerinden olan ana arı döllenmiş ($2n=32$) diploid yumurtalardan gelişir. İşçi arılarla aynı kalıtsal materyale sahiptir. İşçi arılarla arasındaki farklılık besleme döneminde meydana gelmektedir. İşçi arılar 3 günlük larval dönemin sonunda bal ve polenle beslenirken ana arılar tüm larval dönemde arı sütü ile beslenirler. Bu farklı besleme sonucunda işçi arılarla aynı genotipik yapıya sahip olmalarına rağmen ana arılar meydana gelmektedir. Ana arının vücut yapısı ince ve uzun, rengi diğer bireylere göre daha açık, canlı ve parlaktır. Özellikle kolonide yavru yetiştirme aktivitesinin yüksek olduğu dönemlerde karın çok uzundur. Vücudu işçi arılardan daha geniş ve erkek arılardan daha uzundur (Özbakır; 2013).

Kanatları vücut uzunluğuna oranla işçi ve erkek arıların kanatlarına göre kısa görünür; fakat gerçekte işçi arıların kanatlarından daha uzundur. Ancak kanatları kendi vücut uzunluğuna oranla kısa olduğundan uçuş yetenekleri

fazla değildir. Ana arı genellikle kendisini çevreleyen temizliği ve beslenmesi ile ilgilenen bir gurup işçi arı arasında görülür. Yaşamı süresince sadece çiftleşme ve oğul verme amacıyla koloniden dışarı çıkar. Kendi kendine beslenemez. Beslenmeleri bakıcı arıların ağızdan arı sütü vermeleri şeklinde olur (Koç ve Karacaoğlu,2005; Karataş ve Canverdi,2019).

Bir arı kolonisinin performansı, sağlıklı ve kaliteli ana arının varlığına, genetik kapasitesi ise ana arısının ve çiftleştiği erkek arıların çeşitli özelliklerine bağlıdır (Ruttner 1988; Öztürk,2012).Ana arısı olmayan bir koloninin varlığından söz edilemez. Çünkü kolonide tek olan bu bireyin çiftleşmesi ile çiftleştiği erkek arılardan aldığı kalıtsal özellikler sayesinde koloninin; sakinliği, nektar ve polen toplama yeteneği ilkbahar gelişme hızı, kışlama kabiliyeti, oğul eğilimi, hastalık ve zararlılara karşı dayanıklılığı gibi özelliklerini belirlemektedirler (Köseoğlu ve ark.,2017).Bu nedenle, arıcının bir koloniden sağlayacağı kazanç bu koloniyi yöneten ana arının görevini yerine getirip getirmediği ile ilişkilidir (Laidlaw ve Eckert, 1962; Morse, 1982; Delaney ve ark., 2011).

Bir ana arı koloninin birliğinin sağlanması için gerekli olan bütün işlerde rol üstlenir. Yumurta, larva ve pupa dönemlerini 16 günde tamamlayarak ergin hale gelen bu canlılar kovanın denge unsurlarıdır(Öztürk,2014).Ana arı mevcut anatomik yapıları, fizyolojik özellikleri, davranışsal özellikleri, kolonide sağladığı işlevsel özellikleri ile koloni bireyleri arasında ki en önemli bireydir (Lee ve ark.,2019). Kolonin üreme performansı olan tek dişi, tek yumurta üreten arıdır. Ana arı döllenmiş (2n=32) diploid yumurtalardan gelişir. İşçi arılarla aynı kalıtsal materyale sahiptir. İşçi arılar 3 günlük larval dönemin sonunda bal ve polenle beslenirken ana arılar tüm larval dönemde arı sütü ile beslenirler. Bu farklı besleme sonucunda işçi arılarla aynı genotipik yapıya sahip olmalarına rağmen ana arılar meydana gelmektedir (Güneşdoğdu ve Şekeroğlu,2020).

Ana arının salgıladığı iki önemli feromon bulunmaktadır. Bu feromonlar iki doymamış yağ asidi olan 9-oxodec-trans-2-enoic asit [$\text{CH}_3\text{CO}-(\text{CH}_2)_5-\text{CH}=\text{CHCO}-\text{OH}$] ile 9-hydroxydec-trans-2-enoic asittir [$\text{CH}_3-\text{CHOH}-(\text{CH}_2)_5=\text{CH}-\text{COOH}$]. Ana arının mandibulaları üzerinde,her iki yanağın altında, hafif sarkık torba şeklinde iki salgı bezi bulunur. Mandibular bezden salgılanan bu salgı cinsiyet feromonudur. Mandibular bezden salgılanan bu feromonlar anten, vücut teması ve beslenme yolu ile işçi arılara aktarılmaktadır(Koç ve Karacaoğlu,2017).

Ana arı feromonu da denen bu salgı, Çiftleşme uçuşu esnasında erkek arıyı cinsel yönden kendine çeker, işçi arılardan yalancı ana oluşumunu engeller ve kendisine yönelmesini sağlar. Kolonide huzur ve iş birliğini temin eder, arıların gerektiğinde sıkı bir salkım oluşturmalarını sağladığı bildirilmektedir (Korkmaz ve Öztürk,2016).

Yapılan araştırmalara bakıldığında ana arının baş, göğüs ve karın bölgesinden dört bileşiğin daha salgılandığı bildirilmiştir. Salgılanan bu dört bileşik ise (metiloleat,koniferil alkol,palmitil alkol,lineolik asit)önceden belirlenen beş bileşik ile sinerjik etkiye sahip olduğu ve toplamda 9 bileşiğin ana arıda maiyet feromonlarını oluşturduğu bildirilmiştir. Bu maiyet feromonları ise işçi arıların yumurtalık gelişimlerini baskıladığını ve işçi arıların ana arıların etrafında toplanmasına neden olduğu vurgulanmıştır. Yani Bu feromon ve bileşenler ile kolonide yeni bir ana arı oluşumunu engellemektedir (Keeling ve ark.,2003;Hoover ve ark.;2003).Ancak bu bileşenlerin miktarının ana arı yaşına (Rhodes vd., 2004), genotipe,mevsime (DeGrandi-Hoffman vd., 2007) göre değiştiği bildirilmiştir.

Ana arının yapısında bulunan feromonlar sayesinde kovanda varlığı diğer arılar tarafından hissedilebilmektedir. Dolayısı ile ana arının kovan içinde yokluğunda ise işçi arılar kovan içinde huzursuzluk çıkarır ve görevlerinde aksaklıklar yaşanmaya başlar. Ana arısı bulunmayan bu koloniler ise anasız koloniler olarak adlandırılır ve analı kolonilere göre kovanda farklı davranışlar gözlenir (Öztürk ve Korkmaz,2006;Köseoğlu ve ark.,2017).

Ana arının kolonideki en önemli görevi ise yumurtlamaktır. Bu görevi ile kolonideki bireylerin sürekliliğini sağlamaktadır. Kolonide bir ana olmasına rağmen analık içgüdünden yoksun olan bu canlılar yavrularına bakmazlar aynı zamanda salgı bezi ve larva besinini salgılayan bezlerden yoksundurlar. Bu nedenle bu görevleri kolonide işçi arılar üstlenmiştir (Önder,1997;Öztürk,2014)

Ana arıların da yumurta verimi ve feromon üretimleri yaşına bağlı olarak değişiklik göstermektedir. Ana arının ortalama yaşam süreleri 3-5 yıl hatta 7 yıla kadar uzayabilmektedir. Artan yaş ile ana arılar daha az yumurtlarlar ve yüksek oranda dölsüz yumurta bırakırlar. (Kaftanoğlu,1987). Ancak sağlıklı, güçlü koloniler için ise ana arıların her yıl değiştirilmesi gerekmektedir. Eğer bu durum mümkün değilse iki yılda bir yenilenmesi uygundur. Türkiye çapında yetiştirilen bütün kovanlar göz önüne alındığında 2-2,5milyon ana arının üretimine ihtiyaç vardır (Kaftanoğlu,1988; Öztürk,2012). Bu nedenle arıcılara yeni yapılan düzenlemelerle devlet anaarı yetiştiriciliğini teşvik etmesi, yetiştiriciliği yapan özel kuruluş ve arıcılara denetimli kredi, girdi ve eğitim olanakları sağlaması, anaarı ihtiyacının karşılanmasına destekler sağlamaktadır. Bu gibi destekler ülke arıcılığının gelişmesine ve bal üretiminin artmasına büyük katkılar sağlayacaktır (Çevik,2003; Karaca ve Karaman,2018).

Sonuç

Ana arı kolonin üreme yeteneğine sahip tek dişi bireyidir. Koloni için en önemli görevi yumurtlamaktır. Diğer önemli görevi ise salgıladığı feromonlar ile kovan içinde düzeni sağlamaktadır. Bir kolonin verimin yüksek olması ana arı ile ilişkilidir. Kovanda ana arının yokluğunda kovan içi düzen bozulmakta ev kovanlar sönmektedir. Bu nedenle kolonide kullanılacak ana arıların kaliteli ana arılardan seçilmesi önemlidir. Ülkemizde arıcılığın temel sorunlarından biride kalitesiz ana arı kullanımıdır. Türkiye de arıcılığında ana arıların büyük çoğunluğu doğal yöntemlerle üretilmektedir. Oysa doğal yöntemle ana arı üretiminde ana arının kalitesi düşmektedir. Bunun

yanında bu yöntemde ana arıların larva döneminde yeteri kadar beslenememesi ana arı üretimi için çok fazla işçi arı kullanılması, yetiştirilecek ana arının yumurtaya başlayıncaya kadar kolonide kuluçka faaliyetinin durması olumsuzluklar söz konusu olabilmektedir. Bunun yanında ıslah programları üretilen, kontrollü ana arı üretim yöntemleri kullanılarak yetiştirilen ana arıların verim ve kalitesinin daha yüksek olduğu unutulmamalıdır.

Abstract

Sustainable development means maintaining the possibilities and living conditions for future generations, renewable natural resources at least at the level of those existing for the current generation, and redressing the environmental factors affected by pollution.

Environmental management aims at the responsible use of natural, economic and human resources so that the environment is protected and improved. The Environmental Management System (EMS) is a mechanism that addresses major ecological themes by allocating resources, assigning responsibilities, and a continuous evaluation of practices, procedures and processes, which are organized in a systematic manner. Thus, EMS distinguishes itself as a powerful tool that allows the organization to achieve and control the level of environmental performance it establishes, becoming an integral part of the management system of an organization and it needs to be coordinated with the efforts of the management systems in other fields.

EMAS - The European Eco-Management Commission and the Audit System is a voluntary scheme for industry introduced by the European Commission (EC), which aims to promote continuous improvements in the environmental performance of companies and to provide environmental information to the public, because environmental issues have come from the unconsciousness of some to affect the whole of humanity.

Romania has implemented standards (ISO 14001) that refer to the environmental management system, with the general declared purpose of supporting environmental protection and preventing pollution, in balance with socio-economic needs.

The specific purpose of ISO1400 standards is to provide organizations with: all the necessary elements for the effective construction of an environmental management system, which can be integrated into the overall management of the organization and which allows the achievement of the environmental and economic objectives set.

The key to the success of international measures to protect the environment lies in the wider participation of the global community, in cooperation on technical issues and in the functional implementation of funding mechanisms to support developing countries. Similarly, the key to the success of measures at local level depends on the wider participation of citizens, in particular the involvement of non-governmental organisations, to support local initiatives to protect the environment.

The research methodology used includes qualitative methods (meta-analysis of specialized literature) and observations and logical deductions on the impact of environmental policies.

Keywords: *environmental management system; environmental management standards; EMAS sustainable economic development; improvement of environmental quality; ISO 14001 environmental management systems*

ID: 742**Investigation of Agricultural Mechanization Situation in İzmir Province and Districts****Yaşar Serhat Saygılı¹, Bülent Çakmak¹**¹Agricultural Machinery and Technologies Engineering Department, Faculty of Agriculture, Ege University, İzmir, Turkey**Abstract**

İzmir Province is the third most populous city in Turkey in terms of population with 30 districts and is in the Aegean Region. The change in the level of agricultural mechanization of İzmir province and districts between 2004 and 2021 was examined using statistical data on crop production areas and agricultural tractors. To determine the level of agricultural mechanization, the number of tractors, the distribution of tractor engine power and the change in agricultural production areas were considered. In determining and evaluating the level of agricultural mechanization; agricultural area per tractor (ha tractor^{-1}), number of tractors per 1000 hectares of agricultural area ($\text{tractor } 1000 \text{ ha}^{-1}$), tractor power per unit area (kW ha^{-1}) and average tractor power (kW) data were used. It has been determined that the agricultural mechanization level and the number of agricultural tractors of İzmir province and districts have improved. Within the province of İzmir, the production of agricultural products is carried out intensively in the districts of Ödemiş, Bergama, Tire, Menderes, Torbalı, Bayındır, Menemen, Kiraz, Kemalpaşa, Kınık, Selçuk and Dikili, respectively. The data on the level of agricultural mechanization in 2021 for the province of İzmir in general and the change rates in 17 years are respectively; the agricultural area per tractor was calculated as $8.16 \text{ ha tractor}^{-1}$ (-28.5%), the number of tractors per 1000 hectares of agricultural area as 122.58 units (39.8%), the tractor power per unit area as 3.08 kW ha^{-1} (27.0%), and the average tractor power as 39.76 kW (10.0%). For İzmir province, 2021 Turkey agricultural mechanization data and change rates in 17 years were found as $15.88 \text{ ha tractor}^{-1}$ (-39.8%), 62.96 tractors 1000 ha^{-1} (66.2%), 1.39 kW ha^{-1} (49.1%), 45.28 kW (11.5%). When examined at the level of districts according to the average of İzmir, for the criterion of agricultural area per tractor (ha tractor^{-1}); It is seen that it is above average in Torbalı (9.94), Bayındır (12.40), Menemen (8.36), Kiraz (8.56), Kemalpaşa (12.65), Selçuk (10.67) and Dikili (14.88), and below average in Ödemiş (3.54), Bergama (7.12), Tire (7.52), Menderes (7.34) and Kınık (6.03) districts. In the criterion of the number of tractors per 1000 hectares of agricultural area, the opposite of the criterion of agricultural area per tractor is the case. For the tractor power criterion per unit area (kW ha^{-1}); Ödemiş (5.16), Tire (2.72), Menderes (2.69), Menemen (2.64), Kınık (3.06) and Bergama (2.58) districts are above the average of İzmir, while Torbalı (1.99), Bayındır (1.19), Kiraz (1.76), Kemalpaşa (1.81), Selçuk (2.04) and Dikili (1.36) districts are below the average of İzmir. For the average tractor power criterion, while Ödemiş (54.84), Kınık (54.21) and Kiraz (66.26) districts are above the provincial average, the other nine districts are below the provincial average.

Key Words: *İzmir, Tractor, Production area, Agricultural Mechanization Status***İzmir İli ve İlçeleri Tarımsal Mekanizasyon Durumunun İncelenmesi****Özet**

İzmir İli 30 ilçesi bulunan, Türkiye'nin nüfus bakımından üçüncü en kalabalık şehridir ve Ege Bölgesinde yer almaktadır. İzmir ili ve ilçelerinin 2004–2021 yılları arasındaki tarımsal mekanizasyon düzeyindeki değişim, bitkisel üretim alanları ve tarım traktörlerine ait istatistiksel verileri kullanılarak incelenmiştir. Tarımsal mekanizasyon düzeyinin belirlenmesi için traktör sayısı, traktör motor gücü dağılımı ve tarımsal üretim alanlarının değişimi dikkate alınmıştır. Tarımsal mekanizasyon düzeyinin belirlenmesi ve değerlendirilmesinde; bir traktöre düşen tarım alanı (ha traktör^{-1}), 1000 hektar tarım alanına düşen traktör sayısı ($\text{traktör } 1000 \text{ ha}^{-1}$), birim alana düşen traktör gücü (kW ha^{-1}) ve ortalama traktör gücü (kW) verileri kullanılmıştır. İzmir ili ve ilçelerinin tarımsal mekanizasyon düzeyi ve tarım traktör sayılarının gelişim gösterdiği belirlenmiştir. İzmir ili içerisinde sırasıyla, Ödemiş, Bergama, Tire, Menderes, Torbalı, Bayındır, Menemen, Kiraz, Kemalpaşa, Kınık, Selçuk ve Dikili ilçelerinde tarım ürünlerinin üretimi yoğun olarak yapılmaktadır. İzmir ili geneli için 2021 yılı tarımsal mekanizasyon düzeyine ait veriler ve 17 yıldaki değişim oranları sırasıyla; bir traktöre düşen tarım alanı $8.16 \text{ ha traktör}^{-1}$ (%-28,5), 1000 hektar tarım alanına düşen traktör sayısı 122.58 adet (%39,8), birim alana düşen traktör gücü 3.08 kW ha^{-1} (%27,0), ortalama traktör gücü 39,76 kW (%10,0) olarak hesaplanmıştır. İzmir ortalamasına göre ilçeler düzeyinde incelendiğinde bir traktöre düşen tarım alanı kriteri (ha traktör^{-1}) için; Torbalı (9,94), Bayındır (12,40), Menemen (8,36), Kiraz (8,56), Kemalpaşa (12,65), Selçuk (10,67) ve Dikili (14,88)'de ortalama üzeri, Ödemiş (3,54), Bergama (7,12), Tire (7,52), Menderes (7,34) ve Kınık (6,03) ilçelerinde ise ortalama altında olduğu görülmektedir. 1000 hektar tarım alanına düşen traktör sayısı kriterinde bir traktör başına düşen tarım alanı kriterinin tersi durum söz konusudur. Birim alana düşen traktör gücü kriteri (kW ha^{-1}) için; Ödemiş (5,16), Tire (2,72), Menderes (2,69), Menemen (2,64), Kınık (3,06) ve Bergama (2,58) ilçeleri İzmir ortalaması üzerinde, Torbalı (1,99), Bayındır (1,19), Kiraz (1,76), Kemalpaşa (1,81), Selçuk (2,14) ve Dikili (1,36) ilçeleri İzmir ortalaması altındadır. Ortalama traktör gücü kriteri (kW) için; Ödemiş (54,84), Kınık (54,21) ve Kiraz (66,26) ilçeleri il ortalaması üzerindeyken, diğer dokuz ilçe il ortalamasının altında kaldığı görülmektedir.

Anahtar Kelimeler: *İzmir, Traktör, Üretim alanları, Tarımsal mekanizasyon durumu*

Giriş

Hızlı bir artış eğiliminde olan dünya nüfus artışı beraberinde beslenme ihtiyacında bir artış getirmektedir. Tarım alanlarındaki ve tarımsal üretimde çalışan işgücünde yaşanan azalmalar bu ihtiyacın karşılanmasında zorlukların doğmasına sebebiyet vermektedir. Yaşanan olumsuzlukların giderilebilmesi için tarımsal üretimden daha verimli ve daha fazla üretim yapılması gerekmektedir. Mevcut koşullar altında, yükselen talebin eldeki kısıtlı alanlarda yapılan üretimde, modern metotların ve makinelerin kullanılması ile etkin ve ekonomik olarak yapılarak arz artışıyla karşılanması gereklidir (Comart ve Akıncı, 2017). Üretilen tarımsal ürünlerde verim ve kapasite artışı ise; etkin ve modern üretim metodunun seçimi, kaliteli tohumluk kullanımı, su ve toprak kaybını azaltan ve/veya korunmasını sağlayan metotların seçimi, girdi maliyetini azaltmak için değişken düzeyli uygulamaların temel amacı olan doğru zaman ve yerde doğru miktarın uygulanması ile akıllı tarım uygulamaları ile kontrolü sağlanabilen makinelerin kullanılması olarak sıralanabilir (Baran ve ark., 2014; Bilim ve ark., 2014; Özgünaltay Ertuğrul ve ark., 2019; Altuntaş, 2020; Güneş ve ark., 2020; Ertekin ve ark., 2021).

Tarımsal mekanizasyon durumunun incelendiği, Türkiye geneli, farklı coğrafi bölgeler ve yöreler ile il ve ilçe bazında olmak üzere farklı araştırmalar yapılmıştır (Ünal, 2006; Altuntaş ve Aslan, 2009; Cankurt ve Miran, 2010; Altıkat ve Çelik, 2011; Gökdoğan ve Bayhan, 2011; Gökdoğan ve Demir, 2011; Eryılmaz ve ark., 2013; Gürsoy, 2013; Yeşilyurt ve ark., 2013; Eryılmaz ve ark., 2014; Gökdoğan, 2014; Korucu ve ark., 2015; Bayram ve Altuntaş, 2016; Bozkurt ve Aybek, 2016; Duran ve Ünal, 2016; Sağlam ve Kuş, 2016). Bu çalışmaların yanısıra farklı ülkelerin tarımsal mekanizasyon düzeylerinin Türkiye ile karşılaştırılması için çalışmalar da bulunmaktadır (Gökdoğan, 2012; Esenali Uluu and Öğüt, 2019; Güneş ve ark., 2020; Rahman ve ark., 2021). Teknolojide görülen gelişmeler ile uygulanan tekniklerdeki değişikliklerle birlikte, traktör ve makine kullanımının artmasının sonuçlarının incelenmesi ve verilerin güncelliğini koruması amacıyla yeni çalışmaların devam ettiği görülmektedir (Akar ve Çelik, 2017; Comart ve Akıncı, 2017; Işık, 2017; Kayhan ve ark., 2017; Aslantürk ve Altuntaş, 2018; Kirpitçi ve ark., 2018; Yılmaz ve Sümer, 2018; Abdikoğlu, 2019; Bal ve Altuntaş, 2019; Mavioğlu ve Çobanoğlu, 2019; Altuntaş, 2020; Aygün ve Gürsoy, 2020; Malaslı ve ark., 2020; Sessiz, 2020; Ulusoy ve ark., 2020; Saygılı ve Çakmak, 2021a).

Tarım traktörleri, tarımsal üretimde kullanılan temel güç kaynağıdır (Altıkat ve Çelik, 2009; Evcim ve Özgünaltay Ertuğrul, 2017). Bu nedenle; tarımsal mekanizasyon düzeyinin hesaplanması için; birim alana başına traktör gücü (kW ha^{-1}), 1000 hektar başına traktör sayısı (adet traktör⁻¹), traktör başına tarım alanı sayısı (ha traktör^{-1}) ve ortalama traktör gücü (kW) olarak sıralanan kriterler en yaygın kullanılanlardır.

İzmir ili, Ege Bölgesinde yer almakta olup Türkiye'nin nüfus bakımından üçüncü en kalabalık şehridir. 2021 yılı TÜİK verilerine göre şehrin nüfusu 4 425 789 kişi olup, 11 891 km^2 'lik yüz ölçümüyle Türkiye'nin yirmi üçüncü büyük şehridir (İZKA, 2022b). Akdeniz ikliminin hâkim olduğu bölgede yıllık toplam yağış ortalaması 713,8 mm, yıllık yağışlı gün ortalaması ise 84,2 gündür (MGM, 2022). Bu çalışmada da İzmir ili ve ilçelerinde tarımsal üretim faaliyetlerinde kullanılan traktörler incelenmiş ve mekanizasyon durumu değerlendirilmiştir.

Şekil 1. İzmir ili ve ilçeleri (Anonim, 2022)

Materyal ve Yöntem

Çalışmanın materyalini, Türkiye İstatistik Kurumu'ndan alınan 2004-2021 yılları arasında İzmir ili ve ilçelerindeki bitkisel üretim alanları ile tarımsal üretim faaliyetlerinde kullanılan traktörlere ait istatistik verileri oluşturmaktadır.

Çalışmanın yöntemini, İzmir iline ait tarım alanları ve traktör sayılarının verilerin kullanılarak tarımsal mekanizasyon düzeyinin belirlenmesidir. Tarımsal mekanizasyon düzeyinin belirlenmesinde kullanılan ölçütler;

- Traktör başına düşen tarım alanı (ha traktör⁻¹)
- 1000 hektar başına düşen traktör sayısı (traktör 1000 ha⁻¹)
- Birim alana düşen traktör gücü (kW ha⁻¹)
- Ortalama traktör gücü (kW)'dir (Koçtürk ve Onurbaş Avcıoğlu, 2007; Gökdoğan, 2012; Özgünlaltay Ertuğrul ve ark., 2019).

Bulgular ve Tartışma

İzmir, 1 adet büyükşehir belediyesi ve 30 adet ilçe belediyesi bulunan ve tarımsal üretim yapan işletmelerin ortalama parsel büyüklüğü 3,7 ha olan, Türkiye'nin bitkisel üretiminin %3.1'nin yapıldığı bir ildir. Tarımsal üretim yapılan alanlar büyüklüklerine göre büyükten küçüğe doğru, Ödemiş, Bergama, Bayındır, Torbalı, Tire, Menderes, Kemalpaşa, Menemen, Kiraz, Selçuk, Dikili, Kınık, Seferihisar, Aliaga, Urla, Beydağ, Foça, Karaburun, Buca, Çeşme, Bornova, Güzelbahçe, Çiğli, Karabağlar, Karşıyaka, Gaziemir, Balçova, Narlıdere, Bayraklı ve Konak olarak sıralanmaktadır. Büyükşehir belediyesi sınırlarına ve şehir merkezlerine yaklaştıkça tarım alanlarında azalma görülmekte ve Konak ilçesinde tarım alanına ait bir veri bulunmamaktadır. Toplan tarım alanları incelendiğinde 2021 yılı içerisinde üretilen ürün gruplarına göre; meyveler, içecek ve baharat bitkileri birinci sırada yer alırken, tahıllar ve diğer bitkisel ürünler ikinci sırada, sebzeler üçüncü, nadas alanı dördüncü, süs bitkileri beşinci ve örtü altı üretim alanı ise altıncı sırada yer almaktadır. 2004-2021 yılları arasındaki veriler Tablo 1'de yer almaktadır. 2021 yılı İzmir il geneline ait Tarımsal ürün gruplarına göre dağılım Şekil 2'de verilmiştir.

Tablo 1. İzmir ili Tarım alanları gruplarına göre dağılımı

YIL	Meyveler, İçecek Ve Baharat Bitkileri Alanı	Nadas Alanı	Sebze Alanı	Süs Bitkileri Alanı	Tahıllar Ve Diğer Bitkisel Ürünlerin Alanı	Örtüaltı Tarım Alanı

Şekil 2. 2021 yılı İzmir ili tarım alanları dağılımı

Tarımsal üretim yapılan alanların ilçeler düzeyinde incelenmesine ait veriler Tablo 2’de verilmiştir. 2021 yılında en çok tarımsal üretim yapılan ilçeler Ödemiş, Bergama, Bayındır, Torbalı, Tire, Menderes, Kemalpaşa, Menemen, Kiraz, Selçuk, Dikili ve Kınık ilçeleridir. Bu ilçeler İzmir ilinin tarımsal üretim alanlarının %85.89’luk kısmını oluşturmaktadır. 2021 yılına ait verilerden elde edilen tarımsal alan dağılımı Şekil 3’te verilmiştir.

Tablo 2. İzmir ili ilçelerinin toplam tarım alanlarına göre dağılımı

	Meyveler, içecek ve baharat bitkileri Alanı (ha)	Tahıllar Ve Diğer Bitkisel Ürünlerin Alanı (ha)	Nadas Alanı (ha)	Sebze Alanı (ha)	Süs Bitkileri Alanı (ha)

İzmir ilinde tarımsal üretim faaliyetlerinde kullanılan tarım traktörlerinin sınıflandırmasına ait veriler Tablo 3’te verilmiştir. İl genelinde kullanılan traktörlerin toplam sayısının %99.236’sı çift akslı lastik tekerlekli, %0.761’i tek akslı lastik tekerlekli ve %0.003’ü ise paletli traktörlerden oluşmaktadır. Tek akslı traktörlerin kendi içerisinde incelendiğinde 0.5-3.68 kW arası %12.55’lik dilimi, 3.68 kW üzerindeki grup ise %87.45’lik dilimi oluşturmaktadır. Çift akslı traktörler güç gruplarına göre incelendiğinde, tabloda verilen sırasıyla, %0.51, %2.19, %8.20, %49.81, %34.50 ve %4.79’lik oranlara sahip olduğu hesaplanmaktadır. Traktör güç grubunda yoğunluğun 25.76 – 36.8 kW ile 37.54-51.52 kW’lık dilimde yer aldığı görülmektedir. Tarımsal üreticilerin parsel büyüklüklerinin Türkiye ortalamasının altında yer alması, kullanılan tarım makinalarının güç ihtiyaçlarının bu iki grupta yoğunlaşmasındaki en büyük etmendir.

Şekil 3. 2021 yılı İzmir ili ilçeleri tarım alanlarının büyüklüklere göre dağılımı

Tablo 3. İzmir ilinde kullanılan traktörlerin güç gruplarına göre dağılımı

Yıl	Paletli (Tırtıllı)	Tek Akslı		İki Akslı						Toplam
		0,5- 3,68 kW	3,68 kW+	0,5- 7,36 kW	8,01- 17,65 kW	18,4 kW- 25,03 kW	25,76- 36,8 kW	37,54- 51,52 kW	51,52 kW+	
2004	6	18	40	500	1206	3214	16728	8622	554	30888

2021	2	33	230	200	862	3225	19580	13562	1884	39313

İlçeler düzeyinde traktör grupları incelendiğinde tek asklı traktörlerin yer almadığı ilçeler Balçova, Bayraklı, Beydağ, Çiğli, Foça, Karabağlar, Karşıyaka, Kiraz, Konak ve Narlıdere ilçeleridir. Tek asklı traktörlere ait dağılımı ilçeler düzeyinde gösterimi Şekil 4'te verilmiştir.

İki asklı traktörler incelendiğinde tarım traktörü bulunmayan tek ilçenin Konak olduğu görülmektedir. Ödemiş ilçesindeki traktör sayısı il geneline oranlandığında %24.14'lük bir paya sahiptir. Bu ilçenin ardından Bergama (%11.85), Tire (%8.95), Menderes (%7.92) ve Torbalı (%7.90) ilçeleri sıralanmaktadır. İki asklı traktörlerin dağılımları Şekil 5'te verilmiştir. Traktörlerin güç sınıflarına göre gruplandırılmasında ise 25,76-36,8 kW ve 37,54-51,52 kW gruplarında olduğu görülmektedir. Özellikle Ödemiş, Bergama, Menderes, Torbalı, Tire ve Kemalpaşa ilçelerinde bu grupların yoğunlaştığı görülmektedir.

İzmir ili ilçelerinin tarımsal mekanizasyon düzeyine ait veriler Tablo 4'te verilmiştir. Tarımsal Mekanizasyon düzeyinin belirlenmesinde kullanılan kriterlere göre İzmir ili ortalama değerleri; traktör başına düşen tarım alanı 8,14 ha traktör⁻¹, 1000 hektar tarım alanına düşen traktör sayısı 122,87 traktör 1000 ha⁻¹, birim alana düşen traktör gücü 2,28 kW ha⁻¹ ve ortalama traktör gücü 54,00 kW olarak hesaplanmıştır. Aynı kriterlere göre Türkiye ortalamaları 15,88 ha traktör⁻¹, 62,96 87 traktör 1000 ha⁻¹, 1,39 kW ha⁻¹, 45,28 kW olarak bulunmuştur. İlçeler düzeyinde incelendiğinde Konak ilçesinde tarım alanı ve tarım traktörü verisi bulunmadığı için değeri sıfır olarak hesaplanmaktadır. Karşıyaka, Karabağlar ve Narlıdere gibi büyükşehir belediyesi sınırları içerisinde kalan ilçelerde tarım traktörü sayılarının az olması sebebiyle bu kriterdeki değerleri İzmir il ortalamasının ve Türkiye

geneli ortalamasından yüksek hesaplanmaktadır. Karaburun ve Seferihisar ilçelerinde ise tarım alanlarının büyüklüğüne karşın tarım traktörü sayıları mekanizasyon düzeyini iyileştirebilecek seviyelerin altında yer almaktadır. Ödemiş ilçesi tarım alanlarının çok olmasına karşın il genelinde en çok traktör sayısına sahip olduğu için traktör başına düşen tarım alanı kriterinde birinci sırada yer almaktadır. Tarımsal üretim alanı bakımından ikinci sırada yer alan Bergama ilçesi mevcut veriler incelendiğinde İzmir ortalamasının altında kaldığı görülmektedir. Ödemiş, Kınık, Bergama, Menderes ve Tire ilçelerinde traktör sayılarının fazla olması bu kriter göz önüne alındığında İzmir il ortalaması ve Türkiye ortalamasının üzerinde olmasını sağlamaktadır. Birim alana düşen traktör gücü (kW ha^{-1}) Ödemiş, Kınık, Bergama, Kınık, Menderes, Menemen ve Tire gibi tarımsal üretimin yoğun yapıldığı ilçelerdeki traktör güçlerinin yüksek grupta yer aldığını gösteren bir kriterdir. Bayraklı ilçesindeki yüksek değerin sebebi ise tarım alanlarının 10.7 ha gibi bir değerde olması ve traktör güç grubunun yüksek olmasından kaynaklanmaktadır. Ortalama traktör gücü kriterinde ise Bayındır, Kiraz ilçeleri İzmir il ortalamasının üzerinde bir değerde yar almaktayken, Ödemiş, Kınık, Beydağ ve Bergama ilçeleri İl ortalamasında yakın bir değere sahiptir.

Şekil 4. 2021 yılı tek akslı traktörlerin ilçeler düzeyinde dağılımı

Şekil 5. 2021 yılı çift akslı traktörlerin ilçeler düzeyinde dağılımı

	Bir traktöre düşen tarım alanı (ha traktör ⁻¹)	1000 hektar tarım alanına düşen traktör sayısı (traktör 1000 ha ⁻¹)	Birim alana düşen traktör gücü (kW ha ⁻¹)	Ortalama Traktör Gücü (kW)
Aliağa	10.41	96.02	1.62	59.16
Balçova	20.50	48.79	0.82	59.50
Bayındır	12.40	80.67	1.19	67.60
Bayraklı	3.57	280.37	7.01	40.00
Bergama	7.12	140.45	2.58	54.46
Beydağ	12.26	81.58	1.48	54.95
Bornova	11.04	90.61	1.77	51.07
Buca	9.96	100.38	2.07	48.46
Çeşme	8.04	124.33	2.99	41.60
Çiğli	6.29	159.07	1.53	103.67
Dikili	14.88	67.21	1.36	49.41
Foça	9.56	104.56	1.23	85.23
Gaziemir	11.74	85.20	1.08	79.06
Güzelbahçe	20.61	48.53	0.77	63.00
Karabağlar	73.64	13.58	0.21	64.00
Karaburun	57.85	17.29	0.39	44.44
Karşıyaka	156.40	6.39	0.13	47.50
Kemalpaşa	12.65	79.08	1.81	43.66
Kınık	6.03	165.84	3.06	54.21
Kiraz	8.56	116.84	1.76	66.26
Konak	0.00	0.00	0.00	0.00
Menderes	7.34	136.27	2.69	50.58
Menemen	8.36	119.67	2.64	45.28
Narlıdere	35.23	28.39	1.03	27.50
Ödemiş	3.54	282.83	5.16	54.84
Seferihisar	111.18	8.99	0.18	49.23
Selçuk	10.67	93.75	2.04	45.86
Tire	7.52	132.99	2.72	48.82
Torbalı	9.94	100.59	1.99	50.61
Urla	26.45	37.80	0.81	46.67

İzmir ili ve ilçelerine ait 2004-2021 yılları arasını kapsayan 17 yıllık veriler ışığında tarımsal üretimde kullanılan traktör sayılarında artış olduğu ve tarımsal mekanizasyon düzeyinde gelişme olduğu saptanmıştır. Ödemiş, Bergama ve Bayındır ilçeleri en büyük tarım alanlarına sahip olmalarına karşın traktör sayıları arasındaki farktan dolayı Ödemiş ilçesindeki traktör başına düşen tarım alanı kriterinde diğer iki ilçeden daha az alanı işlemektedir. Aynı kriterde İzmir ili geneli Türkiye ortalamasının yarısı kadar bir değere sahiptir. Traktör başına düşen tarım alanı kriterinde Bergama, Tire, Menderes ve Kınık ilçeleri İzmir ili ortalamasının altında değerlere sahiptir. Aynı kriterde Menemen, Torbalı, Selçuk, Beydağ ve Kemalpaşa ilçeleri ise İzmir ili ortalamasının üzerinde değerlere sahiptir. Güneş ve ark. (2020), Türkiye’de bulunan traktörlerin güç büyüklüklerinin 44 ila 52 kW arasında olduğunu bildirmiştir. Çalışmada elde edilen verilerin bu çalışmayı desteklediği görülmektedir. Özgüven ve ark. (2010) ile Mavioğlu ve Çobanoğlu (2019) yaptıkları çalışmalarda İzmir bölgesinde kullanılan traktörlerin güç ortalamalarının Türkiye ortalama değerlerinin üzerinde olduğunu bildirmişlerdir. Birim alana düşen traktör gücü kriteri incelendiğinde Ödemiş, Kınık, Menderes, Menemen, Bergama ve Tire ilçeleri İzmir il ortalamasından yüksek değerdedir. Bu durum kullanılan traktör güç grubunun yüksek sınıfta yer aldığı bir göstergesidir. Bu durum İzmir ili ve ilçelerinde tarımsal üretimde makine kullanımının yoğun olarak gerçekleştiğini desteklemektedir.

Tarımsal üretim yapılan alanlardaki azalmalar, artan beslenme ihtiyacını karşılamak üzere tarımsal üretimde makine kullanımının artması ile teknolojik ve bilimsel gelişmelerin üretim tekniklerini iyileştirmede kullanılması kaçınılmazdır. Verim artışı için akıllı tarım uygulamalarının çoğaltılması ve ortak makine kullanımının yaygınlaşması, farklı güç ihtiyaçlarını karşılayacak büyüklükte ve tipte traktör-makine kullanımının desteklenmesi, üretici sayısını ve üretim miktarını arttıracak tedbir ve teşviklerin alınması önemlidir.

Determination of Optimal Drying Characteristics for Color Quality Parameters of Carrot (*Daucus Carota* L.) at different drying temperatures

Hakan Polat¹, Hüsne Gök¹, Mehmetcan Olgaç¹

¹Biosystem Engineering Department, Faculty of Agriculture, Tokat Gaziosmanpaşa University, Tokat, TÜRKİYE

Abstract

Carrot production has an important place in our country and the world. Carrot, which has a fibrous structure, is generally used in salads, appetizers, desserts, meals, and vegetable juice mixtures. Frequently consumed carrots cannot be stored fresh for a long time. Therefore, it is important to preserve it by drying it. In this study, our purpose to determine the most suitable drying method and temperature by drying the carrot in an oven, vacuum, and laboratory-type convective dryer at 40-50-60-70°C drying air temperature and the shade in terms of color criteria and drying kinetics. According to the average drying times, it was determined that the longest drying time in the shade was 124 hours, and the shortest was 3 hours and 15 minutes at 40 °C in the laboratory-type convective dryer. Midilli Kucuk, Page, and Wang Sing equations were used in the modeling. In the modeling, the highest R² value was 0.9999 in the Midilli Kucuk equation, laboratory type convective dryer method, 40°C, 60°C, and 70°C drying temperatures, and Page equation, laboratory type convective dryer method, 40°C drying temperature. It was determined that the method that best preserves the color properties of the carrot is the laboratory-type convective dryer at 40°C drying air temperature.

Key Words: Carrot, Drying, Color, Modeling

Farklı kurutma sıcaklıklarında Havucun (*Daucus Carota* L.) Renk kalite Parametreleri İçin En Uygun Kuruma Karakteristiklerinin Belirlenmesi

Özet

Havuç üretimi ülkemizde ve dünyada önemli bir yere sahiptir. Lifli yapıya sahip olan havuç genellikle salatalarda, mezelerde, tatlılarda, yemeklerde ve sebze suyu karışımlarında kullanılmaktadır. Sıkça tüketilen havuç uzun süre taze halinde depolanamaz. Bundan dolayı kurutma işlemi yapılarak muhafaza edilmesi önemlidir. Bu çalışmada havucun etüvde, vakumda ve laboratuvar tipi konvektif kurutucuda 40-50-60-70°C kurutma havası sıcaklığında ve gölgede kurutularak renk kriterleri ve kuruma kinetiği açısından incelenip en uygun kurutma yönteminin ve sıcaklığının belirlenmesi amaçlanmıştır. Ortalama kuruma sürelerine göre en uzun gölgede kurutma ile 124 saat, en kısa ise laboratuvar tipi konvektif kurutucu da 40 °C sıcaklıkta 3 saat 15 dakika olduğu tespit edilmiştir. Modellemede Midilli Küçük, Page ve Wang Sing eşitlikleri kullanılmıştır. Modellemede en yüksek R² değeri 0.9999 olarak Midilli küçük eşitliğinde, laboratuvar tipi konvektif kurutucu yönteminde, 40°C, 60°C ve 70°C kurutma sıcaklıklarında ve Page eşitliğinde laboratuvar tipi konvektif kurutucu yönteminde, 40°C kurutma sıcaklığında görülmüştür. Havucun renk özelliklerini en iyi koruyan yöntemin ise laboratuvar tipi konvektif kurutucu 40°C kurutma havası sıcaklığında olduğu belirlenmiştir.

Anahtar Kelimeler: Havuç, Kurutma, Renk, Modelleme

1.Giriş

Havuç (*Daucus carota* L.), maydonozgiller familyasındandır. Anayurdu çoğu kaynağa göre değişiklik göstermektedir. Bazı kaynaklar havucun anayurdunun Avrupa olduğunu gösterirken bazı kaynaklarda da Kuzey Afrika ve eski Asya olarak bilinen Anadolu olarak belirtilmektedir.

İçerisinde bol oranda A vitamini bulunduran havuç B, C, D ve E vitaminleri yönünden de çok zengindir. Ayrıca içerisinde karoten, şeker ve fosfor barındırır. Güzel aroması, yüksek lif oranı, vitamin, antioksidan içeriği ve sağlık yönünden birçok faydalı etkisi ile insan beslenmesinde taze ve kurutulmuş olarak yaygın biçimde tüketilen sebzelerden biridir (Doymaz, İ., 2004; Gamboa-Santos ve ark., 2012).

En önemli kök sebzelerinden biri olan havuç, TÜİK (2022) verilerine göre 2015 yılında Türkiye’de 534.988 ton üretilmiş iken 2021 yılında yaklaşık %11 artış ile 590.483 ton üretime ulaşmıştır.

Bugün doğal bir gıda ve antioksidan kaynağı olan havucun tüketimi her geçen gün daha da çoğalmaktadır. Havuç ürünlerinin işlenmesi neticesinde elde edilen ürünler (kurutulmuş havuç, havuç suyu, havuç tozu ve havuç atıştırmalıkları) son zamanlarda araştırmacılar tarafından çokça araştırılmaktadır (Polat, 2019).

İnsanların yaşamlarını devam ettirebilmeleri için sürekli olarak enerji ihtiyaçlarını karşılamaları gerekmektedir. Bu nedenle enerji ihtiyaçlarını karşılayabilmek için bitkisel besinlerin kullanımına yönelmişlerdir. Hasat sonrasında taze mahsuller bulundurdıkları yüksek nem miktarı sebebiyle bir müddet sonra çürüme eğilimine girerler ve gerek fiziksel gerekse de biyokimyasal özelliklerinde bazı kayıplar meydana gelir. Bu kayıpları önlemek için birçok muhafaza yöntemi geliştirilmiştir. Bu yöntemlerden en uygun olanlarından biri de kurutarak muhafaza yöntemidir.

Kurutma; meyve veya sebzelerin bünyesinde bulundurduğu nemin uzaklaştırılması işlemidir (Ratti, 2001). Fazla nem uzaklaştırılarak mikroorganizmaların gelişimi engellenen seviyelere düşürülecektir (Cemeroğlu, 2004). Böylece raf ömrü daha uzun olacaktır.

Kurutma işlemi, genellikle doğada kendi halinde meydana gelmektedir. Güneşte yapılan kurutma işlemlerinde ürünlerin nem içeriklerini azaltmada bilinen en eski yöntemdir. Ancak açık havada kurutulan materyallerin toz toprak, böcekler, yağmur vb. olumsuz durumdaki çok kolay etkileneceği için ciddi kalite kayıpları yaşanmaktadır. Yaşanan bu kalite kayıpları global piyasada bazı ekonomik problemler oluşturmaktadır (Yaldız ve ark. 2001; Lahsasni ve ark. 2004; Sacilik ve Elicin 2006). Bu sebeple ülkemiz dünya piyasasındaki payını koruması ve arttırabilmesi adına kalite kayıplarının az yaşanacağı temiz şartlarda ürün kurutması gerekmektedir. Dünyada ticareti yapılan kurutulmuş ürünlerin %98'i kontrollü koşullar altında sıcak hava ile kurutulmaktadır. Sıcak havada kurutulan ürünler kaliteli ve doğrudan yenilebilir (Işık ve Alibaş, 2000). Bu çalışmada havuç; etüv, vakum ve laboratuvar tipi konvektif kurutucuda 40, 50, 60, 70 °C kurutma havası sıcaklıklarında ve gölge ortamında kurutularak en uygun kurutma yöntemi ve sıcaklığının belirlenip renk kriteri üzerine etkisinin araştırılması amaçlanmıştır.

2. Materyal Ve Yöntem

2.1. Kurutulacak Ürün

Çalışma materyali Tokat' ta bulunan yerel bir marketten temin edilmiştir. Tokat Gaziosmanpaşa Üniversitesi Biyosistem Mühendisliği kurutma laboratuvarına getirilmiş ve kurutma işlemleri bitene kadar ürünler $+4 \pm 0.5$ °C sıcaklığındaki buzdolabında muhafaza edilmiştir.

Şekil 1. Kurutma materyali taze havuç

2.2 Nem Tayini

Kurutma işlemine başlamadan önce havucun ilk nem seviyesini belirlemek için 100 gr örnek kullanılmıştır. Nem tayini 70 °C sıcaklıkta ürün ağırlığı sabitlenene kadar bekletilmiştir.

2.3. Kurutma Yöntemi

Çalışma kapsamında havuç; etüv, vakum, laboratuvar tipi konvektif kurutucu ve gölge ortamında olmak üzere dört farklı kurutma yöntemi kullanılmıştır. Etüv, vakum ve laboratuvar tipi konvektif kurutucularda 40, 50, 60 ve 70 °C kurutma havası sıcaklıkları kullanılarak kurutma işlemi yapılmıştır. Kurutma işlemi için üçer tekerrür ve her tekerrürde ortalama 125 g ürün kullanılmıştır. Kurutma esnasında ağırlık değişimlerini belirlenmesi için başlangıçta 30 dk daha sonra 60, 120, 180 ve 240 dk aralıklarla ölçüm alınmıştır. Ürünler 0.01 g hassasiyete sahip terazide tartılmıştır. Tartılan ürünler yaş baza göre %10-13 nem değerine düşene kadar kurutma işlemine devam edilmiştir (Polatçı ve Taşova 2017).

2.4. Etüv Kurutucu

Çalışmada kurutma denemesi için Şimşek Labortechnik marka / ST-120 model sıcak havalı kabin tip kurutucu etüv kullanılmıştır.

Şekil 2. Etüv kurutucu

2.5. Vakum Kurutucu

Kurutma denemeleri için CLS Scientific marka / CLVO-64T model vakumlu kurutucu kullanılmıştır.

Şekil 3. Vakum Kurutucu

2.6. Laboratuvar Tipi Konvektif Kurutucu

Denemede, Tokat Gaziosmanpaşa Üniversitesi Biyosistem Mühendisliği Bölümü Kurutma laboratuvarı bünyesinde bulunan kurutma denemeleri önce tasarlanıp Tokat sanayisinde imal edilen laboratuvar tipi konvektif kurutucu kullanılmıştır. Kurutma odası, üç adet kurutma kanalı ve kontrol panosu olmak üzere üç ana bölümden oluşmaktadır.

Şekil 4. Laboratuvar tipi konvektif kurutucu

2.7. Renk ölçümü

Taze ve kurutulmuş havuçların Minolta CR300 marka renk ölçer ile Hunter Lab Chromameter renk değerleri (L , a , b) ölçülmüştür. “ L ” parlaklığı ifade ederken “ a ” pozitifken kırmızıyı negatifken yeşili, “ b ” ise pozitifken sarıyı negatifken mavi renkleri ifade etmektedir (McGuire, 1992). Ölçümler sonucunda ortalama Hunter Lab Chromameter değerlerine DUNCAN testi yapılmıştır. Bu değerler tek başına piyasada direkt anlaşılan renk değerleri olmadığından insanların renk algılarına uyması için kroma, hue açısı, toplam renk değişimi ve kahverengileşme indeks değerleri ile hesaplanarak daha anlamlı hale getirilmiştir. Eşitlikler Çizelge 1’de verilmiştir.

Çizelge 1. Hesaplanan renk kriterlerine ait eşitlikler

Renk Değeri	Eşitlik	Kaynak
Croma, C	$C = (a^2 + b^2)^{1/2}$	Kavdır ve ark. (2007)
Hue, °	$h^\circ = \tan^{-1}\left(\frac{b}{a}\right)$	McGuire (1992)
Renk değişimi, ΔE	$\Delta E = \sqrt{(L_t - L_k)^2 + (a_t - a_k)^2 + (b_t - b_k)^2}$	Çakır (2015)
Kahverengileşme İndeksi	$BI = \frac{[100(x=0,31)]}{0,17}, x = \frac{a + (1,75xL)}{[(5,645xL) + (a = (3,012xb))]}$	Plou ve ark. (1999)

Kuruma modeli

Kurutulan havucun zamana bağlı ayrılan nem oranı değerlerini belirlemek için 1 no'lu eşitlik kullanılmıştır.

$$ANO = \frac{M - M_e}{M_0 - M_e} \quad (1)$$

ANO: Ayrılabilir nem oranı

M: Ürünün anlık nem içeriği (kg su/kg kuru madde)

M_e: Ürüne ait verilen durumdaki nem değeri (kg su/kg kuru madde)

M₀: Ürünün başlangıç nem içeriği

Havucun en uygun ince tabakalı kuruma eğrilerini belirlemek için Midilli Küçük, Page ve Wang-Sing eşitlikleri kullanılmıştır. SigmaPlot 10.0 programı kullanılarak oluşturulan modellere ait eşitlikler Çizelge 2'de verilmiştir.

Çizelge 2. İnce Tabakalı Matematiksel Kuruma Modelleri

Model ismi	Eşitlik	Kaynak
Midilli Küçük	$MR = h \cdot \exp(-j \cdot (t^k)) + (1 \cdot t)$	Midilli ve ark. (2002)
Page	$MR = \exp(-kt^n)$	Murthy ve Manohar (2014)
Wang Sing	$MR = 1 + k \cdot t + h \cdot t^2$	Wang ve Sing (1978)

İstatistiksel Analiz

Kurutma sıcaklıklarının havucun renklerine olan etkilerini belirlemek için SPSS paket programında $p < 0.05$ önem seviyesine göre, çoklu karşılaştırma analizi (DUNCAN) yapılmıştır.

3. Bulgular Ve Tartışma

3.1. Kuruma Verileri

Kurutulan havuç dilimlerinin yaş baza (y.b.) göre ortalama nem içeriği %87,91 olarak belirlenmiş ve son nem değeri %10-13 aralığına gelene kadar kurutma işlemine devam edilmiştir. Uygulanan kurutma yöntemlerindeki sıcaklık değerleri ürünün kuruma sürelerini etkilediği görülmüştür (Çizelge 3).

Çizelge 3. Havucun ortalama son nem değerleri (% yb) ile kuruma süreleri

Kurutma yöntemleri	Kurutma sıcaklıkları	Ortalama son nem değerleri %yb	Kurutma süreleri (dakika)
Etüv	40°C	10,82	3030
	50°C	10,46	1350
	60°C	10,32	570
	70°C	10,88	510
Vakum	40°C	9,98	5070
	50°C	11,33	2070
	60°C	12,07	810
	70°C	12,99	630
Laboratuvar Tipi Konvektif Kurutucu	40°C	10,80	335
	50°C	10,05	450
	60°C	11,54	315
	70°C	10,56	195
Gölge	-	12,89	7440

Çizelge 3'e göre, kurutma yöntemlerinin ürünün kuruma karakteristiklerini etkilediği görülmektedir. Materyalin bünyesindeki mevcut nemin istenilen aralığa gölge ortamında 124 saatte ulaştığı ve aynı zamanda kurutma yöntemleri arasında en uzun işlem olarak da belirlenmiştir. En kısa süren kurutma işlemi ise laboratuvar tipi konvektif kurutucuda 70 °C sıcaklıkta olduğu ve yaklaşık 3 saatte istenilen nem aralığına ulaştığı tespit edilmiştir.

3.2. Kuruma Modellerine Ait Katsayılar, "R²" ve "P" Değerleri

Kuruma modellerinde güvenilirlik değeri $p < 0.001$ olarak bulunmuştur. Tüm kurutma yöntemleri ve sıcaklıklarında hesaplanan en yüksek R² değeri en yüksek 0.9999 ile laboratuvar tipi konvektif kurutucu da 40, 60 ve 70 °C kurutma sıcaklığında Midilli Küçük modelinde belirlenmiştir. Yine laboratuvar tipi konvektif kurutucu da 40°C kurutma sıcaklığında Page modeli de en yüksek R² değerini (0.9999) vermiştir (Çizelge 4).

3.3. Renk Değerleri

Taze ve kurutulmuş havuç dilimlerine ait ölçülen ve hesaplanan renk değerleri ver Çizelge 5 ve Çizelge 6'da verilmiştir.

Çizelge 4. İnce tabakalı kurutma modellerine ait hesaplanan değerler

Model eşitlikleri	Kurutma yöntemi	Kurutma sıcaklıkları	R ²	p	k	h

Çizelge 5 incelendiğinde L, a ve b değerleri %5 önem seviyesinde tazeye göre istatistiki açıdan (P<0.05) farklı bulunmuştur. Fakat L değerine bakıldığında taze ile etüv 70 °C istatistiki açıdan benzer bulunmuştur. Çalışmada

a değerine bakıldığında; etüv 40°C ile 60°C, etüv 50 °C ile 70°C, vakum 60°C ile laboratuvar tipi konvektif kurutucuda 60°C ve laboratuvar tipi konvektif kurutucuda 40°C ile 50°C aralarında istatistiki açıdan bir farkın olmadığı tespit edilmiştir. b değeri incelendiğinde ise; etüv 40°C-50°C ile vakum 40°C, vakum 60°C ile laboratuvar tipi konvektif kurutucu 50°C-60°C aralarında istatistiki açıdan farklılık olmadığı tespit edilmiştir.

Çizelge 6. Hesaplanan renk değerleri

<i>Kurutma Yöntemi</i>	<i>Kurutma Sıcaklıkları</i>	<i>C</i>	<i>H,Derece</i>	<i>ΔE</i>	<i>BI</i>
Taze	-	42,81	90,98	-	-

Gölge	-	34,30	70,37	89,53	144,85

Çizelge 6 incelendiğinde kurutulan havucun taze havuca göre farklı oldukları belirlenmiştir. Renk doygunluğunu gösteren kroma değeri 42,81 olarak bulunmuştur. Demiray (2015) tarafından yapılan çalışmada kroma değeri ortalama 33,79 bulunmuştur ve bu çalışmada bulunan değere yakın değerler elde edilmiştir. En düşük kroma değeri 25,16 ile laboratuvar tipi konvektif kurutucuda 70°C kurutma havası sıcaklığında gözlemlenmiştir. En yüksek kroma değeri ise 43,64 ile laboratuvar tipi konvektif kurutucuda 40°C kurutma havası sıcaklığında bulunmuştur ve tazeye en yakın değer olduğu görülmektedir. Bulgulara göre havuç kurutma işleminde laboratuvar tipi konvektif kurutucuda 70 °C kurutma havası sıcaklığının seçilmesinin renk değeri açısından daha uygun olacağı ve kuruma süresinin de kısa olacağı belirlenmiştir.

Taze havucun hue açısı 90,98 olarak bulunmuştur. Çalışmada en düşük hue açısı laboratuvar tipi konvektif kurutucuda 70°C kurutma havası sıcaklığında 50,21 bulunmuştur. En yüksek hue açısı ise laboratuvar tipi konvektif kurutucuda 40°C kurutma havası sıcaklığında 89,42 olarak tespit edilmiştir.

Toplam renk değişimi en yüksek laboratuvar tipi konvektif kurutucuda 40 °C’ de 113,79 olarak ölçülürken en düşük laboratuvar tipi konvektif kurutucuda 70°C’ de 64,02 olarak ölçülmüştür.

Kahverengileşme indeksinin (BI) en düşük değeri laboratuvar tipi konvektif kurutucuda 40 °C’ de 103,52, en yüksek değeri ise laboratuvar tipi konvektif kurutucuda 70°C’ de 184,10 olarak bulunmuştur.

4. Sonuç

Yapılan bu çalışmada havuç gölge ortamında, etüvde, vakumda ve laboratuvar tipi konvektif kurutucuda 40, 50, 60 ve 70°C kurutma havası sıcaklıkları kullanarak kurutulmuş en iyi renk değerleri ile kuruma kinetiği belirlenmiştir. Havucun kuruma parametreleri göz önünde bulundurulduğunda en kısa kuruma süresi laboratuvar tipi konvektif kurutucuda 70°C kurutma havası sıcaklığında 3 saat 15 dakika olarak tespit edilmiştir. Modelleme sonuçlarına bakıldığında en yüksek R² değeri Midilli küçük eşitliğinde, laboratuvar tipi konvektif kurutucu yönteminde, 40°C, 60°C ve 70°C kurutma sıcaklıklarında ve Page eşitliğinde laboratuvar tipi konvektif kurutucu yönteminde, 40°C kurutma sıcaklığında görülmüştür. Renk kriteri açısından taze havucun özelliklerini en iyi koruyan, en yakın değer laboratuvar tipi konvektif kurutucuda 40°C kurutma havası sıcaklığında olduğu bulunmuştur. Bu nedenle havuç için renk açısından en iyi düşük sıcaklıklarda kurutma olduğu belirlenmiştir.

Abstract

Food systems imply a sequence of processes to fulfill the demand for food, which ranges from farming, processing, distributing to final use. With increasing globalization of the food supply chain, supply chain service providers must consider the full potential for lapses in safety controls. The setting of global freight distribution systems has enabled a wider scale and scope for the commercialization of agricultural goods. A food system can be articulated as a supply chain that reveals much about the global structure of production and consumption. We studied in the presentation about the countries satisfy domestic food consumption by importing from foreign supplies, therefore, highlighting the function of food exports in maintaining and diversifying the global food supply in the age of globalisation,

Investigation of Agricultural Machinery Usage and Agricultural Production in İzmir

Yaşar Serhat Saygili¹, Bülent Çakmak¹

¹Agricultural Machinery and Technologies Engineering Department, Faculty of Agriculture, Ege University, İzmir, Turkey

Abstract

Izmir Province is in the Aegean Region and is the third most populous city in Turkey in terms of population. In this study, statistical data between 2004 and 2021 of plant products produced in Izmir and agricultural machinery used in production stages were used. In the examination of agricultural areas, fruits, beverage and spice crops area, fallow area, vegetable area, ornamental plants area, cereals and other vegetable products area and greenhouse agricultural area criteria were taken into consideration. When the year 2004 is taken as a reference, it is seen that the total production areas have decreased over the years. A loss of 8.17% was calculated in 2021. While there was an increase in the criteria of fruits, beverage and spice plants area (8.02%), ornamental plants area (18.47%) and greenhouse agricultural area (73.06%), fallow area (24.02%), vegetable area (32.22%) and cereals and other vegetable products area (15.82%) decreased. With the decrease in fallow areas, there is an increase in the areas where production is made. It also shows that changes in product patterns lead manufacturers to the production of products with high added value. In 2021, 45.24% of the agricultural production areas are fruits, beverages and spice plants, 43.62% are cereals and other vegetable products, 9.45% are vegetable areas, 0.77% are fallow areas, 0.51% are ornamental plants areas and 0.41% are covered agricultural areas. When tractors (28.13%), harvesters (150.00%) and agricultural machinery (21.81%) used in agricultural production were examined, it was seen that their numbers increased over the years. In the total number of agricultural machinery, tillage group has 29.22%, maintenance, fertilization and spraying group has 25.32%, irrigation group has 22.35%, other machines have 13.58%, sowing and planting group has 5.40% and harvesting and threshing machinery group has 4.11%. The number of agricultural machines per tractor was calculated as 9.33.

Key Words: *Izmir, Vegetative Production, Agricultural Machinery.*

İzmir İlinde Üretilen Tarımsal Ürünler ve Kullanılan Tarım Makinelerinin İncelenmesi

Özet

İzmir İli, Ege Bölgesinde yer almaktadır ve Türkiye'nin nüfus bakımından üçüncü en kalabalık şehridir. Bu çalışmada, İzmir İlinde üretilen bitkisel ürünler ve üretim aşamalarında kullanılan tarım makinalarına ait 2004–2021 yılları arasındaki istatistiksel verileri kullanılmıştır. Tarım alanlarının incelenmesinde; meyveler, içecek ve baharat bitkileri alanı, nadas alanı, sebze alanı, süs bitkileri alanı, tahıllar ve diğer bitkisel ürünlerin alanı ile örtüaltı tarım alanı kriterleri dikkate alınmıştır. 2004 yılı referans alındığında, toplam üretim alanlarının yıllar içerisinde azaldığı görülmektedir. 2021 yılında %8,17'lik bir kayıp hesaplanmıştır. Meyveler, içecek ve baharat bitkileri alanı (%8,02), süs bitkileri alanı (%18,47) ile örtüaltı tarım alanı (%73,06) kriterlerinde artış görülürken, nadas alanı (%24,02), sebze alanı (%32,22) ile tahıllar ve diğer bitkisel ürünlerin alanı (%15,82) kriterlerinde azalış görülmüştür. Nadas alanlarındaki azalma ile üretim yapılan alanlarda artış görülmektedir. Ayrıca ürün desenlerindeki değişikliklerin üreticilerin katma değeri yüksek ürünlerin üretimine yöneldiği sonucunu göstermektedir. 2021 yılında tarımsal üretim alanlarının %45,24'ünü meyveler, içecek ve baharat bitkileri alanı, %43,62'sini tahıllar ve diğer bitkisel ürünlerin alanı, %9,45'ini sebze alanı, %0,77'sini nadas alanı, %0,51'ini süs bitkileri alanı ve %0,41'ini de örtüaltı tarım alanı oluşturmaktadır. Tarımsal üretimde kullanılan traktörler (%28,13), biçerdöverler (%150,00) ve tarım makineleri (%21,81) incelendiğinde yıllar içerisinde sayılarında artış olduğu görülmüştür. Toplam tarım makinaları sayısı içerisinde toprak işleme grubu %29,22, bakım, gübreleme ve ilaçlama grubu %25,32, sulama grubu %22,35, diğer makineler %13,58, ekim ve dikim grubu %5,40 ve hasat ve harman makinaları grubu ise %4,11'lik orana sahiptir. Traktör başına düşen tarım makinası sayısı ise 9,33 adet olarak hesaplanmıştır.

Anahtar Kelimeler: *Izmir, Bitkisel üretim, Tarım makineleri*

Giriş

Her geçen gün artmakta olan dünya nüfusunu beraberinde beslenme ihtiyacının karşılanmasında artış getirmektedir. Tarım üretim alanlarındaki ve bu sektörde çalışan işgücünde görülen azalmalar bu ihtiyacın karşılanmasında yeni önlemler alınmasına sebebiyet vermektedir. Bu durumun önlenmesi için tarımsal üretim yapılan alanlardan daha verimli ve daha yüksek miktarda üretimin gerçekleştirilmesi gerekmektedir. Mevcut koşullar altında, yükselen talebin eldeki kısıtlı alanlarda yapılan üretimde, modern metotların ve makinaların kullanılması ile etkin ve ekonomik olarak yapılarak arz artışıyla karşılanması gereklidir (Comart ve Akıncı, 2017). Üretilen tarımsal ürünlerde verim ve kapasite artışı ise; etkin ve modern üretim metodunun seçimi, kaliteli tohumluk kullanımı, su ve toprak kaybını azaltan ve/veya korunmasını sağlayan metotların seçimi, girdi maliyetini azaltmak için değişken düzeyli uygulamaların temel amacı olan doğru zaman ve yerde doğru miktarın uygulanması

ile akıllı tarım uygulamaları ile kontrolü sağlanabilen makinelerin kullanılması olarak sıralanabilir (Baran ve ark., 2014; Bilim ve ark., 2014; Özgünaltay Ertuğrul ve ark., 2019; Altuntaş, 2020; Güneş ve ark., 2020; Ertekin ve ark., 2021).

İzmir ili, Ege Bölgesinde yer almakta olup Türkiye'nin nüfus bakımından üçüncü en kalabalık şehridir. 2021 yılı TÜİK verilerine göre şehrin nüfusu 4 425 789 kişi olup, 11 891 km²'lik yüz ölçümüyle Türkiye'nin yirmi üçüncü büyük şehridir (İZKA, 2022b). Akdeniz ikliminin hâkim olduğu bölgede yıllık toplam yağış ortalaması 713,8 mm, yıllık yağışlı gün ortalaması ise 84,2 gündür (MGM, 2022). Bu çalışmada da İzmir ili ve ilçelerinde tarımsal üretim faaliyetleri ve bu faaliyetler için kullanılan makineler değerlendirilmiştir.

Şekil 1. İzmir ili ve ilçeleri (Anonim, 2022)

Materyal ve Yöntem

Çalışmanın materyalini, Türkiye İstatistik Kurumu'ndan alınan 2004-2021 yılları arasında İzmir ili ve ilçelerindeki bitkisel üretim alanları ile tarımsal üretim faaliyetlerinde kullanılan traktörlere ait istatistik verileri oluşturmaktadır.

Çalışmanın yöntemini, İzmir iline ait tarım alanları, tarım traktörleri ve tarım makineleri sayılarının verilerin kullanılarak tarımsal mekanizasyon düzeyinin belirlenmesidir. Tarımsal mekanizasyon düzeyinin belirlenmesinde kullanılan ölçüt, Traktör başına düşen tarım makinası (makina traktör⁻¹)'dür.

Bulgular ve Tartışma

İzmir, 1 adet büyükşehir belediyesi ve 30 adet ilçe belediyesi bulunan ve tarımsal üretim yapan işletmelerin ortalama parsel büyüklüğü 3,7 ha olan, Türkiye'nin bitkisel üretiminin %3.1'nin yapıldığı bir ildir. Tarımsal üretim yapılan alanlar büyüklüklerine göre büyükten küçüğe doğru, Ödemiş, Bergama, Bayındır, Torbalı, Tire, Menderes, Kemalpaşa, Menemen, Kiraz, Selçuk, Dikili, Kınık, Seferihisar, Aliaga, Urla, Beydağ, Foça, Karaburun, Buca, Çeşme, Bornova, Güzelbahçe, Çiğli, Karabağlar, Karşıyaka, Gaziemir, Balçova, Narlıdere, Bayraklı ve Konak olarak sıralanmaktadır. Büyükşehir belediyesi sınırlarına ve şehir merkezlerine yaklaştıkça tarım alanlarında azalma görülmekte ve Konak ilçesinde tarım alanına ait bir veri bulunmamaktadır. Toplan tarım alanları incelendiğinde 2021 yılı içerisinde üretilen ürün gruplarına göre; meyveler, içecek ve baharat bitkileri birinci sırada yer alırken, tahıllar ve diğer bitkisel ürünler ikinci sırada, sebzeler üçüncü, nadas alanı dördüncü, süs bitkileri

beşinci ve örtü altı üretim alanı ise altıncı sırada yer almaktadır. 2004-2021 yılları arasındaki veriler Tablo 1’de yer almaktadır. 2021 yılı İzmir il geneline ait Tarımsal ürün gruplarına göre dağılım Şekil 2’de verilmiştir. İzmir ili toplam tarım alanları incelendiğinde, meyveler, içecek ve baharat bitkileri alanı %45,31, tahıllar ve diğer bitkisel ürünlerin alanı %43,53, sebze alanı %9,47, süs bitkileri alanı %0,51, nadas alanı %0,77, örtüaltı %0,41’lik oranlara sahip olduğu görülmektedir.

Tablo 1. İzmir ili Tarım alanları gruplarına göre dağılımı

YIL	Meyveler, İçecek Ve Baharat Bitkileri Alanı	Nadas Alanı	Sebze Alanı	Süs Bitkileri Alanı	Tahıllar Ve Diğer Bitkisel Ürünlerin Alanı	Örtüaltı Tarım Alanı
2004	135 451	3 290	45 092	0	167 607	761,6
2007	139 522,1	3 008,5	39 613,3	0	161 897,1	754
2010	140 622,7	4 409,3	41 148,6	0	162 919	852,2
2014	146 925,2	3 564,5	40 844,6	1 389,88	137 050,7	1 499,38
2017	147 803	3 028	38 449,3	1 545,85	137 847,4	1 528,7
2020	150 102,5	2 317,7	35 940,7	1 636,47	135 700,9	1 760,4
2021	146 312,6	2 499,9	30 564,3	1 646,56	141 083,4	1 318,04

Şekil 2. 2021 yılı İzmir ili tarım alanları dağılımı

Tahıllar ve diğer bitkisel ürünler, buğday, mısır, arpa, çavdar, yulaf, triticale, pamuk, susam, ay çekirdeği, tütün, fiğ, burçak, yonca, patates, italyan çimi ’dir. Meyveler, içecek ve baharat bitkileri, üzüm, avokado, muz, incir, greyluft (altıntop), limon, portakal, mandalina, elma, armut, ayva, kayısı, zerdali, kiraz, vişne, şeftali, nektarin, erik, kivi, ahududu, çilek, böğürtlen, dut, badem, kestane, antep fıstığı, ceviz, muşmula, nar, trabzon hurması, zeytin, anason, kekik ’dir. Sebze, fasulye, barbunya, bezelye, börülce, bakla, lahana, karnabahar, brokoli, marul, ıspanak, enginar, maydanoz, roka, tere, nane, dereotu, karpuz, kavun, biber, domates, kabak, bamya, hıyar, patlıcan, havuç, sarımsak, soğan, pırasa, mantar ’dır. Süs bitkileri olarak kesme çiçekler, iç mekân ve dış mekân çiçek fideleri yetiştirilmektedir.

2021 yılında en çok tarımsal üretim yapılan ilçeler Ödemiş, Bergama, Bayındır, Torbalı, Tire, Menderes, Kemalpaşa, Menemen, Kiraz, Selçuk, Dikili ve Kınık ilçeleridir. Bu ilçeler İzmir ilinin tarımsal üretim alanlarının %85,89’luk kısmını oluşturmaktadır. 2021 yılına ait verilerden elde edilen İzmir ilinde kullanılan tarım makinalarının grupları ve mevcut verileri Tablo 2’de verilmiştir. İzmir ilinde tarımsal üretimde kullanılan traktör sayısı toplamı 39 578 adettir. Bu traktörler incelendiğinde farklı tiplerde olduğu ve güç grupları içerisinde yer aldıkları görülmektedir. Traktör başına düşen makine sayısı grup bazında incelendiğinde; toprak işleme grubu 2,72 adet, ekim ve dikim grubu 0,50 adet, bakım, gübreleme ve ilaçlama grubu 2,36 adet, hasat ve harman grubu 0,38 adet, sulama makine ve sistemleri grubu 1,27 adet ve diğer makineler ise 1,27 adettir.

Tablo 2. 2021 yılında İzmir ilinde kullanılan Tarım Makinaları Dağılımı (adet)

Toprak işleme grubu	Ekim ve dikim grubu	Bakım, Gübreleme ve İlaçlama Grubu	Hasat ve Harman Grubu	Sulama Grubu	Diğer	Toplam
107 787	19 913	93 539	15 149	82 450	50 105	368 943
%29,22	%5,40	%25,37	%4,10	%22,34	%13,57	%100,00

Tarım makineleri içerisinde toprak işleme makineleri grubu en çok adede sahip olan makine grubu olarak öne çıkmaktadır. Tarım makineleri sayısında en büyük oran sahip olan toprak işleme makineleri verileri içerisinde, kulaklı traktör pulluğu (31599 adet), dişli tırmık (18713 adet), diskli tırmık (diskaro) (16086 adet), kültivatör (12516 adet), ark açma pulluğu (9288 adet), Toprak frezesi (rotovator) (3852 adet), diskli traktör pulluğu (2751 adet), kepçe (2186 adet), set yapma makinesi (1857 adet), merdane (1817 adet), kombikürüm (1633 adet), dip kazan (subsoiler) (1371 adet), toprak tesviye makinesi (1319 adet), rototiller (1187 adet), toprak burgusu (564 adet), diskli anız pulluğu (vanvey) (524 adet) ve kulaklı anız pulluğu (524 adet) bulunmaktadır. Toprak işleme makinelerinin %29,32'lik kısmını oluşturan kulaklı traktör pulluğunu, %17,36'lık kısmını oluşturan dişli tırmık, %14,92'lik kısmını oluşturan diskli tırmık(diskaro) ve %11,61'lik kısmını oluşturan kültivatörler izlemektedir. Toprak işleme grubu özelinde traktör başına düşen makine sayısı; kulaklı traktör pulluğu için 0,80 makine traktör⁻¹, dişli tırmık için 0,47 makine traktör⁻¹, diskli tırmık (diskaro) için 0,41 makine traktör⁻¹, kültivatör için 0,32 makine traktör⁻¹, ark açma pulluğu için 0,23 makine traktör⁻¹ ve toprak frezesi için 0,10 makine traktör⁻¹ değerlerine sahiptir.

Ekim ve dikim makinelerine ait veriler, traktörle çekilen hububat ekim makinesi, kombine hububat ekim makinesi, pnömatik ekim makinesi, universal ekim makinesi, anıza ekim makinesi ile patates dikim ve fide dikim makinelerini kapsamaktadır. Bu gruptaki makinelerin %82,89'lık kısmını ekim makineleri %17,11'lik kısmını ise dikim makineleri oluşturmaktadır. Ekim ve dikim makineleri içerisinde universal ekim makineleri (13589 adet) en büyük dilimi oluşturmaktadır. Bu makineyi sırasıyla, patates dikim (2886 adet), pnömatik ekim (1579 adet), traktörle çekilen hububat ekim (712 adet), kombine hububat ekim (539 adet), fide dikim (522 adet) ve anıza ekim (86 adet) makinesi takip etmektedir. Traktör başına düşen makine kriterinde ise; universal ekim makinesi için 0,34 makine traktör⁻¹, patates dikim makinesi için 0,07 makine traktör⁻¹, pnömatik ekim makinesi için 0,04 makine traktör⁻¹, traktörle çekilen hububat ekim makinesi için 0,02 makine traktör⁻¹ ve diğer makineler için 0,01 makine traktör⁻¹ değerleri hesaplanmaktadır. Bu durum tarımsal üretim yapan işletmelerin ekim ve dikim makineleri kullanımı için ortaklaşa makine kullanımı gerçekleştirdiğini göstermektedir.

Bakım, gübreleme ve ilaçlama makineleri grubunda üç ayrı işlemi gerçekleştiren makine grubu yer almaktadır. Bu grupların toplam sayı içerisindeki oranları tipleri, gübreleme (%17,75), ilaçlama (%67,92) ve bakım (%14,34) olarak sayılabilir. Gübreleme makinelerini çiftlik gübresi dağıtma ve kimyevi gübre dağıtma makineleri oluşturmaktadır. Traktör başına düşen makine sayısı kriterinde; çiftlik gübresi dağıtma makinesi için 0,01 makine traktör⁻¹ ve kimyevi gübre dağıtma makinesi için 0,41 makine traktör⁻¹ sayısı hesaplanmaktadır. İlaçlama makinelerini, sırt pulverizatörü (37 752 adet), kuyruk milinden hareketli pulverizatör (10 586 adet), atomizör (9 338 adet), motorlu pulverizatörler (4819 adet), kombine atomizör (550 adet) ve tozlayıcı (483 adet) oluşturmaktadır. Traktör başına düşen ilaçlama makinesi değeri ise kuyruk milinden hareketli pulverizatörler için geçerli olup 0,27 makine traktör⁻¹ değerine sahiptir. Bakım işlemlerinin gerçekleştiren ara çapa makinesi ise 0,34 makine traktör⁻¹ değerindedir. İlaçlama işlemlerinde sırt pulverizatörü kullanımının, gübreleme işlemlerinde mineral gübre kullanımının yaygın olduğu eldeki verilerle desteklenmektedir.

Hasat ve harman makineleri grubunda farklı işlemleri gerçekleştiren makinelerin olduğu görülmektedir. Bu işlemler; tahıl hasadı için orak makinesi, biçer bağlar makinesi, mısır silaj makinesi, mısır hasat makinesi, harmanlama için tınaz makinesi, sap döver ve harman makinesi (batöz), mısır daneleme makinesi, motorlu tırpan, balya makinesi, saman yapma makinesi, meyve hasat makinesi, patates sökme makinesi, pancar sökme makinesi, ot silaj makinesi, pamuk toplama makinesi ve motorlu tırpan olarak sıralanabilmektedir. Traktör başına makine sayısı kriteri; mısır silaj makinesi için 0,11 makine traktör⁻¹, patates sökme makinesi için 0,07 makine traktör⁻¹, traktörle çekilen çayır biçme makinesi için 0,03 makine traktör⁻¹ ve ot silaj makinesi için 0,03 makine traktör⁻¹'tür. Sulama makineleri incelendiğinde sulama makinelerini, santrifüj pompa, elektropomp, motopomp ve derin kuyu pompa olarak sıralamak mümkündür. Sulama tesisleri incelendiğinde ise yağmurlama ve salma sulama tesisleri görülmektedir. Sulama makineleri ve tesislerine ait toplam sayı incelendiğinde makineler %71,20'lik paya sahipken, tesisler %28,20'lik kısmını oluşturmaktadır. Sulama makineleri sayısında ise derin kuyu pompalar 28 321 adet ile %48,24 oranını, elektropomplar 19 839 adet ile %33,80 oranını, motopomplar 6059 adetle %10,32 oranını ve santrifüj pompalar 4484 adetle %7,64'lük oranı oluşturmaktadır. Tesislerin içerisinde ise damla sulama tesisi %86,88'lik kısmı 20 631 adetle oluştururken %13,12'lik oranı yağmurlama sulama tesisleri 3116 adetle oluşturmaktadır. Bu durum tarımsal üretim yapan çiftçilerin bilinç düzeyinin yüksek olduğunu ve su kullanımını azaltmayı hedeflediğini göstermektedir.

Diğer makineler olarak adlandırılan grupta ise, römork, su tankeri, yem hazırlama makinesi, sap parçalama makinesi ve yem dağıtıcı römorklar yer almaktadır. Traktör başına düşen römork sayısı 0,84 makine traktör⁻¹ ve su tankeri sayısı ise 0,28 makine traktör⁻¹ değerine sahiptir. Yem hazırlama makinesi 2258 adet ve yem dağıtıcı

römork ise 1661 adet olarak görülmektedir. Bu makineler haricinde sap parçalama makinesi sayısı 1594 adet olarak bulunmuştur.

Tarımsal üretimde kullanılan traktörler (%28.13), biçerdöverler (%150.00) ve tarım makineleri (%21.81) incelendiğinde yıllar içerisinde sayılarında artış olduğu görülmüştür. Toplam tarım makinaları sayısı içerisinde toprak işleme grubu %29.22, bakım, gübreleme ve ilaçlama grubu %25.32, sulama grubu %22.35, diğer makineler %13.58, ekim ve dikim grubu %5.40 ve hasat ve harman makinaları grubu ise %4.11'lik orana sahiptir. Traktör başına düşen toplam tarım makinası sayısı ise 9.33 adet olarak hesaplanmıştır. Gökdoğan (2012), yaptığı çalışmada Türkiye'de traktör başına düşen makine sayısının 5,20 makine olduğunu bildirmiştir. Bu durum İzmir ili ve ilçelerinde tarımsal üretimde makine kullanımının yoğun olarak gerçekleştiğini desteklemektedir.

Abstract

New commerce ecosystems such as social media platforms and all-in-one apps are also becoming incredibly powerful ways to connect to and engage with consumers. E-commerce sales have been rising yearly and during Covid-19 more consumers began shopping online in greater numbers and frequency. Food Industry professionals also believe that this is a permanent change. In this presentation, we focus on the use of electronic commerce for quality control and cost cutting efficiencies by the food and agricultural industries such as daily food products in the world.

Keywords: E-commerce, Food, Daily Food.

Impact of Microplastic Pollution on Biota in the coastline of Turkey

Koraltan İ. ve Güven O.²

¹Fen Bilimleri Enstitüsü, Akdeniz Üniversitesi, Antalya, Türkiye (Institute of Natural and Applied Sciences, Akdeniz University, Antalya, Türkiye)

²Su Ürünleri Fakültesi, Akdeniz Üniversitesi, Antalya, Türkiye (Faculty of Fisheries, Akdeniz University, Antalya, Türkiye)

Abstract

Plastics are high demand raw material with applications in many industries due to their low costs and easily processable structures. Increasing plastic production in line with the high demand and inadequate waste management of plastic waste gives rise to accumulation of these wastes in terrestrial and aquatic ecosystems. It has been reported that microscopic size plastics (microplastics) (<5 mm) which were either produced intentionally in response to sectoral needs or formed by the degradation of large plastic wastes as a consequence of physical, chemical and biological environmental factors cause significant problems in aquatic ecosystems.

The aim of present study is to reveal the impact of microplastic pollution on biota in the Turkish coastline by evaluation of a data set, created by expanding the scope our biota exposure data with the available information gathered from scientific database platforms (Web of Science, Scopus, and TR index). With the final dataset, we were able to evaluate the impact of the pollution on 13422 individuals belonging to 54 species at a regional sea system level. Results of the study highlights impact of microplastic pollution on biota through the Turkish coastline and the reveals the data gaps and hot pollution spots in regional level. This information has the ability to guide researchers in the process of determining areal coverage of their future studies.

Türkiye Sahil Şeridinde Mikroplastik Kirliliğinin Biyota Üzerine Etkisi

Özet

Plastikler ucuz maliyetleri ve kolaylıkla işlenebilir yapıları sebebiyle, günümüzde birçok sektörel uygulamada tercih edilen bir hammadde. Talep doğrultusunda her geçen gün artan plastik üretimi ve kullanım ömrünü tamamlaması ardından atık niteliği kazanan plastik malzemelerin yönetiminin gereği gibi yapılmaması sebebiyle doğal ortama ulaşan bu atıklar karasal ve sucul ekosistemlerde birikim göstermektedir. Gerek sektörel gereksinimi cevaben kasıtlı üretilen, gerekse de fiziksel, kimyasal ve biyolojik faktörler etkisinde büyük plastik atıkların bozunumuyla oluşan mikroskobik boyuttaki (<5 mm) plastiklerin (mikroplastikler) yapılan bilimsel değerlendirmeler neticesinde sucul ekosistemlerde önemli sorunlara neden olduğu raporlanmıştır.

Sunulan bu çalışmada, kendi çalışmalarımızdan oluşturduğumuz veri bankasındaki bilgilere ek olarak bilimsel veri tabanı platformlarında (Web of Science, Scopus ve TR dizin) yapılan literatür taramaları neticesinde ülkemiz denizlerinde günümüze kadar yapılmış olan ve denizel biyotanın mikroplastik kirliliğinden etkilenme durumunu araştıran çalışmaların incelenmesiyle oluşturulan veri setinin analizi gerçekleştirilmiştir. Bu kapsamda 54 türe ait 13422 birey mikroplastik kirliliğinden etkilenme durumu göz önüne alınarak ülkemiz denizlerinde var olan mikroplastik kirliliğinin biyota üzerine etkisi bölgesel ve deniz bazında ortaya konulmuştur. Yapılan değerlendirmeye veri eksiklikleri gösterilmiş ve gelecekte dizayn edilecek çalışmalara dair öneriler sunulmuştur.

Effects of Tetracycline Exposure on *Neocaridina Davidi* Behavior, Reproduction, and Morphology

Sude Günel¹, Yağmur Parlatan¹, Yağmur Esentur¹, Bengü Ertürk¹, Çiğdem Akın Pekşen¹

¹Molecular Biology and Genetics, Faculty of Science and Letters, Baskent University, Ankara, Turkey

Abstract

Neocaridina davidi, with its non-aggressive behavior and red color, is a freshwater shrimp type and its gender can be easily determined by physical appearance. *N. davidi* are used as model organisms because of various reasons; these freshwater shrimps are easy to look after and breed. Also, their behavioral patterns, morphology, and reproductive habits can be observed, however, there are not enough studies regarding these.

Tetracycline is an antibiotic that is widely used in agriculture and its waste is released into nature. Tetracycline is toxic and as an ecotoxic agent, its behavioral and morphological effects on organisms are unknown. That's why in this study, the behavioral, morphological, and reproductive effects of tetracycline on *N. davidi* have been observed and statistical analyses were made for all four groups; the control group and three different exposure rates 25µg/L, 50µg/L, 100µg/L. All exposure groups had 10 *N. Davidi*, 6 female 4 male, and 100µg/L was determined as the lethal dosage.

It has been shown that the survival rate of *N. davidi* got affected by exposure to tetracycline. Especially when the exposure rate was 50µg/L and 100µg/L. After tetracycline exposure, a total of 10 deaths have been recorded in these two groups.

Reproduction frequency and amount of hatchlings also dropped. Aggressive behavior like attacking pregnant females and eating hatchlings was seen on 25µg/L and 50µg/L groups after 2 weeks and these behavior patterns continued for about 3 weeks.

To sum up, after exposure to different dosages of tetracycline; behavioral, reproductive, and morphological traits of *N. Davidi* got affected.

Key Words: *Neocaridina davidi*, tetracycline, behavior, reproduction, morphology, fresh water.

Tetrasiklin Maruziyetinin *Neocaridina davidi* Davranışı, Üremesi ve Morfolojisi Üzerindeki Etkileri

Özet

Tatlı su karideslerinden biri olarak tanınan *Neocaridina davidi* 2-2.5 cm boylarında ve doğada kırmızı renkleri ile ünlüdür. Agresif olmayan *N. davidi*'lerin cinsiyet ayrımı gözle ayırt edilebilir. Model organizma olarak *N. davidi* seçiminde rol alan birçok sebep bulunmaktadır. Öncelikle tatlı sularda yaşayan *N. davidi*, yetiştirmesi kolay olup davranış, üreme ve morfolojileri gözlemlenebilecek ancak bu konular üzerinde çok fazla çalışma yapılmamış canlılardır. Tetrasiklin antibiyotiği hem tarımsal olarak kullanılmakta hem doğaya atık olarak salınan bir antibiyotiktir. Toksik etkileri olduğu bilinen ve ekotoksik bir ajan olarak sayılan bu antibiyotiğin canlılar üzerindeki hem morfolojik hem de davranışsal etkileri birçok araştırmada incelenmektedir. Bu projede de bu antibiyotiğinin bir model organizma olan *Neocaridina davidi* üzerindeki davranışsal ve morfolojik etkileri gözlemlenmiştir ve 25µg/L, 50µg/L, 100µg/L ile kontrol grubu için istatistiksel analizler gerçekleştirilmiştir. Tüm maruz bırakılan gruplarda 6 dişi, 4 erkek olacak şekilde toplamda 10 *N. Davidi* bulundurulmuştur ve bunun sonucunda 100µg/L, lethal doz olarak belirlenmiştir.

Tetrasiklin maruziyeti sonucunda *N. Davidi* hayatta kalma oranının etkilendiği görülmüştür. Özellikle de 50µg/L ve 100µg/L tetrasikline maruz bırakılan gruplar en çok etkilenmiştir. Tetrasiklin maruziyeti sonrasında her iki grubun toplamında 10 ölüm kaydedilmiştir.

Üreme sıklığı ve yavru sayısı da tetrasiklin maruziyeti sonucunda düşüşe uğramıştır. Aynı zamanda hamile dişilere saldırma ve yavruları yeme gibi agresif davranışlar, 2 haftanın sonunda hem 25µg/L, hem 50µg/L maruz bırakılan grupta görülmüştür ve bu davranış özellikleri yaklaşık 3 hafta boyunca devam etmiştir.

Sonuç olarak bakıldığında, farklı tetrasiklin dozlarına maruz kalan *N. Davidi* 'lerde; davranış, üreme ve morfolojik özelliklerinde değişiklikler olduğu görülmüştür.

Anahtar Kelimeler: *Neocaridina davidi*, Tetrasiklin, davranış, üreme, morfoloji, tatlı su

Production And Characterization of Carboxymethyl Cellulose (CMC)/ Gelatine (GLT)/ Tara Gum (TG) Biomedical Films Enriched with Smoke Tree Leaf Extract

Merve Kalaycı, Suzan Biran Ay

Department of Chemical Engineering, Engineering Faculty, Eskisehir Technical University, Eskisehir, Turkey

Abstract

In this study, the synthesis biomedical films containing different natural polymers, which have the potential to be used as a wound dressing, was studied. The films were produced by the solvent casting method. In the formulation optimization studies, carboxymethyl cellulose (CMC), gelatin (GLT), tara gum (TG) polymers and glycerol (GLY), as a plasticizer, were used. Smoke tree (*Cotinus coggygria*) leaf extract, which has wound healing properties, and AgNO₃, were added to the polymer mixtures, resulting in simultaneous green synthesis of silver nanoparticles (AgNP). The obtained biomedical films were characterized by measuring their thickness, opacity, percent elongation and tensile strength, water vapor permeability (WVP), solubility, and moisture holding capacity. Furthermore, they were analyzed by thermogravimetric analysis (TGA), Fourier Transform Infrared (FTIR) spectroscopy, and determination of total phenolic content, antioxidant and antimicrobial activity analyses. The thickness of the synthesized gelatin-based films varied between 0.05 and 0.12 mm, WVP between 0.788 and 1.481 g.mm/kPa.s.m², solubility between 19.6% and 64%, tensile strength between 9.6 and 18.6 MPa, elongation values between 8.7% and 15.2%. It was observed that the antioxidant and antibacterial activity of the films against *E. coli*, *S. aureus* and *B. pumilus* increased with the addition of smoke tree leaf extract and the presence of AgNP. As a conclusion, these mechanically strong, antioxidant and antimicrobial films, synthesized from natural polymers, have been shown to have the potential to be used as wound dressings.

Key Words: Biomedical film, Wound dressing, Smoke tree, Silver nanoparticles, Green synthesis.

Duman Ağacı Yaprığı Ekstresiyle Zenginleştirilmiş Karboksümetil Selüloz (CMC)/ Jelatin (GLT)/ Tara Gam (TG) Biyomedikal Filmlerin Üretimi ve Karakterizasyonu

Özet

Bu çalışmada, yara örtüsü olarak kullanım potansiyeli taşıyan, farklı doğal polimerler içeren biyomedikal filmlerin sentezi çalışılmıştır. Filmler çözücü döküm yöntemi ile üretilmiştir. Biyomedikal filmlerin formülasyon optimizasyonu çalışmalarında karboksümetil selüloz (CMC), jelatin (GLT), tara gam (TG) polimerleri ve plastikleştirici olarak gliserol (GLY) kullanılmıştır. Polimer karışımlarına, yara iyileştirici özelliği bulunan, duman ağacı (*Cotinus coggygria*) yaprağı ekstresi ve AgNO₃ ilave edilerek eşzamanlı gümüş nanopartikül (AgNP) yeşil sentezi sağlanmıştır. Hazırlanan biyomedikal filmlerin kalınlık, opaklık, uzama yüzdesi ve gerilme mukavemetli, su buhar geçirgenliği (SBG), çözünürlük, nem tutma kapasitesi ölçümleriyle karakterize edilmiştir. Ayrıca termogravimetrik analiz (TGA), Fourier Transform Infrared (FTIR) spektroskopisi ve toplam fenolik içeriğin belirlenmesi, antioksidan ve antimikrobiyal aktivite analizleri de yapılmıştır.

Sentezlenen jelatin bazlı filmlerin kalınlığı 0,05 ile 0,12 mm, SBG 0,788 ile 1,481 g.mm/kPa.s.m², çözünürlüğü %19,6 ile %64, çekme dayanımı 9,6 ile 18,8 MPa, uzama değerleri %8,7 ile %15,2 arasında ölçülmüştür. Duman ağacı yaprağı ekstresinin eklenmesi ve AgNP varlığı ile filmlerin *E. coli*, *S. aureus* ve *B. pumilus*'a karşı antibakteriyel ve antioksidan aktivitesinin arttığı gözlemlenmiştir.

Sonuç olarak, doğal polimerlerden sentezlenen mekanik olarak güçlü, antioksidan ve antimikrobiyal özellik taşıyan bu filmler yara örtüsü olarak kullanım potansiyellerinin olduğu gösterilmiştir.

Anahtar Kelimeler: Biyomedikal film, Yara örtüsü, Duman ağacı, Gümüş nanopartiküller, Yeşil sentez

Abstract

This study was carried out to select winter-hardy pea genotypes and to determine some agricultural characteristics. In the study, lines in the F2 generation obtained by crossing the wild pea genotypes collected from nature with the bred varieties and lines were used (242 lines). Planting of the lines was done in rows with a length of 2m in 50cm row spacing, 20cm in row spacing, and 5cm planting depth. The experiment was carried out in the experimental field of Selçuk University Faculty of Agriculture in the growing season of 2020/2021. Maintenance procedures such as irrigation, fertilization and weed control, which are necessary for the healthy growth of plants, have been carried out. In this study; Winter damage, disease damage, number of flowering days, number of main branches, plant height, number of pods (fruit) per plant, number of seeds per pod, number of plants reaching harvest maturity and seed yield were emphasized. Winter damage was not seen in 174 lines; disease damage was not seen in 164 lines; the number of flowering days varied between 146-176 days; the number of major branches varied between 2-12; plant height varied between 35-150cm; the number of pods per plant varied between 4-81; the number of seeds per pod varied between 2-9.3; The number of plants reaching the harvest maturity ranged from 1-10 and the seed yield per plant was between 0.49-90.90 grams.

Key Words: *Fodder Pea, Seed Yield, Number Of Seeds, Number Of Main Branches*

Melez Yem Bezelyesi Hatlarında (F2) Kışa Dayanıklı Genotiplerin Seçilmesi Ve Bazı Tarımsal Özelliklerin Belirlenmesi

Özet

Bu çalışma kışa dayanıklı bezelye genotiplerinin seçilmesi ve bazı tarımsal özelliklerin belirlenmesi amacı ile yapılmıştır. Araştırmada doğadan toplanan yabani bezelye genotipleri ile ıslah edilmiş çeşit ve hatların melezlenmesinden elde edilmiş F2 generasyonundaki hatlar kullanılmıştır (242 hat). Hatların ekim işlemi 2m boyundaki sıralara 50cm sıra aralığında, 20cm sıra üzeri sıklığında, 5cm ekim derinliğinde yapılmıştır. Deneme, Selçuk Üniversitesi Ziraat Fakültesi deneme tarlasında 2020/2021 yetiştirme mevsiminde yürütülmüştür. Bitkilerin sağlık bir şekilde yetişmesi için gerekli olan sulama, gübreleme, yabancı ot mücadelesi gibi bakım işlemleri yapılmıştır. Bu çalışmada; kış zararı, hastalık zararı, çiçeklenme gün sayısı, ana dal sayısı, bitki boyu, bitki başına bakla (meyve) sayısı, bakla başına tohum sayısı, hasat olgunluğuna gelen bitki sayısı ve tohum verimi üzerinde durulmuştur. Kış zararı 174 hatta görülmemiştir; hastalık zararı 164 hatta görülmemiştir; çiçeklenme gün sayısı 146-176 gün arasında değişmiştir; ana dal sayısı 2-12 arasında değişmiştir; bitki boyu 35-150cm arasında değişmiştir; bitki başına bakla sayısı 4-81 adet arasında değişmiştir; bakla başına tohum sayısı 2-9.3 arasında değişmiştir; hasat olgunluğuna gelen bitki sayısı 1-10 arasında değişmiştir ve bitki başına tohum verimi 0.49-90.90 gram arasında olmuştur.

Anahtar Kelimeler: *Yem Bezelyesi, Tohum Verimi, Tohum Sayısı, Ana Dal Sayısı*

Cauliflower Powder as an Alternative Source for Gluten-Free Products

Pınar Küçük, Nazlı Savlak

Food Engineering, Engineering Faculty, Manisa Celal Bayar University, Manisa, Turkey

Abstract

Gluten-free products prepared from commercial starches and gluten-free cereals are known to have low amounts of dietary fiber. For this reason, celiac patients' gluten-free diet, food choices and eating habits in this direction lead to long-term concerns. Recent studies on this eating style; It has been revealed that it creates insufficient protein, carbohydrate, fat intake. Gluten, which is a limiting nutrient in the diet of celiac patients, is also a component rich in dietary fibers. For this, it is aimed to produce foodstuffs to increase dietary fiber intake with various studies. Fruits and vegetables are a good source of dietary fiber to compensate for nutritional deficiencies in gluten-free products. Vegetables have a higher percentage of soluble dietary fiber than fruits and have superior gel-forming, water retention, fat retention and swelling properties. Therefore, it is recommended to increase the intake of dietary fiber in celiac disease with vegetable supplements. Cauliflower, which contains higher dietary fiber than pumpkin, cabbage, broccoli, sugar beet and carrot, can be used as an alternative source in the enrichment of gluten-free products and in eliminating nutritional deficiencies. Cauliflower, which is one of the brassica vegetables, can be added to the bread structure, which is the basic nutrition product, due to its high secondary metabolite and dietary fiber feature. Bread making causes some reduction of secondary metabolites. Research reveals a promising, innovative and healthy product to increase the consumption of bioactives high in fiber by adding fresh cauliflower and its leaves to bread. This review will focus on the chemical composition of cauliflower, its health benefits, and its use as a potential ingredient in functional food development.

Key Words: *gluten, cauliflower, bread, celiac*

Glutensiz Ürünlerde Alternatif Hammadde Kaynağı: Karnabahar Tozu

Özet

Ticari nişastalardan ve glutensiz tahıllardan hazırlanan glutensiz ürünlerinin düşük miktarda diyet lifine sahip olduğu bilinmektedir. Bu nedenle çölyak hastalarının glutensiz diyet yapmaları, bu yöndeki gıda seçimleri ve beslenme alışkanlıkları uzun vadeli endişelere yol açmaktadır. Bu beslenme tarzı üzerine son zamanlarda yapılan çalışmalar; yetersiz protein, karbonhidrat, yağ alımı oluşturduğunu ortaya koymuştur. Çölyak hastalarının beslenmesinde sınırlayıcı besin olan gluten, diyet lifleri bakımından da zengin bir bileşendir. Bunun için çeşitli çalışmalar ile diyet lifi alımını arttırmaya yönelik gıda maddeleri üretilmesi hedeflenmektedir. Meyve ve sebzeler glutensiz ürünlerdeki beslenme ögesi eksikliklerini telafi etmek için iyi bir diyet lifi kaynağıdır. Sebzeler meyvelere göre daha yüksek oranda çözünür diyet lifine sahip olup üstün jel oluşturma, su tutma, yağ tutma ve şişme özelliklerine sahiptir. Bundan dolayı çölyak hastalığında diyet lifi alımının sebze takviyesi ile artırılması önerilmektedir. Bal kabağı, lahan, brokoli, şeker pancarı, havuca nazaran daha yüksek diyet lifi içeren karnabahar glutensiz ürünlerin zenginleştirilmesinde ve beslenme eksikliğinin giderilmesinde alternatif bir kaynak olarak kullanılabilir. Brassica sebzelerinden olan karnabahar yüksek sekonder metabolit ve diyet lifi özelliğinden dolayı temel beslenme ürünü olan ekmek yapısına ilave edilebilmektedir. Ekmek yapımı sekonder metabolitlerin bir miktar azalmasına neden olmaktadır. Araştırmalar taze karnabahar ve yapraklarının ekmeğe ilave ederek lif oranı yüksek, biyoaktif tüketimini artırmak için umut verici, yenilikçi ve sağlıklı bir ürün ortaya koymaktadır. Bu derleme, karnabaharın kimyasal bileşimi, sağlık yararları ve fonksiyonel gıda gelişiminde potansiyel bir bileşen olarak kullanımı üzerine odaklanacaktır.

Anahtar Kelimeler: *gluten, karnabahar, ekmek, çölyak*

Giriş

Ticari nişastalardan ve glutensiz tahıllardan hazırlanan glutensiz ürünlerinin düşük miktarda diyet lifine sahip olduğu düşünülmektedir. Bu nedenle çölyak hastalarının glutensiz diyet yapmaları, bu yöndeki gıda seçimleri ve beslenme alışkanlıkları uzun vadeli endişelere yol açmıştır. Bu beslenme tarzı üzerine son zamanlarda yapılan çalışmalar, yetersiz protein, karbonhidrat, yağ alımı ile dengesiz protein alımını oluşturduğunu göstermiştir. Çölyak hastalığı için yapılan beslenme diyetinde sınırlayıcı besin olan glutensiz diyet lifleri birçok temel besin maddesini taşıyan maddelerdir. Bunun için çeşitli çalışmalar ile diyet lifi alımını arttırmaya yönelik gıda maddeleri üretilmesi hedeflenmektedir. Yapacağımız çalışmanın temeli de buna dayanmaktadır. Meyve ve sebzeler glutensiz ürünlerdeki beslenme eksikliklerini telafi etmek için iyi bir diyet lifi kaynağıdır. Diyet lifleri, meyve ve sebzelerin hücre duvarından ve parankimatoz dokularından beslenir. Meyvelere nispeten daha yüksek oranda çözünür diyet lifine sahip sebzeler bazı yararlı durumlar sergilerler. Jel oluşumu, su tutma kapasitesi, şişme kapasitesi ve yağ

tutma özellikleri gibi özellikleri daha üstündür (Arslan ve ark., 2018). Bu yüzden sebzelerden elde edilen diyet lifleri daha fazla besin değerine sahiptir. Çölyak hastalığında diyet lifi alımının sebze ve meyve alımını artırılması ile desteklenmesi önerilmektedir. Yapacağımız çalışma glutensiz tahıl ürünlerinde sebzelerdeki yüksek diyet lifinden faydalanarak bu beslenme türünü iyileştirmek, gıdaları zenginleştirmektedir. Bu nedenlerden dolayı, sebze olarak karnabahar çiçeği ve yaprakları esas ürün alınarak glutensiz ekmek yapılması hedeflenmiştir. Böylelikle hem atık ürün olarak çok kıymetli olan karnabahar yaprakları kullanılacak hem de diyet lifi yüksek sebze ile beslenmedeki eksikliğin giderilmesi düşünülmektedir.

Latince Caulis (lahana) ve flower isimlerinin birleşmesiyle oluşan karnabahar (Brassica oleracea var. botrytis) Brassicaceae familyasının önemli türlerinden biridir. Karnabahar, çiçek ve çiçek tablası yenilen sebzeler grubundadır. Çiçek tablaları sarımtırak beyaz, beyaz ve nadiren mor renkli olmaktadır. İki yıllık bir kültür bitkisi olan karnabaharın ilk yıl yenilen çiçek tablası ve yaprakları, ikinci yıl ise tohumları oluşmaktadır. Ana vatani Akdeniz Bölgesi kabul edilen karnabahar buradan Atlantik kıyıları boyunca yayılmıştır ve M.Ö. 600 yıllarından itibaren insanlar tarafından tüketildiği tahmin edilmektedir. (Kıl, 2014; Üslü, 2020). Lahana grubu sebzeler arasında yer alan karnabahar, A, B1, B2, C, K ve E vitaminlerinin yanı sıra, fitokimyasal bileşiklerce de zengin içeriği sayesinde son dönemlerde dikkatleri üzerine çekmektedir (Kıl, 2014). Lahana grubu sebzeler ayrıca vitamin C, karoten, folik asit, kalsiyum ve demir kaynağıdır. Fenolik bileşikler ve karotenoidler gibi çok çeşitli antioksidan maddeler, hücreleri oksidatif strese koruyarak kronik hastalık riskini azaltır. Lahana grubu sebzeler, vitamin içerikleri ve kükürtlü bileşikler sayesinde çeşitli hastalıklara karşı koruyucu özellik göstermektedir. Antioksidan aktivitesini belirlemeye yönelik yapılan çalışmalarda; karnabaharın vitamin içeriğinin azımsanmayacak düzeyde olduğu bildirilmiştir. Serbest radikallerin yarattığı oksidatif stresin önlenmesi ve etkisinin en aza indirilmesi için yeterli miktarda antioksidan tüketilmelidir (Kıyak ve ark., 2014).

Tablo 1. Karnabaharın Bileşen Kompozisyonu (100 g) (Anonim, 2019)

Karnabaharın Besin İçeriği (100 g/ çiğ örnek)					
Bileşimi	Miktar	Mineral Maddeler	Miktar	Vitaminler	Miktar
Su	%92,07	Kalsiyum	22 mg	Askorbik asit	48,2 g
Enerji	25 kcal	Demir	0,42 mg	Thiamin	0,050 mg
Protein	1,92 g	Magnezyum	15 mg	Riboflavin	0,060 mg
Toplam yağ	0,28 g	Fosfor	44 mg	Niasin	0,507 mg
Karbonhidrat	4,97 g	Potasyum	299 mg	B6	0,184 mg
Toplam lif	2g	Sodyum	30 mg	Folik asit	57 µg
Toplam şeker	1,91 g	Çinko	0,27 mg	E vitamini	0,08 µg
				K vitamini	15,5 µg

Brassica sebzelerinin tüketimi, yüksek konsantrasyonlar içerdiğinden sağlık yararları ile bağlantılıdır. Bu durum sekonder bitki metabolitleri olan; glukozinolat yıkım ürünleri, karotenoidler, klorofiller ve fenolik bileşikler ile alakalıdır. Özellikle Brassica sebzeleri mikro yeşillik (gelişmiş kotiledonlar) olarak tüketilmektedir. Brassica sebzelerinde sekonder bitki metabolitleri (SPM) konsantrasyonlarda farklılık gösterir. SPM etkisi ek olarak mikro yeşilliklerde (7 gün) ve yapraklarda (14 gün) sürer. Brassica ailesine ait bir sebze ile SPM'lerden faydalanılarak yapılan karışık buğday ekmeği değerlendirildi. Karnabaharın yapraklarındaki karotenoidler, klorofiller ve fenolik bileşikler mikro yeşilliklerle karşılaştırıldığında daha yüksek bulunmuştur. Ekmek yapımı SPM'lerin azalmasına neden olmuştur. Klorofil bozunması gözlenmiş, feofitin ve pirofeofitin oluşumuna yol açmıştır. Bu nedenle, karnabaharın yaprakları doğal içerik maddeleri olarak uygundur (Klopsch ve ark.,2019). Ekmeğe eklenen malzemelerle ilgili önceki çalışmalar bitki tozlarının eklenmesini içermiştir. Ama Klopsch ve ark., yaptığı çalışma taze veya nazikçe işlenmiş mikro yeşillikler (gelişmiş kotiledonlar) ve Brassica sebzelerinin yaprakları ile ekmeğe biyoaktif tüketimini artırmak için umut verici, yenilikçi, sağlığı geliştirici bir strateji olmuştur (Lin ve Zhou 2018; Świeca, Sęczyk, Gawlik-Dziki, Dziki, 2014). Karnabaharda bulunan SPM'lerin bileşimi ve konsantrasyonunda hasat öncesi faktörlerin (örn. gelişim aşaması) yanı sıra hasat sonrası faktörlerinde etkisi vardır. Örneğin, ekmek yapma işlemi sırasında bitki dokusu bileşimi ve konsantrasyonu etkileyebilecek hem mekanik etkilere hem de ısıl işlemeye maruz kalan metabolitlerin etkisi farklıdır (Klopsch, Baldermann, Voss, Rohn, Schreiner ve Neugart 2018). SPM'lerde gıda işleme bu nedenle spesifik işleme türüne bağlıdır (örn. kesme, pişirme, buharda pişirme, kızartma, fırınlama) ve ayrıca bitki genotipi, ontogenetik aşama, genel bitki gibi çeşitli diğer parametreler, SPM'nin kimyasal yapısı da önemlidir (Gerardin, Paris ve ark. 2017; Klopsch, Baldermann, Voss, Rohn, Schreiner ve Neugart 2018). Tahıl ürünlerinde sebze unları ile zenginleştirme yapılarak glutensiz formülasyona sahip birçok

gıda çalışması yapılmıştır. Örneğin, enginar, karnabahar ilavesiyle glutensiz ekmeği hazırlanmıştır. Yapılan ekmeğin lif bakımından zengin olduğu gözlemlenmiştir (Capriles ve Arêas, 2014; Rocha Parra ve ark., 2015). Ekmek içerisine brokoli, rezene ve kabak ilave edilerek duysal kaliteyi, antioksidan içeriğini ve glisemik kaliteyi artırmak amacıyla bir çalışma yapılmıştır (Saccotelli, Spinelli, Conte ve Del Nobile, 2018). Aynı şekilde, glutensiz spagetti çalışmaları farklı sebzeler ile desteklenmiştir. Yapılan çalışmalarda enginar, kuşkonmaz, balkabağı, havuç ve biber gibi 159 sebze unlu spagetti hazırlanmıştır (Padalino ve Del Nobile, 2013). Karnabahar yapraklarında bulunan peptitlerin yani proteinleri oluşturan parçaların sağlık faydaları bulunmaktadır. Özellikle endotel fonksiyon (kalp-damar sağlığı) ve kanseri iyileştirdiğine dair bilimsel çalışmalar vardır. Karnabahar yaprakları kurutulduktan önce antioksidan sonrasında da protein ekstraksiyonu yapılabilir. Böylelikle atık olarak görülen bir üründen yüksek katma değerli iki ürün çıkartılmış olmaktadır. Antioksidanlar toplum sağlığını güçlendirmede, protein ve peptitler ise özellikle endotel sağlığını güçlendirmede kullanılmış olacaktır. Endotel sağlığı demek, fiziksel ve mental sağlık demektir. Türkiye de yılda yaklaşık 200,000 ton karnabahar üretiliyor ve neredeyse %50 sine yakını yapraktan oluşuyor. 100,000 ton yaş yapraktan 10,000 ton kuru yaprak elde edilmektedir. Bu yapraklardan elde edilecek antioksidan verimi %25, protein verimi de %10 civarlarındadır. 2,500 ton antioksidan yani 1,000 ton protein elde edilmiş olmaktadır. Bu oranlar atık bir üründen elde edildiği için çok yüksektir. Ülkemiz yılda 4,000 ton protein ithal ediyor. Ancak anlatılan yöntem ile sadece karnabahar yaprağından protein ihtiyacının ¼ ini karşılamış olacaktır. Ayrıca içerdiği yüksek diyet lifi ve SPM'lerden dolayı yapılan çalışmalarından da görüldüğü gibi değerli bir hammadde. Karnabaharın en yüksek antioksidan etki göstermesi için buharda pişirme yöntemi kullanılmalıdır. Yapılan birçok çalışmada karnabaharın glukosinolat içeriğinin brokoli ile aynı, lahanadan daha yüksek ve Brüksel lahanasından ise daha düşük olduğu belirtilmiştir (Kushad et al., 1999; Tian et al., 2005; Cieslik et al., 2007). Yapılan araştırmalarda karnabahar sebzelerinin başta kanser olmak üzere çeşitli hastalıklara karşı koruyucu özelliği, içeriğinde bulunan kükürtlü bileşikler olan glukosinolat isimli sekonder metabolitlere dayandırılmaktadır (Sarıkamış, 2016). Karnabaharın kanser riskini %67 oranında azalttığı belirtilmektedir (Güven ve Gülmez, 2006). 5 farklı karnabahar çeşidinin (2 tane beyaz, 2 tane yeşil, 1 tane mor) glukosinolat içeriğinin incelendiği çalışmada beyaz karnabaharın, alifatik glukosinolatlardan sinigrin içeriği en yüksek bulunmuştur. Yeşil karnabaharda ise alifatik glukosinolatlardan glucoraphanin içeriği daha fazla saptanmıştır. Toplam indol içeriği ise alifatiklere oranla daha düşük bulunmuştur. İndollerden glucobrassicin toplam glukosinolat içeriğinin % 29-35'ini oluştururken, bazı karnabahar çeşitlerinde % 45-59'u gibi değerlere ulaşmıştır. Bu yüksek oranla glucobrassicin toplam indollerini temsil etmektedir. Glucobrassicinin glukosinolatlar içinde turpgillere özgü aromayı ve hafif acı tadı baskın bir şekilde sağladığı belirtilmiştir (Volden et al., 2009b). Kushad et al. (1999), karnabaharda sinigrin, glucobrassicin değerlerini yüksek bulmuşlardır. Aynı şekilde Tian et al. 8 (2005), karnabaharda sinigrin ve glucoiberinin en fazla bulunan alifatikler olduğunu belirtmişlerdir. Yapılan bu çalışmada en düşük glukosinolat konsantrasyonu beyaz ve yeşil karnabaharda bulunmuştur. Alifatik glukosinolatların, toplam glukosinolat içeriğinin beyaz karnabaharda % 45.4'ünü, indollerin ise % 54.6'sını oluşturduğu saptanmıştır. Brassicaceae sebzelerinin metabolizma üzerinde detoks etkisi yarattığı, zayıflama amaçlı diyetlerde kullanıldıkları görülmektedir. Bu nedenle son zamanlarda bu sebzelerin zayıflama amacıyla haşlama sularının içildiği, kürlerinin hazırlandığı, salata, çorba olarak yaygın olarak tüketildiğine rastlanmaktadır. Bu sebzeler antioksidan ve antikanserojen özelliklere sahiptir ve bunlar vitamin, karotenoid, polifenoller gibi fotokimyasallar için iyi bir kaynaktır. Karnabahar, fosfor ve vitamin bakımından çok zengindir. Karnabahar sebzelerinin bileşenleri, lipid peroksidasyonu ile ilişkilendirilir. Metabolizma hızını artırdığı ileri sürülmektedir. Lipit otooksidasyonu antioksidanlar tarafından yavaşlatılır. Antioksidanca zengin sebzelerle beslenme seçimi sağlıklı beslenme konusunda anahtar rol oynamaktadır (Karabaş, 2016). Karnabahar hem gıda lifi içeriği açısından hem de flavanoller bakımından kolon kanserine karşı koruyucudurlar. Diyet posasının kolon kanserine karşı koruyucu etkisi bilinmesine rağmen, son araştırmalar folik asidinde kanser riskini azalttığını ortaya koymuştur (Sezgin, 2014). Bıraktığı bol posa ile kabızlık yapmaz ve bağırsakların çalışmasını düzenlemektedir (Kıl, 2014). Karnabahar sebzelerini kurutmak için bazı ön işlemler uygulanmalıdır. Yapılan çalışmalara göre öce sitrik aside yatırılıp, daha sonra ön haşlama yapılarak kurutulan karnabahar örneklerinin nem içerikleri daha düşük olmaktadır (Şahin, 2014). Son on yılda, glutensiz ekmeğinin besin değerini ve kalitesini çeşitli hammaddeler kullanarak veya katkı maddelerinin eklenmesiyle iyileştirmek için çeşitli formülasyonlar, teknolojik parametreler kapsamlı bir şekilde incelenmiştir. Glutensiz ekmeğin üstün gelişimi için emülgatörler, proteinler veya farklı hidrokolloidler araştırılmıştır (Schoenlechner ve ark., 2010). Daha iyi kullanım özellikleri ve su emilimi için hamurda, farklı süt ürünleri bileşenleri de kullanılmıştır. Bununla birlikte çölyak hastaları için glutensiz ekmeklerinde laktoz bakımından zengin tozun takviyesi de uygun değildir (Pruska-Kędzior ve ark., 2008). Fırıncılık endüstrisinde gamlar ve hidrokolloidler doku, görünüm kazandırmak ve diyet lifi alımını arttırmak için yaygın olarak kullanılmaktadır (Anon, 2002; Cunin, 1999). Glutensiz ürün hazırlamak için hazırlanan ürün gamları, hidrokolloid, buğday nişastaları ve buğday dışı nişastalarla birlikte kullanılır. Buğday nişastası, çölyak hastaları tarafından daha az toleransı nedeniyle daha az arzu edilir (Lohiniemi ve ark., 2000; Skerritt ve Tepe, 1992). Hidrokolloidler doğada bitki özleri, deniz yosunları, tohumlar, sebzeler, mikroorganizmalar gibi çeşitli kaynaklardan elde edilir (Norton ve Foster, 2002). Çölyak glutensiz diyetinde diyet lifleri psödotahıllar, meyve,

sebze, baklagil ve bakliyattan karşılanır. Glutensiz beslenme diyetindeki bu önemli besini tamamlamak için hidrokolloidler ve sebzeler uygun bir seçenek olabilir.

Tablo 2. Karnabahar İle Yapılan Çalışmalar ve Sonuçları

Çalışmalar	Elde Edilen Sonuçlar	Değerlendirme
Klopsch ve ark (2019)'ın karnabahar ilavesi ile buğday ekmeği yapımı çalışması	Ekmek yapımı sekonder metabolitlerin azalmasına neden olmuştur. Klorofil bozunması gözlenmiş bu durumda karnabaharın yaprakları doğal içerik maddeleri olarak uygun bulunmuştur.	Tahıl ürünlerince zengin temel beslenme ürünü olan ekmek zenginleştirme ürünü karnabahar ile kullanılıncı lif oranı yüksek gelecekte umut vaat eden bir çalışma olarak görülmektedir.
Wani ve ark (2011)'in karnabahar yaprağı tozu ilavesi ile erişte yapımı çalışması	Protein miktarı karnabahar yaprağı tozu ilavesiyle, artış göstermiştir. Ham lif oranı da karnabahar yaprağı ilavesi ile %1,5 oranda artış göstermiştir.	Tahıl ürünleriyle elde edilen erişte de karnabahar ilavesi ile Klopsch ve ark.'nın sonuçlarını destekler yönde verilere ulaşmıştır.
Alam ve ark. (2016)'ın yaptığı düşük maliyetli, besleyici karnabahar ilaveli ürün çalışması	Ürünlerin besleyiciliği artmış, protein ve lif oranlarında artış gözlenmiştir.	Besleyici ürün çalışmasında karnabahar yine özelliğini ön plana çıkartarak lif oranının yüksek oluşunu son ürüne yansıtmıştır.

Tahıl Ürünlerinde Zenginleştirme Çalışmaları;

- Tahıl ürünlerinde sebze unları ile zenginleştirme yapılarak glutensiz formülasyona sahip birçok gıda çalışması yapılmıştır.
- Örneğin, enginar, karnabahar ilavesiyle glutensiz ekmek hazırlanmıştır (Francisco ve ark., 2010).
- Yapılan çalışmada karnabahar ekmeğinin lif bakımından zengin olduğu gözlemlenmiştir.
- Başka bir çalışmada (Reis ve ark., 2015) ekmek içerisine brokoli, rezene ve kabak ilave edilerek duysal kaliteyi, antioksidan içeriğini ve glisemik kaliteyi artırmak amaçlanmıştır.
- Aynı şekilde, glutensiz spagetti çalışmaları farklı sebzeler ile desteklenmiştir.
- Yapılan çalışmalarda enginar, kuşkonmaz, balkabağı, havuç ve biber gibi 159 sebze unlu spagetti hazırlanmıştır.

Glutensiz Ürünlerin Yapılarının İyileştirilmesi;

Son on yılda, glutensiz ekmeğin besin değerini ve kalitesini çeşitli hammaddeler kullanarak veya katkı maddelerinin eklenmesiyle iyileştirmek için çeşitli formülasyonlar, teknolojik parametreler kapsamlı bir şekilde incelenmiştir.

Glutensiz ekmeğin üstün gelişimi için emülgatörler, proteinler veya farklı hidrokolloidler araştırılmıştır.

Fırıncılık endüstrisinde gamlar ve hidrokolloidler doku, görünüm kazandırmak ve diyet lifi alımını arttırmak için yaygın olarak kullanılmaktadır (Barışık, 2016; Hager ve Arendt, 2013; Lazaridou ve diğ., 2007; Skendi ve diğ., 2021).

Çölyak hastalarının glutensiz diyetinde diyet lifleri psödotahıllar, meyve, sebze, baklagil ve bakliyattan karşılanır. Glutensiz beslenmede bu önemli besin ögesini tamamlamak için hidrokolloidler ve sebzeler uygun bir seçenek olabilir. Sebzeler içerisinden sunum içeriğinde de belirttiğimiz gibi zengin vitamin içeriği, kansere ve çeşitli hastalıklara karşı koruyucu etkisi ve diyet lifi oranının yüksek olması gibi nedenlerle glutensiz ürünlerde karnabahar tozu kullanımı tercih edilebilir.

Sonuç ve Öneriler

Sonuç olarak glutensiz ürünlerin düşük diyet lifi, protein, mineral ve vitamin içeriği karnabahar ve karnabahar yaprağı tozu kullanılarak artırılabilir. Yapılan çalışmalar karnabaharın yüksek diyet lifi içeriğini ve sağlığa karşı koruyucu etkilerini ortaya koymuştur. Karnabahar yaprakları çoğunlukla atık olarak bertaraf edilirken lif oranı yüksek bu kısmı glutensiz ürünlere dahil ederek değerlendirmek ileriki çalışmalar için umut vericidir.

Karnabahar ve karnabahar yaprağının gerek gluten içeren gerekse gluten içermeyen formülasyonlarda değerlendirilmesi için daha fazla çalışmaya ihtiyaç vardır.

Evaluation of Noise in Children's Playgrounds: The Case of Dokuma Park

Rifat Olgun¹

¹Department of Park and Horticulture, Serik G-S. Sural Vocational School of Higher Education, Akdeniz University, Antalya, Turkey

Abstract

The increase in the world population and rapid urbanization cause different types of pollution such as air, water, soil and noise. Today, this situation significantly affects the quality of life in densely populated settlements both in the world and in Turkey. Noise pollution, which is one of the important types of pollution, especially in urban areas, is increasing day by day due to anthropogenic effects. Studies conducted by the European Noise Directive (END) show that noise pollution is one of the important factors that cause health problems.

Parks are places that allow children trapped in the structural environment in urban life to get to know nature and play games in open spaces. In particular, the children's playgrounds in the parks allow children to play and socialize in the open area and also allow parents to rest. However, park users may be exposed to noise pollution due to high-level noises originating from vehicle traffic, user density, and children's playgrounds in these places. This situation adversely affects the physical and mental health of the park users.

The aim of the research is to determine the noise pollution caused by the children's playgrounds in the parks and to develop suggestions for reducing this pollution. As a result of the preliminary studies carried out in this context, Antalya/Kepez Dokuma Park was determined as a research area. Zones were created at certain intervals around the children's playground in the research area. And noise levels were measured on weekdays and weekends from the noise measurement points determined in these zones. The results obtained show that the noise pollution originating from the children's playgrounds in the parks is high. In this context, landscape design and planning proposals have been developed to reduce noise pollution originating from children's playgrounds.

Key Words: *Urban, Park, Playground, Noise, Antalya*

Çocuk Oyun Alanlarındaki Gürültünün Değerlendirilmesi: Dokuma Park Örneği

Özet

Dünya nüfusunda yaşanan artış ve hızlı kentleşme hava, su, toprak ve gürültü gibi farklı kirlilik türlerine neden olmaktadır. Günümüzde bu durum hem dünyanın hem de Türkiye'nin yoğun nüfuslu yerleşim yerlerindeki yaşam kalitesini önemli ölçüde etkilemektedir. Özellikle de kentsel alanlardaki önemli kirlilik türlerinden birisi olan gürültü kirliliği, gün geçtikçe antropojenik etkilere bağlı olarak artmaktadır. Avrupa Gürültü Direktifi (END) tarafından yapılan araştırmalarda gürültü kirliliğinin sağlık sorununa neden olan önemli etkenlerden birisi olduğu görülmektedir.

Kentsel yaşam içerisinde yapısal çevreye hapsolan çocukların doğayı tanıma ve açık alanda oyunlar oynayabilmelerine imkân veren mekanlar parklardır. Özellikle parkların içerisindeki çocuk oyun alanları, çocukların açık alanda oyun oynamasına ve sosyalleşmesine imkân vermekte ve aynı zamanda ebeveynlerin dinlenmesine de olanak sağlamaktadır. Fakat kullanıcılar araç trafiğinden, kullanıcı yoğunluğundan, çocuk oyun alanlarından kaynaklanan yüksek düzeydeki seslerden dolayı bu alanlarda gürültü kirliliğine maruz kalabilmektedir. Bu durum ise kullanıcıların bedensel ve ruhsal sağlığını olumsuz etkilemektedir.

Araştırmanın amacı, parklardaki çocuk oyun alanlarından kaynaklanan gürültü kirliliğini tespit etmek ve bu kirliliğin azaltılmasına yönelik öneriler geliştirmektir. Bu kapsamda yapılan ön çalışmalar sonucunda, Antalya/Kepez Dokuma Park araştırma alanı olarak belirlenmiştir. Araştırma alanında bulunan çocuk oyun alanının çevresinde belli aralıklar ile zonlar oluşturulmuş ve bu zonlar üzerinde belirlenen gürültü ölçüm noktalarından hafta içi ve hafta sonu gürültü seviyeleri ölçülmüştür. Elde edilen sonuçlar, parklarda çocuk oyun alanlarından kaynaklı gürültü kirliliğinin yüksek düzeyde olduğunu göstermektedir. Bu bağlamda çocuk oyun alanlarından kaynaklı gürültü kirliliğinin azaltılmasına yönelik peyzaj tasarım ve planlama önerileri geliştirilmiştir.

Guar Gum and Sumac Based Active Food Packaging: Effect of Sumac Form and Solvent Type

Ayca Aydogdu Emir^{1*}, Elif Isik¹

¹Department of Food Technology, Canakkale 18 Mart University, Canakkale, Turkey

Abstract

The development of edible films from natural, nontoxic, biodegradable polymers has been great interest due to environmental plastic waste problems. Antioxidant food packaging is one type of active packaging based on incorporating antioxidant compounds into packaging materials to eliminate undesirable deterioration of foods. Sumac (*Rhus coriaria*) is a natural antioxidant source due to having significant amount of phenolic compounds, especially tannins, anthocyanins, and flavones. The amount of extracted phenolic compounds changes with the types and forms of sumac and extraction procedure. The main aim of this study is to produce active packaging materials from sumac extract and guar gum. Different forms of sumac (powder and granule) and extraction procedures (water and ethanol/water as extraction solvent, hot and cold extraction) were applied to get the highest extraction yield and extracted sumac phenolics incorporated guar gum films. The total phenolic content, antioxidant activity, density, moisture content, opacity, and color parameters were investigated. When the effect of solvent type was examined, it was obvious that ethanol/water extracted powder sumac incorporated films showed higher total phenolic content and antioxidant activity than water extracted sumac films. Granule sumac particles were extracted at 50°C and room temperature, and hot extracted sumac-added guar gum films showed higher antioxidant activity than the cold ones. While density and moisture content values were found similar, powder sumac extracted films showed higher opacity, a* and b* values than the granule ones. To be used as active packaging material, ethanol/water (4/1) extracted powder sumac incorporated guar gum films can be suggested.

Key Words: guar gum, edible film, sumac, extraction, antioxidant

Guar Gum ve Sumak Bazlı Aktif Gıda Ambalajları: Sumak Formunun ve Çözücü Tipinin Etkisi

Özet

Doğal, toksik olmayan, biyolojik olarak parçalanabilen polimerlerden yenilebilir filmlerin geliştirilmesi, çevresel plastik atık sorunları nedeniyle büyük ilgi görmüştür. Antioksidan gıda ambalajı, gıdalardaki istenmeyen bozulmaları ortadan kaldırmak için ambalaj malzemelerine antioksidan bileşiklerin dahil edilmesine dayanan bir tür aktif ambalajdır. Sumak (*Rhus coriaria*), başta tanenler, antosiyaninler ve flavonlar olmak üzere önemli miktarda fenolik bileşiğe sahip olması nedeniyle doğal bir antioksidan kaynağıdır. Ekstrakte edilen fenolik bileşiklerin miktarı, sumak çeşidine, formuna ve ekstraksiyon prosedürüne göre değişir. Bu çalışmanın temel amacı sumak özü ve guar zatkından aktif ambalaj malzemesi üretmektir. En yüksek ekstraksiyon verimini elde etmek için farklı sumak formları (toz ve granül) ve ekstraksiyon prosedürleri (ekstraksiyon çözütüsü olarak su ve etanol/su, sıcak ve soğuk ekstraksiyon) uygulanmış ve guar zatkı filmlerine ekstrakte edilmiş sumak fenolikleri eklenmiştir. Toplam fenolik içerik, antioksidan aktivite, yoğunluk, nem içeriği, opaklık ve renk parametreleri incelenmiştir. Çözücü tipinin etkisi incelendiğinde, etanol/su ile ekstre edilmiş toz sumak katkılı filmlerin, su ile ekstre edilmiş sumak filmlerinden daha yüksek toplam fenolik içerik ve antioksidan aktivite gösterdiği görülmüştür. Granül sumak partikülleri 50°C'de ve oda sıcaklığında ekstrakte edilmiş ve sıcak ekstrakte edilmiş sumak ilaveli guar zatkı filmleri soğuk olanlardan daha yüksek antioksidan aktivite göstermiştir. Yoğunluk ve nem içeriği benzer bulunurken, toz sumak ekstrakte edilmiş filmler granül olanlara göre daha yüksek opaklık, a* ve b* değerleri göstermiştir. Aktif ambalaj malzemesi olarak kullanılmak üzere etanol/su (80/20 v/v) ekstrakte edilmiş toz sumak içeren guar zatkı filmleri önerilebilir.

Anahtar Kelimeler: guar zatkı, yenilebilir film, sumak, ekstraksiyon, antioksidan

Abstract

The economic, environmental, and social concerns about sustainable energy have increased in the world. These concerns have caused researchers to find sources for biofuel production such as biogas, biodiesel, and bioethanol that are environmentally friendly, sustainable, and renewable. Agricultural residues or wastes, forest residues (branches, leaves), and energy crops have been preferred in biofuel production. In this context, residues or wastes generated as a result of agricultural activities have been widely used to reduce environmental adverse effects resulting from population increase. Agricultural residues or wastes mostly have a lignocellulosic structure, and producing biofuels from biomass offers a significantly sustainable potential compared to fossil fuels. The lignocellulosic biomass composition inhibits hydrolysis to other organic compounds that can convert the cellulose in its structure into sugars and then into biofuels. Physical, chemical, physicochemical, and biological pretreatment methods can change the chemical and physical structure of lignocellulosic biomass; therefore, biomass becomes accessible by improving the hydrolysis ratios. Pretreatments not only disrupt the biomass structure but also offer less energy consumption and lower process costs. This review aims to outline the effects and advantages of physical (mechanical grinding, microwave, ultrasonic) and chemical (acid, alkaline, organo-solvent, ozonolysis) pretreatment methods, which are among the pretreatment methods commonly used in producing biofuel from the lignocellulosic biomass.

Key Words: *Lignocellulosic biomass, Physical pretreatment, Chemical pretreatment*

Lignoselülozik Biyokütle Uygulanan Fiziksel ve Kimyasal Ön İşlemler

Özet

Dünyada, sürdürülebilir enerji ile ilgili ekonomik, çevresel ve sosyal kaygılar artmıştır. Bu endişeler araştırmacıların biyogaz, biyodizel ve bioetanol gibi biyoyakıt üretimi için çevre dostu, sürdürülebilir ve yenilenebilir kaynaklar bulmasına neden olmuştur. Biyoyakıt üretiminde tarımsal kalıntı veya atıklar, orman artıkları (dallar, yapraklar) ve enerji bitkileri tercih edilmiştir. Bu kapsamda, nüfus artışına bağlı olarak çevresel olumsuz etkileri azaltmak için tarımsal faaliyetler sonucu oluşan kalıntı yada atıklar yaygın kullanılmıştır. Tarımsal kalıntı veya atıklar çoğunlukla lignoselülozik yapıda olup, biyokütlenin biyoyakıtlara dönüştürülmesi, fosil yakıtlara göre sürdürülebilir önemli bir potansiyeldir. Lignoselülozik biyokütle bileşimi, yapısında bulunan selülozu şekerlere, daha sonrasında ise biyoyakıtlara dönüştürebilen diğer organik bileşiklere hidrolizi engellemektedir. Lignoselülozik biyokütlenin kimyasal ve fiziksel yapısını; fiziksel, kimyasal, fizikokimyasal ve biyolojik ön işlem yöntemleri değiştirebilir; dolayısıyla hidroliz oranları iyileştirilerek biyokütle erişilebilir hale getirilmektedir. Ön işlem uygulamaları, sadece biyokütle yapısını bozmakla kalmayıp aynı zamanda daha az enerji ihtiyacı ve ekonomik işlem maliyetine sahiptir. Bu derlemede, lignoselülozik biyokütlenin biyoyakıtlara dönüştürülmesinde yaygın kullanımı olan ön işlem yöntemlerinden fiziksel (mekanik öğütme, mikrodalga, ultrasonik) ve kimyasal (asit, alkali, organo çözücü, ozonoliz) ön işlem yöntemlerinin etkileri ve avantajlarının ana hatlarıyla belirtilmesi amaçlanmıştır.

Anahtar Kelimeler: *Lignoselülozik biyokütle, Fiziksel ön işlem, Kimyasal ön işlem*

1. Giriş

Dünyadaki ekonomik gelişmeler, fosil yakıtların zararlı etkileri nedeniyle alternatif kaynaklara olan ihtiyacı gündeme getirmiştir. Fosil yakıtlar, atmosferde yüksek sera gazı emisyon seviyelerine ve küresel ısınmaya neden olmaktadır. Bu yakıtların hızla tükenmesi ve kirletici etkileri devam ederken, biyoyakıtlar (biyohidrojen, biyometan, bioetanol, biyometanol, biyodizel) yenilenebilir, alternatif, sürdürülebilir ve ucuz enerji kaynakları düşüncesini güçlendirmiştir (Kumari ve Singh, 2018). Bir başka sorun da, ekosistemlerin sürdürülebilirliği için çeşitli tipte oluşan atıkların çevreye zarar vermeden yönetilmesi gerektiridir. Atık yönetimi; çevresel olumsuz etkileri azaltmak, dolayısıyla ekosistemlerin sürdürülebilirliği için oldukça önemlidir. Tarımsal faaliyetler ile, milyonlarca ton atık oluşmaktadır. Bu atıkların, tarımsal faaliyetlere bağlı olarak artması ve uygun olmayan şekillerde bertaraf edilmesi çevre sağlığı için endişe verici duruma gelmiştir. Tarımsal atıkları katma değerli ürünlere dönüştürme stratejisi sürdürülebilir, çevre dostu ve atık yönetimi için düşük maliyetlidir. Tarımsal üretim fazlalığı olarak oluşan ve çoğunlukla lignoselülozik yapıda olan biyokütle, yasaklara rağmen genellikle yakma yöntemi kullanıldığı için geçmiş yıllarda etkin şekilde değerlendirilmemiştir. Son yıllarda lignoselülozik

biyokütle, geleneksel atık bertaraf yöntemlerinin aksine, ön işlem uygulamalarından geçirilerek biyoyakıt üretimine katkı sağlamaya başlamıştır.

Lignoselülozik biyokütle, kaynaklarına göre; (i) tarımsal atıklar (şeker pancarı küspesi, buğday samanı, pirinç samanı, arpa samanı, mısır koçanı), (ii) enerji bitkileri (dallı darı), (iii) çeşitli selülozik atık türleri (kereste fabrikası atıkları, kağıt hamuru fabrikası atıkları, kentsel katı atıklar) olarak sınıflandırılabilir (Kim vd., 2016). Ön işlem uygulamalarından herhangi biri, lignoselülozik biyokütleyle uygulanmadan biyoyakıt üretimi için kullanılabilir. Ancak, biyokütlenin hidroliz aşamasında selülozun makrofibrillerdeki hemiselüloz ve lignin kökeni tarafından büyük ölçüde korunduğu, bu nedenle selülozun şekere dönüşümünün çok yavaş olduğu bildirilmiştir (Kamarludin vd., 2014). Bu nedenle, biyokütleyle ön işlem yöntemleri uygulanmıştır. Lignoselülozik biyokütleyle yapılan ön işlemlerde makro ve mikro boyutu, mikroskobik yapısı, kimyasal bileşimde değişiklik oluşturmaları amaçlanmaktadır. Bu sayede, biyokütle artan şeker verimi ile hızlı hidrolize hazır hale gelmektedir (Mosier vd., 2005). Ön işlem uygulamasından sonra katı ve sıvı fraksiyon üretilmektedir. Katı fraksiyon çoğunlukla hidrolize edilmemiş lignin ve selülozdan oluşmaktadır. Sıvı fraksiyon esas olarak ksiloz ve diğer bazı indirgeyici şekerleri içermektedir. Lignoselülozik biyokütle tiplerinde, selüloz ve hemiselüloz ana bileşenleri fermente edici mikroorganizmalar tarafından substratlara dönüştürülmektedir. Şeker üretiminde kullanılan teknikler alkali, seyreltik asit, ozonoliz gibi ön işlem yöntemlerini kapsamaktadır (Triana vd., 2011).

Ön işlem yöntemleri fiziksel, kimyasal, fizikokimyasal, biyolojik ve bunların çeşitli kombinasyonları olarak farklı kategorilere ayrılmaktadır. Lignoselülozik biyokütleyle ön işlem uygulama adımı, biyoyakıt üretim proseslerinin verimliliği üzerindeki etkisinden dolayı tüm proses adımlarındaki en hayati parçalardan biri olarak kabul edilebilir. Bu derlemenin amacı, biyoyakıt üretiminde yaygın kullanımı olan lignoselülozik biyokütlenin parçalanabilirliğinde iyileştirilebilir olan ön işlemlerden fiziksel (mekanik öğütme, mikrodalga, ultrasonik) ve kimyasal (asit, alkali, organo çözücü, ozonoliz) ön işlem yöntemlerinin etkileri ve avantajlarını ana hatlarıyla sunmaktır.

2. Ön İşlem Yöntemleri

Biyoyakıt üretimi için işleme zorluğu olan lignoselülozik biyokütlenin verimli kullanımını, biyokütleyle uygulanan ön işlemler etkilemektedir. Lignoselülozik biyokütle; lignin, hemiselüloz ve selüloz ana bileşenlerinden oluşmaktadır. Ön işlem yöntemleri ile, lignoselülozik biyokütlenin bu bileşenlerinden bir veya daha fazlası çözündürülmekte ve ayrılmaktadır. Kalan katı biyokütle, ileri biyolojik ve kimyasal işlem için daha kullanılabilir hale gelmektedir (Demirbaş, 2005). Lignoselülozik biyokütle kompleksi, Şekil 1'de sunulduğu üzere hemiselüloz zincirleriyle bağlanmış lignin ve selüloz matrisinden oluşmaktadır.

Şekil 1. Lignoselülozik biyokütle için fiziksel ve kimyasal ön işlem yöntemleri

2.1. Fiziksel Ön İşlem

Yaygın kullanımı olan fiziksel ön işlem uygulamaları mekanik öğütme, mikrodalga ve ultrasonik olarak aşağıda sunulmuştur.

2.1.1. Mekanik öğütme

Mekanik boyut küçültme işlemlerinde sıkıştırılmalı öğütme, ıslak öğütme, kuru öğütme ve titreşimli bilyalı öğütme işlemlerinin kullanımı yaygındır. Lignoselülozik biyokütlenin öğütülmesindeki enerji tüketimi; malzeme özellikleri, ilk parçacık boyutu, nem içeriği, makine değişkenleri ve besleme malzemesi hızına bağlıdır. Öğütücülerin ana sınıflandırması öğütme mekanizmasına göre olup, boyut küçültme, parçacık geometrisinin darbe veya sıkıştırma nedeniyle hasar gördüğü keskin bıçaklarla bölünerek veya kesilerek gerçekleştirilebilir (Kamarludin vd., 2014).

Mekanik ön işlem uygulaması, biyogaz üretim verimliliğini artırma başta olmak üzere hammadde tedarik zincirini ve depolama koşullarını kolaylaştırma, toplam erişilebilir yüzey alanını artırma, karmaşık yapıyı kırma, bileşenlerin biyo-erişilebilirliğini ve hidroliz sırasında sakkaritlerin dönüşümünü iyileştirmesi dolayısıyla biyokütlenin morfolojisini değiştirme avantajı bulunmaktadır (Lindmark vd., 2012; Vidal Jr vd., 2011; Miao vd., 2011; Yu vd., 2019). Mekanik öğütme genel olarak, bir sonraki ön işleme geçmeden önce lignoselülozik biyokütlenin biyoyakıt dönüştürülmesinde en önemli ve umut verici ön işlem uygulaması olarak görülmüştür (Kamarludin vd., 2014).

2.1.2. Mikrodalga

Mikrodalga ön işlem uygulaması, çeşitli biyokütle tiplerinin parçalanabilirliğini arttırmak için uygun bir yöntem olarak dikkat çekmiştir. Mikrodalga kullanımının hücre duvarı ve lignini etkili bir şekilde bozduğu ve böylece hidrolizi kolaylaştırdığı rapor edilmiştir (Salema vd., 2017). Bu yöntemin, 300 MHz ve 300 GHz arasında bir frekans ve 0.1 ila 100 cm arasında eşdeğer bir dalga boyundan geçen elektromanyetik radyasyonlardan oluştuğu bildirilmiştir (Bastiaens vd., 2017; Saini vd., 2015; Li vd., 2012).

Mikrodalga ısıtma, mekanizması nedeniyle konvansiyonel ısıtmaya göre daha tercih edilen bir yöntemdir. Konvansiyonel ısıtma, transfer ortamı gerektirmekte, temas yüzeyinde başlamakta ve difüzyonla içeriye doğru iletilmektedir. Dış tarafta aşırı ısınma, biyokütlerde yaygın bir sorundur. Ancak mikrodalga ısıtma, biyokütle ile doğrudan temas olmaksızın aynı anda tüm hacmi ısıtmakta ve böylece homojen, hızlı ve hacimsel ısıtma sağlamaktadır. Buna ilaveten, mikrodalga ısıtma anlık olarak düzenlenebilmektedir. (Saini vd., 2015).

2.1.3. Ultrasonik

Yeşil teknoloji olarak uygulanan ultrasonun, zor ayrışabilen lignoselülozik biyokütlenin etkin ayrışmasıyla katma değerli kimyasalların veya biyoyakıtların verimli üretiminde olumlu rol oynadığı rapor edilmiştir. Ultrasonik ön işlemin başlıca avantajları; kısa işlem süresi ve düşük işlem sıcaklığıdır. Ayrıca, bu ön işlem uygulamasının diğer teknolojilerle birleştirilme potansiyeli bulunduğu bildirilmiştir (Chatel, 2018).

2.2. Kimyasal Ön İşlem

Biyoyakıt üretiminde önemli etkileri olan kimyasal ön işlem uygulamalarından, en yaygın kullanılan asit ve alkali ön işlemi aşağıda sunulmuştur. Buna ilaveten, organo çözücü ve ozonoliz ön işlem uygulamalarından da bahsedilmiştir.

2.2.1. Asit

Asit ön işlem yöntemi uygulanan lignoselülozik biyokütlenin ana fraksiyonu hemiselüloz olup, bu prosesle aynı zamanda lignin ve selülozun bir kısmı çözündürülerek karbonhidratlar serbest bırakılmaktadır (Jönsson ve Martín, 2016). Asit ön işlem uygulama prosesinde; asit konsantrasyonu, katı madde yüklemesi, sıcaklık ve bekleme süresi ana proses değişkenleridir. Dolayısıyla şeker verimi, katı madde geri kazanımı, hemiselüloz dönüşümü, glikoz, furfural ve ksiloz konsantrasyonu çeşitli biyokütle tipleri için yapılmış çalışmalarda incelenmiştir (López-Linares vd., 2013; Triana vd., 2011; Yoon vd., 2015; Cara vd., 2008).

Lignoselülozik biyokütleyi işlemede H_2SO_4 , HCl gibi konsantre asitler kullanılmıştır. Konsantre asit ön işlem uygulaması ile, selülozun hidrolizi aşamasında düşük sıcaklıklarda yüksek şeker verimine ulaşılabilir. Biyokütle kaynağından bağımsız olarak konsantre asit ön işlemi çok verimli olmasına rağmen toksik, aşındırıcı, korozyona dayanıklı reaktör tasarımları gerektirmektedir. Bu da, ön işlem uygulamalarını maliyetli duruma getirmektedir. Buna ek olarak, ön işlemin ekonomik olması hidroliz aşamasından sonra konsantre asitin geri kazanımı ile gerçekleştirilebilir. Araştırmalar, ucuz ve etkili olduğu için %4'ün altı H_2SO_4 konsantrasyonlarında yapılmış çalışmalara ilgiyi artırmıştır. Bu kapsamda, seyreltik H_2SO_4 , biyoyakıt üretiminden ziyade özellikle ticari amaçlı olarak selülozik malzemelerden furfural üretmek için kullanılmıştır. Seyreltik H_2SO_4 , lignoselülozik biyokütle yapısında bulunan hemiselülozu, ksiloz ve diğer şekerlere hidrolize etmek için biyokütleye uygulanmaktadır. Seyreltilmiş H_2SO_4 ön işlemi, selüloz hidrolizini önemli ölçüde iyileştirebilir. Bu ön işlem uygulaması ile, hemiselülozun çoğu çözünmüş şekerler olarak etkin bir şekilde uzaklaştırılmakta ve geri kazanılmaktadır. Selülozdan tam glikoz verimine ise, tam hemiselüloz hidrolizi ile hemiselülozun uzaklaştırılmasıyla ulaşılmaktadır. Dolayısıyla, asit eklenmesi ile hemiselüloz çıkarılarak, kalıntı katılar selülozun bozunabilirliğini artırmaktadır. Seyreltik asit ön işleminde, yüksek sıcaklıklar selüloz hidrolizi için uygundur (Kumar vd., 2009).

Asit ön işlem uygulaması, katı madde yüklemesine göre kuru ve ıslak ön işlem uygulaması olarak sınıflandırılabilir. Islak asit ön işlem uygulaması, % 15 (w/w)'in altındaki katı madde yüklemelerinin kullanılması ile karakterize edilmektedir. Lignoselülozik biyokütle asit ön işlem uygulamasının yolu katalizör olarak hem CH_2O_2 , $\text{C}_2\text{H}_4\text{O}_2$, $\text{C}_3\text{H}_6\text{O}_2$, $\text{C}_4\text{H}_4\text{O}_4$ gibi organik asitleri hem de H_2SO_4 , HCl , H_3PO_4 gibi mineral asitleri kapsamaktadır (Jung ve Kim, 2015; Behera vd., 2014). Islak asit ön işlem uygulaması, lignoselülozik biyokütlenin hemiselüloz parçalanmasını gerçekleştirmek için kullanılmaktadır. Bu ön işlem uygulaması, asit çözeltisindeki asit konsantrasyonuna bağlı olarak, konsantre veya seyreltilmiş asit prosesi olarak sınıflandırılabilir. Konsantre asit ön işlem uygulamasının avantajı, düşük işletme maliyetlerinde (düşük sıcaklık ve uzun süreli çalışma) gerçekleşir. Dezavantajı ise, korozyona dayanıklı proses ekipmanları gerektiği için pahalıdır. Seyreltik asit ön işlem uygulamasında proses ekipmanları daha az maliyetli olup, yüksek sıcaklıklarda çalışılmaktadır. Buna ilaveten bu uygulamada, fermente edici mikroorganizmaların büyümesinin potansiyel inhibitörleri olan furfural, 5-hidroksimetilfurfural (HMF), formik asit gibi şeker bozunma bileşikler üretilmektedir (Janga vd., 2012). Kuru seyreltik asit ön işlem uygulaması, genel olarak sıvı fraksiyondan iki kat daha büyük bir katı fraksiyonda çalışmaktadır. Kuru seyreltik asit ön işlemi, lignoselülozik matris ve asit katalizörü arasındaki kütle transferini iyileştirmeye yardımcı olan seyreltik asit çözeltisi ile bir ön ıslatma adımından sonra gerçekleştirilebilir. Ön ıslatma aşamasında bekleme süresi, oda sıcaklığında yaklaşık 12 saat olarak bildirilmiştir. Bu ön ıslatma adımı, ihtiyaç duyulan uzun bekleme süreleri nedeniyle endüstriyel faaliyet yapılan alanlar için uygun değildir (Zhang vd., 2011).

2.2.2. Alkali

Lignoselülozik biyokütle asit uygulanan alkali ön işlemde oluşan etki, biyokütlenin lignin içeriğine bağlıdır. Bu ön işlem uygulaması, diğer ön işlem uygulamalarından daha düşük sıcaklık ve basınçta yarar sağlamaktadır (Kumar vd., 2009; Kim vd., 2016). Ancak, ön işlem uygulama süresi saniye veya dakika yerine saat veya gün şeklinde daha uzun sürelidir. Asit ön işlem uygulamaları ile kıyaslandığında, alkali ön işlem uygulamalarında daha az şeker bozulması gerçekleşir ve kostik tuzların çoğu geri kazanılabilir ve/veya yeniden üretilir (Kumar vd., 2009). Bu yöntemde, korozyon etkisi düşük olduğundan, pahalı malzemelere ve özel tasarımlara olan ihtiyaç ortadan kaldırılabilir (Kim vd., 2016).

Alkali ön işlem uygulaması ile, lignoselülozik biyokütlenin enzim bozunabilirliğini arttırmak için çeşitli reaktifler kullanılmıştır. Bu reaktiflerin sodyum hidroksit, kalsiyum hidroksit, potasyum hidroksit ve amonyum hidroksit olduğu ve alkali ön işlem reaktiflerinin sülfat ve sülfürik asit gibi asidik reaktiflerden daha az yakıcı olduğu bildirilmiştir. Bunlardan yaygın olarak sodyum hidroksit kullanılmıştır (Li ve Kim, 2011; Kim ve Holtzaple, 2006; Novakovic vd., 2021; Kumar vd., 2009; Kim vd., 2016). Kalsiyum hidroksitin (sönmüş kireç) ise, etkili bir ön işlem malzemesi olduğu ve kg hidroksit başına en uygun maliyetli olduğu bildirilmiştir. Kireç ön işleminde kireç su ile bulamaç haline getirilerek, biyokütle üzerine püskürtülmekte ve biyokütlenin saatlerce veya haftalarca yığın halinde depolanmasını kapsamaktadır. Biyokütle parçacık boyutunun genel olarak 10 mm veya daha küçük boyutlarda olduğu, yüksek sıcaklık değerlerinin temas süresini azalttığı bildirilmiştir (Kumar vd., 2009).

Alkali ön işlem ile diğer ön işlem uygulamalarının kombinasyonunun hidrolizi önemli ölçüde iyileştirebildiği rapor edilmiştir. Seyreltik asit, mikrodalga, ıslak öğütme ve alkali işlemli ultrasonikasyon bir kombinasyonu, tek başına alkali ön işlemi yapılmasına göre yüksek enzimatik hidroliz şeker verimi ile sonuçlanmıştır (Keshwani ve Cheng, 2010; Cheng vd., 2011; He vd., 2010; Moodley ve Gueguim Kana, 2017; Rodrigues vd., 2011).

2.2.3. Organo çözücü

Organosolvasyon yöntemi, lignoselülozik biyokütle asit uygulanmış umut verici ön işlem stratejilerinden biridir. Bu ön işlem yönteminde, iç lignin ve hemiselüloz bağlarının kırılmasında, inorganik asit (H_2SO_4 veya HCl) katalizörleri ile organik veya sulu bir organik solvent karışımı kullanılmaktadır. Organosolvasyon ön işlem uygulamalarında yaygın olarak etanol, metanol, trietilen glikol, etilen glikol ve aseton çözücüler kullanılmaktadır. Oksalik, salisilik ve asetilsalisilik gibi organik asitlerin organosolvasyon işleminde katalizör olarak kullanıldığı bildirilmiştir. Bu işlem temelde, organik çözücüler ve genel olarak seyreltik sulu asit çözelti tarafından desteklenen lignoselülozik biyokütlenin eşzamanlı ön hidrolizini ve ligninin uzaklaştırılmasını (delignifikasyon) kapsamaktadır (Kumar vd., 2009; Zhao vd., 2009; Papatheofanous vd., 1995).

2.2.4. Ozonoliz

Ozon ön işlemi, lignoselülozik biyokütlenin lignin içeriğinin azaltılmasında kullanılarak, ön işlem uygulanmış biyokütlenin parçalanabilirliğini artırmaktadır. Ayrıca, diğer kimyasal ön işlem uygulamalarından farklı olarak toksik kalıntı üretilmemektedir. Buğday samanı, pamuk samanı, çam, fıstık, şeker kamışı küspesi gibi lignoselülozik biyokütlelerde hemiselüloz ve lignini parçalamak için kullanılabilir. Bozunma lignin ile sınırlı olup, hemiselüloz çok az etkilenmekte, selüloz ise etkilenmemektedir (Kumar vd., 2009).

Ozonoliz ön işlem uygulamasının avantajı, sıvı fazın olmaması, ürün seyreltme ile ilgili sorunlardan kaçınma, reaksiyonların oda sıcaklığı ve basınçta gerçekleştirilmesidir. Ayrıca, ozonun sıcaklığın artırılmasıyla veya katalitik bir yatak kullanılarak kolayca parçalanabilmesi, proseslerin çevre kirliliğini minimum seviyelere indirebilecek şekilde tasarlanmasını desteklemektedir. Ozonoliz uygulamasının dezavantajı, prosesin soğutma sistemi gerektirmesi, prosesi maliyetli duruma getirebilecek çok miktarda ozon gerektirmesi, ozonun yüksek derecede reaktif, aşındırıcı, yanıcı ve toksik özellikler göstermesidir (Travaini vd., 2016; Kumar vd., 2009).

3. Sonuçlar ve Öneriler

Lignoselülozik biyokütle kullanımı, hem tarımsal kökenli atık veya kalıntıların azaltılması hem de biyoyakıt üretimi için faydalıdır. Yöntemden yöntemeye değişen ve biyokütle türlerine bağlı olarak ön işlem verimliliği farklı kriterlerle belirlenebilir. Ön işlem yöntemi, biyokütlenin biyolojik parçalanabilirliğini kolaylaştırmak ve genel işleme süresini azaltmak için hayati öneme sahip olmakla birlikte, kullanılabilecek tek ön işlem uygulaması genel verimliliği düşürebilir. Bu nedenle, mekanik öğütme işlemi, diğer ön işlemlerden biri ile birleştirilebilir. Lignoselülozik biyokütleye uygulanan fiziksel ve kimyasal ön işlemin; hidroliz hızını arttırma, nihai karbonhidrat çıktısı, erişilebilirlik ve biyoyararlanım için önemli olduğu sonucuna varılmıştır. Biyokütlenin biyoyakıt kaynağı olarak kullanılabirliği ile ilgili araştırmaların geliştirilmesi ve bu biyokütle tiplerinin bileşenlerinin verimli ayırma ile yüksek değerli kimyasallara dönüştürülmesinin araştırılması önerilmektedir.

² Department of Animal Science, Faculty of Agriculture, Bursa Uludağ University, Türkiye

Abstract

Foods of animal origin contribute significantly to human nutrition. In particular, the necessity of producing these traded products to meet the needs of society makes it difficult and obligatory to ensure that they comply with adequate quality standards. Nowadays, the concepts of food/feed safety and food/feed quality have gained importance, and the need to evaluate both feeds and foods not only in terms of their nutritional properties but also in terms of their ability to protect health has emerged. Because the physical and chemical structures of feeds used in animal nutrition directly affect product safety as well as productivity in animal production. Therefore, feed quality is vital in producing animal foods consumed for long-term human welfare. In this study, the roles of feed production processes and feed quality in ensuring the health, safety, and quality of foods of animal origin are emphasized.

Ruminantlardan Elde Edilen Gıdaların Üretiminde ve İnsan Refahında Yem Kalitesinin Önemi

Özet

Hayvansal kökenli gıdalar, insanların beslenmesine önemli ölçüde katkıda bulunmaktadır. Özellikle ticareti yapılan bu ürünlerin toplumun ihtiyaçlarını karşılayacak ölçüde üretilme gerekliliği, yeterli kalite standartlarına uygun olmasının sağlanmasını hem zorlaştırmakta hem de zorunlu kılmaktadır. Günümüzde gıda/yem güvenliği ve gıda/yem kalitesi kavramları önem kazanmış hem yemlerin hem de gıdaların sadece besinsel özellikleri açısından değil aynı zamanda sağlığı koruma yetenekleri açısından da değerlendirilmesi ihtiyacı ortaya çıkmıştır. Çünkü hayvan beslemede kullanılan yemlerin fiziksel ve kimyasal yapıları hayvansal üretimde verimliliğin yanı sıra ürün güvenliğini doğrudan etkiler. Dolayısıyla uzun vadeli insan refahı için tüketilen hayvansal gıdaların üretilmesinde yem kalitesi önemli role sahiptir. Bu çalışmada hayvansal kaynaklı gıdaların kalitesinin, güvenliğinin ve sağlıklı olmasının sağlanmasında yem üretim süreçlerinin ve yem kalitesinin rolleri üzerinde durulmuştur.

Understanding Aerobic Deterioration and Ensuring Stability in Ensiled Feeds

Erdoğan Altınçekiç

Department of Feed and Feedstuffs, Central Research Institute of Food and Feed Control, Bursa, Türkiye

Abstract

Aerobic stability is a crucial indicator that shows the length of time that the silage opened to be fed to the animals can be used without deterioration. In other words, it refers to the shelf-life of silage. Exposure to oxygen leads to activating microorganisms such as yeast and mold, which cause aerobic deterioration in silage. Aerobic microorganisms grow by consuming components such as water-soluble carbohydrates, organic acids, and nitrogenous compounds in the silage. Hence, there is an increase in silage temperature, an enhancement in pH value, and losses in dry matter content. Therefore, silage spoiled by oxygen is an economic problem. Various additives and methods are used to improve the stability of silages by preventing or minimizing their aerobic deterioration. This study aims to review and update the understanding both in the aerobic deterioration process of silage and in the applications that improve stability.

Silo Yemlerinde Aerobik Bozulmanın Anlaşılması ve Stabilitenin Sağlanması

Özet

Aerobik stabilite, hayvanlara yedirilmek üzere açılan silajın bozulmaksızın kullanılabilceği süreyi belirten çok önemli bir göstergedir. Başka bir deyişle, silajın ömrünü ifade eder. Oksijene maruz kalma, silajda aerobik bozulmaya neden olan maya ve küf gibi mikroorganizmaların aktif hâle gelmesine yol açmaktadır. Aerobik mikroorganizmalar silaj bünyesindeki suda çözünebilir karbonhidratlar, organik asitler ve nitrojenli bileşikler gibi komponentleri tüketerek gelişirler. Bunun sonucunda ise silaj sıcaklığında artış, pH değerinde yükselme ve kuru madde içeriğinde kayıplar olur. Bu nedenle hava alarak bozulmuş silajlar ekonomik bir sorundur. Silajların aerobik bozulmalarını önleyerek veya minimize ederek stabiliteyi geliştiren çeşitli katkı maddelerine ve yöntemlere başvurulmaktadır. Bu çalışmada hem silajın aerobik bozulma sürecindeki hem de stabiliteyi artıran uygulamalardaki anlayışın gözden geçirilmesi ve güncellenmesi amaçlanmıştır.

Anahtar Kelimeler: *aerobik stabilite, silaj, silaj yönetimi, katkı maddeleri*

Abstract

Organic compounds are classes of chemical compounds which evaporate easily from water into the air and they contain carbon. This research examined the analysis of organic compounds in industrial and effluent water of Asa River, Ilorin, Nigeria and the purpose is to ascertain that raw materials used in production have a link to the pollution of surface water, and it was carried out using Fourier Transform Infra red Spectroscopy from eight sampling locations. Findings showed that detergent company effluent and its surface water (EW-GS-1 & GS/SW1) presents peaks 3447.7-3454.2 cm⁻¹ which can be ascribed to primary amines of -N-H- distends; Pharmaceutical companies A&B (EW-TP-1&KC-GS-TP/SW1 with EW-KC-3&KC/SW1 respectively) shows the band at 750.07cm⁻¹ for effluent waters and 754.97cm⁻¹ for surface water were assigned to -C-C stretching of mononuclear aromatic hydrocarbons which is benzene while, battery company (EW-FB-4&FB/SW1) reveals energetic alp at 1271cm⁻¹ assigned to -C-O-C distends indicative of alkyl aryl ether because of strong dipole moment. This research reveals that surface water is most times polluted with organics and it has to be controlled to ensure safe water for drinking.

Key words: *Organic compounds, Peaks, Surface water, Industrial effluent, Dipole moment*

1. Introduction

Organic compounds (OCs) are classes of chemical compounds evaporate easily from water into the air and they contain carbon which components that have high vapour pressure and low water solubility (Kwon and Finneran, 2008). Many organic compounds are human-made chemicals that are used and produced in the manufacture of paints, pharmaceuticals and refrigerants. They are typically industrial solvents such as trichloroethylene; fuel oxygenated such as methyl tetra-butyl ether (MTBE) or by-products produced by chlorination in water treatment, such as chloroform (Kumar and Pransannamedha, 2021). They are often components of petroleum fuels, hydraulics fluids, and paint thinner and dry cleaning agent. They are associated with product such as gasoline, plastics, adhesives, dry-cleaning fluids and biological source, which include trees, cows, termite (methanol) and cultivation (Ninemets *et al.*, 2004; Reikichi andToshihiko, 2005).

Organic compounds can enter groundwater from a variety of sources. Benzene for instance, may enter groundwater from gasoline or oil spills on the ground surface or from leaking underground fuel tanks spilled or improperly disposed of OCs may be released into the environment. Any portion that does not evaporate may soak into the soil and can be carried into groundwater by rain, water and Snow Belt (Mariana and Pietro, 2019; Mirosław *et al.*, 2015; Makshakova *et al.*, 2014). Factor that influence the likelihood of contamination include among others, proximity of the water to the source of contamination, the amount of OCs that are spilled or discarded, depth of the well (shallow wells are affected by surface spills more quickly and severely than deep wells); local geology (groundwater that is protected by thick, dense soil is less vulnerable to contamination); and time (groundwater moves slowly, so it can take months or years after a spill before contamination releases well). (Benotti and Snyder, 2009; Tripathi *et al.*, 2020; Schymanski *et al.*, 2014). The harmful effects of OCs vary considerably. At high levels, some OCs may damage the central nervous systems, the kidney or the liver. They may cause irritation to mucous membranes if inhaled.

In this research, our focus is on Asa River, which was pointed out that the river is subject to high level of eutrophication due to organic matter and industrial discharge into it (Eletta and Adekola, 2005; Reikichi, 2019). The aim of this work is to use Fourier Transform Infra Red Spectroscopy to determine functional groups of organic compounds present in industrial effluent which also traceable to access Asa River in Ilorin, Kwara State used for all activities in that locality. This study was carried out on effluent and surface water samples of Ilorin environs based on eight sampling sites which are EW-GS-1, EW-TP-2, EW-KC-3, EW-FB-4, GS/SW1, KC-GS-TP/SW1, KC/SW1 and FB/SW1 respectively. These sites are highly industrialised and commercialised; also discharge of effluents from various companies into water bodies occurs majorly in these areas.

2. Materials and Methods

2.1 Study sites, sample collection and pretreatment

Eight water samples were collected along the course of Asa River (Figure 1, Table 1) seasonally for two years (February 2013-April 2015). OCs samples were collected in pre-sterilised glass bottles and aluminum foil was used to air tight the bottles to avoid temperature changes and preserved with 2 mL conc. tetraoxosulphate (VI) acid per litre at 4°C to prevent the loss of volatile compounds until chemical analysis.

Figure 1: Study sites and sampling locations

Table 1. Sampling Location and site description

S/No	Sample Location	Longitude	Latitude	Site description
1	EW-GS-1	4° 32' 14.55" E	8° 27' 50.94" N	Effluent collected from a detergent company located at Asa-dam Road, Ilorin, Kwara State at the back close to the fence, which overflows passes into a gutter through an outlet. The effluent was soapy in nature.
2	EW-TP-2	4° 33' 0.39" E	8° 28' 24.52" N	Effluent collected from a pharmaceutical company A situated at New Yidi Road, Ilorin, Kwara State. It is white – brownish in colour.
3	EW-KC-3	4° 32' 35.55" E	8° 28' 50.47" N	Effluent collected from pharmaceutical company B situated at Oko-erin road, Ilorin, Kwara State. Dirty white colour effluent water was obtained.
4	EW-FB-4	4° 33' 58.63" E	8° 28' 11.64" N	Effluent collected from battery company situated at Gaa-imam road close to Stella Obasanjo multipurpose hall, Ilorin, Kwara State. A light colour water effluent was collected.
5	GS/SW1	4° 32' 20.57" E	8° 27' 27.84" N	A soapy surface water /sediment was collected (553 m) away from the detergent industry.
6	KC-GS-TP/SW1	4° 33' 16.91" E	8° 28' 36.21" N	Meeting point one of pharmaceutical site B/detergent/pharmaceutical site A at New Yidi stream (4846 m) from the industries.
7	KC/SW1	4° 32' 26.62" E	8° 28' 25.14" N	A stream located within Kwara State Stadium Complex, Taiwo Road, Ilorin was sampled (889 m) away from the industry B.
8	FB/SW1	4° 34' 1.36" E	8° 28' 7.97" N	An adjoining stream before the battery industry at Gaa – imam, Ilorin was sampled (1380 m).

2.2 Sample Preparation

Organic Compounds was determined using extraction by hexane and separation via gas chromatography. The industrial and surface water samples were filtered through a membrane filter with 0.45 nm pore size before extraction procedures. Water sample of 100 mL was transferred into a separating funnel and 100 mL of organic solvent (50 mL: 50 mL - hexane: dichloromethane) added and the mixture separated for 45 minutes by thorough shaking, afterwards the extract was poured into beaker and left for few minutes to evaporate then the remaining extract filtered using cotton wool as a separating medium in a pasture pipette and anhydrous Sodium tetraoxosulphate (VI) Na_2SO_4 in excess was added to absorb the remaining water in the sample and this was totaled into a vial bottle up to 2 mL ready for Fourier Transform Infra red analysis.

3. Results and discussion

From the figure IR 1 and IR 2, it can be seen that EW-GS-1 and GS/SW1 array present apparent apex in the succeeding amplitudes. $3447.07\text{--}3454.2\text{ cm}^{-1}$; $2075.52\text{--}2964\text{ cm}^{-1}$; $1636.96\text{--}1741.12\text{ cm}^{-1}$; $1378.2\text{--}1461\text{ cm}^{-1}$; $1032.2\text{--}1378.2\text{ cm}^{-1}$; $744.73\text{--}764.22\text{ cm}^{-1}$ and $384.43\text{--}427.97\text{ cm}^{-1}$. The ample and energetic bandeau stationed in the bounds $3447.07\text{--}3454.2\text{ cm}^{-1}$ can be ascribed to primary amines of --N-H distends. The bandeau separating the bounds $2075.52\text{--}2964\text{ cm}^{-1}$ is assigned to the --C-H expands oscillations. The energetic peaks of 1636.96 cm^{-1} for effluent water, while 1621.9 cm^{-1} and 1741.12 cm^{-1} are for surface water respectively could be as a result of a C=O distends in carboxylic or acetamide bands indicative of 1,3-diketones. $\text{--C}\equiv\text{C}$ stretching weak absorption at 2075.52 cm^{-1} for effluent water. --C-O-C stretching at bands 1102.62 cm^{-1} for effluent water and 1032.2 cm^{-1} and 1110.2 cm^{-1} for surface water indicative of aliphatic ethers. All the peaks found in these sampling sites were expected due to the raw materials used by the effluent companies such as sodium benzoate, caustic soda, fatty alcohols, alkyl benzenes and carboxy methyl cellulose.

Figure IR 1: EW-GS-1

Figure IR 2: GS/SW1

From the figure IR 3 and IR 4, it can be observed that EW-TP-2 and KC-GS-TP/SW1 spectrum present specific apex in the succeeding amplitude: $3449.3\text{--}3897.2\text{ cm}^{-1}$, $2879.2\text{--}2964.72\text{ cm}^{-1}$, $1617\text{--}1745.3\text{ cm}^{-1}$, $1256.4\text{--}1467.7\text{ cm}^{-1}$, $1032.2\text{--}1154\text{ cm}^{-1}$, $505.94\text{--}754.97\text{ cm}^{-1}$, $371.83\text{--}391.33\text{ cm}^{-1}$. C=C-H stretching for unconjugated alkenes was observed at 3449.3 cm^{-1} , C-H stretching situated at 2964.7 cm^{-1} for effluent water and 2965.05 cm^{-1} for surface water as asymmetrical stretching indicative of straight chains alkanes. The strong and broad absorption overtone band at 1382 cm^{-1} and 1378 cm^{-1} respectively is assigned to $\text{C}\equiv\text{C-H}$ distends. The band observed at 1258.7 cm^{-1} for effluent water and 1256.4 cm^{-1} for surface water was assigned to --C-H bend overtone of alkynes. The peaks observed at 1154 cm^{-1} and 1032.2 cm^{-1} is attributed to --C-O stretching resonance indicative of tertiary and primary alcohols respectively and also the bands ranges at $1276\text{--}1738.9\text{ cm}^{-1}$ indicated --C-O stretching of alcohols. Bands at 1466 cm^{-1} is assigned to --C-C stretch indicative of aromatic hydrocarbons for benzene ring. The strong characteristic bands observed at 1046.2 cm^{-1} for effluent water and 1032.2 cm^{-1} for surface water is assigned to --C-O-C stretching due to the strong dipole moment. The strong peaks at 1258.7 cm^{-1} for effluent water and 1256.4 cm^{-1} for surface water are attributed to asymmetrical stretch of alkyl aryl ethers.

The intense band at 1745.3 cm^{-1} and 1738.9 cm^{-1} is assigned to C=O stretch indicative of ketones (esters), acids, lactones and lactams (1738.9 cm^{-1}). Crest at 1276 cm^{-1} and 1256.4 cm^{-1} are indicative of α , β unsaturated esters. The peaks at 1467.7 cm^{-1} , 1382 cm^{-1} for effluent water and 1466 cm^{-1} , 1378.2 cm^{-1} for surface water was attributed to alkyl nitrite. The bands at 750.07 cm^{-1} for surface water and 754.97 cm^{-1} for surface water were assigned to C-C stretching of mononuclear aromatic hydrocarbons which is benzene.

Figure IR 3: EW-TP-2

Figure IR 4: KC-GS-TP/SW1

From the figure IR 5 and IR 6, it can be observed that EW-KC-3 and KC/SW1 spectrum present specific crest in the succeeding amplitude: $3449.3\text{--}3897.2\text{ cm}^{-1}$, $2879.2\text{--}2965.80\text{ cm}^{-1}$, $1617\text{--}1745.3\text{ cm}^{-1}$, $1256.4\text{--}1461\text{ cm}^{-1}$, $1032.2\text{--}1154\text{ cm}^{-1}$, $569.3\text{--}754.97\text{ cm}^{-1}$ and 391.43 cm^{-1} respectively. The bandeau observed at 3449.3 cm^{-1} was indicative of C=C-H stretching for unconjugated alkenes. C-H stretching situated at 2964.7 cm^{-1} for effluent water and 2965.05 cm^{-1} for surface water as asymmetrical stretching indicative of straight chains alkanes. The strong and broad absorption overtone band at 1382 cm^{-1} and 1378 cm^{-1} respectively is assigned to C $\equiv$ C-H stretching. The band observed at 1258.7 cm^{-1} for effluent water and 1256.4 cm^{-1} for surface water was assigned to C-H bend overtone of alkynes. The peaks observed at 1154 cm^{-1} and 1032.2 cm^{-1} is attributed to C-O stretching oscillations indicative of tertiary and primary alcohols respectively and also the bands ranges at $1276\text{--}1738.9\text{ cm}^{-1}$ indicated C-O distends of alcohols. Apex at 1466 cm^{-1} is attached to C-C stretch indicative of aromatic hydrocarbons for benzene ring. The strong characteristic bands observed at 1046.2 cm^{-1} for effluent water and 1032.2 cm^{-1} for surface water is assigned to C-O-C stretching due to the strong dipole moment. The strong peaks at 1258.7 cm^{-1} for effluent water and 1256.4 cm^{-1} for surface water are attributed to asymmetrical stretch of alkyl aryl ethers. The intense band at 1745.3 cm^{-1} and 1738.9 cm^{-1} is assigned to C=O stretch indicative of ketones (esters), acids, lactones and lactams (1738.9 cm^{-1}). Alps at 1276 cm^{-1} and 1256.4 cm^{-1} are indicative of α , β unsaturated esters. The peaks at 1467.7 cm^{-1} , 1382 cm^{-1} for effluent water and 1466 cm^{-1} , 1378.2 cm^{-1} for surface water was attributed to alkyl nitrite. The bands at 750.07 cm^{-1} for surface water and 754.97 cm^{-1} for surface water were assigned to C-C stretching of mononuclear aromatic hydrocarbons which is benzene. All peaks found in this sampling site were expected due to the raw materials used by the effluent company of pharmaceuticals such as benzene, methanol, glycerin, acetone, hydrochloric acid, starches and sugar.

Figure IR 5: EW-KC-3

Figure IR 6: KC/SW1

From the figure IR 7 and IR 8, it can be seen that EW-FB-4 and FB/SW1 spectrum present specific crest in the succeeding amplitude: $3439.6\text{--}3444.5\text{ cm}^{-1}$, $2850\text{--}2964.96\text{ cm}^{-1}$, $1617\text{--}1743.7\text{ cm}^{-1}$, $1227.2\text{--}1466\text{ cm}^{-1}$, $1032.2\text{--}1159\text{ cm}^{-1}$, $749.6\text{--}764.22\text{ cm}^{-1}$ and $371.85\text{--}391.39\text{ cm}^{-1}$. Crest of 2964 cm^{-1} and 2928 cm^{-1} are assigned to C-H stretching and the range of $2850\text{--}2964\text{ cm}^{-1}$ indicated $-\text{CH}_3$ and $-\text{CH}_2$ of alkanes asymmetrical stretching respectively. C-C stretches was indicated at peaks 1154 cm^{-1} and 1032.2 cm^{-1} with the band range of $1032.2\text{--}1159\text{ cm}^{-1}$ indicated alkanes. The peak range at $3439.6\text{--}3444.5\text{ cm}^{-1}$ is assigned to C=C-H stretching indicative of alkenes and also intermolecular hydrogen bonding occurs as concentration increases, accompanied by a shift to lower frequency at the expense of the free OH bend. The intense bands observe at 1743.7 cm^{-1} , 1617 cm^{-1} is designated to C=O distends of carbonyls for lactones, aldehydes, acids, esters and acid halides. The broad and strong absorption bandeau from amplitude $1227.2\text{--}1466\text{ cm}^{-1}$ is imputed to $-\text{C}\equiv\text{C-H}$ bending. Alps 1466 cm^{-1} is imputed for $-\text{C-C}$ distends for aromatic, while the peaks at 1271 cm^{-1} , 1261.3 cm^{-1} , 1154 cm^{-1} and 1032.2 cm^{-1} respectively were assigned to C-H stretching in plane bends of aromatics. The peak 1738.9 cm^{-1} , 1667 cm^{-1} for primary alcohol and 1466 cm^{-1} and 1373 cm^{-1} for tertiary alcohol were assigned to C-O stretching vibrations for alcohols. The energetic alp at 1271 cm^{-1} is assigned to $-\text{C-O-C}$ distends indicative of alkyl aryl ether because of strong dipole moment. All the peaks found in these sampling sites both in effluent and surface waters were expected due to the raw materials used by the battery company and other accompany companies nearby which uses paraffin waxes, catechols, sulphur, acids, sodium chloride and tar.

4 Department of Biochemistry, Payame Noor University, Tehran, I. R. P. O. BOX 19395-3697, Iran

Abstract

The main issue in this research is the prioritization of the special value components of the Green brand from the point of view of the women of Hijab Park in Mashhad. The present research is based on the Konkrik (2007) model. The main hypothesis of the research is that there is a positive and significant relationship between recreational and sports activities of women and the value of the green brand visa. According to Konkrik's model, brand equity has four dimensions: brand awareness, brand image, perceived quality, and brand loyalty, so the sub-hypotheses (brand trust, brand satisfaction, and brand experiences) research positive relationship and meaning. There is a correlation between recreational and sports activities of women on the special value of the green brand, it has been evaluated. This research was done by survey method using questionnaire tool. The statistical population includes women who used the recreational and sports services of Hijab Park in Mashhad between April 5 and May 5, 2017. The statistical sample of the current study was 289 women using the Hijab Women's Park in Mashhad, who were randomly selected. Construction of women's park; In fact, it is a response to a need that has arisen for women due to society's limitations or personal preference, and according to some sociologists, this issue can lead to the draining of women's emotions to some extent. The purpose of this research is to investigate the effective factors of the special value of the green brand in the leisure-sports activities of women in Mashhad city with the method of exploratory and confirmatory factor analysis. The descriptive research method is survey type. The tool for data collection is a questionnaire based on the conducted research, research objectives, and the opinions of supervisors and advisors. Cronbach's alpha method was used to calculate the reliability of the tool (>0.88) with 39 questions on the Likert scale, it evaluates the factors affecting the special value of the green brand in the recreational-sports activities of women in Mashhad. Descriptive and inferential statistics are used to analyze the data. Using inferential statistics methods (Kolomgorov Smirnov test, Spearman correlation coefficient test, binomial distribution test and Friedman test) the research hypotheses have been tested. It is necessary to explain that all calculations in this research were done using SPSS 22, Excel 2010 and LISREL 8.80 software. Based on factor analysis, seven factors of brand image, perceived quality, brand loyalty, brand awareness, brand satisfaction, brand experiences, and brand trust were identified as factors affecting the special value of the green brand in recreational and sports activities of women in Mashhad. The importance of the factors was examined from the perspective of the subjects. Therefore, the highest mean among the components is related to the components of "Brand Loyalty" (SD = 0.73, 4.09) and the lowest mean is related to the component "Brand Awareness" (SD = 0.69, = 3.69). Therefore, it is suggested to pay special attention to brand loyalty, in order to increase the various aspects of women's health, to improve useful social relationships along with their cheerful spirit. At the end, the results have been discussed and made suggestions for more well-being. Hijab park ladies are provided.

Key Words: *Green marketing, Special brand value, Women's leisure-sports activities, Environment*

Determination of Usability of Wastewater for Irrigation Purposes in Agriculture in Kırklareli Region

Hacer Gülocak¹, Sultan Kıymaz²

¹Atatürk Soil Water and Agricultural Meteorology Research Institute, Kırklareli, Turkey

²Kırşehir Ahi Evran University, Faculty of Agriculture, Department of Biosystem Engineering, Kırşehir, Turkey

Abstract

Water, which is one of the basic elements of life, is used in many fields such as drinking-use, energy production, agriculture and industry. As a result of the rapid increase in population, agricultural practices, industrialization, and climate change, pressures on water resources in terms of quantity and quality are increasing. Since 70% of the total water consumption in the world is used for agricultural purposes, the use of treated wastewater in agricultural irrigation has an important place in preserving the amount and quality of water resources. The sewage waters of the city of Kırklareli are treated in the existing domestic and industrial treatment plants and discharged into the Kırklareli stream. This study was carried out in order to determine the irrigation water quality and pollution status of the waters released from the waters of the creek and treatment plants and to reveal their suitability for agricultural use. 10 different stations were determined for water samples on Kırklareli Stream. From these stations, sampling was made once seasonally. Physical and inorganic-chemical parameters were investigated. The data obtained from the study was determined according to the Classes of Inland Surface Water Resources (KYSKK) in the Water Pollution Control Regulation. Accordingly; In terms of physical and inorganic-chemical parameters of Kırklareli stream water samples, it is seasonally classified as IV. class has been determined. It has been determined to be in the C3S1 class according to the US Salinity Laboratory Classification system based on electrical conductivity (EC) and sodium adsorption rate (SAR) values. According to the results obtained, it has been determined that it should be used with caution due to its excessive salt content. Analysis of variance, one-way analysis of variance (ANOVA) and correlation analysis were performed in a repeated measurement experiment on the measurement values of water samples. Significant differences and relationships between parameters were determined statistically.

Key Words: Wastewater, domestic waste, industrial waste, water quality, water pollution, reuse.

Kırklareli Yöresindeki Atıksuların Tarımda Sulama Amaçlı Kullanılabilirliğinin Belirlenmesi

Özet

Yaşamın temel öğelerinden olan su, içme-kullanma, enerji üretimi, tarım ve sanayi gibi birçok alanda kullanılmakta olup, ancak; nüfusun hızla artması, tarımsal uygulamalar, sanayileşme, iklim değişikliği gibi etkiler sonucu su kaynaklarına miktar ve kalite açısından baskılar giderek artmaktadır. Dünyadaki toplam su tüketiminin %70'inin tarımsal amaçlı kullanılması nedeniyle, arıtılmış atık suların tarımsal sulamada kullanılması, su kaynaklarının miktarı ve kalitesinin korunmasında önemli bir yere sahiptir. Kırklareli il merkezinin kanalizasyon suları mevcut evsel ve endüstriyel arıtma tesislerinde arıtılarak Kırklareli deresine deşarj edilmektedir. Bu çalışma derenin suları ve arıtma tesislerinden salınan suların, sulama suyu kalitesi ve kirlilik durumunun belirlenerek tarımsal amaçlı kullanıma uygunluğunu ortaya koymak amacıyla gerçekleştirilmiştir. Kırklareli Deresi üzerinde su örnekleri için 10 farklı istasyon belirlenmiştir. Bu istasyonlardan mevsimsel olarak birer kez örnekleme yapılmıştır. Örnekler üzerinde fiziksel ve inorganik-kimyasal parametreler incelenmiştir. Çalışmadan elde edilen değerler, Su Kirliliği Kontrol Yönetmeliğinde yer alan Kıta İçi Yerüstü Su Kaynaklarının Sınıflarına (KYSKK) göre kalite belirlenmiştir. Buna göre; Kırklareli deresi su örneklerinin fiziksel ve inorganik-kimyasal parametreleri açısından mevsimsel olarak kalite sınıfının IV. sınıf olduğu, elektriksel iletkenlik (EC) ve sodyum adsorpsiyon oranı (SAR) değerlerini temel alan ABD Tuzluluk Laboratuvarı Sınıflandırma sistemine göre ise C3S1 sınıfında olduğu, fazla tuzlu olmasından dolayı dikkatle kullanılması gerektiği tespit edilmiştir. Su örnekleri ölçüm değerleri üzerinde yapılan tekrarlanan ölçümlü deneme düzeninde varyans analizi, tek yönlü varyans analizi (ANOVA) ve korelasyon analizi yapılmıştır. İstatiksel açıdan parametreler arasındaki belirgin farklar ve ilişkiler belirlenmiştir

Anahtar Kelimeler: Atıksu, evsel atık, endüstriyel atık, su kalitesi, su kirliliği, yeniden kullanım.

Abstract

The Irish potato (*solanum tuberosum* L.) is one of Rwanda's most important tuber crops, but its yield and processing quality fall short of desired levels. This study was done on two potato varieties namely Kinigi and Rwangume to assess the effect of different inorganic and organic fertilizers on their growth, yield and processing quality (Specific gravity and dry matter content). Field trial was conducted in Musanze district-Busogo sector with the following combination of fertilizers and varieties: T₁, T₂, T₃,...,T₁₀ where T₁: Control +Rwangume, T₂: Control +Kinigi, T₃: Organic manure (Farm yard manure) + Rwangume, T₄: Organic manure (Farm yard manure) +Kinigi, T₅: Yara Winner (15-9-20+S, B, Zn, Mg, Mn) + OM +Rwangume, T₆: Yara Winner (15-9-20+S, B, Zn, Mg, Mn) + OM +Kinigi, T₇: NPK 17-17-17 + OM +Rwangume, T₈: NPK 17-17-17 + OM +Kinigi, T₉: Nitrabor (15N-25.6% CaO+B) + DAP + OM +Rwangume, T₁₀: Nitrabor (15N-25.6% CaO+B) + DAP + OM +Kinigi.

The experiment was set by splitting the main plot into two subplots. In each subplot we planted the potato varieties (Rwangume or Kinikigi) separately. In total we had 5 main plots treated with different treatments due to the combination of fertilizers. Each treatment was replicated into two replications. The parameters studied were emergence rate, number of stems per plant, leaves canopy, plant height, tuber size, number of tubers per plant, weight of tubers and total yield. In addition, the processing quality (dry matter content and specific gravity of tubers) were taken into consideration.

The ANOVA tables with Tukey HSD showed that the studied potato varieties were at 5% level of significant statistically different for all parameters except for specific gravity. The average quantities for kinigi variety were higher than rwangume variety for all measured parameters which implies that kinigi is better than rwangume. The treatments containing Yara Winner (15-9-20+S, B, Zn, Mg, Mn) + OM and Nitrabor (15N-25.6% CaO+B) + DAP + OM were found to perform well for almost all measured parameters and the ones including NPK 17-17-17 followed.

The kinigi variety is better than rwangume variety for all parameters that were studied. The combination of fertilizers with macro elements (Nitrogen, Phosphorus and Potassium) and micro elements applied at right time and right rate was found to perform well than organic manure only

Key words: Growth, Fertilizers, Yield, Processing quality, dry matter content, Specific gravity

Introduction

Around 150 countries grow potato (*Solanum tuberosum* L.) and is the world's most vital non-cereal crop, playing a critical position in the worldwide food chain (Marwaha, 2009)

High yields require both organic and mineral fertilization (Anna et al., 2004), in the potato sector, processing quality has become increasingly crucial (Asunta et al., 2008). The main quality characteristics of interest to both french fry and crisp producers are tuber size and shape, flesh colour, dormancy and storability, lowering sugar content and dry matter content (Genet, 1992).

In Rwanda, the potato is a strategic item that has the ability to increase food and nutrition security while also generating revenue. Potato intensification is low, despite its potential, resulting in low yield as well low quality for processing. A decline in soil fertility is the primary cause of the low yield. Farmers also use a wide range of fertilizer rates and types that are insensitive to the crop's actual needs. (Turamyenyirijuru, 2020). Potatoes with high dry matter content, low reducing sugar content, decent shape, and shallow eyes, for example, are required by established potato processing enterprises (USAID, 2016).

Materials And Methods

Experimental Site

The research was conducted in Northern Province, Musanze district (clay loam of volcanic soil) (Soil cares, Kigali City KK697, Bicumbi /Rwanda), Busogo sector. The site is geographically located at 1.56° or 1° 32' 16.7" south latitude and 29.55° or 29° 33' 44" east longitude. Its altitude is at 2,100 metres above sea level. The average annual temperature is 15.9 °C. The rainfall is around 1845 mm per year. (Rwanda Meteorology Agency (2020-2021))

Soil characteristics

The soil texture was clay loam which needed Nitrogen (N) 85kg, Sulphur (S) 2kg and Lime 250 kg with suitable crops of potatoes, beans, grains and vegetables for that soil type.

Table 1 Soil characteristics of study area

S/N	Parameter	Unit	Analysis Result	Level in soil
1	pH (water)	pH Value	7.0	adequate
2	Organic carbon	g/kg	57	high
3	Total Nitrogen	g/kg	5.1	high
4	Total Phosphorus	g/kg	2.2	high
5	Total Sulphur	g/kg	0.6	high
6	Potassium (exch.)	Mmol+/kg	10.5	high
7	Calcium (exch.)	Mmol+/kg	158.1	high
8	Magnesium (exch.)	Mmol+/kg	17.8	high
9	Zinc (M3)	mg/kg	7.8	high
10	Copper (M3)	mg/kg	0.9	low
11	Cation Exchange Capacity	Mmol+/kg	54	low
12	Total Aluminium	g/kg	82.4	adequate
13	Total Potassium	g/kg	36.8	high
14	Total Silicium	g/kg	242	adequate
15	Total Iron	g/kg	38.1	adequate

Plant Materials

The potato varieties used are:

- Kinigi, where Mbowa and Mwesigye, (2016) reported that Kinigi is grown in high land regions and is high yielded; early matured and resistant to diseases also is able to support industry scale processing businesses as is chosen by processors.
- Rwangume has also almost the same characteristic to Kinigi, where Mbowa and Mwesigye, (2016) reported that Kinigi is grown in high land regions and is high yielded; early matured and resistant to diseases also is able to support industry scale processing businesses as is chosen by processors. This would be given the priorities.

These two varieties are being processed by Hollanda Fair Foods Ltd (Winnaz), needed to be improved in their growth, yield and processing quality for their crisps.

Land Preparation And Experimental Layout

Experimental plot size of land was 30mx15m from UR-CAVM Busogo campus farm and was cleared, cultivated manually with hand hoe; first cultivation was done followed by second cultivation before planting.

The Experimental design used was Split plot for Season A & B, 2020-2021. A plot treatment was the fertilizers and subplots were the potato varieties. The treatments of fertilizers are the following:

- (T₁) Control +Rwangume
- (T₂) Control +Kinigi
- (T₃) Organic manure (Farm yard manure) + Rwangume
- (T₄) Organic manure (Farm yard manure) +Kinigi
- (T₅) Yara Winner (15-9-20+S, B, Zn, Mg, Mn) + OM +Rwangume
- (T₆) Yara Winner (15-9-20+S, B, Zn, Mg, Mn) + OM +Kinigi
- (T₇) NPK 17-17-17 + OM +Rwangume
- (T₈) NPK 17-17-17 + OM +Kinigi
- (T₉) Nitrabor (15N-25.6% CaO+B) + DAP + OM +Rwangume
- (T₁₀) Nitrabor (15N-25.6% CaO+B) + DAP + OM +Kinigi

Fertilizers And Their Application

Fertilizers used in the study are: None Fertilizer as control, Organic manure (Farm yard manure), Yara Winner (15-9-20+S, B, Zn, Mg, Mn), NPK 17-17-17, Nitrabor (15N-25.6% CaO+B) + DAP (18-46-0) applied uniformly at planting time. The fertilizers were applied at planting just below the seed tuber with light covering of soil to avoid direct contact with the seed.

The fertilizers are chosen due their different content as compound fertilizers, the mixed were Nitrabor (15N-25.6% CaO+B) and DAP (18-46-0) as they contain macro elements which are essential for potato growth and micro elements or trace elements work in synergism to assess how they can affect the growth, yield and processing quality of irish potato (*Solanum tuberosum* L.) for the french flies, chips and crisps.

For Organic manure, 12 tons/ha were applied at planting time where for each hole is applied 0.1kg of farmyard manure at planting time. For mineral fertilizers, 6 grams per hole were applied per hole, for the whole hectare 764 kg of NPK 17-17-17 were applied as 130 kg of Urea was required, 866 kg/ha of Yara winner (15-9-20+S, B, Zn, Mg, Mn) and 866 kg/ha of Nitrabor (15N-25.6% CaO+B) applied at planting time (Soil cares, Kigali City KK697, Bicumbi /Rwanda)

Planting

Planting was done in October, 2020 for season A and in April, 2021 for season B. The seeds had oval shape with good planting size of range 28 to 35mm, had also the first sprouts for emergence, at least three eyes had sprouts of about 3 cm height. The planting spacing was 80cm between rows and 30 cm within plants. 12 plants for Kinigi variety and 12 plants for Rwangume planted as subplots of 3m² for each variety with one tuber per hole with planting depth at 8 cm.

Exeprimental Follow Up

All other crop husbandry practices were carried out. Weeding done at 21st day after planting, earthing up done at 45th day after planting using hand hoe. Plants with diseases were uprooted and rejected far from the experiment field. To adequately protect growing plants against late blight of potato, fungicide mancozeb 85% WP was treated once a week, Dudu acelamectin applied to control the insect pests.

Data Collection Parameters

The data were recorded manually by writing in notebook, managed and entered in computer. Among of measured parameters are:

- Emergence was evaluated after 3 weeks after planting by accounting among 12 plants grown in subplot,
- The number of stems per plant was counted for each plant from experimental plots of 12 plants in subplot at blooming stage, Only stems that originated from the mother tuber were measured
- Leaves canopy for plant at flowering stage measured using tape measure,
- Plant height at flowering stage measured using the tape measure and ruler from the ground of plant up the top at blooming phase
- Tuber size measured by passing a tuber through a free space from Potato calibrating tool
- Number of tubers for plant accounted considering the tuber size from 28 mm and above
- Weight of tubers per plant for yield at harvesting time, 4 months after planting using weighing balance
- Dry matter content measured digitally by advice called PW-2050 Digital Dry Matter Weigher
- Specific gravity for processing quality digitally by advice called PW-2050 Digital Dry Matter

Data Analysis

The data was analyzed through Excel sheet to show the results and verify the hypothesis. The data were analyzed using Microsoft excel by showing the ANOVA tables with Tukey HSD among of parameters with considered p-value equal to level of 0.05.

Results And Discussion

Emergence

The Yara Winner (15-9-20+S, B, Zn, Mg, Mn) performed well on Kinigi variety on emergence as it contains the macroelements and microelements that influence on germination rate and followed by control and NPK 17-17-17, Nitrabor (15N-25.6% CaO+B) + DAP and Organic manure (Farm yard manure) while Rwangume combined with these applied fertilizers did not show the difference on emergence, it seemed soil characteristics showed that had Organic Carbon, total Nitrogen, total Phosphorus, total Sulphur, Zinc, total Potassium were on high level for growth of potato and its quality. As reported by Li *et al.*, (2019) significant effects of K inputs on potato plant emergence were observed and Different fertilizer application strategies affected the crop emergence rate and also the emergence rate that might also due the climate factors fluctuation that affect the varieties to have different emergence performance, research showed that crop emergence and leaves canopy are both important significant physiological characteristics to consider when evaluating potato (*Solanum tuberosum* L.) cultivars and managing nutrients.

Number of stems per plant

The applied fertilizers on Rwangume for stem number did not show the difference while Yara Winner (15-9-20+S, B, Zn, Mg, Mn) and Nitrabor (15N-25.6% CaO+B) + DAP performed well on Kinigi variety, P and K have considerable effects, according to reports of Niguse (2016), fertilization on stem number per hill at early maturity were statistically significant, but not their interaction.

Leaves canopy

NPK 17-17-17 and Nitrabor (15N-25.6% CaO+B) and control were well to Rwangume variety whereas Yara Winner (15-9-20+S, B, Zn, Mg, Mn) and Nitrabor (15N-25.6% CaO+B) + DAP were well to kinigi variety on

leaves canopy. Considering that soil of study site had high macroelements, it seemed soil characteristics showed that had Organic Carbon, total Nitrogen, total Phosphorus, total Sulphur, Zinc, total Potassium were on high level for growth of potato and its quality

A large benefit of adequate P supply is quicker and complete canopy formation as mentioned by Jenkins and Ali (1999); Dyson and Watson (1971); Sale (1973); McCollum (1978b); Dyson and Watson (1971).

Rapid canopy development, root cell division, tuber set, and starch synthesis are all aided by phosphorus. The fact that Leaf Area Index (LAI) distribution in potato crop canopy was uneven probably represents a strategy to maximize carbon assimilation (Gastal and Lemaire, 2002; Yin *et al.*, 2003).

However, carbon uptake of the crop is also influenced by crop N obtained via the growth of leaf area, which is less well-known. Furthermore, as of changes N intake throughout the soil for the period of crop growth, various depending on the amount of nitrogen supplied; foliage in the canopy can proliferate. Whereas leaf production stays constant (Gastal and Lemaire, 2002) and according to Villa *et al.*, (2017) confirmed that nitrogen supply is a decisive factor for potato crop canopy formation.

Plant height

NPK 17-17-17 and Nitrabor (15N-25.6% CaO+B) + DAP performed well to Rwangume and NPK 17-17-17 and Organic manure (Farm yard manure) performed well to Kinigi variety on plant height. The applied fertilizers contained potassium showed performance on plant height (table 6) as Niguse, (2016) reported that K treatments resulted in a considerable increase in potato plant height and Similarly, Al-Moshileh and Errebi (2004) found that K fertilizer had a substantial impact on plant height.

Number of tubers per plant and Tuber Size

The tuber size showed the significant difference varieties and no difference among the applied fertilizers. Yara Winner (15-9-20+S, B, Zn, Mg, Mn) and Organic manure (farm yard) responded well to Rwangume variety and Yara Winner (15-9-20+S, B, Zn, Mg, Mn), NPK 17-17-17 and Nitrabor (15N-25.6% CaO+B) + DAP responded well to kinigi variety.

The tubers number showed the significant difference varieties and no difference among the applied fertilizers, Yara Winner (15-9-20+S, B, Zn, Mg, Mn), Nitrabor (15N-25.6% CaO+B) + DAP and Organic manure (farm yard) responded well on Rwangume whereas Organic manure (farm yard), Yara Winner (15-9-20+S, B, Zn, Mg, Mn) and NPK 17-17-17 responded well to Kinigi. The variety with high number of tubers per plant was Kinigi with organic manure.

Tuber size showed the high size for kinigi variety in average and by reaching the size of more 70 mm as the highest tuber size measured from Kinigi whereas Rwangume has the smallest tuber size of about 70 only.

The results showed the difference on number of tubers and tube size where the Yara Winner (15-9-20+S, B, Zn, Mg, Mn) responded well on both varieties on number of tubers, the high number of tubers per plant may be related to the richness of the experimental site in macroelements of Nitrogen, Phosphorus and Potassium which influence the number of tubers per plant and tubers size whereas both varieties has reached the 70mm diameter. But in average, Kinigi has large tuber size in diameter. The amount of phosphorus in the soil had a substantial impact on seed tuber output, according to the findings (Akoto *et al.*, 2020). For french fried, large tubers with a high specific gravity or high starch content is required by processors (WHITE *et al.*, 1974).

Weight of tubers per plant

Yara Winner (15-9-20+S, B, Zn, Mg, Mn) responded well to Kinigi variety as weighed more than Rwangume where all fertilizers did not show the difference to Rwangume.

Kinigi had high yield (147.45 kg season A and 139.7 kg season B) than Rwangume (114.35 kg and 126.4 kg) equivalent to 31.9 tons/ha for kinigi variety and 26.75 tons/ha of Rwangume variety, Yara winner influenced more on tuber weight to kinigi variety (table 9)

According to findings of Nyiransabimana (2011) and (Fashaho *et al.*, 2013), in Busogo (northern Rwanda), nitrogen application rates of 140 kg N/ ha resulted in tuber yields ranging from 31 to 37.7 tons/ ha while nitrogen application rates of 150 kg N/ ha resulted in tuber yields of more than 42 tons/ha.

Dry matter content

Yara Winner (15-9-20+S, B, Zn, Mg, Mn) responded well to Rwangume variety and no difference of applied fertilizers to Kinigi variety on dry matter content.

Combination of applied fertilizers and varieties gave the range of desired dry matter content for crisps processing, in this study, the yara winner performed well on Rwangume variety with least significance difference but the Kinigi variety has the high dry matter content (21.06%), and applied fertilizers did not show the difference for Kinigi variety. Mohamed, E. M., *et al.*, (2017) found that Organic green manure accumulated more dry matter in tubers and throughout the plant over time than mineral fertilizer, resulting in higher rates of dry matter accumulation in tubers and throughout the plant.

Specific gravity

The specific gravity did not show significant differences with the combination of fertilizers and varieties.

The specific gravity ranged from 1.072 to 1.085 for Kinigi and 1.058 to 1.079 for Rwangume, fertilized by organic manure. Findings reported that Excessive application rates of nitrogen and potassium, along with excessive soil levels of either nutrient, may reduce tuber solids (Laboski & Kelling, 2007)

The soil's chemical and physical qualities, as well as the climate, determine the specific gravity as reported by Khan et al., (2012) and the K-source of fertilizer has an impact on specific gravity of tubers (Westerman, 1994)

The best average daily temperature for improved productivity and quality potato production, according to Govindakrishnan and Haverkort (2006), is below 21 °C and above 5 °C. To get more chips, manufacturers prefer tubers with a superior specific gravity than tubers with a lower specific gravity (Solaiman *et al.*, 2015) as found in the results, are in best range for processing standard.

Conclusions And Recommendations

Generally, Kinigi variety showed good results comparatively to Rwangume in all measure parameters. The fertilizers containing more all macroelements (Nitrogen, Phosphorus and Potassium) are good for potato production as well microelements in supplements nutrition to potato crop and about processing qualities, Kinigi variety dominate Rwangume by applying among of Yara winner, NPK and/or Nitrabor + DAP combined by organic manure as resulted in this study.

As recommendation, the farmers can grow Kinigi variety for its great tuber size more than Rwangume where in average reached 70 mm diameter by Yara winner, NPK and Nitrabor + DAP and high specific gravity of 1.08

Acknowledgement

We thank all direct technical support and indirect assistance for the efforts and contributions on these findings. Crop Sciences department, School of Agriculture and Food Sciences, College of Agriculture, Animal and Veterinary Medicine, University of Rwanda-Rwanda and Rwanda Polytechnic-Integrated Polytechnic Regional College (RP-IPRC) Musanze are appreciated in collaboration of research. Holland Fair Foods Limited is also appreciated in laboratory assistant.

We also express our sincere thanks to the Strengthening Education for Agricultural Development (SEAD) Project under MOTT MacDonald from Netherlands under Rwanda Development Board (RDB) for financial support.

We would like to express our gratitude to the international Anatolian Agriculture , Food , Environment and Biology congress(TARGID 2022) and the Turkish Science and Technology Publishing (TURSTEP) in general for not only allowing us to present our research but also for their annual organization of congress, for paper publication in integration among the worldwide researchers.

Development of Prebiotic Edible Films for Food Applications

Merve Kesim, Suzan Biran Ay

Department of Chemical Engineering, Engineering Faculty, Eskisehir Technical University, Eskisehir, Turkey

Abstract

Due to the increasing environmental pollution caused by non-degradable synthetic polymers, significant effort was directed towards developing biodegradable, environmentally friendly, biopolymer films that could be used either to replace the conventional food packaging materials or as a nutritional supplement in the form of edible films. The functionality of these edible films can be achieved by the use of selected plant polymers, which act as prebiotics for the regulation of the customer's digestive system, once consumed with the food. In our study potential food packaging material has been formulized by blending guar gum (GG) and konjac glucomannan (KGM) polysaccharides and using glycerol (G) as a plasticizer. The most important feature that distinguishes this film from other materials is that a prebiotic derivative, konjac glucomannan (KGM), is extremely beneficial to the health of the human digestive system and is renewable and completely natural. Stock solutions of 0.8% (w/w) guar gum (GG) and 0.8% konjac glucomannan (KGM) were used in the generation of different formulations of polymer blends in ratios of 1:0, 3:1, 1:1, 1:3, and 0:1, plasticized with 30% (w/w solids) glycerol (G). The films were obtained by solution casting method. The physical and chemical properties of the prebiotic films were determined by measurement of their thickness, water vapor permeation ratio (WVPR), transparency, water solubility, and antioxidant content, total phenolic content, tensile stress, and elongation.

The thickness of the edible films varied between 0.0356 and 0.0487mm, their opacity between 2.8 and 5.3, solubility between 54.0% and 87.3 %. Films' WVPR was around 55.2 mg/day, and their antioxidant activity was measured as approximately 20% inhibition. The mechanical test revealed that films withstand tensile strength between 21.6 and 54.1 MPa and endure elongation between 5.11% and 24.17%.

The results showed that the GG/KGM/G composite is a promising candidate to be used as a prebiotic edible material for food packaging applications.

Key Words: *Edible Film, Prebiotic, Guar gum, Konjac glucomannan.*

Gıda Uygulamaları için Prebiyotik Yenilebilir Filmlerin Geliştirilmesi

Özet

Bozunmayan sentetik polimerlerin neden olduğu artan çevre kirliliği nedeniyle, geleneksel gıda ambalaj malzemelerinin yerini almak için veya besin takviyesi olarak kullanılabilecek yenilebilir, biyolojik olarak parçalanabilir, çevre dostu biyopolimer filmlerin geliştirilmesine yönelik önemli araştırmalara yönelindi. Bu yenilebilir filmlerin işlevselliği, bir kez yemekle birlikte tüketildiğinde müşterinin sindirim sisteminin düzenlenmesi için prebiyotik görevi gören seçilmiş bitki polimerlerinin kullanılmasıyla elde edilebilir. Çalışmamızda, guar gam (GG) ve konjak glukomannan (KGM) polisakkaritleri ve plastikleştirici olarak gliserol (G) kullanılmasıyla potansiyel gıda ambalaj malzemesi formüle edilmiştir. Bu filmi diğer malzemelerden ayıran en önemli özelliği prebiyotik türevi olan konjak glukomannanın (KGM) insan sindirim sistemi sağlığına son derece faydalı olması, yenilenebilir ve tamamen doğal olmasıdır. %0,8 (a/a) guar gam (GG) ve %0,8 konjak glukomannan (KGM) stok çözeltileri, 1:0, 3:1, 1:1, 1:3 ve 0:1 oranlarında formülasyonlarının üretilmesinde kullanıldı. %30 (a/a katılar) gliserol (G) ise plastikleştirici olarak ilave edildi. Filmler çözelti döküm yöntemi ile elde edildi. Prebiyotik filmlerin fiziksel ve kimyasal özellikleri, kalınlık, su buharı geçirgenlik oranı (SBGO), şeffaflık, suda çözünürlük ve antioksidan ve toplam fenolik içerik, çekme gerilimi ve uzama ölçümleri yapılarak belirlendi.

Yenilebilir filmlerin kalınlığı 0,0356 ile 0,0487 mm arasında, opaklıkları 2,8 ile 5,3 arasında, çözünürlükleri %54,0 ile %87,3 arasında değişmiştir. Filmlerin SBGO 55,2 mg/gün civarındaydı ve antioksidan aktiviteleri yaklaşık %20 inhibisyon olarak ölçüldü. Mekanik testler, filmlerin 21,6 ile 54,1 MPa arasında gerilme mukavemetine ve %5,11 ile %24,17 arasında uzamaya dayandığını ortaya koydu.

Sonuçlar, GG/KGM/G kompozitinin, gıda paketlenme uygulamaları için prebiyotik yenilebilir malzeme olarak kullanılmak üzere umut verici bir aday olduğunu gösterdi.

Anahtar Kelimeler: *Yenilebilir Film, Prebiyotik, Guar gam, Konjak glukomannan*

Selenium And Its Effects In Horticulture

Merve Karakoyun, Sinem Öztürk Erdem

Department of Horticulture, Faculty of Agriculture and Natural Science, Bilecik Seyh Edebali University, Bilecik, Turkey

Abstract

Selenium (Se), an essential microelement for human health, helps cells clean themselves and prevent cancer. Se is required by horticultural plants for human nutrition as well as for its actions in plant metabolism and function. Effects of selenium on resistance to abiotic and biotic stresses. Temperature is an important environmental factor affecting the cultivation of horticultural crops, especially out-of-season vegetable crops. This review aimed to provide a theoretical basis for practical applications for selenium and to review its functions and studies in horticultural crops.

Key Words: Horticultural Plants, Se, abiotic stress, biotic stress

Bahçe Bitkilerinde Selenyum ve Etkileri

Özet

İnsan sağlığı için gerekli bir mikro element olan Selenyum (Se), kanseri önlemede, bağışıklığı artırmada, hücreleri detoksifiye etmede işlev görür. Bahçe bitkileri, insanların beslenmesi için Se'ye ihtiyaç duyar ve bitki metabolizması ve fonksiyonlarındaki mekanizmaları gereklidir. Selenyumun abiyotik ve biyotik streslere karşı direnç üzerindeki etkileri sıcaklık, bahçe bitkilerinin, özellikle de mevsim dışı sebze bitkilerinin yetiştirilmesini etkileyen önemli bir çevresel faktördür. Bu derleme, selenyum için pratik uygulamalara teorik bir temel sağlamak amacıyla ve bahçe bitkilerindeki işlevlerini, yapılan çalışmaları gözden geçirmeyi hedeflemiştir.

Anahtar Kelimeler: Bahçe bitkileri, Se, abiyotik stres, biyotik stres

Giriş

Toprağın kimyası içerisinde geniş bir konuma sahip olan konulardan biri de bitki besin elementleridir. Bitki büyüme ve gelişmesini başarılı bir şekilde gerçekleştirmesi için çevreden bir miktar besin elementi alması gerekmektedir. Bitkide bir besin elementinin gerekliliği için iki kriter göz önünde bulundurulur (Epstein ve Bloom, 2005). Bunlardan ilki besin maddesinin bir bitkinin yapısında veya metabolizması içerisinde içsel bir bileşeni olan bir molekülün parçası olması bir diğeri ise söz konusu besin elementi büyümeden çıkarıldığında bitkinin büyüme ve gelişmesinde farklılık görünmesi durumunda besin elementi bitki için gereklidir. Bitki besin elementleri makro ve mikro olarak sınıflandırılmaktadır. Makro besin elementleri, mikro besin elementleri ile birçok yönden kıyaslanabilmektedir. Bunlardan en önemlisi bitkiler; makro besin elementlerine, mikro besin elementlerine göre büyük miktarda ihtiyaç duymaktadır. Mikro besin elementleri ise bitkiler için eser miktarda gereklidir (Fageria, 2016). Ancak mikro besin elementlerinin yokluğunda veya fazlalığında bitki büyüme ve gelişimi olumsuz etkilenmektedir. Sadece verim üzerine değil elde edilen ürünün kalitesinin bozulmasına da neden olmaktadır (Can ve ark.).

Selenyum (Se) mikro elementler içerisinde yer almaktadır. 1817 yılında İsveçli kimyager Jons Jacob Berzelius (Berzelius, 1817) tarafından keşfedilmiştir. Uzun süre boyunca toksik bir element olarak kabul görülmüştür ancak 1957 yılında bitki için gerekliliği anlaşılmıştır (Schwarz ve Foltz, 1957). Selenyumun insanlar ve hayvanlar için eser bir element olarak bilinmekte ayrıca ikisi arasındaki bağ tam olarak bilinmemekte ve birçok değişkene bağlanmaktadır (Fan ve ark., 2002; Salhani ve ark., 2003).

Selenyumun İşlevleri

Selenyum (Se) mikro elementler içerisinde yer almaktadır. 1817 yılında İsveçli kimyager Jons Jacob Berzelius (Berzelius, 1817) tarafından keşfedilmiştir. Uzun süre boyunca toksik bir element olarak kabul görülmüştür ancak 1957 yılında bitki için gerekliliği anlaşılmıştır (Schwarz ve Foltz, 1957). Selenyumun insanlar ve hayvanlar için eser bir element olarak bilinmekte ayrıca ikisi arasındaki bağ tam olarak bilinmemekte ve birçok değişkene bağlanmaktadır (Fan ve ark., 2002; Salhani ve ark., 2003). Selenyum, insanlarda, hatta COVID-19 enfeksiyonlarıyla mücadelede hayati bir rol oynar (Alexander ve ark., 2020; Bae ve Kim, 2020; Hiffler ve Rakotoambina, 2020; Moghaddam ve ark., 2020; Zhang ve ark., 2020). Bitkilerde az miktarda bulunan bu mikro element, çoğu hayvan ve insanlarda antioksidan etkisi vardır fakat amino asitlerde bulunan kükürtün selenyum ile yer değiştirmesi ile birlikte yüksek konstrasyonlarda toksik etki yapmaktadır. Bunun sonucu olarak da proteinlere zarar vererek yanlış katlanmasına neden olmaktadır.

Son yıllarda yapılan çalışmalarda selenyumun insan sağlığı açısından temel bir öneme sahip olduğu anlaşılmaktadır. İnsanları çeşitli hastalıklardan koruyarak antioksidan etki yapmaktadır. Bugüne kadar yapılan

çalışmalar ile insan vücudunda en az 25 selenoprotein bulunmuştur. Bunlar arasında glutatyon peroksidaz (GPx) (Arthur, 2001) tioredoksin redüktaz (TRx) (Kurozumi ve ark., 2000), deiyodinaz ve selenoprotein P'nin (SeP) önemli biyolojik fonksiyonlara sahip olduğu bilinmektedir (Renko ve ark., 2017). GPx, insan vücudunda çeşitli peroksitleri temizleyen ve dokuları ve hücreleri peroksidasyondan koruyan önemli bir peroksidazdır. Birçok çalışma selenyumun kanser önleyici etkiler gösterdiğini doğrulamıştır (Álvarez-Pérez ve ark., 2018; Elhodaky ve Diamond, 2018; Gandin ve ark., 2018). Selenyum eksikliği, bağışıklık, tiroid ve üreme bozukluklarının yanı sıra kanser ve hatta ölüm dahil olmak üzere çeşitli insan sağlığı sorunlarına neden olmaktadır (Řezáčová ve ark., 2016; Gupta ve Gupta, 2017).

Selenyumun Alımı ve Taşınması

Selenyum doğada inorganik ve organik formlarda bulunmaktadır. İnorganik formlar selenattır ;selenit, selenid, elemental olarak Se ile ifade edilmekte ve başlıca organik formlar SeCys ve SeMet'tir (Sors ve ark., 2005; Bodnar ve ark., 2012; Wu ve ark., 2015). Bitkide selenyum köklerinde ağırlıklı olarak selenat şeklinde alınır. Fakat bitkiler selenit ve organik selenyum olarak da kolayca alır (Sors ve ark., 2005). Selenyumun organik formları, inorganik formlardan daha hızlı alınmakta ve organik formların alımı ile bir protein veya spesifik alım mekanizması arasındaki korelasyon hakkında az şey bilinmektedir. Selenyum alımının uygun dozlarda bitkiye birçok faydası bulunur (Şekil-1). Bitkileri oksidatif hasarlardan korur bunun yanında bitkinin antioksidan özelliklerini geliştiren, strese ve yaşlanmaya karşı bitkinin direncini artırır (Xue, Hartikainen, ve Piironen 2001; Pennanen, Xue, ve Hartikainen 2002) . (Bañuelos ve ark., 2020), doğal olarak yüksek seviyelerde Se ve Bor içeren tuzlu topraklarda brokoli, kırmızı lahana, yeşil lahana, Savoy lahanası ve İsviçre pazısı üzerinde biyofortifikasyon oluşup oluşmadığını gözlemlenmişlerdir. Biyofortifikasyon, insanlarda yaygın olarak eksikliği görülen vitamin ve minerallerin toplum tarafından en çok tüketilen ürünlerdeki konsantrasyonlarının artırılarak, insanlardaki noksanlığının giderilmesi prensibine dayanmaktadır. Bitki içi dokularında, selenyum tür analizleri, selenyum içeren bileşiklerin en büyük yüzdelerinin organik selenyum formlarında (monometillenmiş) ve inorganik Se formlarında selenat olarak bulunduğu belirlenmiştir. Bor ve Selenyum içeriği yüksek tuzlu topraklardan üretilen selenyumla zenginleştirilmiş sebzeler, biyoaktif gıda ürünleri olarak tüketilebilen doğal bir Se ile biyo-takviyeli gıda kaynağı olabileceği sonucuna varmışlardır.

Selenyumun taşınması formlarına göre farklılık göstermektedir. Selenit, bir fosfat taşıma mekanizması kullanılarak taşınır (Li ve ark., 2008), selenat ise sülfat taşıyıcıları ve kanalları kullanılarak taşınır (Zhang ve ark., 2003). Selenit köklerde hızla organik Se bileşiklerine dönüşür, selenat ise hemen ksileme verilir (Ximénez-Embún ve ark., 2004; Li ve ark., 2008). Selenit, meyveler, yapraklar veya kök olmayan diğer yenilebilir kısımlarda selenata kıyasla nispeten güvenlidir. Bununla birlikte, organik selenyumun dönüştürülmesi kesinlikle güvenli bir mekanizma değildir, çünkü Se'nin organik formları, özellikle proteinlere spesifik olmayan bir şekilde dahil edildiğinde SeCys olmak üzere toksisiteye neden olabilir (Brown ve Shrift, 1982).

Se'nin abiyotik ve biyotik streslere karşı direnç üzerindeki etkileri

Selenyumun abiyotik ve biyotik streslere karşı direnç üzerindeki etkileri sıcaklık, bahçe bitkilerinin, özellikle de mevsim dışı sebze bitkilerinin yetiştirilmesini etkileyen önemli bir çevresel faktördür. Uygun olmayan sıcaklıklar genellikle mahsul veriminde ve kalitesinde büyük düşüşlere yol açar. Bu nedenle, bitki sıcaklık adaptasyon mekanizmaları ve ani sıcaklık değişimleriyle başa çıkmak için etkili ve güvenli bitki büyüme düzenleyicileri önemli araştırma alanlarıdır. Yüksek sıcaklık stres koşulları altında net fotosentez, büyüme ve üretkenlikle ilişkili özelliklerde Se kaynaklı gelişmeler, gelişmiş antioksidan aktiviteler ve ozmolit birikimleri ile bağlantılıdır.

Bahçe bitkileri yetiştiriciliğinde ekonomik olarak yetiştiricilikte suya ihtiyaç duyulmaktadır. Su stresi veya fizyolojik kuraklık, mahsullerin büyümesini ve gelişmesini genellikle farklı düzeylerde etkiler. Dolayısıyla verimi de önemli ölçüde etkilemektedir. Son yıllarda yapılan çalışmalarda ise selenyumun kuraklık koşulları altında bitkilerin su durumunu düzenleme yeteneğine sahip olduğu gösterilmiştir (Kuznetsov ve ark., 2003). Kuraklık stresine maruz kalan çilek bitkilerine selenyum uygulaması yapılarak, SiO₂ nanoparçacıkları içeren çözeltilerin püskürtülmesi, Se ve Se/SiO₂ (50 ve 100 mg L⁻¹), normal ve kuraklık stresi koşullarında (30, 60 ve %100 FC) yetiştirilen çilek bitkilerinin büyüme ve verim parametrelerini iyileştirdiğini bunun yanında bağıl su içeriğini (RWC), membran stabilite indeksini (MSI) ve su kullanım verimliliğini (WUE) de artırmıştır. Se/SiO₂'nin dışarıdan püskürtülmesi, katalaz (CAT), askorbat peroksidaz (APX), guaiakol peroksidaz (GPX) ve süperoksit dismutaz (SOD) gibi antioksidan enzimlerin aktivitesini artırarak ve ayrıca lipid peroksidasyonunu ve hidrojeni azaltarak kuraklık toleransını artırdığı gözlenmiştir (Zahedi ve ark., 2019). Araştırmacılar bamyadaki kuraklık toleransını iyileştirmede Selenyum (Se) rolünü değerlendirmek için çalışmışlardır. Kuraklık stresini (üç gün (kontrol), altı gün (hafif stres) ve dokuz gün (şiddetli stres)) ve dört doz Se (0, 1, 2 ve 3 mg L⁻¹) ekimden 30 gün sonra uygulamışlardır. Kuraklık stresi altında Se'nin yapraklara uygulanmasıyla vejetatif ve verim parametrik kalitede bamyada bitkisindeki görsel azalma önemli ölçüde azaltılmıştır. 3 mg L⁻¹ Se uygulaması yaprak sayısını, bitki boyunu, dal sayısını, gövde kuru ağırlığını, kök kuru ağırlığını, meyve çapını, bitki başına meyve sayısını ve 1000 tohum ağırlığını önemli ölçüde artırmıştır (Ali ve ark., 2020).

Sebze endüstrisi içerisinde toprak ve sebzelerin kadmiyum (Cd) kontaminasyonu önemli sorunlardan birisidir. Selenyum uygulamaları yapılan çalışmalarda kadmiyum stres toleransını etkilemektedir. Kurşun ve kadmiyum stresine maruz kalan salatalık üzerinde çiçeklenme indeksleri, çiçeklerin cinsiyet tayini ve verimi üzerine selenyumun etkisini araştırılmıştır ve deneme süresince üç aşamada uygulanan selenyum (0, 4, 6, 8 mg) ve kadmiyum (0, 20, 25 mM) ve kurşun (0, 60, 100 mM) ağır metallerinden oluşan uygulamalar yapmışlardır. Çalışma sonucunda kadmiyum ve kurşun ile muamele edilen bitkilerde gecikmiş meyve verme ve meyve büyüme indekslerinde ve toplam verimde önemli düşüşler gözlemlenmiş ve kültür ortamına selenyum eklenmesi çiçeklenmeyi hız kazandırmış ayrıca daha fazla erkek çiçeğin ortaya çıkması stres altındaki bitkilerde dişi çiçek sayısının erkek çiçeklere oranını artırdığı gözlemlenmiş ve bu elementin en yüksek etkisi 6 mg/L konsantrasyonunda gözlemlenmiştir. Sonuç olarak stresli ve stressiz koşullarda 4 ve 6 mg/L selenyumun uygulanması meyve vermeyi kayda değer biçimde artırmıştır. Çalışma sonucunda selenyumun, ağır kurşun ve kadmiyum elementlerinin stresi altında salatalık bitkisinde stres koşullarının kontrolü ve çiçeklenme indekslerinin ve toplam verimin iyileştirilmesi üzerinde olumlu bir etki yaptığını belirtmişlerdir (Shekari ve ark., 2019). Biyolojik stres açısından selenyum arasındaki ilişki tam olarak belirlenmemekle birlikte Sodyum Se, antioksidan potansiyelini ve fenolik bileşik seviyelerini değiştirerek domatesi fusarium solgunluğundan koruduğu belirlenmiştir (Chen ve ark., 2014).

Selenyumun diğer elementler ile ilişkisi

Selenyumun bazı elementler ile sinerjistik ilişki içerisinde olurken bazıları ile antagonistik ilişki içerisinde. Beslenme üzerinde farklı elementlerin selenyum ile nasıl birleştiği hatta kombinasyon uygulamalarının da bilinmesi son derece önemlidir. (Grujic ve ark., 2021), azot uygulamalarının sürgünlerde Selenyum konsantrasyonu ve birikimi üzerine etkisinin olmadığını bildirmiştir. P kaynağındaki bir artış, kök hücre duvarında Se birikimini önemli ölçüde inhibe eder, ancak organellerdeki Se dağılımını ve kök hücrelerinin çözünür fraksiyonlarını artırır (Liu ve ark., 2018). Sofralık üzüm kalitesine yaprak selenyum gübresi püskürtme ile bazı parametreleri incelemek istemişlerdir. Se gübresi çözünür şeker, Vc, çözünür protein, çözünür katı, indirgenmiş organik asit dahil olmak üzere beslenme kalitesini artırırken, Avrasya türlerinin polifenol antioksidanları üzerinde hiçbir etkisi olmamıştır. Üzüm meyvelerinin K ve Ca içeriği önemli ölçüde artmış ve ağır metallerin Pb, Cr, Cd, As, Ni birikimini azaltmıştır. Se gübresi, özellikle Avrupa ve Amerika türleri için üzümün Se içeriğini artırmak için, üzüm besleme kalitesini artırmanın önemli etkisi ve ağır metalleri düşürmenin etkili bir yolu ile kullanılabilir (Zhu ve ark., 2017). Selenyumun toprak ilavesi ile uygulanması, domateslerde yapraklardan ilaçlamadan daha etkili olduğu belirlenmiştir (Rady ve ark., 2020). Aşırı fosfor gübrelemesi, ürünler tarafından selenyum alımının artmasına katkıda bulunmaktadır (Altansu vd ve ark., 2014). Önemli olan selenyum ile zenginleştirilmiş tarım ürünlerinin hasat edilmesi için, Se düzeyi yüksek çeşitlerin seçilmesi ve yüksek selenyum korumak için uygun yetiştirme koşulları ve tekniklerinin seçilmesidir. Asıl amacı beslenme ve sağlık üzerine olan meyve ve sebze işlenmiş ürünlerde, ürünlerdeki doğal Se içeriklerini korumak için uygun işleme teknolojileri kullanılmalıdır. Şu anda, bu alandaki araştırmalar hala eksiktir.

Ayrıca fosfor arzındaki bir artış, bitki gövdelerinin hücre duvarlarında ve yaprakların hücre organellerinde selenyum birikimini artırır, ancak gövde ve yaprakların çözünürlükleri Se dağılımını engeller (Liu ve ark., 2018). Ayrıca, toprağın uzun süreli fosfor gübrelemesi, ürünler tarafından Se alımının artmasına katkıda bulunur (Altansu vd ve ark., 2014). Se, Na⁺ ve K⁺ düzenlenmesine katılarak tuz stresini azaltabilir (Jiang ve ark., 2017). Yapılan bir çalışmada çilek meyvelerinde selenyum-nanopartiküllerin yaprak spreyi ile püskürtülerek bitkilerinin büyüme ve verimi üzerindeki olumsuz etkilerini fizyolojik ve biyokimyasal mekanizmalar aracılığıyla hafifletmedeki yararlı rolünü araştırmışlardır. Se-NP'lerin (10 ve 20 mg L⁻¹) yaprak spreyi, tuzlu olmayan ve farklı tuzlu topraklarda (0, 25, 50 ve 75 mM NaCl) yetiştirilen çilek bitkilerinin büyüme ve verim parametrelerini iyileştirdiği, Se-NPS'nin yapraklardan uygulanması, süperoksit dismutaz ve peroksidaz gibi antioksidan enzimlerin aktivitelerini artırarak stres kaynaklı lipid peroksidasyonunu ve H₂O₂ içeriğini azaltarak çileklerde tuzluluk toleransını iyileştirdiğini saptamışlardır. Ayrıca, tuzlu koşullar altında Se-NP'lerle muamele edilmiş çilek bitkilerinin meyvelerinde organik asitlerin (örneğin malik, sitrik ve süksinik asitler) ve şekerlerin (örneğin, glikoz, fruktoz ve sakaroz) artan seviyeleri, Se'nin olumlu etkilerini gösterdiğini saptamışlardır (Zahedi ve ark., 2019). Selenat formunda Mg, Zn ve Mn birikimlerini artırma eğilimindeyken, selenat/selenit karışımı olarak Ca, Mg, Zn ve Mn birikimlerini azaltma eğilimindedir (Longchamp ve ark., 2016).

Bahçe Bitkilerindeki Se içeriği ve etkileri

Beslenme ile selenyum alımı, büyük ölçüde topraktaki Se içeriğine ve insan Se'sinin ana kaynakları olan ürünler için biyoyararlanımına bağlıdır (Winkel ve ark., 2015). Bu nedenle bitkilerde selenyum ile ilgili araştırmalar ciddi önem taşımaktadır.

Domates, salatalık, turp gibi bahçe bitkilerinde selenyum konsantrasyonları ve tedaviler arasında büyük farklılıklar gösterebilmektedir (Balal ve ark., 2016; Schiavon ve ark., 2016; Zhu ve ark., 2018). Se konsantrasyonunu belirlemek amacıyla "Jinyou 315" salatalık bitkisine Si (1 mM) ve Se (0.025 mM) ayrı ayrı veya kombinasyon halinde yapraklardan ilaçlama uygulamışlar ve bunların büyüme, verim ve meyve kalitesi üzerindeki etkileri araştırılmıştır.

Araştırma sonucunda, Si ve Se uygulamasının ayrı ayrı veya kombinasyon halinde salatalığın fotosentezi, büyümesini ve verimini artırdığını ve sırasıyla Si ve Se'nin uygulanması, meyvedeki çözünür şekerlerin ve amino asitlerin konsantrasyonlarını ve birikimlerini artırdığı gözlenmiştir. Se ilavesi, sitrik asit, malik asit ve oksalik asit seviyelerini artırarak toplam organik asit birikimini artırdığı gözlenmiştir ayrıca eklenen Si, meyvedeki C vitamini konsantrasyonunu artırırken, eklenen Se, toplam fenolik ve flavonoid konsantrasyonlarını artırmış ve nitrat birikimini azaltmıştır. Bu sonuçlar ile birlikte, Si ve Se'nin ayrı ayrı veya kombinasyon halinde uygulanmasının salatalık büyümesini, verimini ve beslenme kalitesini artırdığını ve Si ve Se'nin birleşik etkisinin, bireysel uygulamalarından daha açık olduğu belirlenmiştir. Bu çalışma, Si ve Se'nin yüksek kaliteli salatalık üretiminde uygulanması için teorik bir temel sağlayabileceği önerisinde bulunmuşlardır (Hu ve ark., 2019).

Selenyumun bitki büyümesi ve verimindeki rolü konsantrasyona bağlıdır. Eğer uygun selenyum konsantrasyonlarında uygulama yapılırsa pozitif bir etki yapmaktadır. Aşırı uygulanan selenyum konsantrasyonlarında negatif etkisi söz konusudur (Hossain ve ark., 2021). Uygun selenyum konsantrasyonlarının uygulanması patates, biber, kuzu marulu, şalgam ve fasulyenin büyümesine fayda sağlar (Aggarwal ve ark., 2011; Li ve ark., 2015; Hawrylak-Nowak ve ark., 2018; Haghighi ve ark., 2019). Hem selenat hem de selenit takviyelerinin düşük dozları sürgün biyokütlesini arttırmaktadır (Boldrin ve ark., 2016). Erken fide gelişimi sırasında, nitrik oksit (NO) içeriği azalır, ancak hidrojen peroksit seviyeleri artar. Se fazlalığı olduğunda oksin azalır ve etilen artar (Lehotai ve ark., 2012). Selenyumun meyve tatlılığında bir artış tespit edilmiş ve bu da Se ilavesi ile meyve kalitesinde bir iyileşme olduğunu düşündürmüştür (Mimmo ve ark., 2017; Lanza ve Dos Reis, 2021). Bamyta bitkilerine yetiştirme mevsimi boyunca farklı tuzluluk seviyelerinde (4, 8 ds.m⁻¹ NaCl) üç selenyum (0,10, 20 mg.L⁻¹) uygulaması püskürtülerek yapılmıştır. Çalışma sonucu olarak artan dozlarda selenyum püskürten bitkiler, verim göstergelerinde önemli bir artışa yol açtığı saptanmıştır. (Abdullah ve Haamed, 2018) Nar meyvesi üzerine tam çiçeklenme ve tam çiçeklenmeyi takiben 1 ay sonra uygulanan 1 ve 2 µM'de selenyum (sırasıyla Se1 ve Se2, N-Se1 ve N-Se2) püskürtülmüştür. Yüksek bir N-Se konsantrasyonunun düşük bir konsantrasyondan daha büyük ve daha faydalı bir etkiye sahip olduğu sonucuna varmışlardır (Zahedi ve ark., 2019). Şeftali ve armutta meyve büyüme ve gelişmesi üzerine sodyum selenatın selenyumun birikimi üzerine etkisi araştırmak amacıyla iki yetiştirme mevsimi boyunca uygulanmıştır. Birinci yıl şeftali ve armutta 0.1-1,0 mg/L-1 uygulanmış, ikinci yıl da 1,0 mg/L-1 selenat uygulaması yapmışlardır. Yapraktan selenat ilavesi hem yapraklarda hem de meyvelerde Se konsantrasyonunda artışa neden olmuştur. Meyvede daha yüksek Se içeriği, et sertliğinde bir artışa ve çözünür katı içeriğinde bir azalmaya neden olmuştur. Artan Se konsantrasyonu meyvenin raf ömrünü etkilemiş, meyve eti sertliğindeki azalmaya neden olmuş bu durum meyve depolamayı olumlu yönde etkilediğini vurgulamışlardır (Pezzarossa ve ark., 2012).

Sonuçlar Ve Öneriler

Selenyum bahçe bitkileri üzerinde birçok faydası bulunmaktadır. Bahçe bitkileri tür ve çeşitler içerisinde selenyum uygulamalarına ve büyüme koşullarına göre farklılık göstermektedir. Her çeşit için uygun selenyum miktarı belirlenmeli ve standartları oluşturulmalıdır. Bahçe bitkilerinde oldukça yeni bir büyüme düzenleyici madde olarak Selenyum, yüksek verimlilik ve çevre koruma özelliklerine sahiptir. Bu nedenle, gelişimi ve kullanımı, bahçe bitkilerinin sağlıklı büyümesini büyük ölçüde destekleyecek, gübre kullanım oranını iyileştirecek ve bitki hastalıklarının oluşumunu azaltacaktır. Gübre ve zirai ilaç sıfır büyüme planı uygulamasında kullanılabilir, bu sayede önemli bir rol oynamaktadır Selenyum eksikliği eksiklik olmayan topraklarda bile strese karşı pozitif etkisinden dolayı tavsiye edilmektedir.

Biological Activities of Extracts of Red and Yellow Hawthorn Fruits in Different Solvents

İlker Atik¹ Ayşe Janseli Denizkara² Gökhan Akarca² Azize Atik²

1Afyon Kocatepe University, Afyon Vocational School, Food Technology Program

2Afyon Kocatepe University, Faculty of Engineering, Department of Food Engineering

Abstract

Hawthorn is a type of wild fruit that grows naturally in almost every region of the world. It has been reported that there are 50 species of the hawthorn distributed in the northern hemisphere and more than 20 species in Turkey. Although hawthorn is generally consumed as a fresh fruit, marmalade, jam and vinegar are also made from its fruit. In this study, the presence of biological activities of extracts of red and yellow hawthorn fruits grown in Afyonkarahisar province and its surroundings in different solvents (methanol, ethanol and acetone) were investigated. As a result of the study, it was determined that the highest anti-bacterial effect was against *Listeria monocytogenes* (12.06 mm zone diameter) in red hawthorn ethanol extract while the highest anti-fungal effect was against *Aspergillus flavus* (17.22 mm zone diameter) in yellow hawthorn ethanol extract. In addition, the lowest minimum inhibitory concentration values were determined to be on *Listeria monocytogenes* (46.87 µg/mL) in red hawthorn ethanol extract and *Aspergillus flavus* (35.15 µg/mL) in yellow hawthorn ethanol extract. The lowest minimum bactericidal and fungicidal concentration values were determined to be against *Staphylococcus aureus* (93.75 µg/mL) in red hawthorn ethanol extract and *Aspergillus flavus* (23.75 µg/mL) in yellow hawthorn ethanol extract. It was revealed that the highest anti-bacterial effect on the microorganisms used in the study was in the red hawthorn ethanol extract, and the highest anti-fungal effect was in the yellow hawthorn ethanol extract.

Key Words: Hawthorn, Anti-bacterial effect, Anti-fungal effect, *Listeria monocytogenes*, *Aspergillus flavus*

Kırmızı ve Sarı Alıç Meyvelerinin Farklı Çözücülerdeki Ekstraktlarının Biyolojik Aktiviteleri

Özet

Alıç, hemen hemen dünyanın her bölgesinde doğal olarak yetişen bir yabani meyve türüdür. Alıcın kuzey yarım kürede yayılış gösteren 50, Türkiye’de ise 20’den fazla türü bulunduğu bildirilmiştir. Alıç, genel olarak taze meyve olarak tüketilmekle beraber, meyvesinden marmelat, reçel ve sirke de yapılmaktadır. Bu çalışmada Afyonkarahisar ili ve çevresinde yetişen kırmızı ve sarı alıç meyvelerinin farklı çözücülerdeki (metanol, etanol ve aseton) ekstraktlarının biyolojik aktivitelerinin varlığı araştırılmıştır. Çalışma sonucunda en yüksek anti-bakteriyel etki; kırmızı alıç etanol ekstraktında *Listeria monocytogenes*’e karşı (12,06 mm zon çapı), en yüksek anti-fungal etki ise, sarı alıç etanol ekstraktında *Aspergillus flavus*’a karşı (17,22 mm zon çapı) olduğu tespit edilmiştir. Araştırma ile ayrıca, en düşük minimum inhibitör konsantrasyon değerlerinin, kırmızı alıç etanol ekstraktında *Listeria monocytogenes* (46,87 µg/mL) ve sarı alıç etanol ekstraktında *Aspergillus flavus* (35,15 µg/mL) üzerinde olduğu belirlenmiştir. En düşük minimum bakterisidal ve fungusidal konsantrasyon değerleri ise; kırmızı alıç etanol ekstraktında *Staphylococcus aureus* (93,75 µg/mL) ve sarı alıç etanol ekstraktında *Aspergillus flavus* (23,75 µg/mL)’a karşı olduğu saptanmıştır. Araştırmada kullanılan mikroorganizmalar üzerinde en yüksek anti-bakteriyel etkinin kırmızı alıç etanol ekstraktında, en yüksek anti-fungal etkinin ise, sarı alıç etanol ekstraktında olduğu ortaya konulmuştur.

Anahtar Kelimeler: Alıç, Anti-bakteriyel etki, Anti-fungal Etki, *Listeria monocytogenes*, *Aspergillus flavus*

Effects of Construction on the Visual Quality of Campus Landscapes: The Case of Burdur Mehmet Akif Ersoy University, Türkiye

Yasin Aşık^{1*}, Hüseyin Samet Aşıkkutlu¹, Latif Gürkan Kaya¹

¹Department of Landscape Architecture, Faculty of Engineering and Architecture, Burdur Mehmet Akif Ersoy University, Burdur, Türkiye

Abstract

The purpose of this study is to determine how construction activities at the İstiklal Campus of Burdur Mehmet Akif Ersoy University affect visual quality. For this purpose, a method based on visual resource management and expert opinions was used in this study. The area was visited by 5 experts and observations were made at 5 points that best describe the area. The obtained data were analysed in a table. As a result, it was found that observation point 3 has the highest visual quality and observation point 5 has the lowest visual quality. Observation point 3 is classified as class I and observation point 5 is classified as class III. Landform, colour, and cultural design had the greatest influence on the visual quality rating. Construction activities that do not fit into the existing landscape fabric have visually impacted the campus landscape. Although the campus landscape is impaired, it has a quality rating of II. The visual quality of the campus should be maintained and enhanced with new development that fits into the existing landscape fabric.

Key Words: *Burdur, Visual Resource Management, Visual Quality, Campus Landscape, Construction*

Yerleşke Peyzajlarındaki Yapılaşmanın Görsel Kaliteye Etkisi: Burdur Mehmet Akif Ersoy Üniversitesi Örneği

Özet

Bu araştırmanın amacı Burdur Mehmet Akif Ersoy Üniversitesi İstiklal Yerleşkesi'nde gerçekleşen yapılaşma faaliyetlerinin görsel kaliteye etkisinin belirlenmesidir. Bu amaçla bu çalışmada görsel kaynak yönetimine ve uzman görüşüne dayalı bir yöntem izlenmiştir. Alan 5 uzman tarafından ziyaret edilmiş alanı en iyi tanımlayan 5 noktada gözlemler gerçekleştirilmiştir. Elde edilen veriler tablo oluşturularak yorumlanmıştır. Sonuç olarak, 3 numaralı gözlem noktasının en yüksek, 5 numaralı gözlem noktasının ise en düşük görsel kaliteye sahip olduğu belirlenmiştir. 3 numaralı gözlem noktası I. Sınıf, 5 numaralı gözlem noktası III. Sınıf olarak sınıflandırılmıştır. Görsel kalite puanına en yüksek etkiyi arazi şekli, renk ve kültürel düzenlemeler göstermiştir. Mevcut peyzaj yapısına uygun olmayan yapılaşma faaliyeti yerleşke peyzajının görsel açıdan olumsuz etkilemektedir. Her ne kadar yerleşke peyzajı olumsuz etkilense de II. Sınıf bir kaliteye sahiptir. Yerleşkenin sahip olduğu görsel kalitenin korunarak artırılması için yeni düzenlemeler mevcut peyzaj yapısına uygun olmalıdır.

Anahtar Kelimeler: *Burdur, Görsel Kaynak Yönetimi, Görsel Kalite, Yerleşke Peyzajı, Yapılaşma*

Giriş

Peyzaj, görüş alanı içerisinde yer alan doğal ve kültürel yapılara ait değerlerden meydana gelmektedir (Kiper vd., 2017). Aynı zamanda peyzaj, çevresel kimliğin tanınması ve mevcut çevre ile insanları birbirine bağlaması yönüyle en önemli bileşenlerden ve araçlardan biridir. İnsanlar her ne kadar farklı duyuları ile çevreyle bağlantı kursa da bağlantının %80'i gözlem yoluyla gerçekleşmekte (Golchin vd., 2012) ve insan algısının %80'inden fazlasını görme duyusu yönetmektedir (Polat, 2015). Peyzajın gözlenmesi ve algılanması, mevcut çevrenin tanınmasında ve peyzajın estetik açıdan uygunluğunun belirlenmesinde oldukça önemlidir (Golchin vd., 2012). Görsel algıyı görsellik, güzellik, hoşnutluk ve estetik gibi kavramlar ifade etmektedir (Kiper vd., 2017). Görsel kalite hem estetiğin bir göstergesi hem de sürdürülebilirlik açısından toplumsal bir ihtiyaç olarak karşımıza çıkmaktadır (Gilani vd., 2017). Brundtland Raporu ile birlikte sürdürülebilirlik kavramı devletler, şirketler ve farklı kuruluşlar için çok önemli bir hale gelmiştir. Raporda sürdürülebilir kalkınma “bugünün ihtiyaçlarını, gelecek nesillerin kendi ihtiyaçlarını karşılama kabiliyetinden ödün vermeden karşılayan kalkınma” olarak tanımlanmaktadır (Tiyarattanachai ve Hollmann, 2016).

Görsel peyzaj abiyotik, biyotik görsel ve kültürel bileşenlerin birbiriyle etkileşiminden meydana gelmektedir. Arazinin şekli, bitki örtüsü, yapılar, zamansal alan kullanımı, kültürel yapı, yaban hayatı ve mevsimlere bağlı değişim gibi bileşenler peyzajın değerini etkilemektedir (Aşur ve Alphan, 2018). Fiziksel çevrenin estetik değerini arttırmak için görsel kaliteyi ölçmeye ihtiyaç vardır. Son yarım asırda çevresel kaliteyi ölçmeye yönelik araştırmalar gelişme göstermektedir (Oludare vd., 2021). Görsel kalitenin analiz edilmesi, doğal ve kültürel çevrenin değerlendirilmesi ve rehabilitasyonu açısından önemlidir (Polat, 2015). Peyzajda yapılan görsel kalite analizindeki amaç peyzajların korunması, onarımı ve yenilenmesi için gerekli faktör ve kriterleri belirlemek aynı zamanda peyzajın estetik açıdan uygunluğuna karar vermektir. Bu sayede estetik açıdan değerli olan peyzajlar

korunarak gelecek nesillere aktarılabilmektedir (Golchin vd., 2012). Bununla birlikte mevcut araştırmalar, mekanı tercih etmede görsel kalitenin etkili olduğunu belirtmektedir (Kiper vd., 2017).

Peyzaj, çevresel estetik kalite için değerli bir kaynaktır ve üniversite tanıtımlarında uzun zamandır kullanılmaktadır. Üniversite internet sitelerinde gölgelik ağaç altında oturan, yerleşkede yeşil alanda sosyalleşen öğrenciler tanıtımlarda yer almaktadır (Mt Akhir vd., 2018). Kaliteli yerleşke peyzajı, öğrencilerin üniversiteye kaydolmasını etkilemekte (Groen ve White, 2003; McFarland vd., 2008; Mt Akhir vd., 2018), üniversitelerin kamusal yüzü haline gelmekte (Mt Akhir vd., 2018) ve üniversitenin imajını arttırmaktadır (Gumprecht, 2007). Dünya üzerinde çoğu üniversite yerleşkelerini daha yeşil hale getirmeye çalışmaktadır (Tiyarattanachai ve Hollman, 2016; Mt Akhir vd., 2018). Araştırmacılar, manzara ve yeşil bitkilerin duyguları olumlu etkilediğini ve stresi azalttığını belirtmektedir (Speake vd., 2013; Li ve Sullivan, 2016). Bu yönüyle yerleşke peyzajı yalnızca dış ortamları iyileştirmek değil aynı zamanda üniversite topluluğunun da refah düzeyini artırabilir. Ayrıca peyzajın öğrencileri yerleşkede zaman geçirmeye teşvik etme, zihinsel yorgunluklarını azaltarak performansını artırma etkisi bulunmaktadır (Mt Akhir vd., 2018). Dolayısıyla görsel kalitesi yüksek manzaralar, daha fazla tercih edilecektir (Kiper vd., 2017). Bu doğrultuda bu araştırmanın genel amacı, yerleşkelerde gerçekleşen yapılaşma faaliyetlerinin peyzajın görsel kalitesine olan etkisini belirlemektir. Araştırmanın üç hedefi bulunmaktadır. 1) Görsel açıdan kaliteli peyzajları belirlemek. 2) Görsel kaliteye etki eden peyzaj bileşenlerini belirlenmek. 3) İlk iki hedefin çıktılarını kullanarak yerleşke peyzajlarında görsel kaliteyi arttırmaya yönelik öneriler geliştirmektir.

Materyal ve Yöntem

Araştırma Alanı

Araştırma alanını Burdur Mehmet Akif Ersoy Üniversitesi (MAKÜ) İstiklal Yerleşkesi oluşturmaktadır. MAKÜ 2006 yılında kurulmuş olup, bünyesinde 12 fakülte, 5 yüksekokul, 13 meslek yüksekokulu, 1 konservatuar ve 4 enstitü bulundurmaktadır (URL-1, 2022). MAKÜ İstiklal Yerleşkesi, Burdur İlinin Merkez İlçesinde bulunmaktadır. Yerleşke ilçe merkezine 10 km uzaklıkta bulunup, ilçe merkezi nüfusu 117189'dur (Şekil 1) (TÜİK, 2022). MAKÜ gelişmekte olan bir üniversitedir ve halen yerleşke içinde yapılaşma faaliyetleri sürmektedir. Bu faaliyetler sonucunda yerleşke peyzaj yapısı değişime uğramaktadır. Yapılaşmanın görsel kaliteye etkisinin en iyi incelenebileceği yer olarak düşünülen; lavanta tepesi hotel ve eğitim binalarının arasında yer alan vadi araştırma alanı olarak belirlenmiştir.

Şekil 1. Çalışma alanı

Görsel Kalite Analizi Süreci

Tüfekçioğlu (2008) görsel kalite değerlendirmelerinde yöntem olarak “Görsel Kaynak Yönetimi (Visual Resource Management System [VRM])”, “Peyzaj Karakter Değerlendirmesi (Landscape Character Assessment [LCA])” ve “Manzara Güzelliği Değerlendirme Yöntemi (Scenic Beauty Estimation Method [SBE])” kullanıldığını belirtmektedir. Bu araştırmada görsel kaynak yönetimine ve uzman görüşüne yönelik bir yöntem izlenmiştir. Uzmanlar tarafından alan ziyaret edilmiş, alanı en uygun tanımlayan 5 noktada (Şekil 2; Tablo 1) gözlemler yapılmıştır. Her noktada yapılan gözlem 5 uzman (alanında en az 5 yıl deneyimli) tarafından Tablo 2 baz alınarak değerlendirilmiştir. Değerlendirme sırasında alandan fotoğraflar çekilmiştir. Yapılan değerlendirmeler sonucunda değerlendirme puanlarının ortalamaları alınarak her noktanın genel görsel kalite puanı belirlenmiştir. Noktalar aldıkları puana göre 4 görsel kalite sınıfına ayrılmıştır. 12 ve üzeri puan alanlar I. Sınıf, 9-11 puan alanlar II. Sınıf, 6-8 puan alanlar III. Sınıf ve 0-5 puan alanlar ise IV. Sınıf olarak değerlendirilmiştir. Görsel kalite sınıflarının planlama kararlarında kullanım amacı şunlardır (BLM, 1986):

I. Sınıf: Bu sınıfa ait peyzajlar mevcut karakterini korumalıdır. Alan kullanımları devamlılığını sağlamalı, peyzaj karakterindeki değişimler dikkat çekici olmamalıdır. Yapılacak tüm değişiklikler mevcut peyzaja uyumlu olmalıdır. II. Sınıf: Bu sınıfa ait peyzajlar mevcut karakterini korumalıdır. Peyzaj karakterindeki değişim çok düşük olmalıdır. Değişimler gözlemcinin dikkatini çekmemeli, Herhangi değişiklik peyzajın temel biçim, çizgi, renk ve doku unsurlarına uygun olmalıdır.

III. Sınıf: Bu sınıfın amacı, peyzajın mevcut karakterini kısmen korumaktır. Peyzaj karakterinde orta düzeyde değişiklik yapılabilir, ancak genel peyzaj karakteri baskın olmalıdır. Değişiklikler gözlemcinin görüşüne hükmetmemeli, peyzajın karakteristik yapısında bulunan baskın doğal özelliklerinin devamı niteliğinde olmalıdır.

IV. Sınıf: Bu sınıfa ait peyzajlarda mevcut karakterinde büyük değişiklikler gerektiren yönetim faaliyetleri gerçekleştirilebilir. Peyzajın karakteristik seviyesinde değişim yüksek olabilir. Değişiklikler genel peyzaj karakterinde baskın olabilir.

Şekil 2. Gözlem noktaları

İstatistiksel Analiz

Veriler tablolar oluşturularak yorumlanmış, veriler arasındaki ilişkiyi bulmak için korelasyon analizi yapılmıştır. Verilerin analizinde SPSS (SPSS Inc., 2002) programı kullanılmıştır.

Bulgular ve Tartışma

Görsel kalite faktörleri incelendiğinde arazi şekli faktörü bakımından en yüksek puanı gözlem noktası 3, en düşük puanı ise gözlem noktası 5 almıştır. Bitki örtüsü faktörü bakımından gözlem noktası 3 ve 4 en yüksek değere sahip iken en düşük değere gözlem noktası 5 sahiptir. Gözlem noktası 1 ve 5 su faktörü bakımından en düşük puanı almıştır. Tüm gözlem noktalarında renk faktörü puanları eşittir. Panoramik görüntü faktörü gözlem noktası 3'te en yüksek, gözlem noktası 2'de ise en düşüktür. Nadirlik faktörü bakımından tüm gözlem noktalarının puanları neredeyse eşittir. Tüm gözlem noktaları kültürel düzenlemeler faktörü açısından düşük puan almıştır. En düşük puanlar gözlem noktası 2 ve 5 aittir. Genel görsel kalite puanları incelendiğinde gözlem noktası 3 en yüksek değere sahipken gözlem noktası 5 en düşük değere sahiptir (Tablo 3).

Gözlem noktalarının görsel kalite sınıfları incelendiğinde gözlem noktası 1; III. Sınıf, gözlem noktası 2; II. Sınıf, gözlem noktası 3; I. Sınıf, gözlem noktası 4; II. Sınıf ve gözlem noktası 5 ise III Sınıf olarak ayrılmıştır. I. Sınıf olarak sınıflandırılan gözlem noktası 3'te tüm yapılan düzenlemeler mevcut peyzaj yapısı ile uyumlu ve dikkat çekici olmamalıdır. II. Sınıf olan gözlem noktası 2 ve 4'te değişimler çok küçük olmalı, gözlemcinin dikkatini çekmemeli ve mevcut peyzaja uygun olmalıdır. III. Sınıf olan gözlem noktası 1 ve 5'te ise mevcut peyzaj karakteri kısmen korunmalıdır. Genel peyzaj karakteri baskın olmak şartı ile orta düzeylerde değişiklik yapılabilir.

Tablo 2. Görsel kalite analiz formu (BLM, 1986; Uzun ve Müderrisoğlu, 2011)

Faktörler	Kriterler	Puan
Arazi şekli	1) Dik yamaçlar, 2) Yoğun kayalık alanlar, 3) Dikkat çeken alanda yaygın yeryüzü şekilleri, 4) Kumullar	5
	1) Dik vadiler, 2) Kanyonlar, 3) Volkanik oluşumlar, 4) Küçük tepe dizileri, 5) Yaylalar, 6) Dikkat çeken alanda yaygın olmayan yeryüzü şekilleri	3
	1) Az dalgalı arazi şekli, 2) Az ya da hiç ilginç peyzaj özellikleri içermeyen alanlar	1
Bitki Örtüsü	1) Çok çeşitli vejetasyon tipine sahip alanlar (renk, form, tekstür)	5
	1) Bir ya da iki çeşit vejetasyon tipine sahip alanlar	3
	1) Çok az bitki örtüsüne sahip alanlar, 2) Genel vejetasyona uyumsuz alanlar	1
Su	1) Temiz ve berrak, durgun ya da hareketli su yüzeyleri genel görünümde baskın	5
	1) Genel peyzajda baskın olmayan hareketli veya durgun su yüzeyleri	3
	1) Peyzajda su yüzeylerinin olmayışı ya da belli belirsiz oluşu	0
Renk	1) Zengin renk kombinasyonları, 2) Canlı ya da çeşitli renkler, 3) Toprak, bitki örtüsü, su ve karlı alanlar arasındaki beğenilen zıtlıkların varlığı	5
	Peyzajda baskın olmasa da; 1) Bir miktar renk yoğunluğu ve çeşitliliğinin olması, 2) Toprak, bitki örtüsü, su ve karlı alanlar arasındaki zıtlıkların varlığı	3
	1) Göze çarpmayan renk çeşitliliği, 2) Genelde yumuşak renk tonlarının olması	1
Panoramik Görüntü	1) Görsel kaliteyi çok yükselten panoramik görüntü	5
	1) Genel görsel kaliteyi kısmen artıran panoramik görüntü	3
	1) Genel görsel kaliteyi çok az ya da hiç etkilemeyen panoramik görüntü	0
Nadirlik	1) Bölge için çok nadir olan, akılda kalabilen peyzaj elemanları (Olağan üstü yaban hayatı görüntüleri)	5
	1) Diğer bölgelerde de görülebilen belirgin peyzaj özellikleri	3
	1) İlginç yapıya sahip ancak bölgede sıklıkla görülen peyzaj özellikleri	1
Kültürel Düzenlemeler	1) Görsel çeşitliliğe uygun ve bu çeşitlilikle uyum içinde olan düzenlemeler	2
	1) Görsel çeşitliliğe katkıda bulunmayan ya da bu çeşitliliği bozmayan düzenlemeler	0
	1) Görsel çeşitliliği bozan, uyumu ortadan kaldıran düzenlemeler	-4

Tablo 3. Gözlem noktaları görsel kalite faktörleri ve genel görsel kalite puanları

Gözlem Noktası	Görsel Kalite Faktörleri							Genel Görsel Kalite Puanı
	Arazi Şekli	Bitki Örtüsü	Su	Renk	Panoramik Görüntü	Nadirlik	Kültürel Düzenlemeler	
1	2,20	2,20	00,00	1,40	2,40	2,60	-3,20	7,60
2	3,00	2,60	3,00	1,40	0,60	2,20	-4,00	8,80
3	4,60	3,00	1,80	1,40	3,00	2,60	-3,20	13,20
4	1,80	3,00	1,80	1,40	1,80	2,20	-3,20	9,20
5	2,20	1,80	00,00	1,40	2,80	2,20	-4,00	6,60

Şekil 3. (a) En yüksek (13,20) görsel kalite puanına sahip gözlem noktası 3, (b) en düşük (6,60) görsel kalite puanına sahip gözlem noktası 5

Tüm gözlem noktalarının ortalamaları alınarak MAKÜ İstiklal Yerleşkesi genel görsel kalite puanı belirlenmiştir. MAKÜ en yüksek puanı arazi şekli faktöründen almıştır. En düşük puan ise kültürel düzenlemelere aittir. Aldığı 9,08 puan ile II. Sınıf görsel kalite değerine sahiptir. Buda MAKÜ'nün mevcut peyzaj karakterini koruması gerektiğini, çok düşük değişimler yapılabileceğini ve yapılan bu değişikliklerin peyzajın temel unsurlarına uygun olması gerektiğini belirtmektedir. Genel görsel kalite puanı ile arazi şekli, bitki örtüsü, renk, nadirlik ve kültürel düzenlemeler faktörleri arasında anlamlı bir ilişki bulunmuştur. Görsel kalite faktörleri arasında ise arazi şekli ve bitki örtüsü, panoramik görüntü ile su ve renk, kültürel düzenlemeler ile renk anlamlı bir ilişkiye sahiptir (Tablo 4).

Tablo 4. MAKÜ İstiklal Yerleşkesi görsel kalite faktörleri ile genel görsel kalite puanı açısından puanları ve korelasyon sonuçları

Sonuç

MAKÜ İstiklal Yerleşkesinde yapılan araştırmanın sonuçları yapılaşma faaliyetlerinin görsel açıdan yerleşke peyzajını olumsuz etkilediğini göstermektedir. Araştırmada görsel açıdan en kaliteli manzaranın gözlem noktası 3'e, en kalitesiz manzaranın ise gözlem noktası 5'e ait olduğu belirlenmiştir. Bunun sebebi gözlem noktası 3'te yapıların gözlem noktası 5'e göre daha az gözükmektedir. Yerleşkenin görsel kalitesini etkileyen en önemli faktörlerin arazi şekli, renk ve kültürel düzenlemeler olduğu belirlenmiştir. Yerleşke içerisinde mevcut peyzaj yapısına uygun olmayan düzenlemeler ve yapılaşma görsel kalitenin düşmesine sebep olmaktadır. Her ne kadar yapılaşma faaliyetlerinden yerleşke olumsuz etkilense de halen II. Sınıf bir görsel kaliteye sahiptir. Görsel kalitenin korunması ve artırılması için ileride yapılması planlanan düzenlemeler mevcut peyzaj yapısına uygun olmalıdır.

Abstract

In recent years, the main causes of environmental pollution are problems such as unplanned urbanisation, population growth and migration movements in natural areas and habitats. Therefore, many professional groups such as biologists, environmental engineers, agricultural engineers, landscape architects, urban and regional planners are working to solve these problems. The aim of this study is to examine the impact of today's very notable environmental pollution on landscape ecology and to present a guideline for research on this topic. For this purpose, the topic of environmental pollution has been studied under five headings such as air pollution, water pollution, soil pollution, noise pollution and radioactive pollution and the significance of the impact of environmental pollution on landscape ecology has been highlighted through literature review.

Key Words: *Environment, Ecology, Impact, Pollution, Landscape Ecology*

Çevresel Kirliliğin Peyzaj Ekolojisine Etkisi

Özet

Son yıllarda doğal alanlar ile yaşam alanlarında görülen çarpık yapılaşma, plansız kentleşme, nüfus artışı, göç hareketleri gibi sorunlar çevre kirliliğinin başlıca nedenlerinden sayılmaktadır. Dolayısıyla biyologlar, çevre mühendisleri, ziraat mühendisleri, peyzaj mimarları, şehir ve bölge planlamacılar gibi birçok meslek grubu, bu sorunları çözmek için çalışmalar yürütmektedir. Çalışmanın amacı, günümüzde oldukça dikkat çeken bir sorun olan çevresel kirliliğin peyzaj ekolojisine etkisinin incelenerek, konuyla ilgili yapılacak araştırmalarda yol gösterici bir kılavuzun ortaya konulmasıdır. Bu amaç doğrultusunda, çevresel kirlilik konusu, hava kirliliği, su kirliliği, toprak kirliliği, gürültü kirliliği ve radyoaktif kirlilik olmak üzere beş başlıkta incelenmiş ve çevresel kirliliğinin peyzaj ekolojisine etkisinin önemi literatür taraması yapılarak ortaya konulmuştur.

Anahtar Kelimeler: *Çevre, Ekoloji, Etki, Kirlilik, Peyzaj Ekolojisi*

Giriş

Dünya üzerindeki mevcut peyzajlar dinamik bir niteliktedir ve yoğun insan müdahaleleri peyzajların değişimine yol açmaktadır (Hofgaard, 1999; Olgun ve Yılmaz, 2019; Zeller vd., 2020; Wu vd., 2021). 1960'lı yıllardan günümüze kadar insanoğlu çevresinde ortaya çıkan olumsuz değişimlerin etkisiyle, yaşam alışkanlıklarını devam ettirmesi halinde mavi gezegen adı verilen dünyadaki yaşam koşullarının hem kendisi hem de diğer canlı türleri için sürdürülebilirliğini kaybedeceğini fark etmiştir (Erdoğan vd., 2007) ve özellikle atmosfer ve su kirliliği gibi olumsuz koşullar giderek artan toplumsal sorunlar olarak ele alınmaya başlanmıştır (Eren, 1999; Miyawaki, 2006). Akten ve Akten (2005) ile Martin vd. (2016)'e göre de, yaşanan teknoloji ve bilimsel alanlardaki ilerlemeler toplumların yaşam şartlarını iyileştirmiş ancak ekolojik dengenin bozulması sorununun ortaya çıkmasına neden olmuştur.

İnsanlığın sınırsız ve sorumsuz doğal kaynakları kullanması, günümüzde pek çok sorunun ortaya çıkmasına sebep olmuştur. Doğal kaynak olarak kabul edilen suyun, toprağın, havanın ve bitki örtüsünün kirlenip, bozulacağı hatta hayvan varlığının bir gün gelip tükeneyeceği düşünülmemiştir (İlke vd., 2011). Yaşam kalitesi, insanların ve ekosistemlerin sağlığı doğal kaynakların nasıl yönetildiğine bağlıdır ve hiç şüphesiz ki bunda sürdürülebilirlik ilkesinin benimsenmesi gereklidir (Gavrilescu, 2021). Ormanların zarar görmesi ve erozyon, hızlı nüfus artışı, çarpık yapılaşma ve açık-yeşil alanların yetersizliği, kıyı alanların tahrip edilmesi, kimyasal maddelerin sanayide kullanılması, termik santraller ya da nükleer enerjiye dayalı çevre sorunlarının insan sağlığına etkisi birçok ülke tarafından çözümlenmeye çalışılmaktadır (Kışlalıoğlu ve Berkes, 2001). Bu duruma bağlı olarak, 19. yüzyılın sonundan itibaren çevre koruma bilinci giderek yaygınlaşmıştır (Köseoğlu, 1983; Xu, 2017). Pek tabii, bilinçlilik toplumların kültürel yapılarından gelen bir davranış biçimi olarak, kişilerin inançları, kuralları, değerleri ve varsayımlarıyla biçimlenmektedir (Güzel, 2020).

Fiziksel çevreyi ve insanların o çevreyi algılaması ve beğenmesini ifade eden “Peyzaj” terimi (Anonim, 2022a), değişen ve yaşayan, dinamik, içinde ekolojik süreçlerin, özellikle insan etki ve müdahalelerinin gözleendiği arazi parçası ve etkileşimlerin bütünüdür (Çabuk ve Değerliyurt, 2014). Doğal bilimler (peyzaj ekolojisi) ve sosyal bilimler (kültürel süreçler) olmak üzere iki bilim dalı peyzajı incelemektedir (Şahin vd., 2014). Bu bağlamda, peyzaj ekolojisi bilim dalının temelini ekosistem dağılım desenleri ve peyzaj elemanları, su kaynakları, enerji,

besin ve diğer materyaller ile türler arasındaki dolaşımı, peyzaj mozaığının zaman içindeki değişimi oluşturmaktadır. Diğer taraftan peyzajın işlevi, peyzaj yapısı ve peyzajdaki değişimlere bağlı olarak peyzajın karakteristiğini ortaya koymak peyzaj ekolojisinin hedefini oluşturmaktadır (Demir ve Demirel, 2018). Bu bilgiler ışığında çalışmanın amacı, günümüzde oldukça dikkat çeken bir sorun olan çevresel kirliliğin peyzaj ekolojisine etkisinin detaylı şekilde incelenerek konuyla ilgili yapılacak araştırmalarda yol gösterici bir kılavuzun ortaya konulmasıdır.

Peyzaj Ekolojisi Kavramı

Peyzaj ekolojisi teriminin kökeni, peyzaj ve ekoloji olmak üzere iki kelimeye dayalıdır (Bastian, 2001). Bu nedenle daha iyi açıklanabilmesi için konu sırasıyla “Peyzaj”, “Ekoloji” ve “Peyzaj ekolojisi” başlıklarında incelenmiştir.

Peyzaj

Fransızca “paysage” kelimesinden türetilmiş olmakla birlikte, görünüm ve manzara anlamlarına gelen peyzaj (Arı, 2005; Şenöz, 2013), kır ve kıra ait manzara anlamına sahiptir (Baş Bütünler ve Çavdar Sert, 2021).

“Peyzaj”, tarihsel sürece bakıldığında özellikle Orta Avrupa’da farklı anlamlara dayandırılmış ve farklı şekillerde tanımlanmıştır. Ortaya çıkan bu tanımlamalar, kullanım hedefi ve çeşitli dönemlerde bilimsel ve sanatsal akımlardan etkilenmiştir (Güngöroğlu, 2008). Peyzaj bilimsel açıdan ilk olarak 1900’lü yılların başında Alman coğrafyacı Alexander von Humboldt tarafından, yeryüzündeki bir alanın bütün karakterleri olarak tanımlanmıştır (Deniz vd., 2006; Kupik, 2010; Förster vd., 2012; Şenöz, 2013; Vural, 2020). Bayer (1977) peyzajı, dünya kabuğu üzerinde bulunan doğal objelerden jeolojik ve morfolojik arazi yapısı ile su yüzeyi, tarım arazisi ve orman arazisi gibi örtülerin kapsadığı görünüm olarak tanımlamaktadır. Odum ve Barrett (2008) ise peyzajı, bir bölgedeki farklı arazi biçimlerinin bütünü olarak tanımlanmaktadır. Hutchinson (2016) farklı şekilde peyzajı, zaman içinde değişim gösteren jeomorfolojik, jeolojik, biyolojik ve kültürel katmanların bütünleşmesinden oluşan ve insanlar tarafından algılandığı, resmedildiği ve değer verildiği bir alanın görünümü olarak tanımlamıştır. Antrop (2013) ve Keshtkaran (2019), peyzaja yaklaşımların çok geniş kapsamlı olması sebebiyle açık bir şekilde tanımının yapılamadığını ifade etmiştir.

Peyzaj, doğal ve kültürel peyzaj olmak üzere iki başlıkta, kültürel peyzaj ise kırsal ve kentsel peyzaj olmak üzere iki başlıkta sınıflandırılmaktadır (Tablo 1) (Çetinkaya ve Uzun, 2014).

Tablo 1. Peyzajın sınıfları (Çetinkaya ve Uzun, 2014)

Kültürel Peyzaj		Doğal Peyzaj
Kırsal Peyzaj	Kentsel Peyzaj	
- Yerleşim alanları - Tarım alanları - Ağaçlandırma alanları - Yeşil koridorlar - Koruluklar	- Ev bahçeleri - Parklar - Kent ormanları - Tarım alanları - Kent/Bölge parkları - Çatı bahçeleri - Düşey Peyzaj (Örn: Yeşil duvar) - Hobi bahçeleri - Yeşil koridorlar - Yol ağaçlandırmaları	- Sulak alanlar (Örn: nehirler, kıyılar, göller, dereler vb.) - Ormanlar - Çayırlar-Meralar

Abiyotik, biyotik ve insan bileşenlerinden oluşan peyzaj (Şenöz, 2013), bir alanın çevresel koşulları ve yeryüzü şekilleriyle tanımlanmış halini ifade etmekle birlikte insanların tarih sürecinde yaptığı etkilerle çeşitlilik ve değişim gösterebilmektedir (Can ve Akay, 2007). Bir başka deyişle, doğal çevre ve kültürel çevrenin etkileşiminden dolayı tüm peyzajların zaman içinde dinamik olduğu ve değişim gösterdiğini ifade etmek mümkündür (Primdahl ve Swaffield, 2011).

Ekoloji

1866’da Alman biyolog Haeckel tarafından önerilen ekoloji terimi, canlıların çevreleriyle olan ilişkilerinin incelenmesini ifade etmektedir. Etimolojik olarak, Yunanca “oikos” ve “logos” kelimelerinden oluşmaktadır ve habitat bilimini ifade etmektedir. Aslında ekoloji, sadece canlılar ve onların fizikokimyasal ortamları arasındaki ilişkileri incelemekle kalmaz, aynı zamanda organizmalar arasında gelişen ilişkileri düzenleyen yasaları oluşturmayı da amaçlamaktadır (Burel ve Baudry, 2003). Kısaca açıklamak gerekirse ekoloji, canlıların birbiri ve cansız çevreleriyle olan ilişkilerini ve bu ilişkilerle bağlantılı süreçleri araştıran bilim dalıdır (Plutynski, 2008; Can, 2013; Rajashekara, 2014). 1900’lü yıllarda ayrı bir bilim dalı olarak ortaya çıkan ekoloji sözcüğü yaklaşık son otuz veya kırk yıldan buyana, günlük terminolojinin bir parçası olarak karşımıza çıkmaktadır (Odum ve Barrett, 2008).

Tarihi boyunca ekoloji ile bilim adamları, ekosistemlerin abiyotik ve biyotik bileşenlerinde zaman ve mekân arasında değişkenlik olup olmadığını incelemişlerdir (Clark, 2010). Bu kapsamda Kaya (2011) ekolojinin başlıca konularını aşağıdaki gibi belirtmiştir:

- Canlı organizmalara ait olan bireylerin yaşayıp gelişmesine fırsat sağlayan edafik (toprakla ilişkili), iklimik (iklimsel), fizyografik (yeryüzü şekline bağlı) ve biyotik (diğer canlılarla ilgili) unsurları incelemek, organizmaların bu doğal şartlara karşı davranışlarını ve bu doğrultuda yetiştirme ortamı isteklerini saptamak,
- Aynı türden meydana gelen canlılar topluluğunun gelişimini, yapısını, topluluk içi ve ayrıca diğer topluluklarla ilişkilerini, enerji temini ve beslenme durumlarını ortaya koymak,
- Çeşitli canlılara ait toplumlar ve bu toplumların içinde yaşadıkları fiziksel mekândan meydana gelen doğal sistemlerin (ekosistemlerin) öğelerini, yapılarını, tiplerini, enerji ilişkileri ve beslenmelerini incelemektir.

Ekoloji, sınırlı bir alanda yaşayan canlılar ile bunları kuşatan cansız çevrelerin karşılıklı ilişkileri ile oluşan ve süreklilik ifade eden bir sistemdir. Bu ekolojik sistem içindeki unsurların işleyişi birbirinden bağımsız şekilde düşünülmemelidir. Alan dinamiklerinin daha uzun süreli ve mekanik yöntemlerle incelendiği araştırmalarda çok net sınırları olan sistemler içinde bile madde ya da organizma alışverişinin olduğu açıkça ortaya konulmaktadır. Dolayısıyla peyzajlar izole ve kapalı sistemler olmanın tersine, sürekli ve açık şekilde birbiri ile etkileşim durumunda olan ekolojik sistemleri ifade etmektedir (Şenöz, 2013) ve peyzajların anlaşılması ekolojinin üzerinde durduğu en önemli unsurlardan birisidir (Antrop, 2013).

Peyzaj Ekolojisi

İlk olarak 1938 tarihinde Alman bir ekolojist olan Carl Troll peyzaj ekolojisi terimini kullanılmıştır. Troll peyzaj ekolojisi terimini, “*Bir peyzaj parçasındaki canlı topluluklar ile çevreleri arasındaki bütün karmaşık ağları inceleyen bir bilim dalıdır*” şeklinde tanımlamıştır. Troll en küçük nitelikteki ekolojik peyzaj biriminin ekotop (ekosistem birimi)’tan oluştuğunu ve peyzaj birimini pek çok elemanın meydana getirdiğini belirtmiştir. Ayrıca, Troll biyoloji ve coğrafya disiplinlerinin peyzaj ekolojisine katkı yaptığını ifade etmiştir. Peyzaj ekolojisine coğrafyanın bütünsel ve fiziksel temel bir yaklaşım hazırladığını ve biyolojinin ise ekosistemin işlevleri ve yapısı ile ilgili kavramları incelediğini belirtmiştir. Jeomorfoloji, toprak ilmi ve bitki bilimlerinin de fiziksel yaklaşıma katkı sağladığını ifade etmiştir (Tozar, 2006; Şenöz, 2013).

Peyzaj ekolojisi, peyzajın bir bölümünde egemen olan çevre şartları ve canlı toplulukları arasındaki karmaşık nitelikteki neden-sonuç ilişkilerini bir bütün halinde ele alan bilim dalı olarak tanımlanmaktadır (Odum ve Barrett, 2008). Peyzaj ekolojisinde doğadaki belirli organizmalar ya da diğer unsurların incelenmesiyle birlikte belirli bir peyzajda mevcuttaki bütün öge ve sistemlerin karşılıklı olan etkileşim ve etkilerinin incelenmesi söz konusudur (Köseoğlu, 1983). Peyzaj ekolojisi modern ekolojinin bir dalı olarak kabul görmektedir. İnsan, bitki ve hayvanlar ile bunların fiziksel çevreleri ve arasındaki ilişkileri konu alan çeşitli disiplinler arasında bir köprü ve bağ kuran, yani disiplinler arası bir bilim dalıdır (Çepel, 1988). Peyzaj ekolojisinin temel amacı; karmaşık doğal sistemlerin yapı ve işlevlerini detaylı şekilde inceleyerek çevre koruma, doğal potansiyel, mekân planlaması konularına ait problemleri çözecek bulguları saptamaktır (Kaya, 2011).

Peyzaj ekolojisi, çevre biliminde ortaya çıkan sorunları hızlı şekilde çözmek için kullanılan büyük oranda kullanılan bir disiplindir ve dünyada sürdürülebilirlik ve küresel değişimle ilgili sorunlar ele alınırken peyzaj ekolojisine ihtiyaç daha çok artmaktadır (Gergel ve Turner, 2002). Bu bağlamda, peyzaj ekolojistleri, aynı anda ve etkileşimli olarak çalışan insan ve doğal sistemlere odaklanan, peyzaj değişikliğinin doğal ve insan kaynaklı birçok etkenini anlamak için disiplinler arası bir bakış açısı kullanmaktadırlar (Mayer vd., 2016).

Barnes (2000) ise, peyzaj ekolojisinin anlaşılabilmesi için dört temel başlığın olduğunu belirtmiş ve bunları aşağıdaki gibi açıklamıştır:

- Peyzaj kompozisyonu: Popülasyonların genetik yapısı, ekosistemdeki türlerin kimliği, çeşitliliği ve mevcut farklı topluluk türleri.
- Peyzaj yapısı: Habitat yamaları ya da ekosistemlerin çeşitliliği ve bunların desenleri (yamalar, meşcereler veya ekosistemlerin boyutu ve düzeni).
- Peyzaj fonksiyonu: İklimsel, jeolojik, hidrolojik, ekolojik, vb. süreçler.
- Peyzaj değişim: Ekosistemlerde mevcut olan sürekli değişim durumu.

Çevresel Kirlilik ve Peyzaj Ekolojisi İlişkisi

İnsanlar, sürekli üretme ve tüketme faaliyetleri içerisinde. Hayatını devam ettirebilmek için beslenme ve barınma gibi zorunlu ihtiyaçlarını ve diğer faaliyetleri gerçekleştirilmesi esnasında ve sonrasında oluşan maddeler ile doğanın dengesi bozulmakta ve sonucunda çevre kirliliği oluşmaktadır (Atabek Yiğit, 2009). Çepel (1988), peyzaj ekolojisi kapsamında çevre kirliliği konusunu; hava kirliliği, su kirliliği, toprak kirliliği, gürültü kirliliği ve radyoaktif kirlilik olmak üzere beş başlıkta incelemiştir.

Hava Kirliliği

İnsan sağlığını ya da çevresel dengeleri yıpratıcı biçimde bileşiminin değişmesi, kirlileti maddelerin havada yer alması hava kirliliği olarak ifade edilmektedir (Zencirci ve Işıklı, 2017). Hava kirliliği sorunu sanayi devrimi sonrasında ve özellikle sanayileşmiş kesimlerde ortaya çıkmıştır. Artış gösteren çevre sorunları ve bu sorunların

neden olduğu ekolojik dengenin bozulması, canlıların karşılaştığı sağlık sorunları ve canlı çeşitliliğin azalması durumu, çevreyle barışık kalkınma modelini sürdürülebilir kalkınma modeli olarak ortaya çıkarmış ve dünyadaki her türlü canlının güvenliğini sağlamakla, ekonomiklik ve kalkınma arasındaki denge ve barışa borçlu olduğu görüşünü beraberinde getirmiştir. Hava kirliliği çevre sorunlarından sadece biridir ve küreselleşen dünyada, ülkeleri birbirlerine sorumlu kılan en önemli kirlilik çeşidi olmuştur. Burada ozon tabakasının incelmeye ve küresel ısınma problemleri etkili olmuştur. Son yıllarda uzun mesafeli taşınımına neden olan, özellikle kalıcı zehirli maddeler için antlaşmaların yapılmasına başlanmıştır (Sofuoğlu, 2022).

Hava kirliliği, kentlerin büyümesi, nüfusun hızla artması, endüstrinin ilerlemesiyle artan oranda ve değişen içerikte etkilerini göstermektedir. Lokal nitelikte bir kaynaktan salınmış olan hava kirleticileri yerel etkilere neden olurken, kent merkezlerinde fosil yakıt yanması, enerji tüketimi, motorlu taşıtların aşırı kullanımı hava kalitesinin niteliğini kaybetmesine sebep olmaktadır. Bölgesel taşınım, artış gösteren sera gazları, asit depolanması, troposferik ozon üretimi bugün hava kirliliğinin küresel ölçeğe ulaşan etkilerini ortaya koymaktadır. Antropojenik kaynaklı trafik, endüstri, ulaşım ve ısınmadan kaynaklı olan kirleticiler hava kirliliğinin en önemlileri iken; topografik yapı, meteoroloji, dispersiyon ve kimyasal dönüşüm süreçlerinin iklim ve hava kirliliği üzerindeki etkileri daha iyi bilinmektedir (Anonim, 2022b). Hava kirliliği hayvan, bitki ve insanların sağlığı ve yaşamını olumsuz biçimde etkilemekle birlikte yapıları da (metal, ahşap ve taş kısımları) tahrip etmektedir. Ayrıca hava kirliliği iklim koşullarının değişmesine de (sıcaklık, nem, rüzgar hızı, ışın enerjisi, yağış) sebep olmaktadır (Çepel, 1988). Şekil 1’de hava kirliliğine ait bir görünüm sunulmuştur.

Şekil 1. Hava kirliliği (URL-1, 2022)

Su Kirliliği

Su kirliliği, istenilmeyen zararlı maddelerin, suyun niteliğini ölçülebilecek düzeyde bozmalarını sağlayacak yoğunluk ve miktarda suya karışması durumudur (Aydoğdu, 2014). Son dönemde çevre sorunlarından bir diğeri de su kirliliği konusudur. Çevre kirliliğinden en çok şekilde etkilenen ve çevre kirliliği bakımından en savunmasız olan doğal kaynak su olarak kabul edilmektedir. Canlıların yaşamı, çevre ve ekonomik gelişim bakımından gerekli olan su kaynakları sınırlı durumdadır ve dışardan gelen olumsuz etkenlere açık niteliktedir. Dolayısıyla günümüzde insanoğlunun birçok faaliyeti neticesinde su kaynaklarının büyük bir kısmının doğal bileşimi bozulmuş yani kirlenmiş durumdadır. Eğer koşullar böyle sürerse gelecekte tatlı suya erişim sıkıntıya girecek ve ayrıca doğal bileşimi zarar gören su ortamında yaşamakta canlılarda birtakım sorunlarla karşılaşılacak şekilde karşı karşıya kalacaktır (Menteşe, 2017).

Su kirliliğinin başlıca kaynakları, endüstri kuruluşları ve enerji santralleri, yerleşim birimleri, zararlılarla mücadele ve gübreleme yapılan orman ve tarım alanları, hayvansal atık maddeler üretimi yapan çiftlikler, toprak erozyonunun görüldüğü alanlardır (Çepel, 1988). Şekil 2’de su kirliliğine ait bir görünüm sunulmuştur.

Şekil 2. Su kirliliği (URL-2, 2022)

Toprak Kirliliği

Toprak kirliliği kısaca toprağın üstünde ve içine bırakılan zararlı atıkların toprağın özelliğini bozmasıdır. Ancak, toprağın özelliğini bozan sadece madde ya da süreçler değildir. Bu sebeple, toprak kirlenmesi, toprağın verimini düşürecek optimum seviyede toprak karakteristiklerini yıpratacak her türlü teknikleri, ekolojik baskıları ve olayları ifade etmektedir (Çepel, 1988). Günümüzde gelişen teknoloji ile beraber besin ihtiyacının sağlandığı topraklar her geçen gün kirlenmekte ve toprak kirliliğinin artması neticesinde sebze, meyve ve tarımsal ürünlerin yetiştirildiği alanlar azalmaktadır (Kızıloğlu Algan ve Bilen, 2005). Şekil 3’de toprak kirliliğine ait bir görünüm sunulmuştur. Toprak kirliliğine sebep olan unsurlar aşağıda belirtildiği gibidir (Anonim, 2022c):

- Yerleşim alanlarında oluşan ya da çıkan atıklar, egzoz gazları, endüstri atıkları, tarımsal mücadelede kullanılan ilaçlar ve kimyasal gübreler toprak kirliliğine neden olan en önemli unsurlardır.
- Yerleşim alanlarında oluşan ya da çıkan çöplerin rastgele atıldığı alanlar ile kanalizasyon şebekelerinin artılmadan, direk olarak toprağa karıştığı alanlarda toprak kirliliği oluşmaktadır.
- Egzoz gazları, kükürtdioksit (SO₂), karbonmonoksit (CO), kadmiyum (Cd), kurşun (Pb), vb. zehirli maddeler havaya yayılarak ve solunum yolu vasıtasıyla büyük bir kısmı canlılar tarafından alınmaktadır. Geriye kalan zehirli maddeler ise rüzgârlar ile uzak mesafelere taşınmakta ve yağışlarla yeryüzüne inerek, suyu ve toprağı kirletebilmektedir.
- Toprak kirliliğine neden olan bir diğer etken de tarımsal mücadele ilaçları ve suni gübrelerden oluşmaktadır. Tarımsal mücadele ilaçlarının aşırı ve bilinçsiz kullanımı neticesinde, toksik maddelerin toprakta birikimi artış göstermekte ve doğal ortamın kirlenmesine neden olmaktadır. Özellikle, sodyum, fosfor, magnezyum, potasyum, kalsiyum, demir, çinko, mangan, bakır, bor gibi besin maddelerini barındıran suni gübrelerin bilinçsiz ve aşırı kullanımı neticesinde, toprağın yapısı bozularak ve toprak kirliliği meydana gelmektedir.
- Endüstri tesislerinde oluşan ve artılmadan toprağa, havaya ve suya verilen atıklar çevrenin kirlenmesine sebep olmaktadır.

Şekil 3. Toprak kirliliği (URL-3, 2022)

Gürültü Kirliliği

Gürültü kaynakları nitelik ve nicelik açısından yaşam düzeyinin artışına paralel biçimde yükselmiştir. Bu sebeple insanların sağlığını etkileyen çevre kirleticilerinden birisi olarak kabul görmektedir. Yaşam düzeyinin artışının uçak, tren, otobüs, vapur gibi toplu taşıma araçlarının kullanımını artırdığı gibi özel araçların kullanımında da artış olmuş ve halen bu artış devam etmektedir. Diğer taraftan, hem imalathane ve fabrikaların sayısı hem de konfor için mutfak eşyaları, havalandırma araç ve gereçleri de insanlar tarafından yoğun şekilde kullanımı artış göstermektedir (Çepel, 1988).

Gürültü; insanların algılamasını ve işitme sağlığını olumsuz şekilde etkileyen, psikolojik ve fizyolojik açıdan dengelerini bozabilen, iş yapma verimliliğini düşüren, çevrenin sakinliği ve hoşluğunu ortadan kaldırarak niteliğini olumsuz yönde değiştiren çok önemli bir çevre kirliliğidir (Toprak ve Aktürk, 2004) ve bir kirlilik kaynağı olarak mevzuatlarda yer almaktadır (Sert Sütçü ve Şahin, 2021). Şekil 4’de gürültü kirliliğine ait bir görünüm sunulmuştur.

Şekil 4. Gürültü kirliliği (URL-4, 2022)

Radyoaktif Kirlilik

Radyoaktif kirlilik dünyadaki tüm peyzajların yapı elemanlarının hepsini etkileyebilecek nitelikte olması sebebiyle, son derece önemli bir konudur. En etkin kaynağı ise nükleer enerji santralleri olarak ifade edilmektedir. Radyoaktif kirlenme esasen, elektron radyasyonu yani elektron yayılmasına dayalıdır (Çepel, 1988).

İnsanlar, güneşten ve uzaydan gelen kozmik ışınlar, yer kabuğundaki radyoizotoplar sebebiyle yapı malzemeleri ve toprak, su ve gıdalar gibi doğal kaynaklardan ışın almaktadırlar. Bu etkenlere ek olarak insanlar enerji üretimi, endüstri, tıp, araştırma, tarım, hayvancılık gibi pek çok alanda kullanılan yapay kaynaklar sebebiyle de radyasyona maruz kalmaktadırlar. Kısaca radyoaktif kirlilik, çevre sorunlarının bir çeşidi olmakla birlikte, biyolojik sistemlere etki ederek kolaylıkla besin zincirine girmekte ve canlılarda büyük hasarlara sebep olmaktadır (Anonim, 2022ç). Şekil 5’de radyoaktif kirliliğe ait bir görünüm sunulmuştur.

Şekil 5. Radyoaktif kirlilik (URL-5, 2022)

Sonuç

Bu çalışma ile çevresel kirlilik konusunun peyzaj ekolojisi üzerinde etkisi ortaya konulması amaçlanmıştır. Belirtilen amaç doğrultusunda çevresel kirlilik konusu, hava kirliliği, su kirliliği, toprak kirliliği, gürültü kirliliği ve radyoaktif kirlilik olmak üzere beş başlıkta incelenmiş ve çevresel kirliliğinin peyzaj ekolojisine etkisi ortaya konulmuştur;

- Hava kirliliği hem doğal alanlar hem de kentsel alanlarda zararlı etkiler yapmaktadır. Ancak hava hareketleri sebebiyle kirli hava başka bölgelere taşınabilmektedir. Dolayısıyla hava kirliliği sorununun çözümü sadece küçük bir bölge olarak değil daha büyük ölçekli bir konu olarak ele alınmalıdır. Bu kapsamda başta sanayi bölgeleri, kentsel alanlar olmak üzere hava kirliliğine neden olan alanlarda planlama ve tasarım çalışmalarında disiplinlerarası yaklaşımların ortaya konulması gerekmektedir.
- Günümüzde susuzluk sorunu sebebiyle mevcut su kaynaklarının korunması gerekmektedir. Dolayısıyla su kirliliği gibi olumsuz bir durum mevcut kullanılabilir su kaynaklarını olumsuz şekilde etkilemektedir. Bu durumun önüne geçecek şekilde su kaynaklarının korunması ve atık suların kullanımı gibi konularda yönetimsel kararların alınması ayrıca su kullanımına yönelik bilinçlendirme ve farkındalık çalışmalarının yürütülmesi faydalı olacaktır.
- Yapılaşma, sanayi ve artan nüfus artışı gibi sorunlar özellikle toprak üzerinde kirliliğe sebep olmaktadır. Ancak tarımsal üretimin temel unsuru olan topraktaki kirlilik durumu insanların besin ihtiyaçlarının karşılanmasını engellememelidir. Bu kapsamda kırsal ve kentsel alanlarda yaşayanların toprak kirliliğine yönelik bilinçlenmesi için ulusal ya da uluslararası projeler dahil olmak üzere birçok çalışma yürütülmelidir. Ayrıca, toprak kirliliğini önleyici çalışmaların yapılması ile yeraltı sularının da korunmasını sağlamak mümkün olacaktır.

- Artan nüfus neticesinde özellikle yoğun yapılaşma alanlarında gürültü kirliliği önemli sorunlardan birisi olarak kabul edilmektedir. Gürültü kirliliği sorunu konut alanlarının yaşanabilirliğini olumsuz şekilde etkilemekle birlikte insanlar başta olmak üzere tüm canlılarda sağlık sorunlarını beraberinde getirebilmektedir. Bunun için planlama ve tasarım kararlarında gürültü kirliliğini azaltıcı ve önleyici disiplinlerarası çalışmalar yürüterek yaşanabilir mekânlar oluşturulması etkili çözümlerden biri olacaktır.
- Günümüzde insanlar radyoaktif kirliliğe bir şekilde maruz kalmakta ve bunun etkileri süreç içinde kendini gösterebilmektedir. Bunun önüne geçebilmek için radyoaktif kirliliği önleyici yönetsel çalışmalar yapılmalı, sebep ve sonuçlarını tanıtan bilinçlendirme ve farkındalık çalışmaları yürütülmelidir.

Sonuç olarak, çevre kirliliğinin olumsuz etkilerinin hem doğal çevre hem de insanların yaşam alanlarında her geçen gün artış gösterdiği bir gerçektir. Çevre kirliliği konusunun peyzaj ekolojisine etkisinin bilinmesi ve bu yönde çözümleyici yaklaşımların geliştirilmesi ile doğal kaynak değerlerinin sürdürülebilirliğinin sağlanması yanı sıra yaşanabilir mekânların oluşturulması da mümkün olacaktır.

*e-mail: huseyinipcak@gmail.com

Abstract

The developments in poultry industry fields, such as genetic improvement, disease control, nutrition, management, and organization have significantly increased the production efficiency of broiler chickens. It is expected that these positive developments observed in the last 50 years will continue in the future. Early nutrition plays a key role in ensuring the sustainability of this success in broiler chicken production. A good start in life is the most important part of profitable production, especially in terms of farm animal species. In the case of broiler chickens, the perinatal period, referring to a few days pre-hatching and about 7 days post-hatching, represents a large part of the productivity in the broiler chick lifespan. The perinatal nutrition in this period plays an important role in the development of their muscle, skeleton, intestinal microbiota, morphology and immune system in the life cycle of broiler chicks. In fact, achieving maximum performance levels of broiler chickens in the fattening stage depends on the management and nutrition in this period. The perinatal nutrition program for broiler chicks can be divided into two basic parts. The first of these is the in-ovo feeding period done within the first few days before hatching, during which the embryo shows rapid growth and development, and the chick prepares for hatching and life outside the egg. The second is the neonatal feeding period, which includes feeding in the incubator during the first 48 hours from when the first chick hatches until the last chick hatches, feeding during their transfer to farms, and feeding programs in the first few days on the farm. Chicks access to feed being delayed during this period after hatching may have negative effects on the yield performance of the chicks throughout the production stage. For this reason, chicks need to be able to have access to feed as soon as possible, immediately after hatching. Therefore, the purpose of this review was to provide information about feeding strategies in the perinatal period and to examine the postnatal effects of such strategies on broilers through the present studies.

Key Words: *Perinatal, In-Ovo, Neonatal, Nutrition, Broilers*

1. Introduction

With the genetic selection, care, and feeding programs carried out in commercial broiler farming, one-day old broiler chicks that weigh 35-45 g can increase their body weight 65-70 times until 42 days old. However, this intense selection pressure for rapid growth has resulted in a number of adverse complications on the immune function and bone development of broilers (Rawlinson et al., 2009; Van der Most et al., 2011). In addition, this rapid growth and development has also increased the susceptibility of broilers to infectious diseases (Havenstein et al., 2003). On the other hand, egg nutrient reserves are insufficient for chick embryos whose metabolic rate increases with the genetic progress achieved today and can be rapidly depleted after hatching (Yair et al., 2013). Therefore, nutrition of chicks during perinatal periods is critical for both embryonic development and the development of postnatal muscle, skeleton, gut, healthy microbiota, and immune systems. The perinatal period in broiler chicks includes a few days before hatching and about 7 days after hatching. The feeding strategies to be applied in this period can be divided into 2 parts as in ovo and neonatal feeding. The purpose of feeding in both periods is to activate the development of the immune and gastrointestinal systems as soon as possible to prepare chicks for hatching and post-hatching life. As a matter of fact, at the end of the incubation period, visceral organs begin to grow and develop rapidly, and in the last 6 days of incubation, the absorption surface of the small intestine increases, goblet cells are formed, and the chicks' ability to digest and absorb develops (Uni et al., 2003; Gilbert et al., 2007). After hatching, gastrointestinal tract grows four times faster than the rest of the body during the first two weeks of a broiler's life (Nitsan et al., 1991). Therefore, a correct and appropriate feeding in the perinatal period affects the future fattening performance of broilers. It has been reported that probiotics provide resistance against pathogens post-hatching (De Oliveira et al., 2014), prebiotics promote early colonization of beneficial bacteria (Tako et al., 2014), carbohydrates (maltose, sucrose and dextrin) increase glycogen stores (Uni et al., 2005), amino acids (threonine, mixture of arginine, glutamine, glycine and proline) improve growth (Kadam et al., 2008; Shafey et al., 2014), vitamins C and E strengthen antioxidant defense and immunity (Zhu et al., 2019; Araújo et al., 2019) and creatine pyruvate supports muscle growth (Zhao et al., 2017) in the early period feeding of chicks. However, there is still insufficient information about the early feeding of broiler chickens. The aim of this review was to provide information about early nutrition programming (in ovo and neonatal feeding) strategies and to reveal the postnatal effects of these feeding strategies on broiler chickens over studies.

2. In Ovo Feeding of Chicks

Feeding in the early period or feeding young animals is an important part of successful animal breeding. In particular, in ovo injection technology is widely used by approximately 95% of the world's industrial hatcheries for embryo vaccination processes (Maiorano et al., 2012). Besides that, the use of this technology in in ovo nutrition of developing embryos with external nutrients can provide a practical way. With this technique, chicks can be fed with amino acids, minerals, vitamins, carbohydrates, fatty acids, and essential oils during hatching (Araújo et al., 2019; El-Kholy et al., 2021; Lu et al., 2022; Sogunle et al., 2022; Tavaniello et al., 2022). Thus, in ovo feeding of broiler chicks during hatching can have a positive effect on their performance during the fattening period (Hassan, 2018; Araújo et al., 2019; Wang et al., 2020). The results of the study on the effects of in ovo feeding on performance in broilers are presented in Table 2.1. Furthermore, broilers getting a good start in life has many advantages. It has been reported in the studies that in ovo feeding in broilers improves hatchability (Naeem Asa et al., 2022), increases chick initial body weights (Zhao et al., 2017; Hassan, 2018), promotes intestinal development (Tako et al., 2004), supports the immune system (Sogunle et al., 2022), enhances antioxidant defense (Lu et al., 2022), improves meat quality (Tavaniello et al., 2019), alters mRNA expression levels of genes (Zhu et al., 2019), and consequently increases final body weights of broilers (Zhao et al., 2017; Hassan, 2018). Moreover, the epigenome is dynamic during embryogenesis and in ovo feeding of chicks can cause changes in cell and gene functions that influence animal growth and development through epigenetic modification such as DNA and histone modifications (Métayer-Coustard et al., 2019). In addition to the advantages mentioned, in ovo injection technology has various difficulties in terms of its applicability and sustainability in practice. For this reason, it is necessary to pay attention to issues such as the additive to be used before in ovo injection and the developmental stage of the embryo for the additive to be used in, the location where the injection will be made, and the dose of the injection.

3. Neonatal Feeding of Chicks

The neonatal period, which covers the period from hatching to reaching feed and the first few days, is a critical period for chicks. As a matter of fact, chicks have to wait about 48 hours in the hatching machine from the first chick's hatching to the hatching of the other eggs (Careghi et al., 2005). Then, in practice, time is also spent with post-hatching vaccination, sex determination, and boxing and transfer of chicks to farms. Therefore, within a period of approximately 72 hours, the chicks use yolk, which is left in hatching towards the end of the incubation period and withdrawn into the abdominal cavity, as the sole energy source. The residual yolk may be sufficient to keep the chicks alive for the first 3-4 days without feed but does not support the development of the gastrointestinal tract and immune system and does not help increase body weight (Panda et al., 2006; Arulnathan et al., 2019). On the other hand, the digestive system of newly hatched chicks has a limited ability to digest and absorb nutrients (Jin et al., 1998). Therefore, the development of the gastrointestinal and immune system is essential for growth to begin, which can be improved by early feeding. As a matter of fact, Li et al. (2022) has determined that access to the feed immediately after hatching of broilers within a 2-hour period increases daily live weight gain and feed intake, improves feed conversion ratio, increases villus height (VH), decreases crypt depth (CD) and increases the VH/CD ratio in the 1-21st days, compared to 48-hour delay time.

In the neonatal period, there are feeding strategies such as feeding in the hatching machine until all chicks hatch, feeding during transportation, bringing embryonated eggs to the broiler chicken farm facilities on the 18th day of incubation to ensure that the chicks hatching on the farms (NestBorn system), thus providing reaching feed and water immediately. Hesabi Nameghi et al. (2022) reported that the hydrated nutritious gel supplement applied to the chicks in the first 24 hours after hatching did not change the body weight, feed intake, feed conversion ratio at the 35th day, as well as VH, CD, VH/CD ratio, and lamina propria thickness. Similarly, it was determined that the hydration nutritious supplementation, which is a commercial product, did not affect chick live weight at 0-7th days (Özlü et al., 2022). On the other hand, Lingens et al. (2021) compared the common practice of transferring chicks to henhouses without feed or water within the first 72 hours after hatching with the new practice in which the embryonated eggs on the 18th day of incubation are transported to henhouses by a special vehicle and chicks hatching on henhouses, and have immediate access to feed and water for 6-7 days. According to the results, they found that the new system significantly increased the final body weights of broilers compared to the traditional system. In addition, the first 3-4 days after hatching, the chicks can be fed with special pre-starter diets with high digestibility and specific nutritional needs. In the study by Franco-Rossello et al. (2022), it was determined that the daily live weight gain and feed intake increased, and feed conversion rate improved significantly at the end of the fattening period (42nd day) in broiler chickens fed with pre-starter feed at 0-4th days after hatching compared to those fed with standard starter feed. Another feeding method observed in the neonatal period is the first 7-day feeding program in which chicks are provided with immediate access to feed and water in henhouse. Brief information on previous studies conducted within the scope of this feeding program is presented in Table 3.1.

Table 2.1 The effects of in ovo feeding on performance in broiler chicks

Materials	Inoculants	In Inoculation Rate/Incu- bation Day (d)	Treatment effect (% difference from untreated control)				References

Fertilized eggs (Hubbard JA57)	Galactooligosa- ccharides (GOS)	3.5 mg GOS per egg/on 12 d.	↓ 2.21	→	→	→	Tavaniello et al., 2022

BW, body weight; FI, feed intake; FCR, feed conversion ratio; ↑, increase; ↓ decrease, → no significant differences.

Table 3.1 The neonatal feeding studies and effects on broiler chicks.

Animals	Dietary information and experimental design	Major results	References
Hybro broiler chickens	The 5 treatments were: immediate feeding (3 hour (h)), delayed access to feed for 12h, 24h, 36h and 48h	↓ BW at 7 d in all delayed access time to feed groups compared with immediate feeding (3 h) group. At 35 d → BW in all groups. According to delayed access time to feeding ↓ FI and →FCR.	Kang et al., 2018
Ross 708 broiler chickens	Chicks were divided into 2 treatment groups as follows: birds receiving ad libitum access to feed and water immediately after hatch (FED) and birds without access to feed for the first 48 h post-hatch (NOTFED).	↑ BWG and FI in FED group compared with NOTFED group. Among Ca transporter genes, only ↑ mRNA expression level of Calbindin D28k in jejunum and ↑ Ca sensing receptor (CaSR) in ileum, and for P transporter genes' expression, only P transporter type III (PIT1) mRNA expression level was significantly ↑ in FED group compared with NOTFED group.	Proszkowiec-Węglarz et al., 2019
Ross 708 broiler chickens	Chicks were divided into 2 treatment groups as follows: birds receiving ad libitum access to feed and water immediately after hatch (FED) and birds without access to feed for the first 48 h post-hatch (NOTFED).	Compared with group NOTFED, broilers in group FED among tight junction and gut-barrier related genes ↑ mRNA expression levels of occludins (OCLN), occludens-1 (ZO-1), junctional adhesion molecule (JAM) 2 in jejunum and OCLN, ZO-1, JAM2, JAM3, claudins (CLDN) 1, immunoglobulin A (IgA) in ileum.	Proszkowiec-Węglarz et al., 2020
Ross 308 broiler chickens	Chicks were allotted to 36 rearing pens in a 2 x 3 factorial design with two hatching treatments (directly provided access to feed and water (Early); deprived of feed and water for 38 h (Late)) and three starter dietary (control, diet with low (0.057%) and high (0.114%) inclusion of algal extract) treatments until 6 d.	↑ BW, FI, and → FCR in early group compared with group late. Late chicks also had longer relative intestine, ↑ relative (g/kg BW) weight of gizzard and proventriculus, but ↓ relative bursa weight on day 6. → Gut microbiota, gut development or vaccine-induced antibody responses in all dietary treatments group.	Ivarsson et al., 2022
Lingnan Yellow broiler chickens	The 3 treatments were: immediate feeding (Group 2 h), delayed access to feed for 24 h (Group 24 h), and delayed access to feed for 48 h (Group 48 h).	During the starter period (1-21 d) ↑ ADG, ↑ ADFI and ↓ FCR in group 2 h compared to the group 48 h. Compared with group 48 h, broilers in group 2 h exhibited ↑ VH, ↓ CD, ↑ VH/CD in the duodenum, ↑ occludin, and claudin-1 mRNA expression level in the jejunum at 50 d. Broilers in group 2 h ↓ Escherichia spp. at 21 d and ↓ Bacteroides spp. at 50 d compared with group 48 h.	Li et al., 2022

BW, body weight; FI, feed intake; FCR, feed conversion ratio; BWG, body weight gain; mRNA, messenger ribonucleic acid; Ca, calcium; P, phosphorus; ADG, average daily gain; ADFI, average daily feed intake; VH, villus height; CD, crypt depth; ↑, increase; ↓ decrease, → no significant differences.

4. Conclusion

In conclusion, perinatal feeding improves the development of the gastrointestinal and immune system necessary for growth induction in broilers. Thus, by providing flock uniformity, it leads the way for successful and profitable industrial broiler breeding. However, more studies are needed to determine the most appropriate early feeding time and the most beneficial feed additive levels for the sustainability of productivity increase in broiler farming.

Investigation of the Expectations and Satisfaction of the Partners from Agricultural Credit Cooperatives in Trabzon

Seyfettin Demirci¹, Asaf Özalp², İbrahim Yılmaz²

¹ Agricultural Credit Cooperatives Trabzon Regional Union Directorate, Trabzon, Turkey

² Akdeniz University, Agricultural Faculty, Department of Agricultural Economics, iyilmaz@akdeniz.edu.tr, Antalya, Turkey

Abstract

Agricultural Credit Cooperatives (ACC) were organized throughout Turkey with 1,001,418 partners in 36,407 affiliated settlements. The main purpose of Agricultural Credit Cooperatives is to meet the credit needs of their partners. In addition to this purpose, meeting the input needs of the partners and marketing the various products grown by the partners are among the objectives. The ability of these cooperatives to perform the expected functions more effectively, the participation of their members in their activities, is directly related to the determination of the opinions, expectations and suggestions of the members about the activities of the cooperatives. For this reason, in this study, it is aimed to determine and evaluate the expectations and satisfaction of its members regarding the functions and activities of Agricultural Credit Cooperatives.

The main population of the research consists of the partners of 3 cooperatives in Trabzon, which is within the body of the Trabzon Regional Union of Agricultural Credit Cooperatives. Care was taken to select the cooperatives established in the settlements where tea, hazelnut and animal husbandry facilities are made. In the study, the data obtained from the survey conducted with 93 randomly selected partners were used. The Wilcoxon Signed Ranks Test was used to test the extent to which the expectations of the partners were met, since the samples were not independent and the variables were measured with a Likert scale.

Most of the surveyed partners find significant about the attitudes and behavior of the ACC towards their partners, their following the innovations, their activities on issues such as agricultural input supply, input quality, price policy and education. Although the rates are lower than the expectations, it has been concluded that a significant part of the partners find the Agricultural Credit Cooperatives successful in their activities.

Trabzon'da Tarım Kredi Kooperatiflerinden Ortak Beklenti ve Memnuniyetinin Araştırılması

Özet

Tarım Kredi Kooperatifleri (TKK), 16 Bölge Birliği ve 1625 birim kooperatifi ile 36.407 yerleşim biriminde 1.001.418 ortak ile Türkiye genelinde örgütlenmiştir. Tarım Kredi Kooperatiflerinin temel amacı ortaklarının kredi ihtiyaçlarını karşılamaktır. Bu amaca ilave olarak, ortaklarının girdi gereksinimlerini karşılamak ve ortaklarının yetiştirdikleri çeşitli ürünlerinin değerlendirilmesi de amaçlar arasında yer almaktadır. Bu kooperatiflerin beklenen işlevleri daha etkin bir şekilde gerçekleştirebilmeleri, ortaklarının faaliyetlerine katılımı, kooperatiflerin faaliyetleri hakkında ortakların düşünceleri, beklenti ve önerilerinin belirlenmesi ile doğrudan ilişkilidir. Bu nedenle çalışmada, ortaklarının Tarım Kredi Kooperatiflerinin işlev ve faaliyetlerine yönelik beklenti ve memnuniyetlerinin tespit edilmesi ve değerlendirilmesi amaçlanmıştır.

Araştırmanın ana kitlesini Tarım Kredi Kooperatifleri Trabzon Bölge Birliği bünyesinde bulunan Trabzon ilindeki 3 birim kooperatifin ortakları oluşturmaktadır. Çay, fındık ve hayvancılık tesislerinin yapıldığı yerleşim yerlerinde kurulan kooperatiflerin seçimine özen gösterilmiştir. Çalışmada tesadüfi olarak seçilen 93 ortak ile yapılan anket çalışmasından elde edilen veriler kullanılmıştır. Ortakların beklentilerinin ne derece karşılandığının istatistiksel olarak test edilmesinde, örneklem bağımsız olmadığı ve değişkenler Likert ölçeği ile ölçüldüğü için işaret testi (Wilcoxon Signed Ranks Test) kullanılmıştır.

Araştırma yapılan ortakların büyük bölümü TKK'lerinin ortaklarına karşı tutum ve davranışını, yenilikleri takip etmelerini, tarımsal girdi tedariki, girdi kalitesi, fiyat politikası ve eğitim gibi konulardaki faaliyetlerini önemsemektedirler. Oranlar beklentilerden daha düşük olmakla birlikte, ortakların önemli bir kısmının Tarım Kredi Kooperatiflerini bahse konu faaliyetlerinde başarılı buldukları sonucuna ulaşılmıştır.

Alkali Extraction Of Phenolic Compounds From Tomato Peel: Optimization Of Extraction Conditions And Investigation Of Phenolic Profile By Lc-Ms/Ms

Özlem Kızılırmak Esmer¹, Erinç Koçak¹, Alp Efe Cevrem¹, Orhan Kicikoğlu¹

¹Food Engineering, Faculty of Engineering, Ege University, Izmir, Turkey

Abstract

With the increasing world population, the food need of humanity is increasing proportionally. Agricultural wastes constitute an important potential for the global economy as they contain components that are less preferred to be consumed as food due to their low bioavailability due to their indigestion in the human body or due to their sensory properties, but that may be beneficial to human health such as antioxidant substances and antimicrobial agents. The benefits of using these wastes in terms of economy and reducing environmental pollution are obvious. Tomato, which is one of the most used agricultural products in our country and in the world, is processed by removing its skins in the processing of many products. Tomato skins cause serious environmental problems and economic losses unless they are valorized. In this regard, this study aims to optimize the extraction efficiency, the antioxidant capacity and total phenolic content of the tomato peel extract according to the independent variables of temperature and time, while the alkaline extraction process applied to tomato skins is cheap and industrially applicable. Using response surface methodology, highest extraction yield (28.77 g/100 g dry extract), total phenolic content (3819,32 mg GAE/100 g dry extract), and total antioxidant capacity (2737.82 µmol Trolox/100 g dry extract) were obtained under extraction conditions at 100°C for 5.26 hours. According to LC-MS/MS results, tomato skins treated with alkali contain various phenolic acids and some flavonoids. The phenolic component found in the highest amount in the tomato peel extract was determined as p-coumaric acid (429.99 ± 38,53 mg/100 g dry extract). Other important phenolic components are ferulic acid (12.44 ± 2.06); 4-hydroxy benzoic acid (7.13 ± 1.01) and vanillin (2.47 ± 0.22) mg/100 g dry extract.

Domates Kabuğunun Alkali Ekstraksiyon Yöntemiyle Fenolik Bileşiklerinin Ortaya Çıkarılması: Ekstraksiyon Koşullarının Optimizasyonu Ve Fenolik Profilin Lc-Ms/Ms İle İncelenmesi

Özet

Artan dünya nüfusu ile birlikte insanlığın gıda ihtiyacı da orantılı olarak artmaktadır. Tarımsal atıklar küresel ekonomi için önemli bir potansiyel oluşturmaktadır çünkü bu atıklar antioksidan maddeler ve antimikrobiyal maddeler gibi insan sağlığına faydalı olabilecek bileşenleri içermektedir. Ancak bu bileşenlerin insan vücudunda sindirilebilirliklerinin düşük olması veya duyuşal özellikleri, tarımsal atıkların gıda olarak tüketimini daha az tercih edilir kılmaktadır. Bu atıkların ekonomiye kazandırılması ve çevre kirliliğinin azaltılması açısından faydaları ortadadır. Ülkemizde ve dünyada en çok kullanılan tarım ürünlerinden biri olan domates, birçok ürünün işlenmesinde kabuğu çıkarılarak işlenmektedir. Domates kabukları değerlendirilmediği takdirde ciddi çevre sorunlarına ve ekonomik kayıplara neden olmaktadır. Bu bağlamda, bu çalışma, domates kabuklarından ucuz ve endüstriyel olarak uygulanabilir bir teknik olan alkali ekstraksiyon işlemi ile elde edilen ekstraktın ekstraksiyon verimini, antioksidan kapasitesini ve toplam fenolik madde miktarını sıcaklık ve zaman bağımsız değişkenlerine göre optimize etmeyi amaçlamaktadır. Yanıt yüzey metodolojisi kullanılarak en yüksek ekstraksiyon verimi (28.77 g/100 g kuru ekstrakt), toplam fenolik madde (3819,32 mg GAE/100g kuru ekstrakt) ve toplam antioksidan kapasite (2737.82 µmol Trolox/100 g kuru ekstrakt) elde edilmiştir. 5.26 saat boyunca 100°C'de ekstraksiyon koşulları altında LC-MS/MS fenolik profil sonuçlarına göre alkali ile muamele edilen domates kabukları çeşitli fenolik asitler ve bazı flavonoidler içermektedir. Domates kabuğu ekstraktında en yüksek miktarda bulunan fenolik bileşen p-kumarik asit (429,99 ± 38,53 mg/100 g kuru ekstrakt) olarak belirlenmiştir. Diğer önemli fenolik bileşenler ise ferulik asit (12.44 ± 2.06); 4-hidroksi benzoik asit (7.13 ± 1.01) ve vanilin (2.47 ± 0.22) mg/100 g kuru ekstrakt.olarak tespit edilmiştir.

Evaluation of Chemical Use in Beekeeping Activities in the Şile Region of Istanbul Province

Canan Köse Zafer¹, İbrahim Yılmaz²

¹ Üsküdar District Directorate of the Ministry of Agriculture and Forestry, İstanbul, Turkey

²Akdeniz University, Agricultural Faculty, Department of Agricultural Economics, iyilmaz@akdeniz.edu.tr, Antalya, Turkey

Abstract

The province of Istanbul, Şile District has a very advantageous position for beekeeping in terms of its geographical structure and vegetation. The main purpose of this research is to reveal some general characteristics of the beekeeping producers in the Şile District of Istanbul, to evaluate the use of chemicals, and to determine the problems in the production and marketing stages. In this evaluation, beekeeping activities, data obtained through a questionnaire applied to a total of 69 beekeepers in 36 villages in Şile Region were used. With the questions asked in this survey study, detailed data were obtained on many subjects such as the reasons for starting beekeeping, educational status, honey yields, produced bee products, and fight against diseases and pests. The deficiencies in beekeeping activities are discussed as education, product marketing, queen bee production or supply, and fight against diseases and pests.

İstanbul İli Şile Bölgesinde Arıcılık Faaliyetlerinde Kimyasal Kullanımının Değerlendirilmesi

Özet

İstanbul ili, Şile İlçesi coğrafik yapısı, bitki örtüsü bakımından, arıcılık için oldukça avantajlı bir konuma sahiptir. Bu araştırmanın temel amacı, İstanbul İli Şile İlçesindeki arıcılık yapan üreticilerin genel bazı özelliklerini ortaya koymak ve kimyasal kullanımını değerlendirmek, üretim ve pazarlama aşamasındaki sorunlarını saptamaktır. Bu değerlendirmede arıcılık faaliyetleri, Şile Bölgesinde 36 köyde toplam 69 arı yetiştiricisine uygulanan anketle elde edilen veriler kullanılmıştır. Bu anket çalışmasında sorulan sorular ile arıcılığa başlama nedenleri, öğrenim durumları, bal verimleri, üretilen arı ürünleri, hastalık ve zararlılar ile mücadele gibi birçok konu hakkında ayrıntılı veri elde edilmiştir. Arıcılık faaliyetlerindeki eksiklikler eğitim, ürün pazarlama, ana arı üretimi veya temini, hastalık ve zararlılar ile mücadele olarak ele alınmıştır.

Anahtar Kelimeler: *Arı Yetiştiriciliği, Kimyasal Kullanımı, Arıcılık, Şile, Istanbul*

Abstract

Fermentation is one of the most economical food production and traditional food preservation methods that has been applied for centuries. Fermented foods carry the cultural history of ethnic communities around the world. Milk, cereals, meat, fish, soy, vegetables and fruits based fermented products are produced in both around the world and our country. Fermented foods have biological functions such as source of probiotic microorganisms, food preservation, enrichment of nutritional value, antioxidant effect, therapeutic factors and immunological effects. Due to their functional properties, interest in the consumption of fermented foods has increased in recent years, with this increasing interest, the sensory properties of fermented foods have come to the fore. In this study, it was aimed to examine the sensory properties such as taste, aroma, smell, color, texture, appearance and shape of foods obtained by using various starter cultures, especially lactic acid bacteria. When the literature studies on fermented foods are examined, it is seen that the prominent sensory properties of fermented milk products such as yogurt, kefir, kumiss, kurut are taste, viscosity, color, aroma and smell. It has been determined that the prominent sensory properties of fermented cereal products such as boza, mahewu, tarhana, bread, idli, dosa are taste, texture, and odor resulting from microorganism activities. It was determined that the prominent sensory properties of sausage, soy sauce and fermented fish sauce were taste, aroma and texture. Finally, it has been emphasized in the literature that the prominent sensory properties of fermented fruits and vegetables such as kimchi, sauerkraut, gundruk, sunki, pickles are taste, aroma, color, texture and appearance. As a result, it has been determined that sensory properties have a significant contribution to product quality and consumer taste.

Key Words: *Fermentation, quality, sensory feature.*

Fermente Gıdaların Duyusal Kalite Özellikleri

Özet

Fermentasyon, yüzyıllardan beri uygulanmakta olan en ekonomik gıda üretim ve geleneksel gıda muhafaza yöntemlerinden birisidir. Fermentasyonla üretilen gıdalar, dünyadaki etnik toplulukların kültürel tarihini taşımaktadır. Hem dünya genelinde hem de ülkemizde süt, tahıl, et, balık, soya, sebze ve meyve bazlı olmak üzere çok çeşitli fermente ürünler üretilmektedir. Fermente gıdalar probiyotik mikroorganizma kaynağı, gıdaları koruma, besin değerini zenginleştirme, antioksidan etki, terapötik faktörler ve immünolojik etkiler gibi biyolojik işlevlere sahiptir. Fonksiyonel özelliklerinden dolayı son yıllarda fermente gıdaların tüketimine olan ilgi artmış, artan bu ilgiyle birlikte fermente gıdaların duyusal özellikleri de ön plana çıkmıştır. Bu çalışmada, laktik asit bakterileri başta olmak üzere çeşitli starter kültürler kullanılarak elde edilen gıdaların tat, aroma, koku, renk, tekstür, görünüş, şekil gibi duyusal özelliklerinin incelenmesi amaçlanmıştır. Fermente gıdalar üzerindeki literatür çalışmaları incelendiğinde, fermente süt ürünlerinden yoğurt, kefir, kıyma, kurut gibi gıdaların öne çıkan duyusal özelliklerinin tat, viskozite, renk, aroma, koku olduğu anlaşılmıştır. Boza, mahewu, tarhana, ekmekek, idli, dosa gibi fermente tahıl ürünlerinde öne çıkan duyusal özelliklerin tat, tekstür, mikroorganizma faaliyetleri sonucu oluşan koku olduğu belirlenmiştir. Sucukta, soya sosu ve fermente balık sosunda öne çıkan duyusal özelliklerin tat, aroma, tekstür olduğu belirlenmiştir. Son olarak kimchi, sauerkraut, gundruk, sunki, turşu gibi fermente meyve ve sebze ürünlerinde öne çıkan duyusal özelliklerin tat, aroma, renk, tekstür, görünüş olduğu literatürde vurgulanmıştır. Sonuç olarak duyusal özelliklerin ürün kalitesine ve tüketici beğenisine önemli derecede katkısının olduğu tespit edilmiştir.

Anahtar Kelimeler: *Fermentasyon, kalite, duyusal özellik.*

Giriş

Fermente gıdalar, bitkisel ve hayvansal kaynaklardan ortamdaki mikroorganizmalarla doğal olarak ya da starter kültürlerin ortama eklenmesiyle üretilen gıdalardır (Tamang ve ark., 2016). Fermentasyon ile farklı duyusal özelliklere sahip yeni bir gıda maddesi üretilmekte, ayrıca gıdanın raf ömrü uzamaktadır. Fermente yiyecek ve içecekler bakteri, maya ve küf mantarları gibi mikroorganizmaların enzimleri aracılığıyla üretilmektedir. Biyokimyasal olarak fermentasyon, karbonhidratların ve proteinlerin herhangi bir elektron alıcısının yokluğunda kısmen okside edilerek enerjinin serbest bırakıldığı metabolik bir süreçtir (Kabak ve Dobson, 2011). Sütün yoğurt ve peynire dönüşmesi, hamurun mayalanması, etil alkol, asetik asit, laktik asit, propiyonik asit, bütirik asit gibi

farklı maddelerin oluşması fermentasyon ile gerçekleşir. Bakteri fermentasyonları etken mikroorganizmaların çeşidine göre gruplandırılmakta, bu biyokimyasal değişimlerle üründe arzu edilen aromatik ve tekstürel yapıya ulaşılmaktadır.

Genel Bilgiler

Starter kültürler, fermentasyonda kullanılan GRAS nitelikteki mikroorganizmalardır. Fermentasyonda rol oynayan mikroorganizmaların doğal olarak hammaddede yeterli düzeyde bulunduğu gıdalarda fermentasyon, starter kültür ilave edilmeden gerçekleştirilebilmesine rağmen, starter kültür kullanılarak gerçekleştirilen fermentasyonlar standart ve daha yüksek kalitede ürünlerin üretilmesine olanak sağlamaktadır. Starter kültürler kullanılacakları hammaddeye uygun olarak seçilmektedir. Dolayısıyla süt, et, hububat ve sebze ürünleri için seçilen starterler genel olarak farklı mikroorganizmaları farklı miktarlarda içermekte, bu durum farklı duyuşal özelliklerin oluşumunu desteklemektedir (Holzapfel, 1997). Gıda endüstrisinde patojen olmayan, starter kültür olarak kullanılan mikroorganizmalar laktik asit bakterileri, bazı maya ve küflerdir. *Lactococcus*, *Lactobacillus*, *Leuconostoc*, *Pediococcus*, *Oenococcus* ve *Streptococcus* cinsi bakteriler ile *Saccharomyces* cinsi mayalar ve *Penicillium* cinsi küfler gıda işlemede kullanılan başlıca starter kültürlerdir (Foulquie vd., 2006; Holzapfel, 2003). Belirli fermente ürünlerin eldesinde uygun starterlerin seçilebilmesi için, öncelikle bu starterlerden üretmeleri istenilen lezzet ve koku bileşiklerinin belirlenmiş olması gerekmektedir (Marshall, 1987). Örneğin peynir üretiminde kullanılan kültürlerde çoğalma direnci olması istenirken, fermente sucuk ve hububat ürünlerinde bu özellik istenmemekte veya hububat ürünlerinde kullanılan starter kültürün asetat ve diasetil üretmesi uygun iken peynir ve fermente sucuklarda bu özellik istenmemektedir (Ganzle, 2009). Fermente et, süt, meyve, sebze ve hububat ürünleri için kullanılan starter kültürlerin gıdaların duyuşal kalite özelliklerine ve tüketici tarafından genel beğenisine ne derece önemli etkide bulunacağı aşikârdır.

Fermente Süt Ürünleri ve Duyusal Kalite

Fermente gıdalar üzerindeki literatür çalışmaları incelendiğinde, fermente süt ürünlerinden yoğurt, kefir, kıymız, kurut gibi gıdaların öne çıkan duyuşal özelliklerinin tat, viskozite, renk, aroma olduğu bilinmektedir. Fermente süt ürünleri içerisinde yaygın olarak tüketilenler arasında yoğurt, peynir, tereyağı ve krema yer almaktadır (De Vuyst, 2000). Özellikle *Lactococcus*, *Leuconostoc*, *Lactobacillus*, *Streptococcus* ve *Pediococcus* cinslerine ait laktik asit bakterileri, bu ürünlerin üretiminde rol almakta, diasetil gibi önemli aromatik bileşenler üretmektedir (Daly vd., 1998). Ayrıca starter kültürler, peynirde arzu edilen tekstürel yapının oluşumuna, yoğurt ve kremada viskoz yapının gelişimine yardımcı olmaktadır. Sağlığa oldukça faydalı süt ürünlerinden biri olan yoğurdun üretiminde *Str. thermophilus* ve *Lb. bulgaricus* türlerini içeren starter kültür karışımları kullanılmaktadır (Caplice ve Fitzgerald, 1999). Fermente süt ürünlerinden kefirin kimyasal özelliklerinin ve mikroflorasının ürünün duyuşal özelliklerine direkt etki ettiği, bu etkiden sorumlu bileşiklerin de laktik asit, etanol, CO₂, diasetil, asetaldehit ve aminoasitler olduğu bilinmektedir (Rattray ve O' Connel, 2011).

Fermente Et Ürünleri ve Duyusal Kalite

Fermente et ürünlerinden fermente sucukta, soya sosu ve fermente balık sosunda öne çıkan duyuşal özelliklerin tat, aroma, tekstür olduğu bilinmektedir. Etin fermente edilerek muhafazası çok eski tarihlerden beri uygulanan işleme yöntemlerindendir. Etin kütleme tuzu ile karıştırılarak fermente edilmesi ve kurutulması mikrobiyolojik açıdan daha dayanıklı bir ürün oluşturmaktadır. Özellikle Avrupa' nın merkezi ve Güney Avrupa' da, ayrıca birçok Asya ülkesinde fermente et ürünleri yaygın olarak tüketilmektedir (Caplice ve Fitzgerald, 1999). Etin fermentasyonu sırasında starter kültürler duyuşal kaliteyi geliştirirken aynı zamanda biyokoruyucu ajanlar olarak da davranmaktadır (Fadda vd., 2010). Et ürünlerinden izole edilip daha sonra fermente et üretiminde starter kültür olarak kullanılan laktik asit bakterileri, fermentasyon sırasında spontan mikroflorayı engelleyerek, fermentasyon ve olgunlaşma aşamalarını kontrol etmektedirler (Hugas ve Monfort, 1997).

Fermente Sebze Ürünleri ve Duyusal Kalite

Kimchi, sauerkraut, gundruk, sunki, turşu gibi fermente meyve ve sebze ürünlerinde öne çıkan duyuşal özelliklerin tat, aroma, renk, tekstür, görünüş olduğu literatürde vurgulanmıştır. Sebze ürünlerinden salatalık, lahana ve zeytin gibi hammaddelerin fermente edilmesi endüstriyel açıdan önem kazanmıştır. Havuç, fasulye, enginar, kapari ve patlıcan gibi diğer bazı sebze çeşitlerinin de standart şartlar altında laktik asit fermentasyonu sağlanarak güvenliği, besin içeriği, raf ömrü, tat, aroma, renk, tekstür, görünüş gibi duyuşal özellikleri iyileştirilmektedir. Ayrıca fermentasyonda oluşan laktik asit antimikrobiyal etki sunmaktadır. İstenen kalitede fermente bir sebze ürünü elde edebilmek için laktik asit bakterilerinin hammaddenin özelliklerine adapte olması gerekmektedir (Rodríguez vd., 2009). Günümüzde birçok sebze fermentasyonu, ortama sadece tuz eklenmesi yoluyla gerçekleştirilmektedir. Taze sebzelerde bulunan laktik asit bakterileri, doğal floranın sadece %0,15–1,5' ini oluşturmaktadır (Buckenhüskes, 1997). Spontan fermentasyon, ortamdaki doğal flora ile kontamine mikroorganizmalar arasındaki rekabet sonucu gerçekleşmekte, zamanla bu süreç uzamakta, işlem başarısız olabilmektedir. Bozucu ve patojen mikroorganizmaların gelişiminin engellenerek yüksek kalite ve güvenliğe sahip ürün elde edilebilmesi için sebze

fermentasyonunda starter kültür kullanılması önerilmektedir. *Lb. plantarum*, salatalık, lahana ve zeytin fermentasyonunda en sık kullanılan ticari starter kültürdür (Rodríguez vd., 2009). Fermente zeytin üretiminde, son ürün için duyuşal özelliklerin korunması ve geliştirilmesi büyük önem taşımaktadır. Fermentasyonun etkinliğini belirlemede en önemli faktör laktik asit konsantrasyonudur. Ayrıca mikrobiyal metabolizma sonucu oluşan ürünler de aroma ve lezzet özelliklerini etkilemektedir. Renk, ürün tercihinde tüketicinin dikkatini çeken öncelikli kriterlerden birisidir. Ürünün tat, tekstür, raf ömrü gibi birçok önemli özelliği hakkında tüketiciye bilgi sunmakla birlikte ürün albenisine de katkıda bulunmaktadır (Erbay vd., 2010).

Fermente Tahıl Ürünleri ve Duyusal Kalite

Boza, mahewu, tarhana, ekmek, idli, dosa gibi fermente tahıl ürünlerinde öne çıkan duyuşal özelliklerin tat, tekstür, mikroorganizma faaliyetleri sonucu oluşan koku olduğu belirlenmiştir. Tahıl ürünleri, günlük protein, karbonhidrat, vitamin, mineral ve diyet lifi ihtiyacını karşılama açısından önemli kaynaklar olup bu ürünlerin fermente edilmesi ile ürünün hem besin değerinde hem de duyuşal özelliklerinde önemli artışlar sağlanmaktadır. Fermentasyonda tahıl ürünlerindeki fitatların optimum pH' da enzimatik yıkımları sonucunda çözünebilir demir, çinko, kalsiyum gibi minerallerin miktarlarında artış olması besinsel kaliteyi iyileştirirken; protein miktarı ve kalitesinde artış arzu edilen tekstürel yapıyı desteklemektedir. Bazı aminoasitlerin sentezi ve B vitamini içeriğindeki artış aromayı etkilemekte, ayrıca güvenli ürünler üretilmektedir (Blandino vd., 2003). Fermente tahıl ürünlerinden tarhana üzerinde yapılan bir çalışmada tarhananın serbest aminoasitlerinden valine, methionin, triptofan ve alanine miktarlarındaki artışın fermentasyon süresince proteolitik aktiviteden kaynaklandığı saptanmıştır (Erbaş vd., 2005). Gerçekleşen bu biyokimyasal ve mikrobiyolojik değişimler ürünün duyuşal özelliklerini yakından etkilemektedir. Ayrıca reaksiyonlarda etken faktör pH da önem arz etmekte, ürünün duyuşal özelliklerini etkilemektedir. Boza üzerinde yapılan bir çalışmada 24 saat fermentasyon süresince kimyasal özelliklerdeki değişim izlenmiş, fermentasyon sonunda toplam asitliğin %0,02' den %0,27' e, alkol içeriğinin %0,02' den %0,79' a yükseldiği; pH değerinin ise 6,13' den 3,48' e düştüğü, tüm bu oluşumların ürün özelliklerini etkilediği belirlenmiştir (Hancıoğlu ve Karapınar, 1998).

Sonuç

Çalışmada, fermente gıdaların duyuşal kalite özelliklerinin ürün için öneminin incelenmesi amaçlanmıştır. Elde edilen literatür bulguları ile kimyasal ve mikrobiyolojik özelliklerin fermente gıdaların duyuşal özelliklerini de etkilediği anlaşılmıştır. Fermente et, tahıl, süt ve meyve sebze ürünlerinin renk, aroma, tekstür, görünüş gibi özellikleri başta olmak üzere duyuşal özelliklerinin gıdalar için kalite standartlarının belirlenmesinde önemli rol oynadığı vurgulanmıştır.

Enhanced immunosuppressive effects of 3,5-bis[4 (diethoxymethyl)benzylidene]-1-methyl-piperidin- 4-one, an α , β -unsaturated carbonyl-based compound as PLGA-b-PEG nanoparticles

Laiba Arshad¹ Ibrahim Jantan² Syed Nasir Abbas Bukhari³

¹Department of Pharmacy, Forman Christian College (A Chartered University), Lahore, Pakistan; ²School of Pharmacy, Faculty of Health and Medical Sciences, Taylor's University, Subang Jaya, Selangor, Malaysia; ³Department of Pharmaceutical Chemistry, College of Pharmacy, Al Jouf University, Aljouf, Sakaka, Saudi Arabia

3,5-Bis[4-(diethoxymethyl)benzylidene]-1-methyl-piperidin-4-one (BBP), a novel synthetic curcumin analogue has been revealed to possess strong *in vitro* and *in vivo* immunosuppressive effects. The aim of present study was to prepare and characterize BBP-encapsulated polylactic-co-glycolic acid-block-polyethylene glycol (PLGA-b-PEG) nanoparticles and to evaluate its *in vivo* efficacy against innate and adaptive immune responses. Male BALB/c mice were orally administered with BBP alone and BBP- encapsulated nanoparticles equivalent to 5, 10 and 20 mg/kg of BBP in distilled water for a period of 14 days. The immunomodulatory potential was appraised by determining its effects of non-specific and specific immune parameters. The results showed that BBP was successfully encapsulated in PLGA-b-PEG polymer with 154.3 nm size and high encapsulation efficiency (79%) while providing a sustained release for 48 hours. BBP nanoparticles showed significant enhanced dose-dependent reduction on the migration of neutrophils, Mac-1 expression, phagocytic activity, reactive oxygen species (ROS) production, serum levels of ceruloplasmin and lysozyme, immunoglobulins and myeloperoxidase (MPO) plasma levels when compared to unencapsulated BBP. Enhanced dose-dependent inhibition was also observed on lymphocyte proliferation along with the downregulation of effector cells expression and release of cytokines, and reduction in rat paw oedema in BBP nanoparticles treated mice. At higher doses the suppressive effects of the BBP nanoparticles on various cellular and humoral parameters of immune responses were comparable to that of cyclosporine-A at 20 mg/kg. These findings suggest that the immunosuppressive effects of BBP were enhanced as PLGA-b-PEG nanoparticles.

Keywords: Immunosuppressive, PLGA-PEG polymer, Immunomodulatory

Abstract

Barley (*Hordeum vulgare* L.) is one of the important cereals widely cultivated in Turkey. The yield and product quality of barley cultivation is decreasing due to infections caused by plant pathogens such as *Fusarium culmorum*. In the scope of the research, 23 barley lines were infected with *F. culmorum* (FcUK99) and incubated for 7 days at 28°C±2. At the end of the period, changes in barley following infection were examined morphologically, and the severity of the disease was evaluated. According to the pathogenicity test, sensitive (*H. vulgare* L. cv. Akhisar 98) and resistant (*H. vulgare* L. cv. Avcı 2002) lines were determined. Changes in epigenetic and genomic stability were investigated by coupled restriction enzyme digestion-random amplification (CRED-RA) analysis. In CRED-RA assays for Akhisar 98, genomic template stability (GTS) and % polymorphism for *HapII/MspI* values were 83% and 22.3/37.8% while, values for Avcı 2002 were 90% and 0%/5.8%, respectively. Total RNA isolation and cDNA synthesis were performed in control and experimental groups. The effects of pathogenicity on gene expression levels in 7 *WRKY* genes were analyzed. The highest gene expression level for Avcı 2002 and Akhisar 98 barley lines was determined in *WRKY 6* gene. Fold changes in *WRKY 6* of Avcı 2002 and Akhisar 98 cultivars were calculated as 4.95 ± 1.28 and 1.72 ± 0.28 , respectively. The lowest gene expression levels for Avcı 2002 and Akhisar 98 were determined in *WRKY 9* (0.042 ± 0.009) and *WRKY 33* (1.073 ± 0.20) genes, respectively. This study is important in terms of knowing the resistance levels of barley against phytopathogens and developing effective strategies against this species in the agricultural field.

Türkiye’de yetiştirilen *Hordeum vulgare* L. hatlarının *F. culmorum*’a karşı direnç seviyesinin belirlenmesi

Özet

Arpa (*Hordeum vulgare* L.), ülkemizde yaygın bir şekilde ekimi yapılan önemli hububat çeşitlerinden biridir. Ancak, *Fusarium culmorum* gibi bitki patojenlerinin geliştirdiği enfeksiyonlar nedeniyle elde edilen ürün kalitesinde düşüş yaşanmaktadır. Proje kapsamında 23 arpa çeşidi *F. culmorum* (FcUK99) fitopatojeni ile enfekte edilmiş, 28°C±2 sıcaklık altında 7 gün boyunca inkübe edilmiştir. Süre sonunda arpalarda enfeksiyon sonucu oluşan değişimler morfolojik olarak incelenmiş, hastalık şiddeti hesaplanmıştır. Patojenite testine göre hassas (*H. vulgare* L. cv. Akhisar 98) ve dirençli hatlar (*H. vulgare* L. cv. Avcı 2002) tespit edilmiştir. Patojenite uygulaması sonucu gelişen epigenetik ve genomik stabilitedeki değişimler çift restriksiyon enzimi kesimi ve rastgele çoğaltımı (CRED-RA) analizi ile gerçekleştirilmiştir. Yapılan CRED-RA analizlerinde *H. vulgare* L. cv. Akhisar 98 ve *H. vulgare* L. cv. Avcı 2002 hatlarının genomik kalıp stabilitesi (GKS) ve *HapII/MspI* % polimorfizm değerleri sırasıyla, %83, %90 ve %22,3/37,8, %0,0/%5.8 olarak belirlenmiştir. Kontrol ve deney gruplarından total RNA izolasyonu ve cDNA sentezi gerçekleştirilmiştir. 7 *WRKY* geninde patojeniteye karşı gelişen gen anlatım düzeyindeki değişimler incelenmiştir. Avcı 2002 ve Akhisar 98 arpa hatları için en yüksek ekspresyon seviyesine sahip gen *WRKY 6* geni olarak belirlenmiştir. Bu gen için Avcı 2002 ve Akhisar 98 hatlarının gen anlatım oransal değişimleri sırasıyla $4,954 \pm 1,286$ ve $1,722 \pm 0,2884$ olarak elde edilmiştir. En düşük gen anlatım seviyesi Akhisar 98 hattında *WRKY 33* ($1,073 \pm 0,20$) geninde belirlenirken, Avcı 2002 hattı için *WRKY 9* ($0,042 \pm 0,009$) genidir. Bu çalışma, arpaların fitopatojenlere karşı direnç seviyelerinin bilinmesi, zirai alanda bu türe karşı etkin stratejiler geliştirilmesi açısından önem arz etmektedir.

Abstract

In this study, the degradation of some pesticides (acetamiprid, boscalid, deltamethrin, kresoxim-methyl, pyraclostrobin and pyridaben) by *Enterobacter cloacae* (plant growth promoting bacteria) was investigated in vitro. The bacterial isolate used in the study was isolated from the rhizosphere region of the plants in the pepper production areas of Tokat province and diagnosed by MALDI-TOF MS (Matrix-Assisted Laser Desorption Ionization-Time of Flight Mass Spectrometry) technique. It was determined that the effective substances used initially did not have a negative effect on *E. cloacae*, and the bacteria showed the same growth as the control group in the nutrient agar medium. Secondly, application doses of pesticides were added to erlenmeyers with nutrient broth, and 1 ml of 1×10^9 cells/ml of *E. cloacae* solution was inoculated and incubated in a shaker at room temperature (24 °C) for 7 days. After the nutrient broth medium were extracted, pesticide amounts were measured by Liquid Chromatography Tandem Mass Spectrometry (LC-MS/MS). When the results were compared with the control group, there was no degradation in acetamiprid, but 98.9% in pyraclostrobin, 98.6% in boscalid, 94.1% in kresoxim-methyl, 73.5% in pyridaben and 57.3% in deltamethrin. The results of this work may provide useful information for the biodegradation of boscalid, deltamethrin, kresoxim-methyl, pyraclostrobin and pyridaben in wastewater, soil, groundwater and plant.

Key Words: Bacteria, Pesticide, Biodegradation, Bioremediation, PGPR, LC-MS/MS,

Özet

Bu çalışmada seçilen bazı pestisitlerin (acetamiprid, boscalid, deltamethrin, kresoxim-methyl, pyraclostrobin ve pyridaben) laboratuvar ortamında *Enterobacter cloacae* (bitki gelişimini teşvik eden bakteri) tarafından bozunması araştırılmıştır. Çalışmada kullanılan bakteri izolatu, Tokat ili biber üretim alanlarındaki bitkilerin rizosfer bölgesinden izole edilmiş, MALDI-TOF MS (Matrix-Assisted Laser Desorption Ionization-Time of Flight Mass Spectrometry) tekniği ile tanısı konulmuştur. İlk olarak kullanılan pestisitlerin *E. cloacae* üzerinde olumsuz bir etki yapmadığı, nutrient agar besi yerinde bakterinin kontrol grubu ile aynı gelişimi gösterdiği tespit edilmiştir. İkinci olarak nutrient broth sıvı besi yeri bulunan erlenmayerlere pestisitlerin uygulama dozları eklenmiş ve 1'er ml 1×10^9 hücre/ml yoğunluğunda *E. cloacae* solüsyonu inokule edilerek 7 gün boyunca oda sıcaklığında (24 °C'de) inkübasyona bırakılmıştır. Süre bitiminde alınan nutrient broth besi yerleri ekstrakte edildikten sonra Sıvı Kromatografi-Tandem Kütle Spektrometre (LC-MS/MS) cihazında pestisit miktarları ölçülmüştür. Sonuçlar kontrol grubu ile kıyaslandığında acetamiprid'de bozunma olmazken pyraclostrobin'de %98.9, boscalid'de %98.6, kresoxim-methyl'de %94.1, pyridaben'de %73.5 ve deltamethrin'de %57.3 oranında bozunma görülmüştür. Bu çalışmanın sonuçları, boscalid, deltamethrin, kresoxim-methyl, pyraclostrobin ve pyridaben etkili maddelerinin atık su, toprak, yeraltı suyu ve bitkide biyolojik olarak parçalanması için faydalı bilgiler sağlayabilir.

²Department of Chemistry and Chemical Process Technology, Lapseki Vocational School, Çanakkale Onsekiz Mart University, Çanakkale, Turkey

Abstract

Temperature is the most important factor in incubation and the developing embryo is very sensitive to environmental temperature. Incubation temperature is effective on hatchability and chick quality as it provides embryonic growth and development. In this context, the effect of cold stress applied during certain periods of hatching on hatchability performance and sex ratio was researched in this study. For this purpose, 800 breeding eggs belonging to Brown Nick and Nick Chick genotypes were used in the study. Eggs were randomly divided into control and cold stress groups and they were incubated in the combined incubators. The study consists of two different experiments. The experiment consisted of 1 control group (CG; 37.8 °C during incubation) and 3 different treatment groups. Group 1 (TRG-1) of the treatment groups was 6 hours on the 3rd day of incubation, group 2 (TRG-2) was 6 hours on the 3rd and 4th days of incubation, and group 3 (TRG-3) was on the 3rd, 4th and 5th days of incubation. They were exposed to cold stress at 10 °C for 6 hours each day. Experiment 2 consists of a control group (CG; 37.8 °C during incubation) and 3 different treatment groups. Treatment groups were incubated at 10 °C for 6 hours on the 15th day (TRG-1), 6 hours on the 15th and 16th days (TRG-2), and 6 hours on the 15th, 16th and 17th days (TRG-3) cold stress was applied. According to the results obtained, it was determined that the application of cold stress did not significantly affect the hatching weight of the chick in both experiments ($P \geq 0.4168$). Nevertheless, no effect of cold application on hatching eggs on hatchability was observed in both experiments ($P=0.9710$; $P=0.5616$). Again, no statistically significant difference was found between the groups in terms of the probability of hatching male chicks ($P \geq 0.5110$). Although it is not statistically significant, considering that the probability of male chick hatching is 49% lower, this numerical difference can be economically important for hatcheries that produce layer chicks. On the other hand, probability means less one-day old male chick culling. In 1, each hour in which the embryos were kept at 10 degrees increased the incubation period by 1.23 hours. Each hour in which the embryos were kept at 10 degrees in Experiment 1 extended the incubation period by 1.25 hours, and in experiment 2 by 1.02 hours. As a result, there was no negative effect of cold stress on hatching weights and hatching eggs on hatchability embryos of different genotypes.

Key Words: Egg, Incubation, Hatchability, Male chick, Hatching weight

Yumurtacı Tavuklarda Kuluçka Esnasında Uygulanan Soğuk Stresinin Kuluçka Performansı ve Cinsiyet Oranı Üzerine Etkileri

Özet

Kuluçkada sıcaklık en önemli faktördür ve gelişen embriyo çevre sıcaklığına karşı çok hassastır. Kuluçka sıcaklığı, embriyonik büyüme ve gelişmeyi sağlaması sebebiyle kuluçka performansı ve civciv kalitesi üzerinde etkilidir. Bu bağlamda bu çalışmada kuluçkanın belirli dönemlerinde uygulanan soğuk stresinin kuluçka performansı ve cinsiyet oranına etkisi araştırılmıştır. Bu amaçla çalışmada 800 adet Brown Nick ve Nick Chick genotiplerine ait damızlık yumurtalar kullanılmıştır. Yumurtalar kontrol ve soğuk stresi gruplarına rastgele bölünerek kuluçka makinelerinde inkübe edilmiştir. Çalışma iki farklı denemeden oluşmaktadır. Deneme 1 kontrol grubu (KG; kuluçka sürecince 37,8 °C) , 3 farklı muamele grubundan oluşmuştur. Uygulama gruplarından grup 1 (UYG-1) inkübasyonun 3. gününde 6 saat, grup 2 (UYG-2) 3.ve 4. günlerinde 6'şar saat ve grup 3 (UYG-3) ise kuluçkanın 3., 4. ve 5. günlerinde 6'şar saat boyunca 10 °C'de soğuk stresine maruz bırakılmıştır. Deneme 2 ise yine kontrol grubu (KG; kuluçka sürecince 37,8 °C) ve 3 farklı muamele grubundan oluşmaktadır. Uygulama grupları 10 °C'de inkübasyonun 15. gününde 6 saat (UYG-1) , 15. ve 16. günlerinde 6'şar saat (UYG-2) ve 15., 16. ve 17. günlerinde 6'şar saat (UYG-3) soğuk stresi uygulanmıştır. Elde edilen sonuçlara göre soğuk stres uygulamasının her iki denemede de civciv çıkış ağırlığını önemli düzeyde etkilemediği belirlenmiştir ($P \geq 0,4168$). Yine her iki denemede soğuk uygulamasının çıkış gücü üzerinde bir etkisi görülmemiştir ($P=0,9710$; $P=0,5616$). Erkek civciv çıkma olasılığı bakımından yine her iki denemede gruplar arasında istatistiksel olarak önemli bir farklılık tespit edilmemiştir ($P \geq 0,5110$). İstatistiksel olarak önemli olmasa da erkek civciv çıkma olasılığının %49 daha düşük olduğu düşünüldüğünde rakamsal olarak gözlenen bu farklılık yumurtacı civciv üretimi yapan kuluçkahaneler için ekonomik olarak önem arz edebilmektedir. Diğer taraftan olasılık daha az erkeğin itlafı anlamına gelmektedir. Deneme 1'de embriyoların 10 derecede tutulduğu her bir saat, kuluçka süresini 1,25 saat, Deneme 2'de ise 1,02 saat uzatmıştır. Sonuç olarak soğuk stresinin farklı genotiplerdeki embriyoların çıkış ağırlıkları ve çıkım gücü üzerinde olumsuz etkisi görülmemiştir.

Anahtar Kelimeler: Yumurta, İnkübasyon, Çıkım gücü, Erkek civciv, Çıkış ağırlığı

Giriş

Kuluçka işletmeciliğinde kârlılık kuluçkalık yumurtadan elde edilecek civciv sayısı ve kalitesine bağlıdır. Kuluçka performansı ve embriyo kaybı damızlıkların yaşı, beslenmeleri, erkek/dişi oranı, yumurta ağırlığı, yumurtaların depolanması, kuluçka sıcaklığı, nemi ve çevirme işleminden etkilenir. İyi bir embriyo gelişiminin sağlanabilmesi ve kaliteli civciv elde edilmesi için inkübatör sıcaklığı büyük önem taşımaktadır.

Kanatlı hayvanlarda ontogenez esnasında fonksiyonel sistemlerin ve fonksiyonel endokrin eksenlerin kurulması için kritik dönemler vardır. Tavuklarda embriyonik gonadların embriyonik gelişimin 3,5 – 4,5 gününe kadar morfolojik olarak her iki cinsiyette de benzer oldukları, ancak embriyonik gelişimin 6,5 gününden itibaren belirgin bir şekilde farklılaştıkları bildirilmiştir (Ebensperger ve ark., 1988). Hipotalamus-hipofiz-tiroid bezleri ve adrenal eksenlerin oluşma dönemi, embriyo gelişmesini etkileyen kritik periyot olarak önerilmiştir (Halle ve Tzschentke, 2011).

En iyi çıkış gücü ve en iyi çıkış sonrası performansın yumurta kabuğu sıcaklığının sürekli 37,8 °C’de tutulduğu embriyolarda olduğu ve özellikle kuluçkanın son haftası boyunca yüksek yumurta kabuk sıcaklığının (38,9 °C) geç dönem embriyonik ölümü artırdığı bildirilmiştir. Optimum civciv kalitesi ve kuluçka performansı elde etmek için inkübasyon koşullarının embriyonik gereksinimleri karşılayacak şekilde ayarlanması gerekir (Meijerhof, 2009).

Bazı türlerde monoseks bireylerin üretimi arzu edilir. Örneğin yumurta üretiminde dişiler ön plana çıkarken et üretiminde erkekler tercih edilir. Yumurtacı tavuklarda erkek civcivler istenmemekte, dolayısıyla milyonlarca 1 günlük erkek civciv imha edilmektedir (Koenig ve ark., 2012). Yumurtacı erkek civcivlerin imha edilmeleri özellikle hayvan hakları savunucularının tepkisine neden olmaktadır. Hayvan hakları savunucularının giderek seslerini yükseltmeleri neticesinde başta Avrupa ülkelerinde olmak üzere, 1 günlük erkek civcivlerin öldürülmesine yönelik toplumsal bir baskı oluşmuştur. Bu anlamda yumurta tavukçuluğu sektörü sorunun çözümü için yollar aramaktadır. Kanatlılarda, özellikle kuluçka süresince maruz kalınan çevresel faktörler yumurtadan çıkan yavruların cinsiyet oranında rol oynayabilmektedir. Örneğin inkübasyonun ilk 5 günü 38,1 °C sıcaklık uygulaması sonucu %8 ile %10 daha fazla erkek civciv üretilmiştir (Piestun ve ark., 2013). Erkek ve dişi embriyoların gelişimsel koşullara ve çevresel stres faktörlerine farklı tepki verdikleri bildirilmektedir (Sackman ve ark., 2008). Tavuklarda cinsiyet farklılaşması inkübasyonun 5. ve 6. günleri arasında şekillenmektedir. Dişilerde aromataz geninin ekspresyonu inkübasyonun 5-6. günlerinde başlamaktadır. Aromataz proteini, dişi gonadların medullasında eksprese edilir ve ekspresyonu yumurtalık gelişimi sırasında artar. Aromataz çevresel etkilere, özellikle sıcaklığa karşı duyarlıdır (Bruggeman ve ark., 2007).

Bugüne kadar kuluçka sorunlarının irdelendiği çalışmaların çoğunda yüksek kuluçka sıcaklıklarının etkisi araştırılmıştır. Genellikle etlik piliçler üzerinde ve embriyonik gelişimin son döneminde yüksek sıcaklıklar uygulanmıştır. Ancak herhangi bir nedenle oluşabilecek olan sıcaklık düşüşlerinin embriyolar ve çıkım sonuçları etkisine yönelik çalışmalar kısıtlıdır. Bu çalışmada embriyonik gelişimin belirli dönemlerinde soğuk stresi uygulamasının farklı yumurtacı tavuk genotiplerinde kuluçka performansı ve cinsiyet oranına etkileri araştırılmıştır.

Materyal ve Yöntem

Çalışma Çanakkale Onsekiz Mart Üniversitesi Deneysel Araştırmalar Uygulama ve Araştırma Merkezi Kanatlı Ünitesi’nde bulunan kombine kuluçka makineleri kullanılarak gerçekleştirilmiştir. Çalışmada ticari bir firmadan temin edilen 800 adet Brown Nick ve Nick Chick genotiplerine ait damızlık yumurtalar kullanılmıştır. Yumurtalar kontrol ve soğuk stresi gruplarına rastgele bölünerek kuluçka makinelerinde inkübe edilmiştir. Çalışma embriyonik gelişimin erken döneminde soğuk stresi ve inkübasyonun geç döneminde soğuk stresi olmak üzere 2 denemeden oluşmuştur.

Deneme 1’e ait soğuk stres uygulaması Çizelge 1’de görülen sürelerde uygulanmıştır. Söz konusu çizelgeden görüleceği üzere Deneme 1, kontrol grubu ve 3 farklı muamele grubundan oluşmaktadır (Çizelge 1.) Buna göre kontrol grubu yumurtalar çıkım ünitesine alınana kadar 37,8 °C’de inkübe edilmiştir. Uygulama gruplarından Grup-1, kuluçkanın 3. gününde 6 saat boyunca 10 °C’ye konmuş, Grup-2 ise 3. ve 4. günlerde 6’şar saat boyunca 10 °C’ye konmuştur. Grup-3’ e ait yumurtalar ise kuluçkanın 3., 4. ve 5. günlerinde 6’şar saat boyunca 10 °C’de muhafaza edilmiştir.

Çizelge 1. Erken Dönemde Uygulanan Soğuk Stresine ilişkin deneme düzeni

Gruplar	Kuluçka Süreci	Sıcaklık	Günlük Süre	Soğuk Uygulanan Toplam Süre
Kontrol	18. güne kadar	37,8 °C	Sürekli	0
Grup 1	3. gün	10 °C	6 saat	6 saat
Grup 2	3. ve 4. günler	10 °C	6 saat	12 saat
Grup 3	3., 4. ve 5. günler	10 °C	6 saat	18 saat

Embriyonik dönemin 14. gününden itibaren, hipotalamus-pituiter-adrenal ekseninin fonksiyonel gelişimi başlamaktadır. Hipotalamus-pituiter-adrenal eksenini tamamen işlevsel olduğunda, salgılanan adrenokortikal steroidler, stres toleransı, embriyonun yaşama gücü ve çıkım sonrası performansı gibi birçok faktör üzerinde önemli bir etkiye sahiptir (Jenkins ve Porter, 2004). Bu bağlamda da Deneme 2'deki uygulama grupları 15. gün soğuk uygulaması, 15. ve 16. günler soğuk uygulaması ve 15., 16. ve 17. günler soğuk uygulaması olarak 3 farklı uygulama grubundan oluşmuştur (Çizelge 2).

Çizelge 2. Geç Dönemde Uygulanan Soğuk Stresine ilişkin deneme düzeni

Gruplar	Kuluçka Süreci	Sıcaklık	Günlük Süre	Soğuk Uygulanan Toplam Süre
Kontrol	18. güne kadar	37,8 °C	Sürekli	0
Grup 1	15. gün	10 °C	6 saat	6 saat
Grup 2	15. ve 16. günler	10 °C	6 saat	12 saat
Grup 3	15., 16. ve 17. günler	10 °C	6 saat	18 saat

Her bir çalışma gruplarındaki yumurtalar kuluçkaya konmadan önce, $\pm 0,1$ g hassasiyette hassas terazi ile tartılarak yumurta ağırlıkları belirlenmiştir. Kuluçkanın 18. günü gelişimini tamamlayan yumurtaların 18. gün tartımı yapılarak 37,5°C sıcaklık, %60 nem içeren çıkım bölümüne aktarılmıştır. Gelişim gerçekleşmeyen yumurtalar kırılarak yapılan gözlemler sonucu çıkış gücü (ÇG) ve çıkım gerçekleşmeyen yumurtalarda ise embriyo ölümleri belirlenmiştir. Yumurtadan çıkımı gerçekleşen her bir civciv tartılarak çıkış ağırlığı belirlenmiştir. Civcivlerin renklerine ve tüylenme hızına bakılarak cinsiyet tayini yapılmıştır. Civcivlerin yumurtadan çıkış saatleri 6 saat aralıklar ile kontrol edilmiş ve kuluçka çıkış saati kayıt altına alınmıştır.

İstatistiksel Analizlerde 0. gün, 18. gün yumurta ağırlıkları ve çıkış ağırlığı, cinsiyet, çıkım gücü ve kuluçka sürelerine ilişkin varyans analizinde grup (Kontrol, Grup 1, Grup 2 ve Grup 3) ve genotip (Brown Nick, Nick Chick) faktörleri ile bunların etkileşimlerini içeren model kullanılmıştır.

Bulgular ve Tartışma

Deneme 1: Erken Dönem Uygulanan Soğuk Stresine Ait Çalışma Bulguları

Çalışmada çıkış ağırlıkları bakımından grup ve genotiplere göre en küçük kareler ortalamaları ve önem seviyelerine bakıldığında ele alınan özelliklerin gruplar arasındaki farkı istatistiksel olarak önemli değil iken Grup*Genotip etkileşimleri istatistiksel olarak önemli bulunmuştur ($P=0,0025$). Muhtemelen grup genotip etkileşiminin önemli bulunması genotipler arası 0. gün yumurta ağırlık farkından kaynaklanmaktadır (veriler sunulmamıştır).

Çizelge 3. Grup ve genotiplere göre 0. ve 18. gün yumurta ağırlıkları ve çıkış ağırlıklarına ilişkin en küçük kareler ortalamaları ($\bar{x}$), standart hataları (SH) ve önem seviyeleri (P)

Faktör	Seviye	18. gün Yumurta Ağırlıkları				Çıkış Ağırlığı			
		$\bar{x}$	SH	P	Grup*Genotip	$\bar{x}$	SH	P	Grup*Genotip
Grup	Kontrol	49,57	0,34	0,1398	<0,0001	38,89	0,34	0,4168	0,0025
	Grup 1	50,35	0,35			39,20	0,33		
	Grup 2	49,76	0,35			38,71	0,32		
	Grup 3	49,22	0,35			38,44	0,33		
Genotip	Brown Nick	48,23	0,25	<0,0001	<0,0001	37,81	0,24	<0,0001	<0,0001
	Nick Chick	51,22	0,25			39,81	0,22		

Soğuk stresi uygulamasının civciv çıkma olasılığı üzerinde olumsuz bir etkisi görülmemektedir (Çizelge 4; $P=0,9710$). Kanatlı hayvanlarda embriyonik ortam - özellikle sıcaklık - bir bireyin metabolik hızını yöneterek yavrunun hayatta kalmasını etkileyebilir. Muhtemelen embriyonik gelişimin erken döneminde uygulanan soğuk stresi embriyonik aşamada hücrelerin gelişimini korumuş olabilir. Kanatlı hayvanlarda kronik veya akut stres altında sıcaklık şoku protein genlerinin (HSP) ekspresyonu artmaktadır (Gol ve ark., 2022). Hipotermi gen ekspresyonunu yeniden şekillendirerek antioksidan sistemi indüklemektedir (Eskla ve ark., 2018). Dolayısı ile oksidatif strese karşı güçlü bir savunma mekanizması oluşmaktadır. Soğuk stresinin embriyoların yaşama gücünü etkilemediği söylenebilir.

Çizelge 4. Çıkım gücü bakımından ele alınan faktörlere ilişkin regresyon katsayıları (b), standart hata (SH), odds oranları (Ψ) ve P değerleri

Faktör	Seviye	b	SH	Ψ	P	Grup*Genotip
Grup	Kontrol	0,00	0,00	1,00	0,9710	0,7998
	Grup 1	0,27	0,64	1,31		
	Grup 2	0,23	0,64	1,25		
	Grup 3	0,56	0,61	1,75		
Genotip	Brown Nick	1,03	0,58	2,81	0,0104	
	Nick Chick	0,00	0,00	1,00		

Brown Nick genotipinde civciv çıkma olasılığı Nick Chick'lere göre 2,81 kat daha yüksek bulunmuştur ($P=0,0104$). 11 farklı beyaz yumurtacı genotip ile 11 farklı kahverengi yumurtacı genotiplerin mevsime göre çıkım güçlerinin değerlendirildiği bir çalışmada tüm aylar boyunca kahverengilerin çıkım güçlerinin beyazlara göre daha yüksek olduğu bildirilmiştir (Bouba ve ark., 2021).

Yapılan incelemeler sonucunda embriyonik ölüm oranları bakımından gruplar arasında istatistiksel olarak önemli fark bulunmamıştır (veriler sunulmamıştır). Kanatlılarda, doğal kuluçka koşullarında cinsiyet oranlarının manipülasyonu, koşullar bir cinsiyet için diğerine göre daha uygun olduğunda daha fazla erkek veya dişi üretilmektedir. Örneğin kuluçka sıcaklığı, cinsiyetler arasındaki farklı embriyonik ölüm oranı yoluyla kuşların cinsiyet oranlarını etkilediği bildirilmiştir (Eiby ve ark., 2008).

Soğuk uygulamasının cinsiyete olan etkisinin istatistiksel olarak önemsiz olduğu tespit edilmiştir (Çizelge 5; $P=0,5110$).

Çizelge 5. Cinsiyet bakımından ele alınan faktörlere ilişkin regresyon katsayıları (b), standart hata (SH), odds oranları (Ψ) ve P değerleri

Faktör	Seviye	b	SH	Ψ	P	Grup*Genotip
Grup	Kontrol	0,00	0,00	1,00	0,5110	0,5169
	Grup 1	0,07	0,44	1,07		
	Grup 2	-0,55	0,43	0,58		
	Grup 3	-0,68	0,44	0,51		
Genotip	Brown Nick	-0,21	0,47	0,81	0,8732	
	Nick Chick	0,00	0,00	1,00		

Soğuk stresi uygulamasının kuluçka süresine etkisi Çizelge 6'da verilmiştir. Söz konusu çizelgeden görüleceği üzere gruplar arasındaki fark istatistiksel olarak önemlidir ($P<0,0001$). En geç çıkımın 524,88 saat ile en uzun süre soğuk stresi uygulanan grup olan Grup 3'te gerçekleştiği görülmektedir. Beklendiği üzere soğuk uygulama süresi arttıkça kuluçkadan çıkım süresi artmıştır. Bu artış ise embriyoların 10 °C'de tutulduğu her bir saat, kuluçka süresini 1,25 saat uzatmıştır (Şekil 1.). Düşük kuluçka sıcaklıklarında kuluçka süresi uzamaktadır (Martin, 2008). Düşük inkübasyon sıcaklığı, muhtemelen embriyonun hücrel bölünmesi ve organsal gelişimini yavaşlatarak belki de durdurarak inkübasyon süresini uzatmıştır.

Çizelge 6. Kuluçka süresi bakımından ele alınan faktörlere ilişkin en küçük kareler ortalamaları ($\bar{x}$), standart hataları (SH) ve önem seviyeleri (P)

Faktör	Seviye	$\bar{x}$	SH	P	Grup*Genotip
Grup	Kontrol	502,64	1,14	<0,0001	0,1799
	Grup 1	511,01	1,13		
	Grup 2	518,01	1,10		
	Grup 3	524,88	1,11		
Genotip	Brown Nick	514,02	0,83	0,6261	
	Nick Chick	514,57	0,76		

Şekil 1. Gruplara göre kuluçka süresinin değişimi

Deneme 2: Geç Dönem Uygulanan Soğuk Stresine Ait Çalışma Bulguları

Çıkış ağırlığı bakımından gruplar arasındaki fark istatistiksel olarak önemli değildir ($P=0,4820$). İnkübasyonun geç döneminde uygulanan soğuk stresi sarı kesesi emilimini olumsuz etkilememiş gibi gözükmemektedir. Çıkım ağırlığının soğuk stresinden etkilenmemesinin nedeninin geç gelişim döneminden önce yapılmış olmasından kaynaklandığı söylenebilir. Zira embriyonik enerji tüketimi geç gelişim döneminde daha hızlı olmaktadır. Ördeklerde (*Aix Sponsa*) yapılan bir çalışmada düşük kuluçka sıcaklığında inkübe edilen embriyoların yumurtadan çıkış ağırlıklarının kontrole göre daha düşük olduğunu bildirmişlerdir (DuRant ve ark., 2012). Embriyonik gelişimin geç döneminde 20 °C gibi bir sıcaklıkta inkübe edilen embriyoların % 20-37 daha fazla enerji harcadığı bilinmektedir (Olson ve ark., 2006).

Çizelge 7. Grup ve genotiplere göre 0. ve 18. gün yumurta ağırlıkları ve çıkış ağırlıklarına ilişkin en küçük kareler ortalamaları ($\bar{x}$), standart hataları (SH) ve önem seviyeleri (P)

Faktör	Seviye	18. gün yumurta ağırlıkları				Çıkış Ağırlığı			
		$\bar{x}$	SH	P	Grup*Genotip	$\bar{x}$	SH	P	Grup*Genotip
Grup	Kontrol	49,95	0,32	0,8595	0,4848	38,66	0,29	0,4820	0,5321
	Grup 1	49,82	0,33			38,46	0,30		
	Grup 2	50,17	0,33			38,20	0,30		
	Grup 3	49,95	0,33			38,07	0,30		
Genotip	Brown Nick	47,44	0,23	<,0001		36,38	0,22	<,0001	
	Nick Chick	52,44	0,23			40,31	0,20		

Çıkım gücü bakımından ele alınan faktörlere ilişkin regresyon katsayıları ve odds oranları Çizelge 8’de sunulmuştur. Çıkım gücü bakımından gruplar arasında istatistiksel olarak önemli bir fark bulunmamıştır ($P=0,5616$). Brown Nick genotipinde civciv çıkma olasılığı Nick Chick’e göre önemli derecede düşük bulunmuştur ($P=0,0070$). Deneme 1’ de Nick Chick’lere göre 2,81 kat daha yüksek çıkım gücü gösteren Brown Nick embriyolarının geç dönemde uygulanan soğuk stresinden olumsuz etkilendikleri belirlenmiştir. Buna göre genotipin embriyonik gelişim dönemleri arasında embriyonun soğuk stresine duyarlılığı değişmektedir.

Çizelge 8. Çıkım gücü bakımından ele alınan faktörlere ilişkin regresyon katsayıları (b), standart hata (SE), odds oranları (Ψ) ve P değerleri

<i>Faktör</i>	<i>Seviye</i>	<i>b</i>	SH	<i>Ψ</i>	<i>P</i>	Grup*Genotip
Grup	Kontrol	0,00	0,00	1,00	0,5616	0,5573
	Grup 1	-1,09	0,71	0,34		
	Grup 2	-0,60	0,76	0,55		
	Grup 3	-0,78	0,74	0,46		
Genotip	Brown Nick	-1,34	0,70	0,26	0,0070	
	Nick Chick	0,00	0,00	1,00		

Cinsiyete ilişkin regresyon katsayıları ve odds oranları Çizelge 9’da verilmiştir. Gruplar bazında erkek civciv çıkma olasılığı istatistiksel olarak önemsizdir ($P=0,5345$).

Çizelge 9. Cinsiyet bakımından ele alınan faktörlere ilişkin regresyon katsayıları (b), standart hata (SH), odds oranları (Ψ) ve P değerleri

Faktör	Seviye	b	SH	Ψ	P	Grup*Genotip
Grup	Kontrol	0,00	0,00	1,00	0,5345	0,5935
	Grup 1	0,17	0,43	1,19		
	Grup 2	-0,45	0,42	0,64		
	Grup 3	-0,54	0,43	0,58		
Genotip	Brown Nick	0,17	0,45	1,18	0,3492	
	Nick Chick	0,00	0,00	0,00		

Çizelge 10’da kuluçka süresi bakımından ele alınan faktörlere ilişkin en küçük kareler ortalamaları ve önem seviyeleri verilmiştir. Soğuk stresi uygulama süresi ile kuluçkadan çıkış süresi arasında doğrusal bir ilişki olduğu görülmektedir. Brown Nick genotipi daha erken çıkış sağlamıştır. Genotipler arasında kuluçka süresi bakımından görülen farklılığın ($P=0,0008$) embriyoların fizyolojik farklılıklarından kaynaklandığı düşünülmektedir. Embriyoların 10 °C’de tutulduğu her bir saat, kuluçka süresini 1,02 saat uzatmıştır (Şekil 2.).

Çizelge 10. Kuluçka süresi bakımından ele alınan faktörlere ilişkin en küçük kareler ortalamaları ($\bar{x}$), standart hataları (SH) ve önem seviyeleri (P)

Faktör	Seviye	$\bar{x}$	SH	P	Grup*Genotip
Grup	Kontrol	489,78	0,85	<,0001	0,0173
	Grup 1	497,23	0,86

Genotip	Brown Nick	497,88	0,63	0,0008	
	Nick Chick	500,79	0,58		

Şekil 2. Gruplara göre kuluçka süresinin değişimi

Çıkım gücü kuluçkahaneler için önemli bir ekonomik göstergedir. Çıkım gücündeki %1'lik bir artışın bile yüksek kapasiteli kuluçkahanelere ekonomik getirisinin yüksek olacağı öngörülmektedir. Aynı zamanda günlük civciv kalitesinin de büyüme ve performans üzerindeki etkileri nedeniyle kuluçkacılık açısından büyük bir önemi bulunmaktadır. Kuluçka koşullarının, kuluçkahanelerin performans göstergesi olan bu özellikler üzerine etkili olduğu bilinmektedir.

Teşekkür

Bu çalışma Çanakkale Onsekiz Mart Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından FDK-2022-3891 numaralı projeden desteklenmiştir.

Abstract

In this study, the contact activity of the essential oil obtained from the *Mentha piperita* L. (Lamiaceae) against two important stored product pests *Tribolium castaneum* (Herbst, 1797) (Coleoptera: Tenebrionidae) ve *Sitophilus granarius* (Linnaeus, 1758) (Coleoptera: Dryophthoridae) was tested under laboratory conditions. For this purpose, 5% (v/v), 10% (v/v) and 15% (v/v) doses of plant essential oil were applied to stored product pests with the help of a microapplicator at a dose of 1 µl to each pest. In the control group, pure acetone was applied. Dead insects were recorded at 24, 48, 72 and 96 hours after applications. As a result of the study, the essential oil showed contact activity at varying rates depending on the insects and doses. For *T. castaneum*, the highest activity at the end of 24 hours was determined at the 15% (v/v) application dose with a mortality rate of 23.6%, while this rate was determined as 33.4% at the end of 96 hours. For *S. granarius*, the contact activity of this oil was higher and a mortality rate of 93.4% was determined at the 15% (v/v) application dose after 24 hours. For *S. granarius*, the mortality rate was 98.2% after 96 hours. The results of the study reveal that *M. piperita* essential oil has the potential to be used in the control of *S. granarius*.

Key Words: Essential oil, Insecticidal activity, Stored product pest, Contact activity

***Mentha piperita* L. (Lamiaceae) uçucu yağının iki önemli depolanmış ürün zararlısı [*Tribolium castaneum* (Herbst, 1797) (Coleoptera: Tenebrionidae) ve *Sitophilus granarius* (Linnaeus, 1758) (Coleoptera: Dryophthoridae)] üzerine kontakt etkileri**

Özet

Bu çalışmada *Mentha piperita* L. (Lamiaceae) bitkisinde elde edilen uçucu yağın iki önemli depo zararlısı *Tribolium castaneum* (Herbst, 1797) (Coleoptera: Tenebrionidae) ve *Sitophilus granarius* (Linnaeus, 1758) (Coleoptera: Dryophthoridae)'a karşı kontakt aktivitesi laboratuvar koşullarında test edilmiştir. Bu amaçla bitki uçucu yağı %5 (v/v), %10 (v/v) ve %15 (v/v)'lik dozlarda depolanmış ürün zararlılarına her zararlıya 1 µl dozunda mikroadplikatör yardımı ile uygulanmıştır. Kontrol grubunda ise saf aseton uygulaması yapılmıştır. Uygulamadan 24, 48, 72 ve 96 saat sonra ölü bireyler kaydedilmiştir. Çalışma sonucunda uçucu yağ uygulama yapılan zararlı ve doza bağlı olarak değişen oranlarda kontakt aktivite göstermiştir. *T. castaneum* için 24 saat sonunda en yüksek aktivite %23.6 ölüm oranı ile %15 (v/v) uygulama dozunda belirlenirken bu oran 96 saat sonunda en yüksek %33.4 olarak belirlenmiştir. *S. granarius* için ise bu yağın kontakt aktivitesi daha yüksek olmuş ve 24 saat sonunda %15 (v/v)'lik uygulama dozunda %93.4 ölüm oranı belirlenmiştir. 96 saat sonunda ise ölüm oranının %98.2 olduğu saptanmıştır. Çalışma sonuçları *M. piperita* uçucu yağının *S. granarius* mücadelesinde kullanılma potansiyelinin olduğunu ortaya koymaktadır.

Anahtar Kelimeler: Uçucu yağ, Insektisidal aktivite, Depolanmış ürün zararlısı, Kontakt aktivite

Abstract

To avoid browning of the finished product, potatoes destined for industrial processing must have a low reducing sugar concentration. Genotype and a range of pre- and post-harvest factors, all affect potato sugar content. The primary pre-harvest variables that affect sugar concentration are crop maturity, temperature throughout development, mineral nutrition, and irrigation, whereas the key post-harvest variables are mechanical stressors and storage conditions. Each genotype needs the proper pre- and post-harvest care to maintain low sugar levels; stress of any form leads to sugar accumulation. The goal of this study was to look at the processing quality of five different potato cultivars growing in Rwanda, as well as their potential use in food products. On season 2021B and 2022A, potatoes were cultivated in the Busogo model farm. The reducing sugars in potatoes tubers were investigated. Although there are many different Irish potato varieties, their nutritional value and viability for domestic and industrial usage have not been thoroughly investigated. This research was done at Busogo Farm in the Musanze District of Rwanda to determine how organic and synthetic fertilizers affected the composition of newly harvested Irish potato cultivars' reducing sugar, specific gravity, dry matter, and starch (Kinigi, Gikungu, Gisubizo, Kirundo and Twihaze). In seasons 2021 B and 2022 A, the experiment was set up using a randomized complete block design. In seasons B and A, tubers were harvested 120 and 90 days after sowing, respectively. The results of the analysis of variance showed that the effects of season and treatment on the amount of reducing sugar (glucose) in fresh Irish potatoes are highly significant. The findings demonstrated that in season B (2021), Twihaze and Kirundo varieties recorded high glucose (0.09%), while Gisubizo variety in control, recorded low glucose (0.01%). Additionally, the data for season 2022 A showed that Twihaze variety had high glucose content of 0.80% while Kinigi variety had low glucose content of 0.10%. Additionally, the analysis of variance showed that Irish potato varieties with low to moderate and moderate to high glucose contents, respectively, experienced extremely significant ($p < 0.001$) effects of farmyard manure and NPK on glucose content for the seasons 2021 B and 2022 A. The application of inorganic and organic fertilizers had a significant impact ($p < 0.05$) on dry matter in seasons B and A, according to the analysis of variance. Additionally, the results demonstrated extremely significant ($p < 0.01$) differences in specific gravity and starch in both seasons, with Kinigi variety having higher values of dry matter, specific gravity, and starch content in season B and A, respectively, of 24.58, 1.10, and 18.59%. Season 2022 A's high decreasing sugar levels were caused by meteorological conditions brought on by the soil's high moisture content as well as the maturity of the tubers. Due to its low level of reducing sugar, Gikungu, Kirundo, and Kinigi are excellent for chips whereas Twihaze variety is advised for boiling cooking methods.

Key Words: Reducing sugars, Potato cultivars, Mineral fertilizers, genotype, industrial processing

Introduction

A type of sugar known as reducing sugar acts as a reducing agent and is capable of giving electrons to another molecule by oxidizing it. In other words, any sugar that has an aldehyde group (-CHO) or ketone group (-CO-) and may act as a reducing agent in basic solution is known as a reducing sugar (Kunz et al., 2011) and is referred to as a carbohydrate or natural sugar. If the oxygen on the anomeric carbon is unconnected to anything else, a sugar can operate as a reducing agent and is referred to as a reducing sugar. Sugars are part of the family of substances known as carbohydrates. Examples include glucose, fructose, and sucrose. A few sugars with an aldehyde functional group have the ability to act as reducing agents. The composition of reducing sugars can be established using this property as a starting point. For instance, Fehling's solution has copper (II) ions that specific sugars can change to copper (I) ions. Reducing sugars can be processed in a quantitative manner. When the oxygen on its anomeric carbon is unconnected to anything else, a sugar can function as a reducing agent; this sugar is referred to as a reducing sugar (Subrizi, et al., 2019). Irish quality, one of the most crucial features of the potato, is influenced by the amount of reducing sugar and is based on both the exterior and interior tuber's properties (Abebe et al., 2013). The crucial elements and things to take into consideration were amount of sugars, dry matter content, variety, stage of ripeness, storage, and reconditioning procedures

The amount of sugar in potato tubers affects the final product's color after frying, making it crucial. The most significant group of sugars is the reducing sugars, which include fructose, glucose, and sucrose and are responsible for browning. Irish potatoes have a high yield potential, good nutrition, a short growing season, and a wide range of adaptation, making them a crop with a great promise for ensuring food security in sub-Saharan countries (Tewodros et al., 2014).

Materials and Methods

Potatoes were planted in Busogo sector on the model farm campus of the University of Rwanda in Musanze District, Rwanda's Northern Province. It is located at 1°33'26" south latitude and It may be found at 29°32'39" east latitude and 1°33'26" south latitude. The area is well-known for its Andosol because of the volcanic soil. A Randomized Complete Block Design (RCBD) was employed to set up the experiment, with three replications and twenty treatments reflecting the cultivars that were used as factors. Five cultivars from the Musanze RAB Station were used in the study: Kinigi, Kirundo, Gisubizo, Gikungu, and Twihaze. Blocks were divided by 1 m, and guard rows of 0.5 m, with a spacing of 80 cm between rows and 30 cm within rows, separated adjacent plots. They were raised during the 2021–2022 growing season under traditional cultural conditions. Farmyard manure is applied at a rate of 10T/ha, and mineral fertilizer NPK 17.17.17 is applied at a rate of 300kg/ha, either in combination, alone, or not at all, over a period of two seasons.

Sampling

a) Reducing sugars

Healthy potatoes of processing size were chosen for the biochemical investigation. Each plot's center rows were randomly selected for twenty fresh potato tubers, and three blocks were used for each cultivar (three replications). They underwent laboratory food analysis using Martin Lishman's flow procedure after being rinsed in portable water, shredded into small pieces, and subjected to flow:. The sample of 20 potato tubers from the test plot to serve as a representative sample was taken. These were washed and dried Separately. Each tuber was cut in lengthwise into eight parts. Cut each wedge into 1-cm pieces. All pieces were inserting in the press's basin. Over the bowl, place the press. by tightening the screws potato bits were compressed, the top reservoir is completely filled with juice. With the micro-pipette, removal of 1ml of juice from the reservoir were made and avoiding any impurities. Caution for each fresh sample, fresh tip were used. Juice sample were added to one of the tubes containing the dilution solution (distilled water). Homogenization of the fluid is made by turning the tube upside down. A tiny bit of the solution were filled to the yellow cap. Insert a single paper strip into the monitor. **Caution:** Avoid putting your fingers near the reactive (yellow) tip of the strip. Verification code on the strip. Dip the front edge of the yellow tip into the solution in the cap in case the symbol of flashing displayed in screen. The reading is already in progress. The glucose readings in mg/dl were appearing in 5 seconds. Take a note of the quantity (G). For each sample, the exercise were repeated Repeat 3 times (G1, G2, G3). Result of average measurement (mg/dl) = (G1, G2, G3)/3 . This 3 means count of stripes. Utilize the correction table to look up the juice's glucose content in g/l. Percentage Juice glucose content was calculated following the formula: g/l glucose/10. Percentage fresh weight glucose content was calculated following the formula: Juice glucose (%) x (100-DM*)/100*DM: Dry matter content (%) of the tubers

b) Specific gravity

Around 5 kg of potatoes were cleaned, dried, and weighed in the air and in tap water.

c) Dry matter

Nine processing-sized potatoes were cut and thoroughly combined with dry materials. Following that, 10 g of material were weighed in a crucible with three replications and cooked in a forced-air oven at 80 °C for 72 hours,

or until a constant weight was achieved dry matter was calculated following this formula: $\frac{\text{Dry weight}}{\text{Fresh weight}} \times 100$

Samples weighing around 3 g were placed in a 250 ml volumetric flask. Following the addition of 20 ml of concentrated HCl and 3 glass beads, 200 ml of purified water was added. Until a clear solution was achieved, the solution was refluxed. After adding 50% NaOH and 3 drops of phenolphthalein as an indicator, the solution was

neutralized. Whatman no 541 filter paper with 20–25 mm pore size was then used to filter the mixture into a 250 volumetric flask, where it was diluted to the proper strength with distilled water.

S_{tarch}, g per 100g, equals % total sugar times 0.9...

Statistical analysis

The 15th version of Genstat statistical software were used to perform an ANOVA on the acquired data, and the Least Significant Difference test between treatments were used to examine means separation. Additionally, linear relationships between the variables were computed using Pearson correlation analysis.

Results and Discussion

The investigation of variation in the reducing sugar content of various Irish potato varieties revealed impacts of variation where season and treatment affect fresh Irish potato's highly substantial glucose content.

Effects of farmyard manure on reducing sugar of Irish potato varieties

The results showed that Twihaze and Kirundo varieties treated with 10 tons of farmyard manure recorded high glucose (0.09%) in season B (2021), while Gisubizo variety under control recorded low glucose (0.01%). However, the prior farming methods are to blame for the high glucose levels for the Kirundo and Twihaze cultivars grown in control plots. Twihaze treated with farmyard manure had a high glucose value of 0.65% in season A 2022, while Kinigi planted as a control had a low glucose value of 0.10%. Gikungu, Gisubizo, and Kinigi's recorded glucose values are all categorized as low by ARVALIS-Institut du végétal's (2004) standards of interpretation since they are all less than 0.4%, whereas Kirundo and Twihaze's values are categorized as moderate because they range from 0.45 to 0.6%. Additionally, the analysis of variance showed that farmyard manure had a highly significant ($p < 0.001$) impact on Irish potato cultivars with low to moderate glucose content (Table 2).

Table 2: Effect of farmyard manure on glucose content of Irish potato varieties in Musanze,

Effect of chemical fertilizers on reducing sugar content of Irish potato varieties

Results showed that Twihaze variety (0.11%) treated with 300 kg of NPK had the highest glucose content in season B 2021, while Gisubizo variety had the lowest glucose content (0.01%). (Table3). Additionally, Twihaze types that got 300 kg of NPK had a high glucose content of 0.78% in season A, but Kinigi varieties had a low glucose content of 0.10%. The recorded glucose values for Gikungu, Gisubizo, and Kinigi are all categorized as low by ARVALIS-Institut du végétal (2004) because they are all less than 0.45%, while Kirundo's glucose content is categorized as moderate and Twihaze's glucose value is categorized as high because it is greater than 0.7%. Additionally, the analysis of variance showed that chemical fertilizers (NPK) had a highly significant ($p < 0.001$) impact on the glucose content of various Irish potato cultivars (Table 3)

Effect of mixture of FYM manure and chemical fertilizers on reducing sugar content of irish potato's varieties

The combination of farmyard manure and NPK 17 17 17 has an impact on the glucose content of Irish potato types in the Musanze District, as shown in Table 5. Results showed that in season B 2021, Twihaze variety had a high glucose content of 0.15 percent and Gisubizo variety had a low glucose content of 0.01%. Additionally, season A 2022 results showed that Twihaze variety had high glucose content of 0.80% while Kinigi variety had low glucose content of 0.10%. All recorded glucose values for Gikungu, Gisubizo, and Kinigi are categorized as low because they are all less than 0.45%, in accordance with ARVALIS-Institut du végétal's (2004) standards of interpretation. Similar to how the glucose concentration found in Kirundo is categorized as moderate since it is between 0.45 and 0.6%, whereas Twihaze is categorized as high because it is greater than 0.7%. Additionally, the analysis of variance showed that farmyard manure and chemical fertilizers (NPK) had a highly significant (p 0.001) impact on the glucose content of several Irish potato cultivars (Table 4)

Table 4: Effect of mixture of FYM manure and chemical fertilizers on reducing sugar content of irish potato's varieties

Discussion

The greater glucose in season 2022 A than in season 2021 B is an indication of the effects of seasons on lowering sugar (glucose), which is explained by weather conditions by the higher soil moisture content in season A than B. During the growth of Irish potatoes, moisture content permits both translocation and the flow of plant nutrients. The findings are consistent with those of Kumar et al. (2004) who found that potato tubers grown during a drought are less water stressed and had lower decreasing sugar levels. Additionally, water challenged tubers showed a substantial correlation between invertase activity and hexose formation, according to Kumar et al. (2004). Low precipitation during the growth stage led to low reducing sugar content. The findings are consistent with Belachew

(2016), who found a significant correlation between the tuber's access to water before harvest and the levels of sucrose found after harvest. Twihaze's high glucose content can be attributed to genetic characteristics, and these characteristics have a significant impact on a mature tuber's early decreasing sugar levels. A heritable characteristic is the propensity to have a high or low concentration of total sugar or a specific sugar.

Effects of FYM manure on irish potato glucose content

Because FYM releases plant nutrients (nitrogen, phosphorus, potassium, calcium, etc.) that promote plant growth, it has the effect of lowering sugar (glucose concentration). The availability of plant nutrients that alter Irish potato biomass accounts for the high significance (p 0.001) effect of farmyard manure on glucose content across Irish potato cultivars. For the Kirundo variety, the application of FYM boosted the glucose level from low to moderate, and for Twihaze, the glucose content was high. Zewide et al. (2018), claimed that increasing N application increased or decreased reducing sugars in the apical and stem ends, respectively, are in conflict with the findings of this study. Furthermore, Najm (2012) discovered that potatoes' decreasing sugar content has been observed to decrease in response to greater nitrogen treatment.

Effect of chemical fertilizers on glucose content of Irish potato varieties

Chemical fertilizers, in particular NPK, help reducing sugar by making mineral nitrogen, potassium, and phosphorus readily available. A significant amount of nitrogen also retards crop maturation, resulting in a tuber with a relatively high nitrate content and low dry matter concentration. In order to estimate the amounts of nitrogen, phosphate, and potassium fertilizer to be applied to the potato crop, mineral testing of the soil was done to determine the actual soil fertility prior to planting. However, the prior farming methods are to blame for the high glucose levels for the Kirundo and Twihaze cultivars grown in control plots.

Similar findings were made by Ababulgu (2018), who noted a notable impact of the application of blended NPS fertilizer and animal dung.

Effect of mixture of FYM manure and chemical fertilizers on reducing sugar content of irish potato's varieties

By supplying additional amino acids and so increasing the starch and sugar levels in the tubers, the application of both chemical and organic substances has a detrimental influence on the quality of the tubers. In addition to the use of mineral fertilizers on potatoes, the value of bovine manure is now understood due to the periodic gradual release of plant nutrients and their long-term impacts on the chemical characteristics of soil. The results support

Sun et al(2018)'s findings that fertilizations increase reducing sugar content, which has an impact on the quality and nutritional value of derived products (chips) by causing Acrylamide to develop. The increased levels of free amino acids brought on by higher nitrogen fertilization have been connected to this departure from the predicted level of reducing sugar (glucose), although not all free amino acids are affected to the same extent. Studies on the effect of nitrogen on sugar accumulation during storage demonstrated that high nitrogen fertilizer rates decreased the amount of glucose and fructose in the crop at harvest, but that sugar accumulation increased and sucrose accumulation decreased throughout storage when compared to no or low fertilization (Kolbe et al., 1995). According to Mohammed et al. (2018), varying rates of inorganic fertilizer (N and P) combined with different amounts of farmyard manure (FYM) resulted in noticeably distinct reductions in sugar and tuber dry matter yield.

Effect of farmyard manure and NPK on Specific gravity, Dry matter and Starch of Irish potato

Results showed that dry matter, specific gravity, and starch content are affected by maturity and season, with the highest values reported in season 2022 B, where harvesting was carried out 90 days after planting. Environmental factors like weather and genetic producer of types are responsible for the differences.

The use of inorganic and organic fertilizers had a significant impact ($p < 0.05$) on dry matter in seasons A and B, according to the analysis of variance. Additionally, data indicated that specific gravity and starch in both seasons were extremely significant ($p < 0.01$), and that the Kinigi variety had higher values of dry matter, specific gravity, and starch in both seasons (A and B) of 24.58%, 1.10, and 18.59%, respectively. Overall findings showed that Twihaze cultivar had low dry matter, specific gravity, and starch contents of 17.63%, 1.06, and 12.12%, respectively. Because it impacts chip crispiness and oil uptake during processing, Kinigi's high specific gravity justifies its suitability for chips as well as the fact that tubers with a high specific gravity are chosen for dehydrated and fried items. This changes product production (Mohammed, 2016). A product's flavor is enhanced by having a high specific gravity while using less energy in production. Potatoes with a low specific gravity, however, have been shown to be better for canning since they are less likely to disintegrate throughout the process (Ndungutse et al., 2019).

These findings are in line with those from Mohammed (2016) and Abebe et al. (2013), which found that 25 varieties were produced, with results ranging from 1.050 to 1.119 for 17 types and two cropping seasons. According to Soboka et al. (2017), six types of potatoes cultivated in two distinct locales have specific gravities ranging from 1.086 to 1.107.

The outcomes, however, outperformed those of Ekin (2011), who recorded specific gravities ranging from 1.065 to 1.077 on eight kinds.

According to one study, both genetic and environmental variables can affect specific gravity (Abebe et al., 2013). According to Fitzpatrick et al. (1964), potatoes fall into one of three categories: high if the specific gravity is above 1.086, intermediate if it is between 1.077 and 1.086, and low if it is less than 1.07

Acknowledgements

I would like to express my gratitude to the international Anatolian Agriculture , Food , Environment and Biology congress(TARGID 2022) and the Turkish Science and Technology Publishing (TURSTEP) in general for not only allowing me to present my research but also for their annual organization of congress, free of charges paper publication and for adding my name among the worldwide researchers.

Using of *Landoltia punctata* to remove chromium from leather wastewater

Orcan Demircan, Abdülrezzak Memon

Department of Molecular Biology and Genetics, Faculty of Arts and Sciences, Uşak University, 64000 Uşak, Türkiye

Abstract

Several industrial wastes such as power generation plants, leather tanning, timber treatment, pulp production, and municipal sludge release heavy metals including chromium (Cr). Chromium is also used for metal decoration, in the textile industry for dyeing, silk treating, and printing, in the leather industry for tanning, inks, and paints, and in the manufacture of green varnishes such as catalysts for halogenations, alkylation, and catalytic cracking of hydrocarbons, in the ceramic industry and finally as fuel and a propellant additive. The leading regions of the leather industry in Turkey are mainly the Marmara and Aegean Regions. Due to the increase in leather tanning activities in the Aegean region, chromium and its derivatives are being used in enormous amounts in this industry. Chromium and its derivatives are used in the leather tanning process. This process has increased the Cr-treated waste and is accumulating in enormous amounts, especially in Cr-contaminated waters and sludge. These industrial activities have disturbed the aquatic ecosystems leading to significant assimilation of heavy metals and the rise of chromium and its derivatives to dangerous levels, which has become a critical concern in the world. In this study, the use of Lemnaceae's *Landoltia punctata* in the removal of trivalent and hexavalent forms of chromium in leather wastewater will be investigated.

Key Words: *Landoltia punctata*, Lemnaceae, Leather wastewater, Heavy metals, Leather tanning

Deri atık suyundaki kromun gideriminde *Landoltia punctata*'nın kullanılması

Özet

Enerji üretim tesisleri, deri tabaklama, kereste işleme, kâğıt hamuru üretimi ve belediye çamuru gibi çeşitli endüstriyel atıklar, krom (Cr) dahil olmak üzere ağır metalleri serbest bırakır. Krom ayrıca metal dekorasyon için, tekstil endüstrisinde boyama, ipek işleme ve baskı için, deri endüstrisinde tabaklama, mürekkepler ve boyalar için ve halojenasyonlar, alkilasyon ve hidrokarbonların katalitik çatlaması için katalizörler gibi yeşil verniklerin üretiminde, seramik endüstrisinde ve son olarak yakıt ve itici katkı maddesi olarak kullanılır. Türkiye'de deri sektörünün önde gelen başlıca bölgeleri Marmara ve Ege Bölgeleridir. Ege Bölgesi'nde deri tabaklama faaliyetlerinin artması nedeniyle krom ve türevleri bu sektörde büyük miktarlarda kullanılmaktadır. Krom ve türevleri deri tabaklama işleminde kullanılır. Bu işlem, Cr ile işlenmiş atıkları arttırmıştır ve özellikle Cr ile kirlenmiş sularda ve çamurda büyük miktarlarda birirmektedir. Bu endüstriyel faaliyetler, ağır metallerin önemli ölçüde asimilasyonuna ve krom ve türevlerinin tehlikeli seviyelere yükselmesine yol açan sucul ekosistemleri rahatsız etmiştir ve bu da dünyada ciddi bir endişe kaynağı haline gelmiştir. Bu çalışmada, deri atık sularında +3 ve +6 krom formlarının giderilmesinde Lemnaceae'deki *Landoltia punctata*'nın kullanımı araştırılacaktır.

Anahtar Kelimeler: *Landoltia punctata*, Lemnaceae, Deri atık suyu, Ağır metaller, Deri tabaklama

Giriş

Çevre kirliliği ilk defa kentsel yaşamın başlaması sonucu ortaya çıkmış ve endüstriyel ve beşerî gelişme ile orantılı olarak bir artış meydana gelmiştir. Özellikle yirminci yüzyılın ikinci yarısında, nüfus artısındaki hızlanmaya bağlı olarak artan çevre kirliliği (su, toprak ve hava), yaşam kaynaklarının daha fazla kirlenmesine neden olmuş ve sonuçta biyosferin bozulmasıyla giderek çok daha tehlikeli bir hal almıştır. Biyosferin bir bölümünü oluşturan su ortamı, kullanılmış sular ve diğer atıklar için alıcı ve uzaklaştırıcı bölge olarak kullanıldığında, ekosistem içinde hava ve toprağa oranla en yoğun kirlenmeye uğrayan biyosfer türü haline gelmiştir (Ojuederie ve Babalola, 2017). Deri sanayisi Türkiye'de suyun en yaygın şekilde kullanıldığı sanayi kollarından birisini teşkil etmektedir. Türkiye'nin en çok deri ihracatı yaptığı ilk üç ülke sırasıyla Hindistan, İtalya ve Çin'dir (Şekil 1). Türkiye'de büyükbaş hayvan derisinin işlendiği bölgeler, İstanbul-Tuzla, İzmir-Menemen, Niğde-Bor, Bolu-Gerede ve Çorlu iken; küçük baş hayvan derisinin işlendiği bölgeler ise Isparta-Yalvaç, Uşak ve İzmir-Menemen yöresidir (Öztürk, 2014). Özellikle deri tabaklama işlemi sırasında 1 kg ham derinin işlenmesi sonucunda ortalama 30 ila 50 litre arasında atık su meydana gelmektedir. Bu miktar deri sanayinde üretilen toplam atık suyun yaklaşık %8 ila 10'una tekabül etmektedir. Tabaklama ünitesinden çıkan atık suyun pH, yaklaşık olarak 3 ila 4,5 aralığında ve krom konsantrasyonu 3000–6000 mg·L⁻¹ arasında değişmektedir (Öztürk, 2014). Deri endüstrisi, diğer endüstriler ile karşılaştırıldığında en fazla kirlilik oluşturan ve işleme sırasında oldukça yüksek miktarlarda atık su oluşturan endüstrilerden biri olma özelliğine sahiptir. Bu kirlilikten dolayı, Türkiye gibi gelişmekte olan ülkelerde sanayi, sulama, içme suyu temini gibi faaliyetlerde kullanım alanına sahip yüzeysel su kaynakları (baraj, göl, gölet vb.) hızlı sanayileşme, tarımsal faaliyetler, nüfus artışı gibi antropojenik etmenlerin deşarj alanı olarak kullanılan sucul ekosistemleri olumsuz etkilerler (Canpolat ve Çalta, 2020).

Şekil 1. Türkiye'nin 2021 yılında ham ve işlenmiş deri ihracatı yaptığı ilk on ülke (Ticaret Bakanlığı, 2022)

Bu gibi antropojenik etmenlerden dolayı sucul ekosistemlerde kirliliğe yol açan başlıca etkenler, yoğunluğu $4g \cdot cm^{-3}$ 'ten büyük olan, uzun süreli çevresel kirliliğin bulunduğu ortamlardan fiziki olarak uzaklaştırılması zor olan ve arsenik (As), bakır (Cu), kadmiyum (Cd), kurşun (Pb), krom (Cr) gibi ağır metaller olarak bilinen metal ve metaloidlerdir. Bunlar, bitkilerde fotosentetik aktivitelerin azalması, bitki mineral beslenmesi ve esansiyel enzimlerin aktivitesinin azalması gibi olumsuz etkilere sebep olur (Ojuederie ve Babalola, 2017).

Ağır metallerin/metaloidlerin kirlenmiş ortamdan uzaklaştırılmasında, fizikokimyasal metotların yanında günümüzde yeni ve modern bir yaklaşım olarak bitki ve mikroorganizmalar gibi biyolojik metotlar ön plana çıkmaktadır. Fitoremediasyon yöntemi daha uygun ve çevre dostu bir biyolojik yaklaşımdır. Filogenetik adları Lemnaceae olan su mercimekleri, monokot, Lemnoidea (*Lemna*, *Spirodela* ve *Landoltia*) ve Wolffioideae (*Wolffia* ve *Wolffiella*) olmak üzere iki altfamilyanın altında beş cins ve otuz sekiz türe ayrılan, 1 ila 15 mm arasında boyuta sahip, kendine özgü bileşik yaprak yapıları, hızlı bir şekilde büyüyeabilmeleri, oldukça yaygın bulunabilen ve kolayca hasat edilebilen ve aynı zamanda kendi bünyelerinde yüksek oranda kirlenici biriktirebilen ve kısacık yaşam sürelerinde en az iki yavru yaprak ile nesillerini devam ettirebilme gibi karakteristik ve morfolojik özelliklere sahip yüzer sucul bitkilerdir (Şekil 2; Bog, Appenroth ve Sree, 2019, Liv vd., 2020). Su mercimekleri aynı zamanda birçok ağır metale karşı dirençli olduğundan ötürü fitoremediasyon için uygun türlerdir (Baek, Saeed ve Choi, 2021). Bu gibi avantajlarından ötürü *Landoltia punctata* bitkisi tercih edilmiştir.

Şekil 2. Su mercimeklerinin altfamilyaları ve türleri (Bog, Appenroth ve Sree (2019)'den modifiye edilmiştir).
Materyal ve Yöntem

Numunenin Temini ve Kültür Koşulları

Landoltia punctata su mercimeği türü, İstanbul Üniversitesi Fen Fakültesi Biyoloji Bölümü Öğretim Üyesi Doç. Dr. Taylan KÖSESAKAL'dan, denemede kullanılacak deri endüstrisi atık suyu, Uşak ve İzmir-Menemen yöresindeki bir atıksu fabrikasından (K38.62, D29.48) temin edilmiştir.

Bitkinin Yetiştirilme Koşulları

Su bitki türleri, 16 saat gündüz ve 8 saat gece periyodu, 22 ila 25°C aralığındaki hava sıcaklığı, %70 ila 85 aralığındaki bağıl nem oranı ve 10.000 lüks ışık yoğunluğu olacak şekilde ayarlanan uygun koşullar altında doğal ışıklandırma ve düzenli 1x Hoagland solüsyonu takviyesiyle yetiştirilmiştir.

Krom Uygulamaları

Su bitkinin birer gram tartılarak sırasıyla, 0, 50, 100, 500, 1000 mM konsantrasyonlarında Cr^{3+} ve Cr^{6+} içeren Hoagland çözeltisinde 24–28°C ortam sıcaklığında çalışılmıştır. Deney kabı içerisindeki krom konsantrasyonu sabit olana dek deneye devam edilecek, toplanılan su örnekleri nitrik asit ile pH'ı 2'nin altına getirilerek analizleri için buzdolabında bekletilmiştir.

Krom Miktarının Tayini

Farklı krom konsantrasyonları uygulanan *Landoltia punctata* bitkisinin krom tayini için örneklerin hasat edilmesinin ardından asit ile yaş yakma yöntemi, AAS (Atomik Absorbsiyon Spektroskopisi) analiz okuması için 82°C'de kurutulan bitki numunelerine Memon'un (1980) yöntemi uygulanmaktadır.

Bulgular ve Tartışma

Landoltia punctata bitkisinin de içinde bulunduğu su mercimekleri çöl ve kutup bölgeleri haricinde değişik ortamlarda ve bölgelerde yetiştirilme kapasitesine sahiptir. Bu özelliklerinden ötürü, diğer bitki türlerine nazaran değişen parametrelerde (CO_2 , ışık, sıcaklık, besiyeri, pH vb.) ağır metal kirleticilerinin fitoremediasyonunda kullanılmasına dair önemli bir avantaja sahiptir. Su mercimekleri aynı zamanda 5 ila 35°C gibi sıcaklık spektrumunda gelişme gösterebilmekte, uygun olmayan koşullarda dormansi halinde kalabilmektedir (Baek, Saeed ve Choi, 2021). Ekonomik ve endüstriyel olarak değerlendirilmeleri açısından araştırma konularında çalışma materyali olarak kullanılmaları önem arz etmektedir (Tablo).

Tablo. Su mercimeği türlerinin ağır metal/metalloid giderimleri (Sharma ve Lenaghan (2022)'dan modifiye edilmiştir.)

Su mercimeği türleri	Metal/metalloid	Akümüasyon seviyesi/verimi	Kaynaklar

Abstract

Reactive oxygen species (ROS) are a major factor in heavy metal (HM) stresses; excess ROS is harmful to plants. Glutathione reductase (GR) acts a significant role in plant redox homeostasis. Chromium (Cr), which has no biological function for the plant, is a toxic pollutant that causes the deterioration of homeostatic balance by producing oxidative stress. In this study, different levels of chromium (Cr) metal will be applied for two weeks to trigger oxidative stress in *B. juncea* L. var. S-9 plant during the germination process. Accordingly, the physiological and antioxidant system response of *B. juncea* L. var. S-9 will be observed and the role of the glutathione reductase (GR) gene in the plant under Cr stress and its expression profile will be investigated.

Key Words: ROS, Glutathione reductase, Cr, *Brassica juncea* L. var. S-9, Gene expression

***B. juncea* L. var. S-9’da Cr-stresinin glutatyon redüktaz (GR) gen anlatımı üzerine etkisi**

Özet

Reaktif oksijen türleri (ROS), abiyotik streslerde önemli bir faktördür; aşırı ROS bitkiler için zararlıdır. Glutatyon redüktaz (GR), bitkide redoks homeostazisinde önemli bir rol oynar. Bitki için biyolojik bir fonksiyonu olmayan krom (Cr) oksidatif strese yol açarak homeostatik dengenin bozulmasına neden olan toksik bir kirleticidir. Bu çalışmada, çimlenme sürecinde *B. juncea* L. var. S-9 bitkisinde oksidatif stresi tetiklemek için farklı seviyelerde Cr metali iki hafta boyunca uygulanacaktır. Bu doğrultuda, *B. juncea* L. var. S-9’un fizyolojik ve antioksidan sistem yanıtı gözlenecek ve Cr stresi altında bitkide GR’in rolü ve ekspresyon profili araştırılacaktır.

Anahtar Kelimeler: ROS, Glutatyon redüktaz, Cr, *Brassica juncea* L. var. S-9, Gen anlatımı

Giriş

Modern dünyanın hızlı sanayileşmesi ve sınırsız antropojenik faaliyetler nedeniyle, çevreye salınan toksik metaller/metalloidler yol açtığı stresler bitki büyümesi ve gelişimi için büyük bir sorun haline gelmektedir (Banerjee vd., 2016; Memon, 2016; Ghorı vd., 2019). Ağır metal stresi bitki büyümesi ve gelişimi için ciddi bir tehdittir; sonuç olarak, bitkilere alınarak besin zincirine dahil olduktan sonra hayvan/insan sağlığını yanı sıra ürün verimini etkilemektedir (Khan vd., 2015). Bu toksik kirleticiler, bitki metabolizmasına ve gelişimine müdahale ederek fitotoksisiteye neden olmaktadır. Bu anormal ortamlarda yetişen bitkide, nekroz, kloroz ve düşük verim gibi stresle ilişkili ciddi semptomlara yol açmaktadır (Banerjee ve Roychoudhury, 2018a). Bitki, uyarıcı algısına, hücre içi sinyalleşmeye ve enzimatik/enzimatik olmayan tepkilere dayanan olumsuz bir çevreye yanıt vermek için karmaşık mekanizmalar geliştirmiştir. Bu sabit organizmalar, karmaşık bir dizi biyolojik aktivite (antioksidan mekanizmalar, şelasyon ve HM iyonlarının bölgeselleşmesi gibi) yoluyla çevredeki aşırı boyuttaki ağır metaller ile başa çıkmaktadır.

Ağır metal stresi, hücreyi oksidatif hasardan korumak için en aza indirgenmesi gereken, oldukça reaktif ve toksik olan reaktif oksijen türlerinin (ROS) aşırı üretimini indüklemektedir. Hücre organelleri, özellikle kloroplast ve mitokondri, aşırı elektron akışının gerçekleştiği bitkide ROS üretiminin başlıca bölgeleridir. Bitki hücreleri, son derece önemli enzimatik ve enzimatik olmayan antioksidan bileşenlerden oluşan antioksidan mekanizmaların koordineli ve uyumlu iş birliği ile ROS’u ve reaksiyon ürünlerini verimli bir şekilde temizlemektedir. Hem enzimatik hem de enzimatik olmayan farklı antioksidan türlerine dayalı ikili bir hücresel sistem, bitkide üretilen ROS’u temizlemektedir (Gill ve Tuteja, 2010). İlk mekanizma, süperoksit dismutaz (SOD), askorbat/guaiakol peroksidaz (APX/GPX), glutatyon-S-transferazlar (GST), katalaz (CAT), glutatyon redüktaz (GR) enzimlerine dayanmaktadır. İkinci mekanizma, poliaminlerin yanı sıra indirgenmiş glutatyon (GSH), askorbik asit ve α -tokoferol gibi vitaminler, prolin gibi ozmolitler ve ikincil metabolitler, özellikle flavonoidler, fenolikler, karotenoidler gibi düşük moleküler ağırlıklı bileşiklerin üretimini düzenleyen enzimatik olmayan yanıtıdır (Ashraf, 2009; Akram vd., 2017).

Glutatyon redüktaz (GR), bitki hücrelerini ROS’a ve ROS’un reaksiyon ürünlerinde oluşan potansiyel anormalliklere karşı korumada önemli rol oynayan askorbat-glutatyon (AsA-GSH) yolunun ana bileşenlerinden biridir. GR, GSH ile fizyolojik olarak birlikte hareket eden ve NAD(P)H-bağımlı enzimatik bir antioksidan olup, hücresel bir tiyol olan indirgenmiş GSH havuzunu etkin bir şekilde korumakla görevlidir.

Bu süreç, GR, NAD(P)H ile glutatyon disülfidin (GSSG, yükseltgenmiş glutatyon) glutatyon (GSH, indirgenmiş glutatyon) rejenerasyonunu katalize etmektedir (Asada, 1999; Mittler, 2002). Bu antioksidan enzim, hücre içi glutatyon havuzunu esas olarak indirgenmiş durumda; yani, H₂O₂ ve O₂⁻ gibi ROS'u temizleyebilen bir antioksidan olarak işlev gören GSH'yi koruyarak oksidatif strese karşı bitkinin metal stresine karşı tepkisinde önemli bir rol oynamaktadır (Yousuf vd., 2012).

Bu çalışmada, krom stresine maruz kalan (0, 25, 50, 100, 200, 500 µM) *B. juncea* L. var. S-9 bitkisinde oksidatif stresin etkisi ve bu olumsuz etkinin üstesinden gelmek için tetiklenen antioksidan savunma mekanizmasında rol oynayan glutatyon redüktaz (GR) ile ilgili araştırma yapılmaktadır.

Materyal ve Yöntem

Bitki Materyali

B. juncea L. S-9, Tarım Araştırma Enstitüsü, Tandojam, Sind Eyaleti, Pakistan' dan temin edilmiştir. Bu çalışma, Uşak Üniversitesi, Bilimsel Analiz ve Uygulama ve Araştırma Merkezi' nde (UBATAM) Moleküler Biyoloji Bölümü' ne ait bitki odasında uygun koşullarda 3' er tekerrürlü olarak yürütülmektedir. Bitkilere uygulanan Cr(III) kimyasalı Sigma firmasından temin edilmiştir.

Bitkilerin Yetiştirilmesi ve Cr muamele

B. juncea L. S-9 türünden 100 adet tohum ayrı ayrı 50 ml' lik falkon tüplerde Tween-20 içeren %5' lik sodyum hipoklorit çözeltisi ile 15 dakika boyunca yüzey sterilizasyonuna tabi tutulmuş ve ardından deiyonize suyla iyice yıkanmıştır. Akabinde imbibisyonu sağlamak için petri kaplarında 1 saat boyunca deiyonize suda bekletilerek tohumlar, çimlenme ve fide gelişimi için ekilmiştir. Çimlenme aşamasında tohumların karanlıkta bekletilmesi ve büyüme fazında nemini korunması amacıyla her bir kapın üzeri 3 gün boyunca alüminyum folyo ile kaplanmıştır. Bu aşamadan sonra, 3. gün çimlenen fideler; 16 saat gündüz/ 8 saat gece periyodu, 22-25 °C hava sıcaklığı, %70/85 bağıl nem oranı ve 10.000 lüks ışık yoğunluğu olarak ayarlanan uygun koşullar altında iklim odasında ışıklandırma ve düzenli olarak temel besin ihtiyacının karşılanması için 1/4 oranında seyreltilen Hoagland besi çözeltisi ile yetiştirilmiştir (Hoagland ve Arnon, 1938). Çimlenen fidelere 50 ml' lik konsantrasyonları içeren solüsyon gün aşırı 10 gün boyunca uygulanmıştır. Cr uygulanmayan kontrol gruplarına ise sadece 1/4 Hoagland besi çözeltisi uygulanacaktır. Cr muamelesinden sonra, bitkiler gövde ve kök kısımları ayrı ayrı olacak şekilde hasat edilmiştir. Hasat işlemi sırasında, her bir deney grubu kontrol grubu dâhil olmak üzere 3' er tekerrürlü (R1, R2, R3) olacak şekilde ayrılmıştır.

RNA İzolasyonu ve Jel Elektroforezi

Total RNA, Thermo Scientific™ in GeneJet Bitki RNA saflaştırma kiti kullanılarak izole edilecektir. İzole edilen RNA konsantrasyonu, Thermo Scientific Nanodrop 2000 cihazı kullanılarak RNA miktarı tayin edilecektir (Memon vd., 2014; Demirel vd., 2014). İzole edilecek RNA' nın kontrolü denatüre jel elektroforezi ile Memon vd., (1995) metoduna uygun bir şekilde gerçekleştirilecektir.

Ters Transkripsiyon-Tamamlayıcı DNA (cDNA) Sentezi ve Kontrolü

RNA izolasyonundan sonra, saf hale getirilmiş olan total RNA' lar Thermo Scientific™ markasının RT-PCR kiti olan Maxima First Strand cDNA sentez kiti kullanılarak DNA komplementleri sentezlenecektir (Cevher-Keskin vd., 2019). cDNA sentezi, Maxima First Strand cDNA sentez kiti içerisinde mevcut olan tampon ve enzimler dâhil edilerek gerçekleştirilecektir. Tüm cDNA' lardan pozitif sonuç elde edildikten sonra, örnekler bir sonraki aşama olan kantitatif qRT-PCR' da kullanılmak üzere -20 °C' de saklanacaktır.

Primer Tasarımı ve qReal-Time PCR

Hasat işleminden sonra, kontrol ve Cr-muameleli bitki gövde ve kökleri qRT-PCR kullanılarak transkripsiyon seviyelerini belirlemek için öncelikle *B. juncea* L. S-9 bitkisine ait GR enzimi için primer dizayn edilecektir. Daha sonra, primerler Primer3 programı kullanılarak tasarlanacaktır. Total hacim 25 µl olacak şekilde hazırlanan cDNA örnekleri (4 µl), hazırlanan master mix (13 µl), polimeraz enzimi, dNTP' ler, primerler (Glutathione reductase forward primer (GR-forward), GR-reverse primer ve referans gen olarak Glyceraldehyde 3-phosphate dehydrogenase (GAPDH) forward primer, GAPDH reverse primer), SYBR Green gibi floresan boyalardan oluşan karışım 96 kuyucuklu platelere yüklenerek BioRad CFX96 sisteminde gerçekleştirilecektir. Her bir örnek için reaksiyon 3 kez tekrar edilecektir.

İstatistiksel Analizi

2^{ΔΔCt} hesaplaması kullanılarak her bir örnek için değerler hesaplanacaktır. Veriler, ortalamalar arasında anlamlı farklılıkların olup olmadığını belirlemek için Tek yönlü ANOVA, IBM SPSS 25.0 paketi (SPSS, ABD) kullanılarak analiz edilecektir.

Bulgular ve Tartışma

Bitkiler toksik metaller/metaloidler stresini antioksidan savunma sistemlerini kullanarak bir dereceye kadar hayatta kalmaya çalışmaktadırlar. Ancak savunma sisteminin aktivitesi ve performansı stres konsantrasyonu, stres süresi, bitki tipi ve bitkinin yaşına göre farklılık göstermektedir. Dengeli metabolizma, biyotik ve abiyotik stresler nedeniyle her zaman bozulan bitkilerde daha iyi üretkenlik için ön koşuldur. Bu nedenle, redoks dengesi, daha fazla oksitlenme ve enerji temini için oksitlenmiş ürünlerin indirgendliği yaşamın temel özelliklerinden biridir.

İndirgenmiş durumdaki glutatyon havuzu, dehidro-askorbatı askorbat-glutatyon döngüsü yoluyla askorbata indirgeyen GR tarafından düzenlenmektedir (Arora vd., 2012). Sonuç olarak, çeşitli streslerle karşı karşıya kalan bitkilerde GR'in rolü son derece önemli hale gelmektedir. Örneğin, farklı Cr (0.0, 0.1, 0.3 ve 0.5 mM) konsantrasyonlarda maruz kalan 30 ve 60 günlük *B. juncea* L. bitkilerinde total proteinler, antioksidatif enzimler (SOD, CAT, POD, APX, GR, MDHAR ve DHAR) ve MDA içeriği gibi morfolojik ve biyokimyasal stres belirteçleri üzerindeki etkiler değerlendirilmiştir (Kanwar vd., 2015). Diğer bir yandan, AsA-GSH yolunun enzimleri arasında, GR'in farklı toksik metaller/metaloidler (Cd, Hg, Cr, Cu vs.) stresine karşı bazı bitki türlerinin tepkileri gösterilmiştir (Tablo 1).

Brassicaceae familyasının üyelerinin HM'lere karşı toleranslı oldukları bildirilmiştir (Kanwar vd., 2012). *B. juncea* bir yağlı tohum bitkisi olarak yetiştirilen ve soya ve palmyeden sonra yemeklik yağ üretiminden kullanılan endüstriyel bitkidir (Sinha vd., 2010). Hızlı büyüme, yüksek biyokütle, daha az su gereksinimi ve yüksek konsantrasyonda HM'leri absorbe kabiliyeti nedeniyle (Memon vd., 2001; Meng vd., 2009; Gill vd., 2015), HM'lerin fitoremediasyonu için potansiyel bir bitki olarak kabul edilmektedir.

Bu çalışmada, krom stresine (0, 25, 50, 100, 200, 500 µM) maruz kalan *B. juncea* L. var. S-9 bitkisinde oksidatif stresin etkisi ve bu olumsuz etkinin üstesinden gelmek için tetiklenen antioksidan savunma mekanizmasında rol oynayan glutatyon redüktaz (GR) üzerine araştırmalar devam etmektedir.

Tablo 1. Metal stresi altındaki bitki türlerinde glutatyon redüktazın (GR) antioksidan aktivitesi

Bitki türleri	Metal türü	Uygulanan konsantrasyon	Referans
<i>Brassica napus</i>	Cd (10 µM kadar)	GR aktivitesi artış göstermiş	Nouairi vd., 2009

Determination of The Yield and Yield Parameters of Demre Sivrisi, Dogal Sarı Sivri and Dogal Carliston (*Capsicum Annuum* L.) Pepper Varieties Grown By Fertigation Method in Greenhouse Conditions

Ahmet Demirbas¹, Hasan Durukan¹, Mustafa Ozturk¹, Handan Sarac¹

¹Department of Plant and Animal Production, Sivas Vocational School of Technical Sciences, Sivas Cumhuriyet University, Sivas, Turkey

Abstract

In the research, it was aimed to cultivate three different pepper varieties during two years in greenhouse conditions, to investigate their adaptation abilities to Sivas ecological conditions and to determine the most suitable pepper variety to be grown in greenhouse conditions.

Demre Sivri, Dogal Sarı Sivri and Dogal Carliston pepper (*Capsicum Annuum* L.) species were used as test plants in the study. The research was carried out in a total of 9 plots with 3 replications according to the randomized blocks experimental design. Seeds were made into seedlings by regularly watering for about 60 days in the prepared peat and perlite mixture (1:1 V/V) in viols and planting was carried out in the greenhouse environment when they had 3-4 leaves. Irrigation processes in the research were carried out by drip irrigation method, and irrigation was carried out every 3 days during the 20-day period from planting to 7 leaves of pepper plants. In other processes, irrigation was done every 2 days until the plants were harvested. Considering the results of soil analysis in the research, fertilization was done by fertigation method (fertilization with drip irrigation) for pepper purely at 20 kg N da⁻¹, 6 kg P₂O₅ da⁻¹, 20 kg K₂O da⁻¹. In the study, nitrogen (N) ammonium sulfate (NH₄)₂SO₄, phosphorus (P) MKP (monopotassiumphosphate) and potassium (K) potassium nitrate (KNO₃) forms were applied. Nitrogen, phosphorus, potassium, calcium, magnesium, iron, zinc, manganese and copper analyzes were made in the leaf samples taken when the pepper plant reached half of the fruit size and yield were determined. According to the results of the research, Dogal Carliston stood out in the first year in terms of yield (2987 kg da⁻¹), while Demre Sivri (2788 kg da⁻¹) gave the highest yield in the second year.

Key Words: Fertigation, Pepper, Yield, Nutrient Uptake, Drip Irrigation

Fertigasyon Yöntemiyle Yetiştirilen Demre Sivrisi, Doğal Sarı Sivri Ve Doğal Çarliston (*Capsicum Annuum* L.) Biber Çeşitlerinin Sera Koşullarında Verim Ve Verim Parametrelerinin Belirlenmesi

Özet

Araştırmada sera koşullarında iki yıl süreyle üç farklı biber çeşidinin yetiştiriciliği yapıp, Sivas ekolojik koşullarına adaptasyon yeteneklerinin araştırılması ve sera ortamında yetiştirilmesi en uygun olan biber çeşidinin belirlenmesi amaçlanmıştır.

Araştırmada test bitkisi olarak Demre Sivrisi, Doğal Sarı Sivri ve Doğal Çarliston biber (*Capsicum Annuum* L.) türleri kullanılmıştır. Araştırma tesadüf blokları deneme desenine göre 3 tekerrürlü olarak toplam 9 parselde yürütülmüştür. Tohumlar hazırlanan torf ve perlit karışımında (1:1 V/V) viyoller içerisinde yaklaşık 60 gün süreyle düzenli olarak sulanarak fide haline getirilmiş ve 3-4 yapraklı olduğunda sera ortamında toprağa dikim işlemi gerçekleştirilmiştir. Araştırmada sulama işlemleri damla sulama yöntemiyle yapılmış olup biber bitkileri dikimden 7 yapraklı oluncaya kadar olan 20 günlük süreçte 3 günde bir sulama işlemi yapılmıştır. Diğer süreçlerde bitkiler hasat edilinceye kadar 2 günde bir sulama işlemi yapılmıştır. Araştırmada toprak analiz sonuçları dikkate alınarak biber için saf olarak 20 kg N/da, 6 kg P₂O₅/da, 20 kg K₂O/da olacak şekilde fertigasyon yöntemiyle (damla sulama ile birlikte gübreleme) gübreleme yapılmıştır. Araştırmada azot (N) amonyum sülfat (NH₄)₂SO₄, fosfor (P) MKP (monopotasyumfosfat) ve potasyum (K) potasyum nitrat (KNO₃) formlarında uygulanmıştır. Biber bitkisinin verim ile meyve büyüklüğünün yarısına ulaştığında alınan yaprak örneklerinde azot, fosfor, potasyum, kalsiyum, magnezyum, demir, çinko, mangan ve bakır analizleri yapılmıştır. Araştırma sonuçlarına göre, verim bakımından birinci yıl Doğal Çarliston öne çıkarken (2987 kg/da), ikinci yıl Demre Sivrisi (2788 kg/da) en yüksek verimi vermiştir.

Utilization of Postbiotics in Foods

Özlem Derebaşı, Ahmet Şükrü Demirci, Göksel Tırpancı Sivri

Food Engineering, Faculty of Agriculture, Namık Kemal University, Tekirdağ, Türkiye

Abstract

There is a continuous discussion about addition of probiotics to food product leading to technological problems and health risks. For this reason, studies about the use of postbiotics in foods instead of the addition of probiotics have been taking attention recently. Postbiotics are metabolites such as exopolysaccharides, short chain fatty acids, enzymes, peptides, bacteriocins, vitamins and peptidoglycans secreted by probiotics. The addition of postbiotics to food products improve the quality parameters and longer the shelf life owing to antioxidant, antibacterial and antifungal effects. In this review, recent studies on the use of postbiotics in food formulations, production processes and packaging were compiled.

Key Words: *Postbiotics, postbiotic foods, probiotics,*

Postbiyotiklerin Gıdalarda Kullanımı

Özet

Gıda endüstrisinde yaygın olarak kullanılan canlı probiyotiklerin birçok gıdaya eklenmesinde yaşanan teknolojik sorunlar ve sağlık riskleri hakkında tartışmalar devam etmektedir. Bu nedenle son yıllarda gıdalarda probiyotik yerine postbiyotik kullanımına yönelik çalışmalar yapılmaktadır. Postbiyotikler; probiyotikler tarafından salgılanan ekzopolisakkaritler, kısa zincirli yağ asitleri, enzimler, peptitler, bakteriyosinler, vitaminler ve peptidoglikanlar gibi metabolitlerdir. Gıdalara antioksidan, antibakteriyel ve antifungal etkileri olan postbiyotiklerin eklenmesiyle depolama sürecinde kalite özelliklerinin kaybolmadığı ve daha uzun raf ömrüne sahip gıdaların üretilbildiği görülmektedir. Bu çalışmada postbiyotiklerin gıda formülasyonlarında, üretim süreçlerinde, paketlenme alanlarında kullanımına ilişkin güncel çalışmalar derlenmiştir.

Anahtar Kelimeler: *Postbiyotikler, postbiyotik gıdalar, probiyotikler*

Giriş

Probiyotikler yeterli miktarda tüketildiğinde konakçıya sağlık açısından fayda sağlayan canlı mikroorganizmalar olarak tanımlanmaktadır (Moradi, ve diğerleri, 2020). Dünya Sağlık Örgütü postbiyotikleri “fermantasyon sırasında üretilen biyoaktif çözünür faktörler ve çoğunlukla hücre içermeyen kültür üst fazlarında bulunan moleküller” şeklinde tanımlamıştır (WHO & FAO, 2002). Postbiyotikler; hücre yüzeyi proteinleri, bakteriyel enzimler ve peptitler, teikoik asitler gibi bakteriler tarafından üretilen metabolitleri, peptidoglikan türevli nöropeptidleri, polisakkaritleri ve laktik asit gibi organik asitleri içerebilmektedir (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020). Parabiyotikler ise yeterli miktarlarda uygulandığında tüketicilere fayda sağlayan inaktif edilmiş (canlı olmayan) mikrobiyal hücreler veya hücre fraksiyonları olarak tanımlanmıştır. Benzer şekilde parabiyotikler canlı olmayan probiyotikler, inaktif edilmiş probiyotikler veya hayalet probiyotikler olarak adlandırılır (Sabahi, ve diğerleri, 2021).

Postbiyotikler gıda proseslerinde işleme kolaylığı sağlaması, fonksiyonel gıdalarda duyu özelliklerinin geliştirilmesi, antimikrobiyal ve antioksidan etkileri ile raf ömrünü arttırması, biyo-ambalaj materyallerinde kullanılabilirliğinin bulunması, in vivo ve in vitro çalışmalarda hayvan denekler ve insan sağlığı üzerine olumlu ve iyileştirici etkilerinin bulunması gibi sebeplerle bu alanlardaki çalışmalar son yıllarda hız kazanmaktadır. Her geçen gün yeni postbiyotik üreten suşların bulunması, kimyasal yapılarının analizi, etki mekanizmaları, laboratuvar ortamında ve endüstriyel ortamlarda üretiminin araştırılması, yeni proseslerin geliştirilmesi söz konusudur. Yapılan analizler ve in vivo/in vitro denemeler iyi tanımlanmış suşlarda ve metabolitlerinde beklenen sonuçları ve etkileri verirken mekanizması tam olarak aydınlatılamamış suşların ve postbiyotiklerin var olduğu da bilinmektedir (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020).

Probiyotikler ve Postbiyotikler

20. yüzyılın başlarında yoğurt gibi fermente süt ürünleri yoluyla laktik asit bakterilerinin düzenli tüketiminin Bulgar köylerinde yaşayan insanlar arasında genel olarak daha iyi sağlık ve uzun ömür ile ilişkili olduğu gözlemlendi. Böylece bazı bakterilerin sağlığa yararlı olabileceği gözlemi probiyotik kavramının gelişmesine yol açmıştır (Metchnikoff, 1907). Probiyotikler şu anda “yeterli miktarlarda uygulandığında konakçıya sağlık yararı sağlayan canlı mikroorganizmalar” olarak tanımlanmaktadır (Hill, ve diğerleri, 2014). FAO/WHO tarafından güncellenen tanımda ise probiyotikler hem bakteri (ör. başlıca *Lactobacillus*, *Bacillus* ve *Bifidobacterium*) hem de maya (örn. *Saccharomyces*) cinslerini içerir. Uluslararası Probiyotikler ve Prebiyotikler için Bilimsel Birlik

(ISAPP) konsensüs paneline göre probiyotik mekanizmalar suşa özgü olabilir, belirli bir türün sadece birkaç suşunda olabilir veya türe özgü olabilir (Rad, Hosseini, & Pourjafar, 2022).

Mevcut tanım gereği, bir probiyotik canlı olmalıdır; bu nedenle ölü bakteri hücreleri veya hücre bileşenleri probiyotik olarak değerlendirilemezler. Bu sebeple probiyotik kavramına geniş bir boyut sağlayan, probiyotiklerin doğal canlılıklarının ötesinde sağlık yararlarını belirtmek için parabiyotik ve postbiyotik gibi terimler oluşturulmuştur. Bu terimler son zamanlarda ortaya çıkmış olmasına rağmen gıda bilimi ve teknolojisi alanında olduğu kadar insan sağlığı ve beslenmesinde de hızla benimsenmiş ve fonksiyonel gıdalar, besin maddeleri ve ilaçlar olarak potansiyel uygulamaları için özellikle gıda, biyoteknoloji ve ilaç endüstrilerinde ilgi görmüştür. Tanımlarını sınırlayarak postbiyotik ve parabiyotik kavramlarını birbirinden ayırmak önemlidir. Postbiyotikler canlı probiyotik bakteriler veya mayalar tarafından salgılanan veya bakteri/maya lizisinden sonra salınan ve konakçıya olumlu etki sağlayabilen çözünebilir materyallerdir. Parabiyotikler ise yeterli miktarlarda alındığında tüketicilere fayda sağlayan inaktive edilmiş, probiyotik ya da probiyotik olmayan mikrobiyal hücreler veya bu hücrelerin kültür üst fazları olarak tanımlanmıştır (Vinderola, Sanders, & Salminen, 2022).

Postbiyotikler ve parabiyotikler gıda ve farmasötik uygulamalar için üretildikleri canlı mikroorganizmadan daha kararlı ve daha güvenlidir çünkü canlılıkları tüketim sırasında veya büyük ölçekli üretim sırasında gerekli değildir. Bu nedenle postbiyotikleri ve parabiyotikleri elde etmek için kullanılan teknoloji mikroorganizmada canlılık kaybını indüklemeye odaklanır. Yüksek sıcaklık, yüksek basınç, sonikasyon dahil olmak üzere bu amaçlar için yaygın olarak kullanılan birkaç yöntemdir. Postbiyotikler için hücre içi metabolitleri ve/veya hücre duvarı bileşenlerini fragmantlar halinde elde etmek için en az iki işlemin bir kombinasyonunu uygulayarak bakteri zarının parçalanması gerekmektedir (İcier, Güzelcan, Hıdır, & Türköz, 2022). Bununla birlikte bazı durumlarda ortaya çıkan karışımın, uygulanan işlem ve koşullara bağlı olarak aynı anda parabiyotikler ve postbiyotikler içerebildiği bildirilmiştir. Bu nedenle bozulmamış hücreleri ortadan kaldırmak ve yalnızca postbiyotik fraksiyonu kurtarmak için mikrofiltrasyon gibi ek adımlar gereklidir (Moradi, ve diğerleri, 2020). Bu arada canlı hücreler tarafından salgılanan postbiyotikleri, bunların kültür üst fazlarından geri kazanmak için gerekli yöntemler veya teknoloji, temel olarak canlı hücrelerin, santrifüjleme ve/veya filtrasyon yoluyla ortamdan çıkarılmasına dayanır. Elde edilen postbiyotik daha sonra dondurarak kurutma ya da püskürtmeli kurutucu ile toz hale getirilebilir (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020).

Üretilen postbiyotiklerin tanımlanması için gaz kromatografisi (GC), sıvı kromatografisi (LC), ince tabaka kromatografisi (TLC), nükleer manyetik rezonans (NMR) spektroskopisi, Fourier transform kızılötesi (FTIR) gibi spektroskopi gibi yöntemler sıklıkla kullanılan analitik tekniklerdir (Moradi, ve diğerleri, 2020) (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020). Bu cihazlarla tanımlanan postbiyotikler çeşitli gruplar altında şu şekilde toplanmıştır;

Proteinler: Bakteriyosinler, antimikrobiyal peptitler (AMP)

Enzimler: Glutasyon peroksidaz (GPx), süperoksit dismutaz (SOD), NADH peroksidaz

Kompleks moleküller: Peptidoglikandan türetilmiş muropeptitler, lipoteikoik asit

Vitaminler: B grubu vitaminleri

Organik Asitler: Propiyonik asit, 3-fenillaktik-asit

Lipidler: Propiyonat, bütirat, plasmalojen, kısa zincirli yağ asitleri

Karbonhidratlar: Galaktoz bakımından zengin polisakkaritler, teikoik asit, ekzopolisakkaritler (EPS) (İcier, Güzelcan, Hıdır, & Türköz, 2022).

Postbiyotiklerdeki metabolitlerin tanımlanması veya parabiyotiklerin sağlam hücrelerindeki bütünlüğün veya değişikliklerin değerlendirilmesi için farklı analitik teknikler kullanılabilir de postbiyotiklerin ve parabiyotiklerin tanımlanması ve karakterizasyonu için tekniklerin ve analitik araçların seçimi analitik amaçlara, niteliksel ve/veya mikrobiyal komplekslerin ve incelenen moleküllerin nicel özelliklerine bağlıdır. Postbiyotikler söz konusu olduğunda kullanılan analitik teknikler ilgilenilen metabolitin tanımlanması veya yeni metabolitlerin keşfedilmesi için en çok belirtilen teknik olmalıdır (Shenderov, 2013).

Probiyotikler tarafından besiyerlerinde fermantasyon yoluyla üretilen postbiyotikler besiyeri ve fermantasyon koşullarına bağlıdır ve aynı suş farklı koşullarda farklı postbiyotikler üretebilmektedir (Amiri, Rezazadeh-Bari, Alizadeh-Khaledabad, Rezai-Mokarram, & Sowti-Khiabani, 2021). Son yıllarda endüstriyel ölçekte postbiyotik üretimi için alternatif besiyerleri de araştırılmaktadır. Örneğin bir çalışmada yağsız süt, proteolitik *Lactobacillus* DSM-100H kültürünün postbiyotik üretimi için endüstriyel ölçekte başarılı bir şekilde kullanılmıştır (Dunand, Peralta, Forzani, Reinheimer, & Vinderola, 2019).

Artan sayıda bilimsel kanıt postbiyotiklerin ve parabiyotiklerin çeşitli yöntemler kullanılarak laboratuvar ölçeğinde üretilebileceğini göstermektedir. Bir çalışmada araştırmacılar anti-mikrobiyal etkili et paketlenmesinde kullanılmak üzere nano kâğıt geliştirmek için bakteriyel nanoselüloza dahil edilen *Lactobacillus plantarum* ATCC 14917'den üretilen postbiyotikleri içeren liyofilize bir toz hazırlamıştır (Yordshasi, Moradi, Tajik, & Molaei, 2020). Başka bir çalışmada araştırmacılar klinik bir çalışma için bir jöle içine dahil edilen *Lactobacillus paracasei* MCC1849'un ısıl işlemlerle canlı olmayan bakteri hücrelerini (1×10^{10} hücre/72 g ürün) hazırlamıştır (Maruyama, ve diğerleri, 2016). Ancak prosesin bahsedilen şekliyle gerçekleştirildiğinde yeterli miktarlarda elde ürün edilemeyeceği ve görece pahalı olduğu görülmüştür (Chaluvadi, Hotchkiss, & Yam, 2016). Ek olarak yoğurt,

lahana turşusu, salamura sebzeler ve kombucha içeceği gibi bazı gıdalar doğal olarak postbiyotikler ve parabiyoetikler içerebilir ancak bunlar kontrol edilemez şekilde üretilir ve üretilen miktar in vivo fizyolojik bir yanıt oluşturmak için yetersiz olabilir. Sonuç olarak parabiyoetiklerin ve postbiyotiklerin üretimini işlevsel hale getirmek ve uygun maliyetli seviyelere çekebilmek için kullanılabilecek teknolojik ve endüstriyel süreçleri gözden geçirmeye ihtiyaç duyulmaktadır (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020).

Postbiyotiklerin Gıdalarda Kullanım Olanakları

Postbiyotiklerin teknolojik avantajları sebebi ile probiyotiklerin yerine gıdalarda kullanımının araştırılması ve çeşitli proseslere eklenmesi son yıllarda hız kazanmıştır. Gıda endüstrisinde postbiyotiklerin kullanımı yeni bir yaklaşımdır. Buna rağmen biyofilmlerin giderilmesi, antimikrobiyal etkileri, antioksidan etkileri, gıdalarda kimyasal kontaminantların biyolojik olarak parçalanması, gıda kaynaklı patojenlerin inhibe edilmesi, duysal açıdan ürünlerin iyileştirilmesi ve yenilebilir kaplamalarda kullanılmaları gibi güncel uygulamalar mevcuttur. Probiyotiklerin fermentasyonu ile elde edilen kültür üst fazları çeşitli formlarda gıda matrisine eklenmektedir. Bu formlar doğrudan, liyofilize, çözelti, mikroenkapsüle ve konsantre olarak ekleme gibi çeşitlere ayrılmaktadır. Bu şekilde eklendikten sonra da postbiyotiklerin gıda üzerine etkileri incelenmektedir (Moradi, ve diğerleri, 2020). Postbiyotiklerin gıdalara eklenmesi doğrudan sıvı kültür üst fazı olarak ya da konsantre kültür üst fazının çözelti olarak eklenmesi şeklinde de yapılabilmektedir. Fakat yapılan çalışmalarda liyofilize ya da enkapsüle postbiyotiklerin gıda proseslerinde daha iyi sonuçlar verdiğini gözlemlenmiştir (İçier, Güzelcan, Hıdır, & Türköz, 2022).

Mikroenkapsülasyon yöntemi ile postbiyotiklerin çeşitli kimyasallar, safra tuzları, düşük pH, antimikrobiyal ajanlar ve yüksek sıcaklık gibi olumsuz koşullara karşı korunması yaygın bir yaklaşımdır. Akışkan yataklı kurutma, püskürtmeli soğutma, birlikte kristalleştirme ve birlikte biriktirme gibi teknikler kullanılarak birçok postbiyotik çeşidine mikroenkapsülasyon yapılmaktadır (Hosseini, Abbasi, Sabahi, & Khani, 2021). Postbiyotiklerin enkapsüle edilebilmesi için karbonhidrat, protein ve lipitler kullanılmaktadır (İçier, Güzelcan, Hıdır, & Türköz, 2022). Postbiyotiklerin gıda kullanımlarında bakteriyosinler ve diğer biyoaktif peptitler, ekzopolisakkaritler (EPS) ve antioksidan moleküller öne çıkmaktadır. Birçok probiyotik suşun antioksidan etkiye sahip postbiyotikler ürettiği görülmüştür. Bu antioksidan moleküller arasında proteinler, peptitler, glutatyon, pirok ve halkalı bileşikler vardır (Cuevas-González, Liceaga, & Aguilar-Toalá, 2020). Biyoaktif peptitler amino asit dizilerine ve üç boyutlu yapılarına bağlı olarak antioksidan ve antimikrobiyal etkiler gösterir. Ayrıca doğrudan insan sağlığı üzerine etki gösteren antihipertansif, antidiyabetik, anti-enflamatuvar gibi etkiler gösterebilen peptitlerdir (Ötleş, Bakar, & Kaplan Türköz, 2022). Biyoaktif peptitler proteinlerin enzimatik hidrolizi ile ya da fermentasyon yoluyla elde edilebilir. Laktik asit bakterilerinin fermentasyonu sonrasında postbiyotik fraksiyonlarında biyoaktif peptitler olduğunu gösteren çok sayıda çalışma mevcuttur (İçier, Güzelcan, Hıdır, & Türköz, 2022).

Ekzopolisakkaritler mikroorganizmalar tarafından üretilen ve hücre dışına salgılanan biyopolimerlerdir. Probiyotik organizmaları olumsuz çevre koşullarına karşı korumak, hücre tanıma ve biyofilm oluşumunda yer almak gibi görevleri vardır. Ekzopolisakkaritlere örnek olarak dekstran, gellan, ksantan, pullulan, aljinat verilebilir (İçier, Güzelcan, Hıdır, & Türköz, 2022). Başta gıda endüstrisi olmak üzere birçok endüstride kullanılırlar. Genel kullanım alanları jelleştirici, stabilizatör, koyulaştırıcı ve emülgatör olarak kullanılmalarıdır ve bu biyopolimerler aynı zamanda gıda ambalajlanmasında da kullanılabilirler (Moradi, ve diğerleri, 2020). Süt ürünlerinde su tutma kapasitesi ile viskoziteyi arttırmakta ve reolojiyi geliştirmede kullanılmaktadırlar. Hububat ürünlerinde de benzer reolojik özelliklerin geliştirilmesinde kullanılmaktadır (Shukla, Mehta, Parmar, Pandya, & Saraf, 2019).

Postbiyotiklerin et ürünlerinde kullanımları konusunda çok sayıda çalışma mevcuttur. Et ürünlerinde doğal katkı maddeleri olarak kullanımları söz konusudur. Bu kapsamda postbiyotik kullanımının özellikle antioksidan ve antimikrobiyal etkileri önem kazanmaktadır. Bir çalışmada *Lactobacillus salivarius*, *Lactobacillus acidophilus* LA-5 ve *Lactobacillus casei* 431 kültür üst fazlarının liyofilize edilerek dana kıymasına eklenmiş ve antimikrobiyal etkileri incelenmiştir. *L. monocytogenes*'e karşı inhibe edici etki gösterdikleri gözlemlenmiştir. *L. salivarius*'un postbiyotikleri, *L. monocytogenes* üzerinde en yüksek inhibitör aktiviteyi gösterirken *L. casei* 431'in postbiyotiklerinin ise en düşük aktiviteyi gösterdiği bildirilmiştir. Üç probiyotik suşun da üst fazları ile gaz kromatografisi-kütle spektrometrisi (GC-MS) analizi yapılmıştır ve bu analizler sonucunda hücre içermeyen kültür üst fazlarının benzoik asit, pirok [1,2-a] pirazine-1,4-dion bakımından zengin oldukları belirlenmiştir. Bulunan bu ajanların antioksidan etki gösterdiği bilinmektedir. Bu suşlardan elde edilen postbiyotiklerin fonksiyonel gıdalarda potansiyel antioksidan ajan adayı olabileceğini gösterilmiştir (Moradi, ve diğerleri, 2020). Başka bir çalışmada laktik asit bakterilerinin çeşitli suşlarının parabiyoetik ve postbiyotik ürünleri doğal fermente sucuklarda kullanılmış ve bu suşların antioksidan içerikli postbiyotikler ürettiği ve aktivitenin suşa bağlı olduğu gösterilmiştir (Aydın, Çiydem, Kaya, & Açık, 2021).

Lactobacillus paracasei N2 ve *L. casei* TM1B suşlarından elde edilen postbiyotiklerin keçi kıymasında kullanıldığı bir çalışmada *Pseudomonas aeruginosa* ve *E. coli* suşlarına karşı antimikrobiyal etki gösterdiği, raf ömrünün 15 güne kadar arttırdığı gözlemlenmiştir (Mouafo, Mbawala, Tanaji, Somashekar, & Ndjouenkeu, 2020). Domuz eti ile yapılan bir çalışmada yerel geleneksel Vietnam yoğurdundan izole edilen *L. plantarum* SC01 suşuna

ait bakteriyosinlerin farklı saklama koşulları altında domuz etine eklenmesi sonucunda çeşitli patojenlere karşı antimikrobiyal etki gösterdikleri görülmüştür (Le, ve diğerleri, 2019). Başka bir çalışmada *L. plantarum* ST16Pa'ya ait bakteriyosin benzeri postbiyotikler (BLIS) ve laktat farklı oranlarda tavuk göğüs etine eklenmiş ve 4°C'deki buzdolabı koşullarında antimikrobiyal etkinin 7 gün boyunca devam ettiği gösterilmiştir (da Silva, Pérez-Rodríguez, Domínguez, & de Souza Oliveira, 2017). *Lactobacillus rhamnosus*, *Lactobacillus fermentum*, *Pediococcus acidilactici*, *Lactobacillus delbrueckii susp. lactis*'in liyofilize postbiyotiklerinin antimikrobiyal etkisini incelendiği başka bir çalışmada *L. rhamnosus* EMCC 1105 postbiyotiklerinin *Clostridium perfringens*'e karşı en fazla antimikrobiyal etki gösterdiği, tavuk etine doğrudan eklenmesi sonucunda antimikrobiyal etkisinin devam ettiği görülmüştür (Hamad, Abdelmotilib, Darwish, & Zeitoun, 2020). Postbiyotik varlığında gıdadaki duysal ve tekstürel özelliklerini araştıran çalışmalardan birinde sucuğun duysal özelliklerini geliştirmek amacıyla EPS üreten *L. plantarum* ve *Leuconostoc mesenteroides* suşları seçilmiş ve uygun fermentasyon koşullarında sucuk örneklerinin dokusal özelliklerinin geliştiği, daha sert ve daha az yapışkan sucuk ürünleri elde edildiği bildirilmiştir (Dertli, ve diğerleri, 2016).

Sardalya filetolarının vakumlu ambalajlarında ve normal ve modifiye atmosferde paketlenmiş ambalajlarında yapılan bir çalışmada *Enterococcus faecalis* A-48-32 bakteriyosinlerinin stafilokok türlerine karşı antimikrobiyal etki gösterdiği, biyojen amin oluşumunu azalttığı ve filetoların raf ömrünü uzattığı görülmüştür (Ananou, ve diğerleri, 2014). Füme somonlarla yapılan bir çalışmada *Lactobacillus reuteri*'den izole edilip saflaştırılan reuterin çözeltisinin 8°C ve 30°C'de 15 dakika uygulandığı soğuk füme somonlarda *L. monocytogenes*'e karşı antimikrobiyal etkisi olduğu gösterilmiştir (Montiel, ve diğerleri, 2014). Ayrıca yapılan başka bir çalışmada *Lactobacillus curvatus* BCS35 suşundan elde edilen sıvı ve liyofilize formdaki bakteriyosinlerin de farklı balık türlerinde antimikrobiyal etkileri olduğu gösterilmiştir (Gómez-Sala, ve diğerleri, 2016). Bakteriyosinler ile ilgili yapılan çalışmalarda doğrudan kültür üst fazının kullanılmasının bakteriyosinin antimikrobiyal etkisini göstermesi için yeterli olduğu sonucu ortaya koyulmuştur. Örneğin bir çalışmada *L. plantarum* suşundan elde edilen bakteriyosin içeren kültür üst fazları portakal suyu ve fermente mısır içeceği chicha suyuna eklenmiştir. Bu çalışmada bakteriyosinin *E. coli* ve *S. enterica*'ya karşı antimikrobiyal etkileri olduğu gösterilmiştir (Tenea & Barrigas, 2018).

Lactococcus lactis tarafından üretilen postbiyotikler olan nisin ve formik asit ile patatestede yapılan çalışmada bu postbiyotikler taze patatese 10 dakika uygulanmış ve 0., 3., 5., 7. ve 10. günlerde depolama sırasında durumu takip edilmiştir. *Bacillus subtilis* gelişimini durdurduğu, aynı zamanda patatestede renk değişiminin gözlenmediği ve raf ömrünün 10 güne çıktığı gösterilmiştir (Ruengvisesh, Khunrae, Rattanarojpong, & Jongruja, 2020). Ev yapımı domates salçası ile yapılan bir çalışmada *S. aureus*, *E. coli*, *Aspergillus niger* ve *Aspergillus flavus* organizmaları inokule edilmiş ev salçasına *L. plantarum* CS ve *L. acidophilus* ATCC 314 suşlarından elde edilen kültür üst fazları eklenmiş ve oda sıcaklığında 25 günden fazla antimikrobiyal ve antifungal etki gösterdiği gözlemlenmiştir (George-Okafor, Ozoani, Tasie, & Mba-Omeje, 2020). Meyve sebzelerle ilgili yapılan bir çalışmada çilek, mantar, mısır ve domates kullanılmıştır. Raf ömrünü uzatma amacı ile yapılan bu çalışmada *Pediococcus spp.*'den izole edilen bakteriyosinler, kimyasal koruyucular olan sodyum sülfid ve sodyum benzoatla karşılaştırılmıştır. Bakteriyosinlerin *E. coli* ile *S. sonnei* patojenlerine karşı antimikrobiyal etki gösterdiği ve bu meyve sebzelerin raf ömrünü uzattığı gözlemlenmiştir (Skariyachan & Govindarajan, 2019). Balda yapılan bir çalışmada balda izole edilmiş *Lactobacillus kunkeei* ENH01 suşuna ait postbiyotikler bal içeren şekerli limonataya kültür üst fazı olarak eklenmiştir. Bu çalışma sonucunda antimikrobiyal peptid içeren kültür üst fazlarının *Candida albicans*'a karşı antifungal etki gösterdiği belirlenmiştir (Ebrahimi, Sadeghi, Rahimi, Purabdollah, & Shahryari, 2021). Başka bir çalışmada Asya turşusu olan kimçiden izole edilmiş *L. plantarum* YML007 suşu postbiyotiklerinin antifungal etkisi kurutulmuş soya fasulyesi üzerinde gösterilmiştir (Ahmad Rather, ve diğerleri, 2013).

Süt ürünlerinde bakteriyosin ve ekzopolisakkaritlerin kullanımına yönelik çalışmalar öne çıkmaktadır. Yapılan çalışmalarda bakteriyosinlerin tek başına ya da diğer antimikrobiyal ajanlar ile birlikte kullanımının süt ürünlerinde başarılı sonuçlar verdiği görülmüştür. Probiyotik suşlar tarafından yaygın olarak üretilen bir bakteriyosin türü olan nisin ile sarımsak özütünün birlikte kapsüllenecek kullanıldığı bir çalışmada, buz dolabı koşullarında ve 37°C'de bekletilen UHT sütün durumu 25 gün boyunca takip edilmiş ve *L. monocytogenes*, *S. enteritidis*, *E. coli* ve *S. aureus*'a karşı antimikrobiyal aktiviteleri gösterilmiştir (Pinilla & Brandelli, 2016). *L. sakei* 2a'dan elde edilen bakteriyosinlerini doğrudan ya da nanovesiküller içinde enkapsüle olarak UHT keçi sütüne eklediği bir çalışmada keçi sütünün durumu 7°C'de 14 gün ve 30°C'de 24 saat boyunca takip edilmiş ve enkapsüle bakteriyosinin antimikrobiyal etkisinin daha yüksek olduğu gösterilmiştir (Malheiros, Cuccovia, & Franco, 2016). Yeni doğal antimikrobiyal ajanların bulunmasına yönelik de çok sayıda çalışma yapılmaktadır. Bu çalışmalardan birinde araştırmacıların yerel Polonya peynirlerinden izole ettiği 29 farklı *L. plantarum* suşunun kültür üst fazları doğrudan sıvı olarak yağsız süte eklenmiş ve *S. aureus*'a karşı antimikrobiyal etki gösterdikleri saptanmıştır (Ołdak, Zielińska, Łepecka, Długosz, & D., 2020).

Manda sütünde yapılmış bir çalışmada *L. delbrueckii subsp. bulgaricus* suşundan izole edilen ekzopolisakkaritler farklı konsantrasyonlarda manda sütüne doğrudan ilave edilmiş ve yoğurdun su tutma kapasitesi ve jel sertliğini arttırdığı gösterilmiştir (Yang, ve diğerleri, 2014). *L. fermentum* Lf2 tarafından üretilen ekzopolisakkaritlerin yoğurda eklediği bir çalışmada ekzopolisakkarit eklenmesi ile yoğurda sertlik, kıvam ve su tutma kapasitesinin arttığı gösterilmiştir (Ale, ve diğerleri, 2016). Az yağlı Cheddar peynirinde yapılan bir çalışmada *L. plantarum*

JLK0142'ye ait saflaştırılmış ekzopolisakkaritler peynire eklenmiş ve depolama sırasındaki durumu takip edilmiştir. Ekzopolisakkarit eklenmiş peynirlerin nem, proteoliz ve duysal açıdan olgunlaşma karakteristiklerinin daha iyi olduğu gözlemlenmiştir. Ayrıca ekzopolisakkarit eklenmiş peynirlerin antioksidan ve ACE inhibitör biyoaktivitelerinin de daha iyi olduğu görülmüştür (Wang, Wu, Fang, & Yang, 2019). Postbiyotik eklenmesinin probiyotik ürün stabilitesine etkilerinin incelendiği bir çalışmada ise *Lactarius volemus* Fr. suşuna ait ekzopolisakkaritler 3 farklı probiyotik yoğurda eklenmiştir. Üretilen probiyotik yoğurtlarda yaşayan probiyotik canlı sayısının, esansiyel amino asitlerin ve su tutma kapasitesinin arttırdığı gösterilmiştir (Huang, ve diğerleri, 2020).

Çölyak hastaları için üretilen glutensiz ekmeklerde su absorpsiyonunda azalma, kırıntı yapısında değişim, somun hacmi, dokusal ve reolojik özellikler açısından zarar görme gibi durumlar söz konusu olabilir. Bu özellikleri iyileştirme ve gıdalardaki yapay katkı maddelerinin kullanımını azaltmak için hububat ürünlerinde ekzopolisakkaritlerin kullanımı son zamanlarda gündeme gelmeye başlamıştır (Ryan, Ross, Fitzgerald, Caplice, & Stanton, 2015). Laktik asit bakterileri tarafından sentezlenen ekzopolisakkaritlerin literatürde hamur reolojisi ve ekmek tekstürünün geliştirilmesi için önemli bir bileşen oldukları belirtilmiştir. Ekzopolisakkaritlerin ticari hidrokoloid ve sakızlar gibi ağ oluşturma ve suyu bağlama yetenekleri vardır ve bu sebeple somun hacmini ve raf ömrünü arttırma ve bayatlamayı geciktirme açısından kaliteyi arttırabilecekleri düşünülmektedir (Lynch, Coffey, & Arendt, 2018). Ekzopolisakkarit kullanımının glutensiz ekmek kalitesi üzerine etkisinin araştırıldığı bir çalışmada 4 farklı suştan elde edilen ekzopolisakkaritler liyofilize formda karabuğday ve pirinç unundan yapılmış ekmeğe eklenmiştir. En fazla *L. curvatus* TMW 1.624 suşundan elde edilen dekstranın glutensiz ekmeğin nem içeriğini arttırdığı, pişirme kaybını azalttığı ve kırıntı sertliğini geliştirdiği gösterilmiştir (Rühmkorf, ve diğerleri, 2012). Düşük kalorili unlu mamüllerde yapılan bir çalışmada *L. delbrueckii* subsp. *bulgaricus*, ve *Streptococcus thermophilus* suşlarından elde edilen ekzopolisakkaritler keklere yağ oranını azaltıcı bileşen olarak eklenmiş ve standart yağlı kek ile sertlik, hacim, tekstür, çiğnenebilirlik ve esneklik gibi özellikleri karşılaştırılmıştır. Ekzopolisakkaritlerin kullanıldığı düşük yağlı keklerde ürün özelliklerinin iyileştiği gözlemlenmiştir (Doğan, Akbaş, & Tunçtürk, 2012).

Postbiyotiklerin hububat ürünlerine starter kültür ile beraber ilave edildiği bir çalışmada *L. reuteri* kültür üst fazlarının çavdar ve tam buğday ekmeklerinde antifungal etkileri olduğu gösterilmiştir (Jonkvienė, Vaičiulytė-Funk, Šalomskienė, Alenčikienė, & Mieželienė, 2016). Başka bir çalışmada ise *Lactobacillus* RM1 suşunun kültür üst fazları liyofilize edildikten sonra 10 kat konsantrasyon edilip buğday tanelerine eklenmiş ve depolama sırasında antifungal etkileri olduğu gösterilmiştir (Shehata, Badr, El Sohamy, Asker, & Awad, 2019).

Son yıllarda postbiyotiklerin gıda ambalajlarında kullanımı için dekstran, levan, kefiran ve hyaluronik asit gibi ekzopolisakkaritler üzerinde çalışılmış ve yenilebilir film ve kaplamaların üretiminde suda çözünmeyen polisakkaritlere alternatif olarak kullanılabilecekleri gösterilmiştir. Ekzopolisakkaritler yenilebilir film ve kaplamalarda yapısal polimer, katkı maddesi veya probiyotik taşıyıcısı olarak görev alabilir. Böylece gıda güvenliği ve kalitesi iyileştirilebilir (Moradi, Guimarães, & Sahin, 2021). Levam ile yapılan başka bir çalışmada ise *B. subtilis natto* suşundan üretilen levan polisakkariti manyok nişastasına dayalı yenilebilir filme farklı nişasta:levan oranlarında çözelti şeklinde eklenip plastikleştirici olarak gliserol kullanılmıştır. Tüm formülasyonlarda iyi bir görünüme sahip yenilebilir film üretilmiştir. Levanın çözünürlüğü yükselttiği, gerilme direnci ve uzamayı arttırdığı ve su buharı geçirgenliğini düşürdüğü gözlemlenmiştir (Mantovan, Bersaneti, Faria-Tischer, Celligoi, & Mali, 2018).

Liyofilize *L. sakei* konsantrasyon kültür üst fazlarının ambalaj filmlerine eklendiği bir çalışmada *E. coli* ve *L. monocytogenes* inokule edilmiş taze biftek küplerinin bu film ile kaplanmış ve filmin patojenlere karşı inhibisyon etkisi olduğu gösterilmiştir (del Carmen Beristain-Bauza, Mani-López, Palou, & López-Malo, 2017). Başka bir çalışmada enterosin AS-48 bakteriyosini eklenen filmler ile kaplanan elma küplerinde de bu bakteriyosinin *L. monocytogenes* 'e karşı antimikrobiyal etkisi olduğu gösterilmiştir (Aguayo, Burgos, Pulido, Gálvez, & López, 2016). Bir diğer çalışmada taze domatesler antimikrobiyal filmler ile kaplanmıştır. *L. plantarum* UTNGt2 suşu kültür üst fazı antimikrobiyal peptitleri yenilebilir kaplamalara eklenmiştir. Peptitlerin küf gelişimini azaltarak domatesin depolama süresini uzattığı ve domatese inoküle edilen *Salmonella* hücre karışımında da hücre ölümüne sebep olduğu gösterilmiştir (Tenea & Pozo, 2019). Aynı çalışma grubunun yaptığı bir başka çalışmada *L. plantarum* UTNCys5-4 ve *L. lactis* subsp. *lactis* Gt28 suşlarından elde edilen Cys5-4/Gt28 antimikrobiyal peptitleri *S. enterica*, *S. sonnei* ve *E. coli* ile kontamine edilmiş ananas dilimleri üzerine eklenmiş ve soğuk depolama koşullarında patojenlerin gelişimini inhibe ettiği gözlemlenmiştir (Tenea, Olmedo, & Ortega, 2020). Aktif gıda kaplamalarında liyofilize olarak postbiyotiklerin ilave edilmesi ile ilgili yapılan bir çalışmada *L. monocytogenes* ile kontamine edilmiş dana kıyması *L. plantarum* liyofilize üst fazı içeren bakteriyel nanoselüloz film ile kaplanmıştır. Üretilen bu nanokâğıdın kıymanın duysal özelliklerinde istenmeyen değişikliklere sebep olmadığı ve patojenlerin büyümesini kontrol ettiği, raf ömrünü de iki katına çıkardığı belirlenmiştir (Yordshasi, Moradi, Tajik, & Molaei, 2020). Yapılan bir diğer çalışmada *Pediococcus pentosaceus* 'dan elde edilen pediosin içeren filmlerle kaplanmış papayada raf ömrünün uzadığı görülmüştür (Narsaiah, ve diğerleri, 2015). Başka bir çalışmada ise *Bacillus methylotrophicus* BM47 suşu bakteriyosinini içeren yenilebilir filmlerin taze çileklere kaplanması ile küflenmeyi geciktirdiği ve ağırlık kaybını büyük ölçüde azalttığı gösterilmiştir (Tumbariski, Nikolova, Petkova, Ivanov, & Lante, 2019).

Sonuç

Postbiyotiklerin biyolojik etkileri gıda işlemlerinde, hücre kültürlerinde ve yapılan bazı laboratuvar deneylerinde doğrulanmıştır. Bununla birlikte postbiyotiklerin kanıtlanmış sağlık yararları olan fonksiyonel gıdalar olarak kabul edilebilmesi için Uluslararası Probiyotikler ve Prebiyotikler Derneği (ISAPP), Dünya Sağlık Örgütü (WHO) veya Gıda Tarım Örgütü (FAO) gibi kuruluşlar tarafından tanımlanması ve uzmanlar tarafından belirgin ifadelerle açıklanabilmesi gerekmektedir. Sonuç olarak postbiyotiklerin bütün mekanizmaları tam olarak aydınlatılmamış olsa da gıda proseslerindeki iyileştirici etkileri ve konakçı sağlığının iyileştirilmesine katkıda bulunabildiği belirtilmiştir. Ancak konu üzerine yapılacak daha pek çok çalışmaya ihtiyaç vardır. Postbiyotikler depolama ve raf ömrü açısından probiyotiklere kıyasla daha az zorluk içerdiğinden ve canlı probiyotikler gibi uzun süreli kullanımlarında bilinmeyen reaksiyonlara yol açmadığından gıda endüstrisi ve sağlık için daha iyi bir alternatif olma potansiyeli taşımaktadırlar. Bunlara ek olarak postbiyotikler ve biyoaktif bileşikler, probiyotiklerin fonksiyonel bileşenlere veya terapötik ajanlara dönüşme gücünü artırmanın etkili bir yolu olabilirler.

Abstract

Adoption of improved technologies and agricultural practices are prerequisites for increased farm productivity. Assessing the appropriateness of potential new technologies or practices increases the likelihood of adoption or modification to suit farmers' needs; however, low farm output still persists among smallholders, attributable to several factors including poor and low adoption of modern production practices. This study therefore analyzed the index of adoption of recommended onion production practices (ROPPs) and correlation of multivariate factors among smallholder farmers in Dambatta, Kano State, Nigeria. A multistage sampling procedure was used in selecting 100 respondents for this study. Primary data collected via well-structured questionnaires were analyzed using Descriptive statistics, Adoption index and Multivariate Correlation techniques. The results revealed that the prevalent ROPPs adopted by the farmers include improved onion varieties (78%), plant spacing (69%), planting method (55%), weed management (50%) and fertilizer application (44%). Moreover, most (72%) of the farmers have low adoption index (≤ 0.33). Further, significant correlations between multivariate factors (farm output, adoption cost and adoption index) exists and the estimated correlation coefficients for r_{xz} , r_{yz} and r_{xy} were -0.53, 0.71 and -0.82 respectively. Subsidizing cost of adoption of ROPPs, improving access to modern production practices/technologies, agricultural credit/farm capital, extension services, adequate labour supply and tenure policy modification are recommended to ameliorate adoption constraints.

Key Words: Adoption, correlation, multivariate factors, production practices, smallholders

Introduction

The introduction of improved inputs and agricultural practices are prerequisite for increased production in particular and agricultural development in general. Onion (*Allium cepa* L.) is believed to have originated in the Middle East region which includes Iran, Afghanistan and Pakistan. It is also cultivated in the West African region both as a food and cash crop (Nisar *et al.*, 2011). According to the United Nations Food and Agriculture Organization estimates, there are seven million acres of land in the world producing over 37 million tons of onions each year. Onion is produced in almost 170 countries of the world. China ranks first in the world with respect to onion production followed by India, USA, Turkey, Pakistan, Iran, Indonesia, Vietnam and Myanmar (Ojo *et al.*, 2009). Onion (*Allium cepa* L) is a vegetable crop belonging to the family *Liliaceae* (Alabi and Adebayo, 2008). In Nigeria, onion production is concentrated in the northern region, most especially in dry tropical zones; specifically in Kaduna, Kano, Jigawa, Katsina, Sokoto, Kebbi, Plateau and Bauchi States (Ojo *et al.*, 2009; Nisar *et al.*, 2011). The natural features of these regions, especially the presence of flood prone plain and river basins and above all the development of vast irrigated lands, create conditions that greatly favour the development of this crop in the area. Onions need well-drained humus and alluvial soils with high organic matter content, capable of retaining moisture during the dry season (Nisar *et al.*, 2011). Commercial onion production in Nigeria was mainly by smallholder *Fadama* farmers particularly under irrigation in dry seasons (Ojo *et al.*, 2009). It is therefore a major source of income for the rural farmers. Several factors influence adoption of recommended onion production practices. The identification and understanding of these factors will certainly provide valuable and significant information for policy formulation. Assessing the appropriateness of potential new technologies or practices increases the likelihood that they will be adopted, and if necessary modify them to suit farmers' needs better.

Agricultural technology or practice responds to farmers' concerns in specific ways. Any technology or practice used by farmers represents a particular way to solve one or several problems. The choice of one technology/practice over others is greatly influenced by the balance between its positive and negative characteristics; preferences, resources, and constraints that individual farmers face. Any new technology presented to farmers will either improve or substitute for the technological options they currently have. It is fundamental to identify these options and understand farmer's perceptions. Despite years of onion production in Nigeria, the yield is still very low (15ton/ha) compared to other regions with potential yields of 70ton/ha. This can be attributable to poor adoption of improved production practices by the farmers (NAERLS, 2014; Nagaraj and Katteppa, 2002). Moreover, a lot of recommended practices or technologies have been developed by Research institutes in Nigeria (Bawa and Ani, 2014; Komolafe *et al.*, 2010; and Nagaraj and Katteppa, 2002). The recommended onion production practices (ROPPs) available in the study area include: (i) Improved onion varieties; (ii) Spacing 15cm x 20cm, 15cm x 15cm to 20cm x 20cm; (iii) Planting method (seed or sets); (iv) Weed management; (v) Transplanting (mid-June or Nov/Dec) (vi) Fertilizer application (20-25 ton/ha of farm yard manure (FYM) or 300 kg/ha NKP 15-15-15); (vii) Pest and disease control (use of *Toxipkan*, *Malathion*, *Heptactilor dieldrin*, *Parathion*); and (viii) Harvesting (onions are hand pulled and kept in shelter; bulbs are left in the shelter to cure for two weeks). However, low yields among onion farmers persist despite the availability

and introduction of improved practices. The study will provide information on the index of adoption and constraints encountered in the adoption of recommended onion production practices to facilitate adjustments that improves productivity and farm income. Besides, it would help stakeholders (private and public sector) in designing policies and intervention programs that will improve the yield, income and standards of living of farmers engaged in onion production. Based on the foregoing this study analyzed the adoption index of ROPPs and the correlation matrix among smallholder farmers. It specifically identifies ROPPs available in the area, evaluates the adoption index of ROPPs, and estimates the correlation matrix of multivariate factors among smallholders.

Materials and Methods

Study Area

This study was carried out in Dambatta, Kano State, Nigeria. Dambatta Local Government Area (LGA) has coordinates between latitude 12°25'N and longitude 8°35'E; with a land mass of 2732km² (NBS, 2012). It has a land mass area of 305.51km². Average daily temperature and rainfall are 26.8°C and 700mm respectively (NBS, 2012). Most of the populations are smallholder farmers; moreover, villages that are located close to the nearby oasis irrigation project engage in the production of rice, pepper, onions, tomatoes and wheat. In addition, they rear livestock like; goats, sheep and poultry.

Sampling Techniques

Primary data used for this study was derived through field survey, using well-structured questionnaires. Multi-stage sampling technique was employed in the selection of respondents for this study. In the first stage Dambatta Local Government Area (LGA) was purposively selected. The second stage involved the systematic random selection of four districts in the study area out of ten (10) due to the prevalence of onion production in these districts, which include Dambatta-Yamma, Dambatta-Gabas, Ajumawa and Gwarabjawa. The final stage involved the random selection of respondents from a sample frame of 1,182 onion famers compiled by the Agricultural Development Project (ADP) at the LGA in synergy with local enumerators; hence, at constant sampling proportion of 9% (0.09) a sample size of 100 onion farmers was derived and validated using raosoft sample size calculator at 95% confidence level and 10% margin error as adapted from Onuwa *et al.*, 2022.

Analytical Techniques

Data for the study were analyzed using descriptive statistics (percentages and frequency distribution), adoption index and multivariate correlation techniques.

Adoption Index

The index of adoption of ROPPs was measured using the adoption index. Adoption index was computed for individual farmer following Saka and Lawal (2009) whereby adoption index (B_i) is presented in equation (1) as follows:

$$B_i = \sum (R_i/R_T) \dots\dots\dots (1)$$

Where:

B_i = the adoption index of ROPPs by i_{th} farmer; R_i = number ROPPs adopted by i_{th} farmer; and R_T = Total number of ROPPs available to the i_{th} farmer.

$i = (1 \dots\dots\dots n)$

For this study, an index of ≤ 0.33 indicates low adoption, while an index of ≥ 0.55 indicates high adoption. Some of the recommended onion production practices (ROPPs) in the study area include: (i) Improved onion varieties; (ii) Plant spacing (15cm x 20cm, 15cm x 15cm to 20cm x 20cm); (iii) Planting method (seed or sets); (iv) Weed management; (v) Transplanting (mid-June or Nov/Dec) (vi) Fertilizer application (20-25 ton/ha of farm yard manure (FYM) or 300 kg/ha NKP 15-15-15); (vii) Pest management and disease control (use of *Toxipkan*, *Malathion*, *Heptactilor dieldrin*, *Parathion*); (viii) Harvesting techniques (bulbs are hand pulled and kept in shelter to cure for two weeks); and (ix) Storage methods.

Multivariate Correlation

The correlation analysis was used to analyze the multivariate relationship between adoption cost (x) (₦), adoption index (y) (ratio/index) and farm output (z) (kg), where multiple correlation coefficients (R , r) are defined in equation (2), following Gujarat (2004) and Wikipedia (2018):

$$R_{z, xy} = \sqrt{r^2_{xz} + r^2_{yz} - 2r_{xz} \cdot r_{yz} \cdot r_{xy} / 1 - r^2_{xy}} \dots\dots\dots (2)$$

Where:

$R_{z, xy}$ = multiple correlation coefficient between dependent and independent factors; z = dependent variable; x = independent variable; y = independent variable; r^2 = coefficient of determination; r^2_{xz} = coefficient of determination between x and z ; r^2_{yz} = coefficient of determination between y and z ; r^2_{xy} = coefficient of determination between x and y ; r_{xz} = correlation coefficient between x and z ; r_{yz} = correlation coefficient between y and z ; and r_{xy} = correlation coefficient between x and y .

Decision Rule: The strength of relationships based on the correlation coefficient (r) is expressed as follows: $\geq \pm 0.7$ (strong linear relationship); $\pm 0.4 - 0.69$ (moderate linear relationship); and $\leq \pm 0.39$ (weak linear relationship).

Results and Discussion

Recommended Onion Production Practices (ROPPs)

Table 1: Distribution Based on Production Practices Adopted

Production practice	Frequency*	%	Ranking
Improved onion varieties	78	78	1 st
Plant spacing	69	69	2 nd
Planting method	55	55	3 rd
Weed management	50	50	4 th
Fertilizer application	44	44	5 th
Adjustments in transplanting	31	31	6 th
Harvesting techniques	23	23	7 th
Storage methods	11	11	8 th
Pest management and disease control	5	5	9 th

Source: Field Survey, 2020; * = Multiple response

Table 1 revealed the various production practices adopted by onion farmers in the study area. The significant practices adopted among onion farmers include improved onion varieties (78%), plant spacing (69%), planting method (55%), weed management (50%), fertilizer application (44%), adjustments in transplanting (31%), harvesting techniques (23%), storage methods (11%) and pest management and disease control (5%). These production practices when adopted significantly affect onion yield and enhanced the level of farm productivity. However, low adoption of onion production practices in the study area among the respondents was observed. This result corroborates with Sabo and Dia (2009); Nagaraj and Katteppa (2002) who reported similar outcomes in their respective studies on adoption of production technologies and agricultural practices.

Index of Adoption of Production Practices

Table 2: Distribution based on the Index of Adoption of Production Practices

Adoption index	Frequency	%
Low adoption index (≤ 0.33)	72	72
High adoption index (≥ 0.55)	28	28

Source: Field survey, 2020.

The result in Table 2 reveals that most (72%) of the farmers have low adoption index of ≤ 0.33 ; while, 28% have high adoption index of ≥ 0.55 . Moreover, it was evident that several technologies for improved agricultural technologies for onion farming are available in the area; however, the index of adoption of these technologies was very low and not satisfactory. This trend was responsible for the existing low farm productivity of this crop in the area; as observed in previous studies (Bonabana- Wabbi, 2002). It is well known that in sub-Saharan Africa low agricultural productivity by smallholder farmers have been attributed to poor adoption of improved agricultural technologies. Therefore, identification of factors hindering adoption/uptake of improved agricultural technologies is pertinent and particularly critical to agrarian communities (Adesope *et al.*, 2012; Bonabana- Wabbi, 2002).

Correlation of Multivariate Factors

Table 3: Correlation Coefficient Matrix

Factors	Farm Output (z)	Adoption cost (x)	Adoption index (y)
Farm Output (z)	1.00		
Adoption Cost (x)	-0.53*	1.00	
Adoption index (y)	0.71*	-0.82*	1.00

Source: Field Survey, 2020; *Correlation coefficient (r) is significant at 5% level (2-tailed).

Table 3 revealed that the result of the correlation analysis was significant at 5% level of probability. This suggests that a significant correlation between multivariate factors (output, adoption cost and adoption index) exists. The estimated correlation coefficient between x and z (r_{xz}) was -0.53; which suggests a moderate and inverse linear relationship between the factors. This implies that as adoption cost increases technology adoption decreases and consequently overall farm output declines. The estimated correlation coefficient between y and z (r_{yz}) was 0.71 which suggests a strong linear relationship between the factors. This implies that as the adoption index increases the level of farm productivity (output) tend to also increase. The estimated correlation coefficient between x and y (r_{xy}) was -0.82, which suggests a strong and inverse linear relationship between the factors. This implies that as adoption cost increases the index of adoption of ROPPs among the farmer's declines. The implication of these findings is that adoption of ROPPs tends to increase the level of farm productivity in the study area and hence

improve agricultural sustainability. Furthermore, the cost of production practices determines farm level adoption. Thus, this result corroborates with Matata *et al.* (2010) and Yasin (2003) who also evaluated the correlation of similar multivariate factors in their respective studies on adoption of production practices and technology among farmers.

Conclusion and Recommendations

This study analyzed the adoption index of ROPPs and the correlation of multivariate factors among smallholders. The findings revealed that there were several ROPPs available in the study area; however, adoption of these production practices was relatively low. Moreover, a low index of adoption of ROPPs among respondents in the study area was very prevalent. Furthermore, a significant linear relationship between the multivariate factors (farm output, adoption cost and adoption index) exists; thus, positive correlates facilitate agricultural sustainability. Based on the foregoing, this study recommends formulation and implementation of policies that will subsidize the cost of adoption of ROPPs; improved farmer's access to modern technologies, agricultural credit and farm capital; to enable smallholders adopt more options of ROPPs. Further, improving extension services by establishing agro service centers in the area will also facilitate technology transfer. Additionally, adequate farm labor supply and tenure policy modification facilitates technology intensification for agricultural sustainability and expansion of farm holdings for agricultural commercialization.

Abstract

The study consists of the determination and evaluation of the waste composition, leachate and biodegradable waste characterization in the dump site in Akhisar district, Manisa. Considering the wastes to be disposed of between 2018 and 2020 on the site, biomass energy potential based on biogas content and methane gas has been determined using the LandGEM model. It was seen that 59% of the waste brought to the site for disposal was biodegradable and 26% were composed of basic recyclable materials. The water content of the biodegradable waste in the site was 73% on average and the organic content of the dry matter was 68%. The mean of the stored waste height was 2.5 m, and there was no methane gas detected in the profile. However the acidic and acetogenic bacteria were observed in the profile samples. The BOD/COD value in the leachate was calculated as 0.37 and it is concluded that a conventional biological treatment would not be suitable. Approximately 207000 tons of waste will come to the landfill between 2018 and 2020. According to the LandGEM model, the methane gas potential of the stored waste is 5,288.383 m³ in total and the highest methane gas production is found to be 418000 m³ in 2021. These values express the gross energy generation potential of 1.694 GWh and net 96.69 KW electrical energy.

Düzensiz Depolama Sahalarının Enerji Potansiyellerinin Değerlendirilmesi: Akhisar- Manisa Örneği

Özet

Çalışmada, Manisa Akhisar ilçesindeki düzensiz depolama sahasına kabul edilen evsel atık kompozisyonu belirlenmiş, atığın biyo-bozunur kısmının ve atıktan oluşan sızıntı suyunun özellikleri değerlendirilmiştir. Sahada 2018-2020 yılları arasında bertaraf edilecek atıklar dikkate alınarak, biyokütle kaynaklı enerji potansiyeli LandGEM modeli kullanılarak tespit edilmiştir. Sahaya ulaşan atığın %59'u biyo-bozunur özellikte olup, %26'sı temel geri dönüşümlü malzemelerden oluşmaktadır. Biyo-bozunur atığın ortalama su içeriği %73, kuru maddenin organik içeriği ise %68'tir. Sahada depolanmış haldeki atık kütlelerinin ortalama yüksekliği 2.5 m'dir, atık kütlelerinde metan varlığına rastlanmamış olup asidojenik ve asetojenik bakteriler mevcuttur. Sızıntı suyunda belirlenen BOİ/KÖİ değeri (0.37) geleneksel bir biyolojik arıtmanın uygun olmayacağı göstermektedir. Depolama sahasında 2018-2020 yılları arasında yaklaşık 207,000 ton atık gelecektir. LandGEM modeline göre, depolanacak atığın metan gazı potansiyeli toplamda 5,288,383 m³, en yüksek metan gazı üretimi ise 2021 yılında 418,000 m³ olarak bulunmuştur. Depolanacak atıkta bulunan biyokütlelerin enerji üretim potansiyeli brüt 1.694 GWh olup, bu değer net 96.69 KW elektrik enerjisine karşılık gelmektedir.

Anahtar kelimeler: katı atık, düzensiz depolama, biyogaz, enerji, Akhisar

Giriş

Türkiye'de, 82 milyona ulaşan nüfus, ilerleyen endüstrileşme ve yaşam standartları, atık yönetimi uygulamalarının önemini arttırmaktadır. Türkiye İstatistik Kurumunun verilerine göre 2018 yılında yaklaşık 32 milyon ton atık belediyeler tarafından toplanmış olup, bunun %67'si düzenli depolama sahalarında bertaraf edilmiştir. Çevre mevzuatındaki gelişmeler, özellikle atık konusundaki yaptırımların artmasının bir sonucu olarak, 2018 yılında toplanan atığın %12'si çeşitli geri kazanım işlemleri ile ekonomiye kazandırılmıştır. Ancak halen, Türkiye'de oluşan atıkların %20'si belediyelerin işletmekte olduğu sahalarda kontrolsüz bir biçimde bertaraf edilmektedir (TÜİK, 2020)

Manisa, Türkiye'nin batısında ve toplam nüfus bakımından İzmir'den sonra Ege Bölgesi'nin 2. büyük ili ve ticaret merkezidir. Kent, 2012 yılında çıkarılan 6360 sayılı kanun ile büyükşehir olmuştur (Resmi Gazete, 2012). 2018 yılı toplam nüfusu yaklaşık 1.43 milyon olan Manisa'da, Büyükşehir Belediyesinin 2018 yılında bertaraf etmek üzere topladığı atık miktarı 642,222 ton olarak kaydedilmiştir. Toplanan atıkların %63'ü biyo-bozunur özelliği olan yiyecek atıkları olarak tespit edilirken, %20 si plastik, cam, karışık kağıt-karton ve metalden oluşan geri kazanılabilir atıklar grubuna girmektedir (ÇŞB, 2020). Şehirde 2017 yılının son aylarında hizmete giren Uzunburun Entegre Atık Bertaraf Tesisi ile geçmişte sayısı 70 olan düzensiz depolama sahaları kapatılmış olup, sadece dört adet belediye çöplüğü atık kabulüne devam etmektedir. Mevcut durumda kişi başı atık üretim hızı 1.25 kg/gün olan şehirde, toplanan atığın %47'si 2017 yılında işletmeye alınan entegre sistemde bertaraf edilmekte olup, %6.3 ü geri kazanılmaktadır. Bununla beraber, oluşan atıkların %46'lık büyük bir kısmı Büyükşehir

Belediyesine ait diğer sahalarda depolanmaya devam etmektedir (TUİK, 2020). Bu sahalardan en büyüğü Manisa merkezine karayolu ile 48 km mesafede bulunan Akhisar Atık Depolama Sahasıdır. İlçede yaşayan 171,381 kişilik nüfusa ait atıkların getirildiği bu saha, depolama amaçlı olarak kullanılabilir yaklaşık 13 hektar alana sahiptir. Sahanın 2020 yılı sonuna kadar aktif olacağı bilgisi Manisa Belediyesi tarafından sahayı işletme yetkisi verilen firma tarafından beyan edilmektedir.

Sunulan çalışmada, sahaya ulaşan atıkların kompozisyonu gelir seviyesine bağlı olarak belirlenecek, sahadaki anaerobik bozunma değerlendirilecek ve atığın biyo-bozunur kısmı ile atıktan kaynaklanan sızıntı suyunun karakterizasyonu gerçekleştirilecektir. Ayrıca, sahada tesis edilebilecek biyokütle enerji üretim tesisi için alandaki mevcut ve gelecekte depolanacak atıkların enerji potansiyeli belirlenecektir. Çalışma kısa ve orta vadede kullanım dışı kalacak kontrolsüz atık depolama sahalarının rehabilitasyon planlarına esas hızlı bir karakterizasyon örneği oluşturmada, ayrıca bu tür sahalardaki atık kaynaklı biyokütlenin enerji potansiyelinin değerlendirilmesine yönelik fizibiliteye esas verilerin belirlenmesinde yol göstermektedir.

Materyal ve Yöntem

Örnekleme ve kompozisyon belirleme

Atık örnekleme Temmuz 2018'de Akhisar Atık Depolama Sahası'nda gerçekleştirilmiştir. Atıkların karakterizasyon çalışması; düşük, orta ve yüksek gelir grupları ile çarşı atığını temsil edecek şekilde yapılmıştır. Bunun için, atık sahasına çeşitli gelir seviyesi bölgelerinden gelen evsel atık toplama ve taşıma kamyonları kaydedilmiş, her gelir seviyesini ve çarşı bölgelerini temsil edecek ikişer bölge belirlenerek, bu bölgelerden gelen atıklar depolama sahası atık kabul noktası yakınında kalın naylon bir tabaka ile kaplanmış bir bölgeye boşaltılmıştır. Atık yığınları, elle bileşenlerine ayrıldıktan sonra plastik kovalar ile tartılarak kompozisyonu belirlenmiştir. Kompozisyon belirleme çalışmasında atıkta bulunan 13 ayrı bileşenin (biyo-bozunur, kağıt-karton, PET plastik, PE-Nylon plastik, diğer plastik, cam, metal, poşet türü kompozit, tetrapak kompozit, tekstil, hijyenik, tehlikeli, diğer yanabilirler) tespiti yapılmıştır. Yoğunlukla mutfak ve bahçe atıklarını içeren kalan kısım önce tartılmış, ardından çeyrekleme yöntemi ile azaltılarak laboratuvar örneği elde edilmiştir. Laboratuvar örnekleri (≥ 5 kg) plastik poşetler ile hızlı bir şekilde laboratuvara iletilerek analizlere kadar $+4^{\circ}\text{C}$ 'de saklanmıştır.

Sahada halihazırda bulunan atığın karakterizasyonu için de profil örnekleme gerçekleştirilmiştir. Bu amaçla yaklaşık 2.5 m yüksekliğe ulaşmış durumda bulunan atık kütesinden kepçe makinası yardımı ile en yukarıdan tabana kadar bir profil açılarak derinlik boyunca her 0.5 m'de bir örnek alınmıştır. Profil örnekleri derhal kalın plastik poşetlere alınmış, poşetler sıkıştırılarak içindeki hava uzaklaştırılmış, poşetlerin ağzı bağlanarak derhal laboratuvara ulaştırılmış, laboratuvar ortamına ulaşan poşetlerin içinden azot gazı geçirilerek olası hava varlığı uzaklaştırılmıştır. Sahada ayrıca profil derinliği boyunca 50 cm uzunluğunda bir kontrol çubuğu kullanılarak atık kütlesi içindeki biyogazın metan içeriği Dräger marka PacEx 2 model gaz ölçüm cihazı kullanılmak suretiyle belirlenmiştir.

Sahada kontrolsüz biçimde depolanan atıklardan sızan sular, sahanın düşük kotlu bir bölgesinde doğal bir sızıntı suyu göleti oluşturmuş olup, sızıntı suyu örneği plastik bir numune şişesine alınarak $+4^{\circ}\text{C}$ 'de laboratuvara ulaştırılmış ve saklanmıştır.

Biyo-bozunur atık karakterizasyonu

Laboratuvara ulaştırılan biyo-bozunur özellikteki atıklar öncelikle homojenize hale getirilmiş, ardından atığın su içeriği gravimetrik metod kullanılarak, atığın 105°C de kurutulması yoluyla belirlenmiştir (ASTM, 1993). Atıkların organik madde içerikleri de gravimetrik bir yöntem olan TS 8336 'ya göre belirlenmiştir (TSE, 2008). Kuru atığın kalorifik değer analizi ASTM D5468-02 standardına göre kalorimetre bombası (İKA, C200) kullanılarak yapılmıştır (ASTM, 2007).

Sızıntı suyu karakterizasyonu

Atık sahasından alınan sızıntı suyunun pH, elektriksel iletkenlik ve toplam çözünmüş katı madde değerleri, WTW Multi 3620 İDS SetG marka multimetre ile yerinde ölçülmüştür. Örnekteki biyokimyasal oksijen ihtiyacı (BOİ) değeri, Velp BOD Evo 6 Sensor Set kullanılarak belirlenmiş olup, kimyasal oksijen ihtiyacı (KOİ) kapalı çevrim (closed reflux) kolorimetrik metod ile tespit edilmiştir (APHA, 1995).

Profil atığı örneklerinde anaerobik mikroorganizmaların tespiti

Profil örneklerinde bulunan anaerobik bakteriler asidojenik, asetojenik ve metanojenik bakteriler olarak ayırt edilmiş olup, bu kültürler için tanımlanmış besiyerleri kullanılarak tespit edilmiştir (Sponza ve Cigal, 2008). Numune içindeki organizmalar, petri kaplarında $+37^{\circ}\text{C}$ 'de 15 gün boyunca inkübe edilmiştir ve en muhtemel sayı (EMS) yöntemi ile sayıları belirlenmiştir (Franson vd, 1995).

Gaz Potansiyeli Belirleme

Yıllar içinde oluşacak metan gazı miktarını hesaplamak için LandGEM v.3.0 modeli kullanılmıştır (USEPA, 2005). Modelin çalıştırılabilmesi için, atıkların depolanmaya başladığı yıl, atıkların depolanmasının bittiği yıl, her yıl için oluşan biyo-bozunur atık miktarı, metan oluşum hızı (k), metan oluşum kapasitesi (L₀), depo gazı içindeki metan gazı oranı ve diğer organik bileşiklerin oranı verilerine ihtiyaç duyulmaktadır (Güven, 2019). Bu veriler modelde kullanılarak yıllar içinde oluşan toplam biyogazın ve metan gazının miktarı hesaplanmaktadır.

Bulgular ve Tartışma

Atık kompozisyonu

Düşük, orta ve yüksek gelir seviyeleri ile çarşı bölgesinden alınan atık örneklerinde yapılan kompozisyon belirleme çalışmaları sonucunda atık bileşenlerinin toplam atık içindeki payları Tablo 1 ile sunulmuştur. İlçede düşük, orta ve yüksek gelir seviyelerinin nüfus içindeki dağılımının sırasıyla %11.6, %59.1 ve %29.3 olduğu ve çarşı bölgesi atıklarının toplam atık içindeki payının %5 olduğu dikkate alınarak ağırlıklı ortalama hesaplanmıştır (TUİK, 2018). Buna göre Akhisar'da oluşan atıkların %59'u biyo-bozunur nitelikte olup, bu durum Türkiye ve bilhassa Ege Bölgesi geneli ile uyumludur (Akinci vd, 2012). Depolama sahasına gelen atığın %26'sını temel geri dönüşümlü malzemeler olan kağıt-karton, plastikler, cam ve metal oluşturmaktadır. Plastikler yaklaşık %12 gibi bir payla atık içinde önemli bir yer tutmaktadırlar. Plastiği takiben cam atıkların payı %7.9 olarak belirlenirken, kağıt-karton %4.9'luk bir paya sahiptir. Metal atıklar, metalin piyasa değerinin yüksek olması sebebi ile muhtemelen sokak toplayıcıları tarafından titizlikle atıktan ayrılmakta ve depolama sahasına gelen atıkta ancak % 1.7'lik bir paya sahip olabilmektedir.

Tablo1. Akhisar ilçesi atık kompozisyonu, % dağılımı

Atık Bileşeni	Düşük Gelir	Orta Gelir	Yüksek Gelir	Çarşı	Ağırlıklı Ortalama
Biyo-bozunur	65.45	57.33	60.84	55.67	58.94
Kağıt-karton	4.06	4.71	3.65	9.91	4.88
Plastik-PET	1.08	0.80	1.01	5.09	1.31
Plastik-PE-Nylon	5.42	8.29	8.64	8.12	8.07
Plastik-diğer	1.89	2.70	2.29	4.80	2.72
Cam	7.33	9.20	6.38	5.30	7.87
Metal	0.16	1.53	0.99	1.77	1.27

Tehlikeli	0.28	2.27	1.18	0.27	1.58
Diğer yanabilirler	2.29	3.38	0.49	0.34	2.20
Toplam	100.0	100.0	100.00	100.0	100.0

Biyo-bozunur atık özellikleri

Temel olarak yiyecek artıkları, meyve sebze kabukları/köklerinden ibaret olan biyo-bozunur atıklar sahaya gelen ve kompozisyonu belirlenen atıkların ayıklanması suretiyle örneklenmiştir. Tablo 2'den de görüleceği üzere, ilçeden toplanarak sahaya gelen biyo-bozunur atıkların su içeriği %69-75 arasında bulunmuştur. Atığın organik madde içeriği de kuru maddede ortalama %68 tir. Atığın kalorifik değeri, özellikle orta ve yüksek gelir seviyelerinde oldukça yüksektir. Bu da ortalama değeri yükseltmektedir.

Tablo 2. Biyo-bozunur atık özellikleri

	Su Muhtevası, %	Organik Madde, % km	Kalorifik Değer, kcal/kg
Düşük Gelir Seviyesi	69.60	57.95	2888
Orta Gelir Seviyesi	75.44	62.76	3888
Yüksek Gelir Seviyesi	69.44	84.24	4453
Çarşı	73.31	63.98	3178
Ağırlıklı Ortalama	73.02	68.27	3899

Profil Atık Özellikleri

Sahada depolama işlemi ile 2.5 m derinliğe ulaşan yeni atık tabakasında açılan profil ile beş farklı derinlikten atık örnekleri alınmış olup, bu örneklerin genel özellikleri Tablo 3 ile sunulmuştur.

Profil örneklerinde su içeriğinin sahaya kabul edilen biyo-bozunur atığa göre daha düşük olduğu görülmektedir (%46.64). Bunun iki temel sebebi mevcuttur; bunların ilki depolanmış kütlenin üst tabakalarında yer alan atığın alt tabakaları bir miktar sıkıştırması sonucu gerçekleşen su kaybıdır. İkinci sebep ise, atığın sahaya ilk ulaştığı dönemde boşluklarında bulunan havanın içerdiği oksijen sebebi ile biyo-bozunur maddede gerçekleşen aerobik

dekompozisyon ve bunun sonucunda yükselen sıcaklık ile atık kütleindeki suyun bir kısmının buharlaşmasıdır. Depolanmakta olan atık, Tablo 2’de analiz sonuçları sunulan biyo-bozunur atık gibi diğer atık bileşenlerinden ayıklanmış halde değildir. Bunun yanı sıra, saha toprağı ile gelişigüzel karışmış haldedir, ayrıca su muhtevasında görülen azalmanın sebeplerinden biri olan atığın sahaya ilk kabul edildiği dönemde gerçekleşen aerobik dekompozisyon da organik madde içeriğinde bir azalmaya yol açmaktadır. Bu sebeple profil atıklarında organik madde oranı ortalama %40.97 gibi hanelerden toplanan atığa göre daha düşük olarak belirlenmiştir. Profil atıklarının kalorifik değeri de sahaya yeni ulaşan hane atıklarından örneklenen biyo-bozunur atıklar kadar yüksek bulunmamıştır. Bu durum da yukarıda belirttiğimiz sahadaki aerobik üst tabakada gerçekleşen biyokimyasal reaksiyonlar sonucu kaybedilen organik karbondan kaynaklanmaktadır. Profil boyunca alınan metan gazı ölçümleri sahada % 0 ila %2 arasında metan gazı varlığını göstermiştir. Bu bulgular sahanın henüz anaerobik koşulları sağlayamadığını ve hatta depolanan kütleye atmosferden doğrudan veya yağışlar ile dolaylı olarak hava (oksijen) girişinin söz konusu olabileceğini göstermektedir.

Tablo 3. Profil atık özellikleri

Profil Derinliği	Su Muhtevası, %	Organik Madde, % km	Kalorifik Değer, kcal/kg
-0.50 m	25.87	14.69	1047
-1.00 m	55.01	54.14	3135
-1.50 m	51.87	53.29	2979
-2.00 m	43.90	38.73	1698
-2.50 m	56.55	43.99	2001
Ortalama	46.64	40.97	2172

Profil örneklerinde anaerobik bakteri popülasyonu belirlenmiştir. Asidojenik, asetojenik ve metanojenik bakterilerin profil örneklerindeki sayım sonuçları Tablo 4 ile sunulmaktadır. Sonuçlara göre, depolama alanının en derin noktası olan yüzeyden 2,5 m derinlikte dahi henüz metanojenik bakterilerin aktivite göstermeye başlamadığı anlaşılmaktadır. Ortamda faaliyet gösteren asidojenik bakterilerin popülasyonunun derinlikle azalmakta olduğu görülmektedir. Asidojenik fazda organik moleküllerin uçucu yağ asitlerine dönüşmesini takiben asetojenik faz başlamaktadır. Asetojenik bakterilerin popülasyonlarının derinlikle artıyor olması olumlu olarak değerlendirilmiştir. Zira metanojenik bakterilerle asetojenik bakteriler arasında simbiyotik bir ilişki vardır (Filibeli vd., 2000). Asetojenik bakterilerin derinlikle artış göstermesi metanojenik bakterilerin sistemde faaliyete başlamaları için gerekli ortamın sağlanmaya başlandığının bir göstergesidir.

Tablo 4. Profil örneklerinde anaerobik bakteri sayısı

Profil Derinliği	Bakteri türü	EMS/100 ml
-0.50 m	Asidojenik	33
	Asetojenik	8
	Metanojenik	<1.8
-1.00 m	Asidojenik	20
	Asetojenik	10
	Metanojenik	<1.8
-1.50 m	Asidojenik	17
	Asetojenik	15
	Metanojenik	<1.8
-2.00 m	Asidojenik	13
	Asetojenik	15
	Metanojenik	<1.8
-2.50 m	Asidojenik	12
	Asetojenik	24
	Metanojenik	<1.8

Sızıntı suyu özellikleri

Sahadan alınan sızıntı suyu örneğinin pH değeri 7.35 iken, iletkenlik 47700 $\mu\text{S}/\text{cm}$ gibi oldukça yüksek bir seviyede tespit edilmiştir. Sızıntı suyunda toplam katı madde seviyesi 63117 mg/l iken çözünmüş katı madde 23900 mg/l’dir. Yani sızıntı suyunun bir litresinde 63 g katı madde mevcut olup, bunun %38’lik bir kısmı çözünmüş haldedir (~24 g). Bulunan çözünmüş ve toplam katılara ait yüksek konsantrasyonların yanı sıra sızıntı suyunda BOİ (12900 mg/l) ve KOİ (34300 mg/l) değerleri de oldukça yüksektir. Suyun BOİ/KOİ oranı 0.37 olup, bu oran atıksuyun biyolojik sistemlerle arıtılabilirliğinin iyi bir göstergesi olan BOİ/KOİ >0.5 değerinden düşüktür (Genç, 2008). Bu bulgu, sızıntı suyunun geleneksel biyolojik arıtma yöntemleri ile arıtılmasının uygun olmadığını göstermektedir.

Depolama sahasının metan gazı potansiyeli**LandGEM modelinde kullanılan verilerin hesaplanması**

Model çalıştırılmadan önce, sahada 2018-2019-2020 döneminde depolanacak biyo-bozunur atık miktarı belirlenmiştir. Bunun için Akhisar ilçesinin son 5 yıllık nüfus verilerinden faydalanarak 2019 ve 2020 yıllarına ait nüfus projeksiyonu lineer regresyon ile hesaplanmıştır (TUIK, 2020). İl Çevre Durum Raporlarına göre, Akhisar’da kişisel atık üretim hızı, 2018 yılı için 1.08 kg/kşi.gün iken, bu değer 2015-2018 yılları için ortalama 1.1 kg/kşi.gün olarak hesaplanmış olup, düzenli bir artma veya azalma eğilimi göstermemektedir (ÇŞB, 2019). Bu sebeple 2019-2020 yılları kişisel atık üretim hızı 1.1 kg/kşi.gün olarak kabul edilmiştir. 2016 yılında Çevre ve Şehircilik Bakanlığı (mülga Çevre ve Orman Bakanlığı) tarafından yayımlanan Katı Atık Ana Planı’nda, Ege Bölgesi’nde İzmir dışındaki iller, 1c model grubuna dahil edilmiş olup, 2018 yılı için biyolojik olarak ayrışabilir atıkların oranı %58.69 olarak öngörülmüştür (ÇOB, 2006). Mevcut çalışmamızda ise hanehalkı atık kompozisyonu belirlenerek, sahaya gelen atığın %58.9 unun biyo-bozunur malzeme olduğu belirlenmiş olup, tespit edilmiş olan değer Katı Atık Ana Planı öngörülleri ile birebir örtüşmektedir. Modelde kullanılacak biyo-bozunur atık miktarı 2019-2020 yılları için %58.9 oranı kabul edilerek hesaplanmıştır. Bu durumda 2018-2020 yılları arasında sahaya toplam 206,955 ton atık gelecek olup bu miktarın 121,896 tonu biyo-bozunur atık olacaktır. Hanehalkı biyo-bozunur atık analizlerinin sonuçlarından yararlanarak modelde atığın ortalama su içeriğinin %73 olduğu kabul edilmiştir. Anaerobik bozuma hızı (k , yıl⁻¹), atık depolanmaya başladıktan hemen sonra biyogaz üretiminin başladığı birinci derecede reaksiyondaki ayrışma hızıdır. Çalışmada k değerleri, Kanada Çevre Bakanlığı için Conestoga-Rovers & Associates (CRA) isimli kuruluş tarafından hazırlanarak yayınlanan bir yaklaşım ile, illerdeki yıllık ortalama yağış verilerine dayanarak seçilmiştir (CRA, 2009). Bunun için, Manisa iline ait son iklim periyoduna (1930-2018) göre kaydedilmiş ortalama yıllık yağış verileri kullanılmıştır [20]. Buna göre yıllık ortalama yağış yüksekliği 727.9 mm olan Manisa ili için k değeri 0.09 yıl⁻¹ olarak kabul edilmiştir. Metan üretim potansiyeli (L_0 , m³ CH₄/ton kuru atık), birim atık kütlelerinden elde edilebilecek metan potansiyelini ifade etmektedir. Bu değer, atığın kompozisyonuna ve organik madde içeriğine bağlı olarak değişim göstermektedir. Hanelerden sahaya ulaşan biyo-bozunur atıkta elde edilen ortalama organik madde oranı %68.27 (km) olarak belirlenmiştir. Organik madde kütlelerinin yaklaşık olarak %40’lık bir kısmının ayrışabilir organik karbon olduğu bilinmektedir. Bu durumda, Akhisar ilçesinde üretilen bir ton kuru biyo-bozunur atığın metan üretim potansiyeli 254.8 m³ olmaktadır. Bununla birlikte, bu çalışmada LandGEM modeli ile yürütülen hesaplamalarda emniyetli tarafta kalmak amacı ile L_0 değeri için CRA tarafından biyo-bozunur atıklar için önerilen 160 m³ CH₄/ton kuru atık değeri kullanılmaktadır [19]. Depolama gazı içindeki ortalama metan gazı oranı, %50 olarak kabul edilmiştir (Themelis ve Ulluo, 2007). LandGEM Modelinde kullanılan değerler Tablo 5 ile özetlenmiştir.

Tablo 5. LandGEM modelinde kullanılan değerler

	2018	2019	2020
Akhisar İlçesi Nüfusu (kişi)	171,381	172,574	174,561
Kişisel Atık Üretim Hızı, q =kg/(kişi.gün)	1.08	1.1	1.1
Kuru biyo-bozunur atık kütleleri (ton)	10,743.81	11,018.94	11,145.82
k (yıl ⁻¹)	0.09		
L_0 (m ³ CH ₄ /ton kuru atık)	160		

LandGEM modeline göre düzensiz depolama sahasında oluşan metan gazının ve toplam gazın yıllar içindeki değişimi Şekil 1 ile gösterilmektedir. 100 yıllık bir öngöründe, sahaya gelen biyo-bozunur atıkların metan gazı oluşturma potansiyeli 5288383 m³ olarak bulunmuştur. Çalışmada, mevcut sahaya ilave üç yıllık bir depolama süresi öngörüldüğü için, yıllık bazda oluşacak en fazla metan gazı miktarını 2021 yılı için 418,000 m³ olarak gerçekleşeceği hesaplanmış olup, sahadaki metan gazı potansiyelinin %80’i ilk 20 yıl içinde açığa çıkacaktır. Akhisar evsel atık depolama sahasında oluşan metan gazının brüt enerji potansiyeli, gazın birim enerji değeri 8720 kcal/m³ esas alınarak hesaplanmıştır (Özal ve Alamur, 2018). Sahadaki gazın toplanma verimi %40 kabul edilmiştir. Depo gazından elektrik üretimi verimi, tesislerde kullanılan teknolojilere göre %20-42 arasında değişim göstermektedir (Güven, 2019). Hesaplamalarda, metandan elektrik dönüşüm verimi %40 ve bir yılda tesisin aktif çalışacağı saati gösterir kapasite faktörü %80 kabul edilmek suretiyle net enerji potansiyelleri belirlenmiş olup, elde edilen bulgular, 2018-2020 yılları arasındaki atık depolama işlemi için hesaplanmıştır. Buna göre, bir yılda oluşacak maksimum metan gazı miktarı dikkate alındığında 2021 yılında brüt 1.694 GWh enerji üretim potansiyelinden bahsedilebilmektedir. Aynı yıl üretilen metan gazının net elektrik enerjisi karşılığı ise 96.69 KW olacaktır (Tablo 6).

Şekil 1. Akhisar düzensiz depolama sahasında yıl bazında deponi gazı üretim miktarı

Tablo 6. Depolama sahasından elde edilebilecek brüt ve net enerji potansiyeli (2019-2033)

Yıllar	Metan Gazı Üretimi, m ³ /yıl	Brüt Enerji Potansiyeli-KWH/yıl	Net enerji potansiyeli KW
2019	148619.9	602774.7	34.4
2020	288254.2	1169105	66.7
2021	417625.3	1693811	96.7
2022	381680.8	1548026	88.4
2023	348830	1414790	80.8
2024	318806.6	1293020	73.8
2025	291367.3	1181732	67.5
2026	266289.7	1080021	61.6
2027	243370.4	987065.2	56.3
2028	222423.8	902109.7	51.5
2029	203280.1	824466.2	47.1
2030	185784.0	753505.4	43.0
2031	169793.8	688652	39.3
2032	155179.8	629380.6	35.9
2033	141823.7	575210.5	32.8

TEİAŞ 2011 yılında yaptığı bir araştırmada, iki çocuklu dört kişilik bir ailenin yıllık ortalama elektrik tüketimini belirlemiştir. Bu çalışma, öncelikli elektrik tüketimi ihtiyaçları olan aydınlatma, ısıtma ve elektrikli aletler gibi tüketimleri dikkate alarak, bir ailenin yıllık elektrik tüketiminin 3.036 MWh olduğuna işaret etmektedir (TEİAŞ, 2018). Bu durumda, sadece üç yıl boyunca sahada depolanacak biyo-bozunur atıktan üretilecek metan gazı, diğer kurulum ve işletme giderleri gibi ekonomik giderler dikkate alınmadığında, 2021 yılında Akhisar’da 223 ailenin yıllık elektrik ihtiyacını karşılayabilecek düzeyde olacaktır.

Sonuçlar

Sunulan çalışmada, Manisa ili Akhisar ilçesinde işletilen depolama sahasına ulaşan atıkların kompozisyonu belirlenmiş, halen depolanmış halde mevcut atıkların özellikleri belirlenmiş, oluşan sızıntı suyunun karakterizasyonu değerlendirilmiş ve burada tesis edilebilecek bir biyokütle enerji üretim tesisi için sahada 2018-2020 döneminde depolanacak olan atıkların biyogaz üretim ve metan gazına bağlı olarak enerji üretim potansiyeli tespit edilmiştir. Sahaya bertaraf için getirilen atığın %59’u biyo-bozunur türde olup bu atıkların su içeriği gelir

seviyesine göre %69-75 arasında değişmektedir. Depolama sahasına gelen atığın %26'sını ise temel geri dönüşümlü malzemeler oluşturmaktadır.

Sahadaki mevcut depolanmış atık kütlesi 2.5 m olup, profil alma çalışmaları sırasında bu atık kütlesi içinde metan varlığına rastlanmamıştır. Ancak metanojenik bakteriler için gerekli yaşam koşullarını oluşturan asidojenik ve asetojenik bakterilerin mevcut olduğu ve anaerobik ortama geçişi ifade eden asetojenik bakterilerin derinlikle arttığı belirlenmiştir. Metan varlığının mevcut olmaması ve depolanan kütledeki metanojenik bakteri sayısındaki yetersizlik, atık kütlesi yüksekliğinin anaerobik koşulları sağlamak için yeterli seviyelere erişmemiş olması ile açıklanabilir. Depolamanın sürdürülmesi ile atık yüksekliğinin en az 10 m'ye çıkarılması ve ara örtülemeye ilave olarak atığın sıkıştırılması, depolama sahalarında anaerobik ortamın sağlanması ve buna bağlı olarak metan gazı üretimi açısından önemlidir.

Depolama sahasına 2018-2020 yılları arasında yaklaşık 207,000 ton atık gelecek olup, bu miktarın 33,000 tonu kuru halde biyo-bozunur malzemedir. Bu veriler ışığında depolanan atığın metan gazı potansiyeli toplamda 5,288,383 m³ olarak bulunmuştur. LandGEM modeli ile atık kütlesi ve bölge özellikleri dikkate alınarak yapılan hesaplamalar sonucunda en fazla metan gazı üretiminin 2021 yılında 418,000 m³ olarak gerçekleşeceği belirlenmiş olup, bu değer brüt 1.694 GWh enerji üretim potansiyeli ve net 96.69 KW elektrik enerjisine eşdeğerdir. Hesaplanan bu enerji, Akhisar Bölgesi'nde 223 ailenin yıllık elektrik ihtiyacını karşılayabilecektir.

Çalışmada izlenen bulgular, sayıları giderek azalmakla beraber, ülkemizde halen işletilmekte olan düzensiz depolama sahalarının biyogaz potansiyellerinden yararlanma yoluna gidilmesi konusunun incelemeye değer olduğu sonucunu işaret etmektedir. Görülmektedir ki bu tür kontrolsüz evsel atık depolama sahaları hızlı bir şekilde karakterize edilebilir, enerji üretim potansiyelleri belirlenebilir ve gerekli fizibilite yapılarak ekonomik yönden uygun olan sahalar için rehabilitasyon çalışmalarının projelendirildiği dönemde gaz toplama ve dönüştürme sistemleri planlanarak enerji potansiyelleri değerlendirilebilir.

Teşekkür

Çalışmanın gerçekleşmesi için destek veren Manisa Geri Dönüşüm Enerji Üretim A.Ş.'ye teşekkür ederiz.

Abstract

Purslane (*Portulaca oleracea L.*) is an edible wild plant that is widely grown in the world, including Türkiye. Purslane plant, which is an important component of Mediterranean cuisine, can grow spontaneously in nature. There are various factors that directly or indirectly affect its growth and development in the environment in which it is grown. These factors, which we call soil stress conditions, are soil organic matter content, irrigation water amount and irrigation water salinity. In the current study, pot experiments were used to determine plant growth and characterization under these conditions. This work, which was carried out within the scope of the Prima 2019 Section 2 call, project number 19N594, was carried out in the 72 m² greenhouse established on the Dokuz Eylül University Tınaztepe campus. From the variables, organic matter was determined as 1%, 1.8% (control), 3% and 5%. 15 purslane seeds were planted in each pot and left to germinate. Irrigation water amounts were based on field capacities and irrigation water amounts were chosen as 100%, 75%, 50%, 30%, 15%. The last variable in the application was determined as the salinity of the irrigation water, and the conductivity of the prepared irrigation water was control (tap water-about 0.5 mS/cm), 4 mS/cm, 8 mS/cm, 16 mS/cm. All pots were prepared in four repetitions and the study was carried out with a total of 320 pots. Experiments were carried out for 90 days from the first planting. In the study, it was observed that the increase in organic matter increased plant germination. As the field capacity decreased, various decreases were observed in plant growth, but this was mostly observed at 30% and 15% field capacity. The negative effects of salinity on plant growth were observed at 8 mS/cm and 16 mS/cm values.

Keywords: Purslane, *Portulaca oleracea*, organic matter, drought, salinity

Özet

Semizotu bitkisi (*Portulaca oleracea L.*) ülkemiz de dahil olmak üzere dünya üzerinde yaygın bir yetiştirme olan yenilebilir yabani bir bitkidir. Akdeniz mutfağının önemli bir bileşeni olan Semizotu bitkisi doğada kendiliğinden yetişebilir. Yetiştirildiği ortamda büyümesini, gelişmesini doğrudan veya dolaylı bir şekilde etkileyen çeşitli faktörler vardır. Toprak stres koşulları olarak adlandırdığımız bu faktörler, mevcut çalışmada toprak organik madde içeriği, sulama suyu miktarı ve sulama suyu tuzluluğudur. Bu koşullar altında bitki gelişimini ve karakterizasyonunu belirlemek amacı ile saksı deneyleri ile çalışılmıştır. Prima 2019 Section 2 çağrısı, 19N594 numaralı proje kapsamında gerçekleştirilen bu çalışma, Dokuz Eylül Üniversitesi Tınaztepe kampüsünde kurulan 72 m² lik serada gerçekleştirilmiştir. Değişkenlerden organik madde %1, %1.8 (kontrol), %3 ve %5 olarak belirlenerek saksılar hazırlanmış ve saksılara 15'er adet semizotu tohumu ekilerek çimlenmeye bırakılmıştır. Sulama suyu miktarları tarla kapasiteleri üzerinden gerçekleştirilmiş ve sulama suyu miktarları %100, %75, %50, %30, %15 olarak seçilmiştir. Uygulamadaki son değişken sulama suyu tuzluluğu olarak belirlenmiş, hazırlanan sulama suları iletkenlikleri musluk suyu, 4 mS/cm, 8 mS/cm, 16 mS/cm değerlerinde olacak şekilde sulamalar yapılmıştır. Tüm saksılar dörder tekrarlı olacak şekilde hazırlanarak toplamda 320 adet saksı ile çalışma yürütülmüştür. Deneyler ilk ekimden itibaren 90 gün süreyle gerçekleştirilmiştir. Çalışmada organik madde artışının bitki çimlenmesini artırdığı görülmüştür. Tarla kapasitesi azaldıkça bitki büyümelerinde çeşitli düşüşler görülmüş, ancak bu durum daha ziyade %30 ve %15 tarla kapasitesinde gözlemlenmiştir. Tuzluluğun bitki gelişiminde olumsuz etkisi, 8 mS/cm ve 16 mS/cm değerlerinde gözlemlenmiştir.

Anahtar kelimeler: Semizotu, *Portulaca oleracea*, organik madde, kuraklık, tuzluluk

Introduction

Compared to other plants, purslane contains high levels of omega-3 fatty acids, is a good source of vitamin C, is rich in B-complex vitamins such as riboflavin, niacin, pyridoxine and carotenoids. It is a vegetable with important nutritional value in terms of containing important minerals such as iron, phosphorus, copper, zinc, magnesium, calcium, potassium and manganese (Açık, 2017; Dweck 2001; Turan et al., 2003). Purslane is an annual, multi-leaved, creeping herbaceous plant belonging to the family of purslane (Portulacaceae). In the gardens where vegetable farming is carried out, wild forms begin to emerge in the spring with the warming of the weather. In winter, in the cold, it dries up and dies. Although its wild forms have been known for many years, its place and importance in human nutrition has only just begun to be understood. In our country, the culture form of purslane is produced commercially in the Aegean, Marmara and Mediterranean regions, and its wild forms are mostly used in other regions. (Eşiyok, 2012; Vural et al., 2000; Yurdağül, 2019). In places where it is hot and day long and if

there is a water problem, the plant quickly passes into the generative phase and blooms. With the aging of the plant, the amount of dry matter increases. Likewise, the amount of dry matter increases in plants grown from spring to summer (Convington, 2004; Günay, 2005; Uğur et al., 2014).

The growth of purslane plant under various soil stress factors has been the subject of various studies in the literature. For example, soil salinity is seen as an important environmental factor with serious adverse effects on agricultural productivity and sustainability in semi-arid regions. Salt stress during the germination stage negatively affects the osmotic balance or the ionic balance, or both (Zivkovic, 2007). Yazıcı et al., (2007) conducted research on the effects of salt stress on purslane. Purslane plants were grown in pots for two months under 65% humidity and 30/20 °C temperature conditions. At the end of two months, 0, 70 and 140 mM doses of salt were applied to the plants, and a decrease was observed in plant height after salt applications. Kılıç et al., (2008) cultivated purslane plants at salt levels of 0.65 (control), 3.5, 5.0 and 6.5 dS/m. After harvesting, it was observed that the weight and dry weight decreased due to the increase in salinity. This decrease was 8.75% in 5.0 dS/m salt application and 8.21% in 6.5 dS/m salt application. As the salt level increased, the ratio of Na and Cl increased, while the ratio of K decreased. Purslane is considered to be an economical plant to use in removing Na and Cl from the soil in arid and semi-arid land conditions due to its salt tolerance, short vegetation period and its ability to be produced several times a year. Jin et al. (2015) examined the changes in plant structure in purslane during drought stress and subsequent water application. After the drought stress, leaf samples were taken on the 5th, 10th, 15th and 22nd days and harvested. At the end of the 22nd day, the leaves were wilted and rehydrated. However, drought stress caused decreases in leaf water content and chlorophyll content.

Another soil stress factor in plant growth is soil type and organic matter content. Kocamanoğlu (2018) investigated the effects of humic acid application doses on yield and quality characteristics of purslane grown in environments prepared using different ratios of peat and perlite in the early spring season. When the growing media were evaluated in terms of yield, all mixtures containing peat gave higher yield. Cros et al., (2007) studied the variation of yield and quality in purslane grown in different environments. Peat, perlite, vermiculite, coal, peat/perlite (1:1), peat/perlite (3:1) media were used in the study, peat, peat/perlite (1:1) and peat/perlite (3:1) media were used as 14.7, respectively. , 13.6 and 14.2 cm plant height values, while perlite (6.2 cm) and coal dust (6.3 cm) media gave the lowest values. Montoya-Garcia et al. (2018) investigated the relationship between fertilization and changes in the fatty acid content and antioxidant capacity of purslane plant. Taking into account the effects of these ingredients with abiotic factors such as nitrogen, phosphorus and potassium, N, P, K fertilizations were applied and two different harvest turns (27 and 42 days) and different fertilizer doses were used. Nitrogen fertilization was investigated for the amount of total phenolic, flavonoid, β -carotene and chlorophyll at low doses, and the amount of linoleic and α -linoleic acid at high doses. P and K application increased the total phenolic and ascorbic acid content. It formed the idea that the content and antioxidant capacity of purslane plant could be controlled by fertilization adjustment.

The present study aims to investigate the development of purslane plant under different soil stress conditions. For this, different organic matter contents, different irrigation conditions and different salinity levels were tested in pot experiments, plant germination under variable conditions and plant growth at the end of the harvest were monitored.

Materials and Methods

For pot experiments, natural purslane seeds were purchased from the market and the seeds were found to have a high germination rate in preliminary trials before the current study. The soil used in the project was obtained through a local landscape firm that is in contact with the soil sellers in the Aegean Region. In addition to these, goat manure and peat were obtained from the same seller to obtain higher organic matter contents and to use in the studies. Stream sand is needed to obtain low organic matter, for this, sand produced from crushed stone was supplied from river mining facilities. These supplied materials will be mixed in different proportions to meet the desired conditions for the pot experiments.

pH, electrical conductivity, water content, organic matter content were determined in soil samples. pH and electrical conductivity values of soil samples were determined regarding TS ISO 10390 and TS ISO 11265 standards, respectively. Measurements were made with Hanna HI 2030-02 pH/EC model measuring device. Water contents of soil samples were determined gravimetrically according to TS EN ISO 11461 standard. Moreover, organic matter contents of soil samples were analyzed regarding ASTM D2974-13 standard. The field capacity of the soil mixtures were measured according to the standard gravimetric methods.

Pot experiments were carried out in plastic trial pots of 8 L volume, each containing 6 kg of soil mix. Plant growth was monitored for 3 different parameters in the experiments. Sets were created by mixing sand, peat and goat manure with the first parameter, the organic matter content of the control, 1%, 3% and 5%. The second parameter, drought, was carried out by irrigation of plant growth with field capacities of 100%, 75%, 50%, 30% and 15% after germination. The third parameter, salinity, refers to the amount of salt in the irrigation water. For this, the plants were irrigated by preparing irrigation water containing control (tap water), 4dS/m, 8dS/m, and 16 dS/m

salinity. While preparing brine, table salt was used and firstly a high salinity stock saline solution was prepared (200 dS/m), then the desired saline irrigation water was obtained by making dilutions.

The experiments were carried out in a specially designed greenhouse on the university campus (Figure 1). Seeds (15 seeds for each pot) were planted in March 2022 and the main irrigation was started at the end of the 4-week germination period. During germination, irrigation was carried out every other day, while the main irrigation was applied twice a week.

During the experiments, plant growth was carried out using calipers by taking the height and diameter measurements of the plants once a week. 60 days of growth was followed and then the plants were harvested.

Pots containing all trial parameters were prepared with 4 replications and average values were taken.

Figure 1. a) Seed preparation b) Experimental pots in the greenhouse

Results and Discussion

General characteristics of the soil, peat, goat manure and the sand are given with Table 1. There was no organic matter arrangements in the control pots and they were named as OM1.8. Considering the organic matter content, soil and sand were mixed at the rates of 43 and 57%, respectively, for the 1% OM (OM1) trial pots. For higher organic matter contents than the control pots, a goat manure/peat mixture was first prepared and a fertilizer with 50% organic matter was obtained. For 3% OM (OM3), 97.5% soil and 2.5% fertilizer were added. For the soil mixture containing 5% OM (OM5), the ratios of soil and fertilizer mixture were 93.4% and 6.6%, respectively. The field capacities (100% FC) determined for 6 kg mixtures in soil mixtures are as follows; 980 ml for OM1, 1153 ml for OM1.8, 1250ml for OM3 and 1510 ml for OM5. In the irrigations carried out, 100 FC refers to irrigation with full field capacity, while other values express the percentage of full capacity of that value.

Table 1. General characteristics of materials used in soil mixtures

	<i>Water content, %</i>	<i>Organic matter, %</i>	<i>pH</i>	<i>EC (dS/m)</i>
Soil	2.61	1.80	7.72	0.167
Sand	0.09	0.32	8.03	0.067
Peat	9.98	30.95	6.17	0.404
Goat manure	9.58	73.58	7.81	3.240

The germination process within 4 weeks after sowing purslane seeds in pots was monitored. For nearly all the pots, the germination started in 4-10 days after the sowing. At the end of the 4-week germination period, the average germination rates in pots with different organic matter contents are given in Table 2. When the sprout numbers were examined in pots containing soil and river sand with 1% organic matter, it was observed that the germination number of 15 seeds planted in pots was between 0-10 in 80 pots. The final germination rate of purslane in OM1 pots was 23%. According to the number of sprouts in pots containing only soil with 1.8% organic matter, it was observed that 15 seeds planted between 0-11 in 80 pots. Accordingly, the germination rate of OM 1.8 pots was calculated as 31% at the end of 4 weeks. Germination numbers were investigated in pots containing 3% organic matter, including goat manure and peat. It was observed that the number of sprouts were between 4-14 in 80 pots of 15 seeds planted in pots. When the average of the germinating plants is taken, the germination rate of purslane in OM3 pots was calculated as 52%. Germination numbers were investigated in pots containing 5% soil, goat manure and peat. It was observed that the germination number of 15 seeds planted in pots was between 3-15 in 80 pots. When the average of the germinating plants is taken, the germination rate of purslane in OM5 pots was calculated as 66%.

Table 2. Germination ratios after 4 weeks

OM content, %	OM1	OM1.8 (control)	OM3	OM5
Germination rate, %	23	31	52	66

Figure 2. Young sprouts in different OM pots

The date of the study covers the months of April-May-June. High temperatures inside the greenhouse were controlled by constantly ventilating the greenhouse and covering the greenhouse ceiling with lime. The highest temperature measured is 46.8 °C, while the lowest temperature is 10 °C. Considering the humidity values, the highest 64% humidity was measured while the lowest 3% was measured. In line with the measured values, the average temperature is 29.4°C and the average humidity percentage is 25.4.

During the irrigation process, plant growth was followed as the number of thin stems, the number of thick stems, thin diameter, thick diameter, thin stem length and thick stem length. Table 3 presents the number of plants in the pots due to different conditions.

Table 3. Number of plant growths in the pots due to different conditions.

# of plants	OM1	OM1.8	OM3	OM5

75FC	5	8	8	7
50FC	2	8	8	8
30FC	2	5	7	7
15FC	3	7	6	5
100FC/4salinity	6	4	6	7
75FC/4salinity	6	3	6	8
50FC/4salinity	4	3	6	8
30FC/4salinity	4	4	7	8
15FC/4salinity	6	2	7	8
100FC/8salinity	2	3	5	8
75FC/8salinity	5	4	8	7
50FC/8salinity	2	5	8	8
30FC/8salinity	5	3	6	7
15FC/8salinity	1	3	4	8
100FC/16salinity	3	5	7	5
75FC/16salinity	3	4	7	8
50FC/16salinity	2	4	8	8
30FC/16salinity	1	6	8	8
15FC/16salinity	1	1	7	7

Thick stem diameters in pots vary between 4-9 mm. Pots with high thick stem diameters are OM3 and OM5 pots where growth is observed more. Thin diameters in pots vary between 1-3,8 mm. When the thick stem lengths in the pots are examined, it is seen that they vary between 11-30 cm. Plant height elongation was clearly observed in all pots except OM 1.

When we look at the changes of thin stems in pots, it is seen that thin stems generally develop towards thicker diameters over time. This situation can be interpreted as the growth of thin stems by turning into thick stems and the development of the plant. However, this improvement was not seen in pots with 30% and 15% field capacity. This shows the negative impact of water scarcity on development. Similarly, there was no thickening of thin stems in pots with salinity of 8-16 mS/cm, indicating the negative effect of saline water on growth.

It is seen that the number of thick stems in the pots increases over time in the pots where the irrigation is applied with 50% TK and above and the salinity is below 4 mS/cm. 15% TK irrigation greatly reduces growth, this is more evident in OM 1 and OM 1.8 pots. Although saline irrigation was somewhat tolerated in OM3 and OM5 pots, it was determined that 16 mS/cm irrigation stopped the development. Pots with the highest number of thick stems are those in which OM3 and OM5 are watered with 75%-100% TK with unsalted water.

Figure 3. Plant growth under saline water irrigation a)OM1 b)OM1.8 c)OM3 d)OM5

When thin and thick stem diameters of plants are examined, it is seen that organic matter content does not have a serious effect on thin plant stems, but causes an increase in thick stem diameters. Decreased irrigation amount causes a decrease in plant diameters. Similarly, it was observed that there were significant decreases in thin and thick plant diameters as salinity increased.

In the study, the effects of different soil stress conditions on purslane plant growth were observed. At the end of the 90-day plant growing process, it was observed that the increase in organic matter was effective in plant growth in every sense from the germination stage. Considering the irrigation effect, it is seen that field capacities below 50% affect plant growth negatively. Similarly, irrigation with salt water above 4 dS/m has a negative effect on plant growth, especially on thick stem growth.

The Effects of Different Organic and Inorganic Fertilizer Applications on Yield and Improvement of Maize Plant

Hasan Durukan¹, Zekeriya Duran², Handan Sarac¹, Ahmet Demirbas¹

¹Department of Plant and Animal Production, Sivas Vocational School of Technical Sciences, Sivas Cumhuriyet University Sivas, Turkey.

²Department of Mining and Mineral Extraction, Sivas Vocational School of Technical Sciences, Sivas Cumhuriyet University Sivas, Turkey.

Abstract

In this study, it was aimed to determine the effects of organic and inorganic fertilizer applications at different rates on the yield and development of maize plant. The research was carried out in three replications in greenhouse conditions, according to the randomized plot design, in plastic pots with a capacity of three kg. Applications in research; control, conventional fertilization, gypsum (1% and 2% w/w), anhydrite (1% and 2% w/w), calcite (1% and 2% w/w), perlite (1% and 2% w/w), vermicompost (5% and 10% w/w) and animal manure (5% and 10% w/w). Maize was used as the test plant. Maize plant was harvested approximately 60 days after planting and analysis of dry matter production and nitrogen, phosphorus, potassium, calcium, magnesium, iron, zinc, manganese and copper were made. According to the results of the research, the highest dry matter production was determined at 15.4 g pot⁻¹ and 10% of the vermicompost application. This application was followed by conventional fertilizer application (13.64 g pot⁻¹). In addition, vermicompost application in general had higher values in macro and micro element concentrations of maize plant.

Farklı Organik ve İnorganik Gübre Uygulamalarının Mısır Bitkisinin Verimine ve Gelişimine Etkileri

Özet

Araştırmada farklı oranlarda organik ve inorganik gübre uygulamalarının mısır bitkisinin verimine ve gelişimine olan etkilerinin belirlenmesi amaçlanmıştır. Araştırma sera koşullarında üç tekerrürlü olarak tesadüf parselleri deneme desenine göre üç kg kapasiteli plastik saksılarda yürütülmüştür. Araştırmada uygulamalar; kontrol, geleneksel gübreleme, jips (%1 ve %2 w/w), anhidrit (%1 ve %2 w/w), kalsit (%1 ve %2 w/w), perlit (%1 ve %2 w/w), vermikompost (%5 ve %10 w/w) ve hayvan gübresi (%5 ve %10 w/w) şeklindedir. Test bitkisi olarak mısır kullanılmıştır. Mısır bitkisi ekimden yaklaşık 60 gün sonra hasat edilmiş ve kuru madde üretimi ile azot, fosfor, potasyum, kalsiyum, magnezyum, demir, çinko, mangan ve bakır analizleri yapılmıştır. Araştırma sonuçlarına göre, en yüksek kuru madde üretimi 15.4 g/saksı ile vermikompost uygulamasının %10'luk dozunda belirlenmiştir. Bu uygulamayı ise geleneksel gübre uygulaması takip etmiştir (13.64 g/saksı). Ayrıca mısır bitkisinin makro ve mikro element konsantrasyonlarında genel olarak vermikompost uygulaması daha yüksek değerlere sahip olmuştur.

Investigation of Some Morphological Traits of Hair Goats in Under Breeder Conditions in Isparta Province

Mustafa Varol¹, Sibel Alapala Demirhan²

¹Provincial Directorate of Agriculture and Forestry, Isparta, Turkey

²Department of Animal Science, Agriculture Faculty, Uşak University, Uşak, Turkey

Abstract

Our country is one of the important centers of sheep and goat breeding. The Mediterranean region, especially in our country, is one of the places where goat breeding is done intensively. The province of Isparta has an important potential in terms of goat breeding. In this study, the morphological body characteristics of hair goats bred in Isparta province, such as withers height, back height, rump height, chest width and body length, were investigated. The animal material of the study consisted of 3 farms in total, in lowland conditions, high pasture and highland conditions located in the center of Isparta province. The wither, back and rump height, 78.1 cm, 71 cm, 74.6 cm, chest width 80.5 and body length were determined as 73.5 cm, respectively, in hair goats in 3 enterprises located in the central villages of Isparta province. It will make important contributions to the literature on programs

Isparta İlinde Yetiştirici Koşullarındaki Kıl Keçilerinin Morfolojik Özellikleri

Özet

Ülkemiz küçükbaş hayvan yetiştiriciliğinde önemli merkezlerdendir. Akdeniz bölgesi özellikle ülkemiz keçi yetiştiriciliğinin yoğun olarak yapıldığı yerlerin başında gelmektedir. Isparta ili keçi yetiştiriciliği bakımından önemli bir potansiyele sahiptir. Bu araştırmada Isparta ilinde yetiştiriciliği yapılan kıl keçilerin morfolojik vücut özelliklerinden olan cıdago yüksekliği, sırt yüksekliği, sağrı yüksekliği, göğüs genişliği ve vücut uzunluğu incelenmiştir.

Çalışmanın hayvan materyalini Isparta ilinde merkezinde bulunan ova koşulları yüksek mera ve yayla koşullarında olmak üzere toplam 3 işletmede bulunan 45 baş kıl keçisi oluşturmuştur. Yapılan incelemelerde sırasıyla cıdago, sırt ve sağrı yüksekliği, 78,1 cm, 71 cm, 74,6 cm göğüs genişliği 80,5 ve vücut uzunluğu 73,5 cm olarak belirlenmiştir. Elde edilen bilgiler yetiştirme ve ıslah programları ile ilgili literatüre önemli katkılar sağlayacaktır.

Investigation of the Changes In Rheological Properties of Purple Basil Sherbet Samples Concentrated By Ohmic Heating At Different Voltage Gradient

Zeynep Eroğlu¹, Mutlu Çevik²

¹Department of Nutrition and Dietetics, University, Faculty of Health Sciences, Munzur University, Tunceli, Turkey

²Department of Gastronomy and Culinary Arts, Faculty of Fine Arts, Design and Architecture, Munzur University, Tunceli, Turkey

Abstract

Purple basil is widely used medicinally and aromatically due to its essential oil properties, and it is a plant that stands out with its antibacterial, antimutagenic and antioxidant properties. It has been determined that purple basil has positive effects on health such as appetizing, insomnia, sputum, diuretical and antispasmodic. Purple basil contains high concentrations of anthocyanins and with these properties it stands out as a potential new source of stable red pigments for the food industry. In recent years, it has been seen that purple basil has been processed into different products such as tea and sherbet in order to benefit from its functional properties. With the processing of purple basil into different products, it is seen that the consumption of basil and basil products has increased by consumers. In this study, purple basil sherbet samples were concentrated at different voltage gradient values (14, 17 and 20 V/cm) under atmospheric conditions with ohmic heating up to 25% soluble solid content (SSC) and the changes in their rheological properties during the concentration process was investigated. The changes in the rheological properties of the purple basil samples were determined in the range of 1-148 s⁻¹ shear rate values and measurement temperature was 25°C. The compatibility of different rheological models (Newton, Power-Law and Herschel-Bulkley) to the experimental data was statistically evaluated to determine the flow behavior index of the purple basil sherbet samples. It has been determined that the shear stress values increased as the shear rate values increased in all the process conditions. Similarly, at the same shear rate values, it was determined that the shear stress values increased as the SSC values increased. It has been determined that the best suitable rheological model was Herschel-Bulkley Model for all purple basil sherbet concentrates. It is thought that the results obtained will provide important data to the food and machinery industry for the installation of pilot and industrial scale ohmic heating systems.

Key Words: Ohmic heating, evaporation, purple basil sherbet, rheology

Farklı Voltaj Gradyanı Kullanılarak Ohmik Isıtma İle Konsantre Edilen Mor Reyhan Şerbeti Örneklerinin Reolojik Özelliklerindeki Değişimlerin İncelenmesi

Özet

Reyhan (mor fesleğen), uçucu yağ özelliğinden dolayı tıbbi ve aromatik olarak yaygın olarak kullanılan, antibakteriyel, antimutajenik ve antioksidan özellikleri ile öne çıkan bir bitkidir. Reyhan iştah açıcı, uykusuzluk, balgam, idrar söktürücü ve spazm giderici gibi sağlık üzerinde olumlu etkileri olduğu tespit edilmiştir. Reyhan yüksek konsantrasyonlarda antosiyanin içermekte ve bu özellikleri ile gıda endüstrisi için potansiyel bir stabil kırmızı pigment kaynağı olarak öne çıkmaktadır. Son yıllarda reyhanın sahip olduğu fonksiyonel özelliklerinden yararlanmak için işlenerek çay ve şerbet gibi farklı ürünlere dönüştürüldüğü görülmektedir. Reyhanın farklı ürünlere dönüştürülmesiyle birlikte tüketiciler tarafından reyhan ve reyhan ürünlerinin tüketiminin arttığı görülmektedir. Bu çalışmada, reyhan şerbeti örnekleri, %25 suda çözünür kuru madde içeriğine (SÇKM) kadar ohmik ısıtma ile atmosferik koşullar altında farklı voltaj gradyanı değerlerinde (14, 17 ve 20 V/cm) konsantre edilmiş ve konsantrasyon işlemi sırasında reolojik özelliklerinde meydana gelen değişimler incelenmiştir. Reyhan örneklerinin reolojik özelliklerindeki değişimler 1-148 s⁻¹ kayma hızı değerleri aralığında, 25°C ölçüm sıcaklığı gerçekleştirilmiştir. Reyhan şerbeti örneklerinin akış davranış özelliklerini belirlemek amacıyla farklı reolojik modellerin (Newton, Power-Law ve Herschel-Bulkley) deneysel verilere uygunluğu istatistiksel olarak değerlendirilmiştir. Tüm konsantrasyon işlemi koşullarında kayma hızı değerleri arttıkça kayma gerilimi değerlerinin artış gösterdiği tespit edilmiştir. Benzer şekilde aynı kayma hızı değerlerinde, SÇKM değerleri arttıkça kayma gerilimi değerlerinin de artış gösterdiği tespit edilmiştir. Tüm reyhan şerbeti konsantreleri için en uygun reolojik modelin Herschel-Bulkley Modeli olduğu belirlenmiştir. Elde edilen sonuçların pilot ve endüstriyel ölçekli ohmik ısıtma sistemlerinin kurulumu için gıda ve makine sektörüne önemli veri sağlayacağı düşünülmektedir.

Anahtar Kelimeler: Ohmik ısıtma, evaporasyon, reyhan şerbeti, reoloji

Global Epidemic and Its Effects on Livestock

Sibel Alapala Demirhan, Nuray Şahinler

1,2 Depertman of Aniamal Science, Agriculture Faculty, Uşak University, Uşak, Turkey

Abstract

In this study, the effects of the COVID-19 pandemic process on farm animals in our country were evaluated. The situation in our country has been revealed by examining the available resources on this subject. In addition, information on the characteristics of the COVID-19 agent and the differences between animal species was given, and the production of cattle, sheep, poultry and bee products was examined by examining the number of farm animals. The Covid-19 outbreak has revealed the importance of the food and livestock industry. The continuation of production in the livestock sector prevented a possible food crisis. The Covid 19 epidemic has had some effects on livestock in our country, and there has been an increase in costs along with the global markets. Unfortunately, the increase in costs still continues and puts the producer in a difficult situation.

This study has been prepared to contribute to the literature by compiling data on the effects of COVID-19 in the livestock sector and animals.

Keywords: Pandemic, Covid-19, livestock sector, Impact.

Küresel Salgın ve Hayvancılık Üzerine Etkileri

Özet

Bu çalışmada, yurdumuzda pandemi sürecinin çiftlik hayvanları üzerine olan etkileri değerlendirilmiştir. Bu konu ile ilgili ulaşılabilen kaynaklar incelenerek yurdumuzdaki durum ortaya konulmuştur. Ayrıca, COVID-19 etkeninin özelliği ile hayvan türleri arasındaki farklılıklara ait bilgiler verilmiş ve çiftlik hayvanları sayıları incelenerek büyükbaş, küçükbaş, kanatlı ve arı ürünleri üretimleri incelenmiştir. Covid-19 salgını gıda ve hayvancılık sektörünün önemini ortaya çıkarmıştır. Hayvancılık sektöründe üretimin devam etmesi olası gıda krizini önlemiştir. Covid 19 salgını ülkemizde hayvancılık üzerinde bazı etkiler yaratmıştır ve küresel piyasalarla birlikte maliyetlerde artış olmuştur. Ne yazık ki maliyetlerdeki artış halen devam etmekte ve üreticiyi zor duruma sokmaktadır. Bu çalışma COVID-19'un hayvancılık sektöründe ve hayvanlarda görülen etkileri ile ilgili veriler derlenerek literatüre katkı sağlamak üzere hazırlanmıştır.

Anahtar Kelimeler: Pandemi, Covid-19, hayvancılık sektörü, Etki

Geographical Indication Ayran and Yogurts of Türkiye

Mehmet Ali Salık, Songül Çakmakçı

Department of Food Engineering, Faculty of Agriculture, Atatürk University, Erzurum, Türkiye

Abstract

Geographical Indication (GI) registration is very important in distinguishing traditional foods from their counterparts and protecting them against unfair competition, ensuring continuity in quality and production conditions, increasing their value and branding. GI's are registered as Protected Designation of Origin (PDO: all features of the product must be specific to the known geographical area) or Protected Geographical Indication (PGI: at least one feature of the product must be specific to a known geographic region). In Türkiye as of September 2022, 55 dairy products (34 cheese, 9 yogurt, 2 ayran, 4 kaymak, 2 butter, 2 ice cream, 2 keş) have been protected by the GI registration certificate. Among these, yogurt and ayran are our important fermented milk products spread all over the world from Central Asia. The production of these products, which have an important place in Turkish culture, is basically based on the fermentation of milk (such as cow, buffalo, sheep and goat milk), specifically with cultures of *Streptococcus thermophilus* and *Lactobacillus bulgaricus*. As of September 2022, 9 yogurt (3 PDO, 6 PGI) and 2 ayran (PGI) have been registered by the Turkish Patent and Trademark Office (TÜRKPATENT). **PDO:** Çaycuma Buffalo Yogurt (2020), Afyon Buffalo Yogurt (2021), and Eşmekaya Yogurt (2021). **PGI:** Antakya Salted Yogurt (2020), Emirdağ Sheep Yogurt (2021), Mamak Ravak Yogurt (2021), Ereğli Sheep Yogurt (2021), Silifke Yogurt (2022), Silivri Yogurt (2022), Susurluk Ayran (2017) and Malatya Pirpirim (Purslane) Hot Ayran (2022). 8 yogurt (2 PDO, 4 PGI and 2 TSG/Traditional Speciality Guaranteed) for which GI and TSG applications have been made, are under evaluation by TÜRKPATENT. There is no application for ayran. In this study, information (registration certificate mainly) about ayran and yoghurts registered with GI in our country is given.

Key Words: Geographical Indication, PDO, PGI, Yogurt, Ayran

Türkiye'nin Coğrafi İşaretli Ayran ve Yoğurtları

Özet

Geleneksel gıdaların; benzerlerinden ayrılması ve haksız rekabete karşı korunması, kalitesi ve üretim koşullarında sürekliliğin sağlanması, değerinin artırılması ve markalaşmasında Coğrafi İşaret (Cİ) tescilinin payı oldukça önemlidir. Coğrafi İşaret (Cİ)'ler menşe adı (Protected Designation of Origin, PDO: ürünün tüm özellikleri bilinen coğrafi bölgeye özgü olmalı) ya da mahreç işareti (Protected Geographical Indication, PGI: ürünün en az bir özelliği bilinen coğrafi bölgeye özgü olmalı) olarak tescillenmektedir. Türkiye'de Eylül 2022 itibarıyla 55 adet süt ürünü (34 adet peynir, 9 adet yoğurt, 2 adet ayran, 4 adet kaymak, 2 adet tereyağı, 2 adet dondurma, 2 adet keş) Cİ almıştır. Bunlar içerisinde, yoğurt ve ayran Orta Asya'dan tüm dünyaya yayılmış önemli fermente süt ürünlerimizdir. Türk kültüründe önemli bir yere sahip olan bu ürünlerin üretimi temelde sütün (inek, manda, koyun ve keçi sütü gibi), spesifik olarak *Streptococcus thermophilus* ve *Lactobacillus bulgaricus* kültürleri ile fermentasyonuna dayanmaktadır. Eylül 2022 itibarıyla 9 adet yoğurt (3'ü Menşe, 6'sı Mahreç) ve 2 adet ayran (Mahreç) Türk Patent ve Marka Kurumu (TÜRKPATENT) tarafından tescillenmiştir. **Menşe işaretliler:** Çaycuma Manda Yoğurdu (2020), Afyon Manda Yoğurdu (2021) ve Eşmekaya Yoğurdu (2021). **Mahreç işaretliler:** Antakya Tuzlu Yoğurt (2020), Emirdağ Koyun Yoğurdu (2021), Mamak Ravak Yoğurdu (2021), Ereğli Koyun Yoğurdu (2021), Silifke Yoğurdu (2022), Silivri Yoğurdu (2022), Susurluk Ayranı (2017) ve Malatya Pirpirimli (Semizotu) Acılı Ayran (2022). Cİ ve geleneksel ürün adı başvurusu yapılmış 8 adet yoğurt da (2 Menşe, 4 Mahreç ve 2 geleneksel ürün adı) TÜRKPATENT tarafından değerlendirme aşamasındadır. Ayran için başvuru bulunmamaktadır. Bu çalışmada, ülkemizde Cİ tescili almış ayran ve yoğurtlar hakkında bilgiler (tescil belgesi ağırlıklı) verilmiştir.

Anahtar Kelimeler: Coğrafi İşaret, Menşe, Mahreç, Yoğurt, Ayran

1.Giriş

“Sınai Mülkiyet Kanunu” kapsamında Menşe adı (ürünün tüm özellikleri bilinen coğrafi bölgeye özgü olmalı) veya Mahreç işareti (ürünün en az bir özelliği bilinen coğrafi bölgeye özgü olmalı) olarak tescillenen Coğrafi İşaretler (Cİ), geçmişte eskiye dayanan ve karakteristik özelliklerinden dolayı bir coğrafyaya ait ürünlerin orijinini gösteren işaretlerdir. Geleneksel ürün adı ise Cİ olmayıp, en az 30 yıldır üretimi yapılan ürünlerin bileşim veya geleneksel üretim yöntemini koruyan bir sistemdir (Mevzuat, 2016; Tekelioğlu, 2019). Cİ ürünlerin orijini ve üretim yöntemini korumayıp üretici çıkarlarını da korumaktadır.

Türkiye, dünyanın Cİ potansiyeli çok yüksek nadir ülkelerinden birisidir (Tekelioğlu, 2019; Çakmakçı ve Salık, 2021). Eylül 2022 itibarıyla 1217 adet ürün Cİ tescil belgesi ile koruma altına alınmıştır. Türk Patent ve Marka

Kurumu (TÜRKPATENT) tarafından değerlendirilmesi için 681 adet ürün de başvurusu yapılmıştır. TÜRKPATENT'in verilerine göre, tescilli Cİ'lerin ürün gruplarına göre dağılımında gıda ürünleri 1011 adet tescille %83'lük payı oluştururken, el sanatları ve diğerleri 206 adet tescille %17'lik payı oluşturmaktadır. Süt ürünleri [(55 adet: 34 peynir, 2 tereyağı, 4 kaymak, 9 yoğurt, 2 dondurma, 2 ayran ve 2 keş] ise gıda ürünleri içerisindeki payın %5.4'ünü oluşturmaktadır. Bunlar içerisinde ise yoğurdun (%16) ve ayranın (%3.6) payı peynire (%61.8) göre oldukça azdır (TÜRKPATENT, 2022).

Bu çalışmada; Cİ kavramına değinerek, Türkiye'de Cİ almış ayran ve yoğurtlar derlenerek (tescil belgesi ağırlıklı bilgilerle) ürünlerin tanımları, özgünlükleri, karakteristik ve kalite özellikleri ile ilgili özet bilgiler verilmiş, tanınırlıklarına katkı yapmak amaçlanmıştır.

2. Cİ Tescilli Almış Ayran ve Yoğurtlar

İlk olarak Türkler tarafından Orta Asya'da keşfedilen ve oradan tüm dünyaya yayılan yoğurt ve bir yoğurt içeceği olan ayran (Chandan *et al.*, 2017), günümüzde süte (inek sütü başta olmak üzere manda, koyun ve keçi sütü) spesifik olarak *Streptococcus thermophilus* ve *Lactobacillus bulgaricus* kültürleri ilave edilerek üretilen önemli Türkiye'nin önemli fermente süt ürünleridir (Tamime and Deeth, 1980; Fazilah *et al.*, 2018).

Dünya çapında yaygın tüketim potansiyeli olan yoğurt ve ayran geleneksel ve endüstriyel olarak üretilmektedir. Besin maddesi içeriği süte en benzer süt ürünü olan yoğurt; biyolojik değeri yüksek protein, B₂, B₆, B₁₂ vitaminleri ile kalsiyumun mükemmel bir kaynağıdır (Fazilah *et al.*, 2018). Yoğurt, kalsiyum biyoyararlanımı artırması ve laktoz intoleransına olumlu etkisi nedeniyle de önemlidir (Ghasempour *et al.*, 2020). Yapılan araştırmalarda; yoğurt tüketiminin bağışıklık sistemini güçlendirdiği, kabızlığı azalttığı, kolon kanseri ve inflamatuvar bağırsak hastalıklarını azalttığı, laktoz sindirimini kolaylaştırdığı ve kan şekerini dengelemede faydalı olduğu şeklinde çok sayıda terapötik etkiler sağladığı bildirilmektedir (Amadarshanie *et al.*, 2022).

Ayran, Türkiye'de özellikle yaz aylarında yaygın olarak tüketilen yoğurt içeceğidir. Ayran geleneksel olarak yoğurdun belirli oranda su ile seyreltilmesi ve tuz ile karıştırılmasıyla hazırlanmaktadır (Köksoy and Kılıç, 2004). Yoğurda benzer olarak ayran da, kalsiyum, fosfor, magnezyum ve potasyum mineralleri ile B₂, B₁₂, A, D ve K vitaminleri bakımından iyi bir kaynaktır (Ötleş and Nakilcioğlu Taş, 2019).

Ülkemiz genelinde TÜRKPATENT tarafından 2 adet ayran (Susurluk Ayranı ve Malatya Pirpirimli (Semizotu) Acılı Ayran) ve 9 adet yoğurt (Çaycuma Manda Yoğurdu, Afyon Manda Yoğurdu, Eşmekaya Yoğurdu, Antakya Tuzlu Yoğurt, Emirdağ Koyun Yoğurdu, Mamak Ravak Yoğurdu, Ereğli Koyun Yoğurdu, Silifke Yoğurdu ve Silivri Yoğurdu) Cİ tescilli almıştır. Cİ ile koruma altına alınmış ayran ve yoğurtların tescil belgelerinde bildirilen bazı bilgiler Tablo 1'de, bu ürünlere ait fotoğraflar ise Şekil 1'de verilmiştir. Ayrıca, TÜRKPATENT tarafından değerlendirilmek üzere 8 adet yoğurt için de başvuru yapılmıştır.

Tablo 1. Türkiye'de Cİ almış ayran ve yoğurtların tescil belgelerinde belirtilen bazı bilgiler

Cİ Adı	Tescil Tarihi	Başvuru Sahibi	Cİ Türü	Coğrafi Sınır	Kullanım Biçimi	R*
Susurluk Ayranı	20.11.2017	Susurluk Ticaret Odası	Mahreç	Balıkesir ili Susurluk	Markalama	1
Malatya Pirpirimli (Semizotu) Acılı Ayran	11.04.2022	Battalgazi Belediyesi	Mahreç	Malatya ili	Markalama	2
Antakya Tuzlu Yoğurt	10.09.2020	Antakya Ticaret ve Sanayi Odası	Mahreç	Hatay ili	Markalama	3
Çaycuma Manda Yoğurdu	08.05.2020	Çaycuma Ticaret ve Sanayi Odası	Menşe	Çaycuma ilçesi	Markalama	4
Afyon Manda Yoğurdu	27.07.2021	Afyonkarahisar Ticaret ve Sanayi Odası	Menşe	Afyonkarahisar ili	Markalama	5
Eşmekaya Yoğurdu	25.05.2021	Aksaray Ticaret Borsası	Menşe	Aksaray ili Eskil ilçesi Eşmekaya kasabası	Markalama	6
Emirdağ Koyun Yoğurdu	06.09.2021	Emirdağ Belediyesi	Mahreç	Afyonkarahisar ili Emirdağ ilçesi	Markalama	7
Mamak Ravak Yoğurdu	06.08.2021	Mamak Belediyesi	Mahreç	Ankara ili Mamak ilçesi	Markalama	8
Ereğli Koyun Yoğurdu	12.07.2021	Konya Belediyesi	Mahreç	Konya ili Ereğli ilçesi	Markalama	9
Silifke Yoğurdu	07.02.2022	Silifke Ticaret ve Sanayi Odası	Mahreç	Mersin ili Silifke ilçesi	Markalama	10
Silivri Yoğurdu	26.07.2022	Silivri Belediyesi	Mahreç	İstanbul ili Silivri ilçesi	Markalama	11

Markalama; üreticilerin marka ile birlikte Cİ'yi ürünlerinin üzerinde kullanmalarıdır. **R*:** Referanslar. **1:** TÜRKPATENT (2017), **2:** TÜRKPATENT (2022a), **3:** TÜRKPATENT (2020a), **4:** TÜRKPATENT (2020b), **5:** TÜRKPATENT (2021a), **6:** TÜRKPATENT (2021b), **7:** TÜRKPATENT (2021c), **8:** TÜRKPATENT (2021d), **9:** TÜRKPATENT (2021e), **10:** TÜRKPATENT (2022b), **11:** TÜRKPATENT (2022c).

2.1. Susurluk Ayranı

Susurluk Ayrarı, Balıkesir'in Susurluk ilçesine özgü teknikle ve tadı klasik ayrana göre farklılık gösteren yöresel bir içecektir. Susurluk Ayrarı'nın üretiminde; tam yağlı (%en az %3.8) ve kurumadde oranı artırılmış (en az %13) tam yağlı inek sütünden yapılan yoğurt (10 kg), bir miktar su (8-9 L) ve tuz (2 yemek kaşığı) ile karıştırıldıktan sonra insan gücü veya makine yardımı ile istenen kıvama gelinceye kadar karıştırılıp köpürtülür. Hazırlanan ayan, bidonlara aktarılaraq buzdolabında (0 ile 4°C'de) muhafaza edilir ve sunum öncesinde en az 5 dakika karıştırılarak servis edilir. Böylece Susurluk Ayrarı'na has köpüğün sürekliliği sağlanmış olmaktadır. Bu ayanın en önemli ayırt edici özellikleri; köpüklü olması, az tuzlu olması ve üretiminde hiçbir katkının kullanılmamasıdır. Türkiye genelinde bir ün yakalamış Susurluk Ayrarı (Şekil 1-1) adına her yıl, "Susurluk Ayan Festivali" düzenlenmektedir (TÜRKPATENT, 2017).

2.2. Malatya Pirpirimli (Semizotu) Acılı Ayan

Malatya Pirpirimli Acılı Ayan; yoğurt/süzme yoğurt, pirpirim (semizotu), acı kırmızıbiber, su ve tuz kullanılarak üretilen bir ayanıdır. Coğrafi sınırda "yandım çavuş ayanı" olarak da bilinen Pirpirimli Acılı Ayan (Şekil 1-2) Malatya ilinin mutfak kültüründe önemli yere sahiptir. Pirpirimli Acılı Ayan'ın üretiminde; yoğurt (2 kg)/süzme yoğurt (800 g), 1 demet pirpirim (bölge sınırları içerisinde yetişmiş olmalı ve isteğe bağlı olarak çiğ veya haşlanmış kullanılabilir), acı kırmızıbiber (300 g), su (1 L) ve tuz (isteğe bağlı) karıştırılarak toprak küplere aktarılır ve 4°C'de 15-18 gün süreyle fermente edilir. Hazırlanan ayan 4°C'de muhafaza edilir ve servisi bakır kupalarda yapılır (TÜRKPATENT, 2022a).

2.3. Antakya Tuzlu Yoğurt

Antakya Tuzlu Yoğurdu; inek veya keçi sütlerinden üretilen yoğurdun süzülmesi, kazanlarda pişirilmesi ve tuz ilavesi ile üretilen bir yoğurt çeşididir. Geleneksel üretimde, Antakya Tuzlu Yoğurdu (Şekil 1), ekşi ve tuzlu tadı dışında, odun ateşinde pişirilmesinden dolayı hafif tütsülenmiş tat ve koku ile pişmiş tada sahiptir. Endüstriyel olarak da üretilen yoğurda tütsülenmiş tat ve koku bulunmamaktadır. Bu yoğurdun rengi, üretiminde kullanılan sütün çeşidine ve uygulanan ısı işlemine bağlı olarak beyaz-krem renk aralığında değişmektedir. Yoğurt, pürüzlü ve dil üzerinde pütürlü bir yapı hissi bırakan, sürülebilir kıvamda bir üründür. Antakya Tuzlu Yoğurdunun üretim aşamaları sırasıyla; sütün yoğurda işlenmesi, yoğurdun süzülmesi, yoğurdun pişirilmesi, yoğurt belli bir kıvama geldiğinde tuz ilave edilmesi (%2-5), geniş leğenlerde soğutulması ve ambalajlanması (bu aşamada genellikle yoğurdun üzerine zeytinyağı dökülerek hava ile temas kesilir) şeklindedir. Elde edilen yoğurt 4°C'de en az 6 ay kadar muhafaza edilebilmektedir. Ürün hem geleneksel hem de endüstriyel olarak üretilmektedir. Geleneksel yöntemle üretilen tuzlu yoğurtların ambalajında "geleneksel üretim", endüstriyel yöntemle üretilen tuzlu yoğurtların ambalajında "endüstriyel üretim" ifadesi yer alır (TÜRKPATENT, 2020a).

Antakya Tuzlu Yoğurdu'nun bazı fiziksel ve kimyasal özellikleri: kurumadde en az %22.5, asitlik (laktik asit cinsinden) %2.7, kurumadde (KM) protein en az %34.8, KM'de yağ en az %29.3 ve KM'de tuz en çok %17.7'dir. Antakya Tuzlu Yoğurdu'nda 50'den fazla (30 kadarı aroma aktiftir) uçucu bileşik bulunmaktadır; etilbutanoat, metiyonal, etanoik, butanoik ve hekzanoik asit ile Maillard reaksiyonu ürünleri (asetofenon, asetoaseton, 2-furankarboksaldehit, 5-metilfurfuralaldehit ve 5-hidroksimetilfurfural) ana bileşikleri oluşturmaktadır (TÜRKPATENT, 2020a).

2.4. Çaycuma Manda Yoğurdu

Çaycuma Manda Yoğurdu, Çaycuma (Zonguldak) meralarında otlayan Anadolu manda ırkının sütlerinden ticari veya geleneksel maya kullanılarak üretilen bir yoğurt çeşididir. Çaycuma Manda Yoğurdu'nun üretiminde; manda sütü kaynatıldıktan (15-20 dakika) sonra 39-40°C'de 4 saat kadar mayalandıktan sonra soğutularak buzdolabında muhafaza edilir. Yoğurdun üretiminde kullanılan manda sütünün bileşimi; kurumadde %16-18, yağ %6-8, protein %4.2-4.6, laktoz 4.2-5.0, kül %0.7-0.9, özgül ağırlık 1.027-1.040 ve pH 6.1-6.56'dır. Kurumadde oranı yüksek olan manda sütünden üretilen Çaycuma Manda Yoğurdu'nun (Şekil 1-4) bazı fiziksel ve kimyasal özellikleri: kurumadde %14-20, yağ %2-8, protein %4-8, laktoz %2-5, kül %0.8-1.2 ve asitlik %0.9'dur (TÜRKPATENT, 2020b).

2.5 Afyon Manda Yoğurdu

Afyon Manda Yoğurdu; manda kaymağı üretiminden geriye kalan kaymakaltı sütünden üretilen bir yoğurt çeşididir. Bölgede manda sütü (Anadolu mandası olarak bilinen yerli ırklardan elde edilen) genellikle kaymak üretiminde kullanıldığı için kaymakaltı sütleri yoğurda işlenerek değerlendirilmektedir. Afyon manda yoğurdu; porselen beyazı renkte, kendine has tat ve kokuya sahip, sıkı ve kıvamlı yapıda bir yoğurttur. Yoğurt genellikle küçük ölçekli işletmelerde üretilmekle birlikte, endüstriyel olarak büyük ölçekli üretimleri de yapılmaktadır. Afyon Manda Yoğurdu'nun üretiminde; yağ oranı %3'e ayarlanmış kaymakaltı manda sütü; homojenizasyon (isteğe bağlı), ısı işlem (90-95°C'de 5-10 dakika) ve soğutma (40-45°C'de) işlemlerinin ardından starter kültür inokülasyonu (1-2) 42-45°C'de 3-5 saat mayalanır. Mayalama sonunda soğutularak buzdolabında (4-6°C) muhafaza edilir. Bu yoğurdun raf ömrü, üretiminden sonra buzdolabı koşullarında en fazla 20 gündür. Afyon

Manda Yoğurdu'nun özellikleri: pH 4.2-4.9, asitlik %0.6-1.5, yağ en az %3 ve protein en az %5'dir (TÜRKPATENT, 2021a).

2.6. Eşmekaya Yoğurdu

Eşmekaya Yoğurdu (Şekil 1-5), Eşmekaya kasabasının zengin ve endemik bitki (gökbaş, yağlıca, pıtırak, tilki kuyruğu, güvenik, yabancı buğday, kangal sitili, yavşan otu, keme otu, yabancı yonca, tosbağa otu, üzerlik, keçi bacağı gibi) örtüsüyle beslenen koyunlardan elde edilen süttten geleneksel maya (yoğurdun kendisi) kullanılarak üretilen koyu kıvamlı bir yoğurttur. İki kez süzülen koyun sütü kaynatıldıktan sonra 36-38°C'de 2.5-3 saat oda sıcaklığında bekletilerek mayalanır. Mayalama işlemini takiben yoğurtlar soğutularak buzdolabında muhafaza edilir. Eşmekaya Yoğurdu'nun protein oranı %6.2 ve yağ oranı %8,5'dir (TÜRKPATENT, 2021b).

2.7. Emirdağ Koyun Yoğurdu

Emirdağ Koyun Yoğurdu; Afyonkarahisar ilinin Emirdağ ilçesindeki yaylalarda otlayan koyunların sütünden geleneksel maya (yoğurdun kendisi) kullanılarak üretilen, yağ oranı yüksek, beyazımsı-kremsi renkte, kıvamlı bir yoğurttur. Yoğurdun üst kısmında, sarımsı bir kaymak tabakası bulunur. Emirdağ Koyun Yoğurdu'nun üretiminde; süzülen koyun sütü kısık ateşte kaynatıldıktan (8-10 dakika) sonra kış mevsiminde 50-55°C, yaz mevsiminde 40-45°C'de 5-6 saat mayalanır (%2 maya ilavesi). Emirdağ Koyun Yoğurdu (Şekil 1-7), tercihen bakraç/helke olmak üzere gıda ile temasa uygun kaplarda ve en az 4 °C'de muhafaza edilir. Emirdağ Koyun Yoğurdu'nun kurumadde miktarı %15-19, yağ miktarı %6-8.5, protein miktarı %5.5-7.5 ve karbonhidrat miktarı %3.5-6.5'dir (TÜRKPATENT, 2021c).

2.8. Mamak Ravak Yoğurdu

Mamak Ravak Yoğurdu, Ankara ili Mamak ilçesinden temin edilen inek sütünden "ravak mayası" olarak bilinen geleneksel maya ile bölgeye özgü yöntemle üretilen bir yoğurttur. Bu yoğurt; porselen beyazı rengine, kendine özgü tat ve kokuya sahip, sıkı ve kıvamlı yapıdadır. Ravak mayasının üretiminde; inek sütünden seperatör yardımı ile ayrılmış krema, pastörizasyon işleminden sonra gıda mevzuatına uygun starter kültür ile mayalanır. Böylece, ravak mayası olarak bilinen yoğurt mayası elde edilir. Mamak Ravak Yoğurdu (Şekil 1-8) inek sütünden kremanın alınması sonucunda kaymakaltı sütü; kaynatma ve soğutma işlemlerinin ardından ravak mayası inokülasyonu (%2) birlikte 45°C'de 4-5 saat mayalanır. Mayalama sonunda yoğurtlar soğutularak buzdolabında (4-6°C) muhafaza edilir (TÜRKPATENT, 2021d).

2.9. Ereğli Koyun Yoğurdu

Ereğli Koyun Yoğurdu, Konya ili Ereğli ilçesinde beslenen koyunların sütünden geleneksel ve endüstriyel yöntemlerle üretilen, yanık tat ve aromaya sahip bir çeşittir. Bu yoğurdun üretiminde, koyun sütü 90°C'de 20-30 dakika kaynatıldıktan sonra soğutularak 40-45°C'de 2-3 saat mayalanır (%2 maya ilavesiyle). Mayalama sonrasında yoğurt 0-6°C'de muhafaza edilir. Sütün pişirilmesi sırasında yoğurda özgü yanık tat kazandırılır. Ereğli Koyun Yoğurdu (Şekil 1-9) %15-25 kurumadde, %1-2 asitlik, %6-13 yağ ve %5-10 protein içermektedir (TÜRKPATENT, 2021e).

2.10. Silifke Yoğurdu

Silifke Yoğurdu; esas olarak kıl keçisinden elde edilen süttten üretilen ancak keçi sütünün azaldığı dönemlerde %80 inek sütü + %20 keçi sütü karışımından da üretilen, toprak kaplarda veya çingillerde (bakraç veya helke olarak da bilinmekte) mayalanan bir yoğurt çeşididir. Silifke Yoğurdu yüksek kuru madde ve yağ içeriğine sahip olduğu için kıvamlı ve ağızda kremi bir his bırakır. Silifke Yoğurdu (Şekil 1-10), sütünün odun ateşinde kaynatılması nedeniyle tutsu aromasına sahiptir. Ancak, endüstriyel üretimde ısıl işlemin kızgın buharla yapılması nedeniyle tutsu aroması oluşmamaktadır (TÜRKPATENT, 2022b).

Silifke Yoğurdu'nun geleneksel üretiminde çiğ süt; ısıl işlem (90-95°C'de 5-10 dakika) ve soğutma (40-48°C) işlemlerinin ardından bir önceki günün yoğurdu (%0.5-1) ile toprak kaplarda veya çingillerde yaklaşık 12 saat mayalanır. Mayalama işlemini takiben yoğurtlar soğutularak (<10°C) buzdolabında muhafaza edilir. Endüstriyel üretimde ise yağ standardizasyonu ve homojenizasyon işlemlerinin (isteğe bağlı) ardından kontrollü şartlarda mayalama yapılır. %100 keçi sütünden üretilen yoğurdun pH değeri 4.2-4.6, asitliği %1-1.2, kurumadde %19-22, yağ miktarı %7-8.5, protein miktarı %7.5-8.5, laktoz miktarı %2.5-3.5 ve kül miktarı %1-2'dir. %80 inek sütü + %20 keçi sütü karışımından üretilen yoğurdun özellikleri ise: pH değeri 4.2-4.6, asitliği %1-1.2, kurumadde miktarı %16-17.5, yağ miktarı %6.3, protein miktarı %5.5-6, laktoz miktarı %2-3 ve kül miktarı %1-1.5'dir (TÜRKPATENT, 2022b).

2.11. Silivri Yoğurdu

Silivri Yoğurdu; inek, koyun, manda, eşit oranda inek - koyun veya eşit oranda inek - manda sütünden geleneksel veya endüstriyel yöntemlerle üretilen, sarımtırak, koyu kıvamlı ve üzerinde pürüzlü kalın bir kaymak tabakası

bulunan yoğurt çeşididir. Silivri Yoğurdu'nun (Şekil 1-11) endüstriyel olarak üretiminde; kurumadde ve yağ standardizasyonu yapılmış süt, 90-95°C'de 30 dakika uygulanan ısıtılma işlemin ardından köpük oluşması için ambalajlara üstten sıcak dolum yapılır. Daha sonra 50°C'ye ayarlanmış inkübasyon odasında en az 2 saat bekletildikten sonra, 42-45°C'de starter kültür ilavesiyle (%1.5-3) yaklaşık 2-3 saat (pH 4.6'ya ulaşıncaya kadar) mayalanır. Daha sonra yoğurtlar soğutulurak 4°C'de muhafaza edilir. Silivri Yoğurdu'nun bileşimi, üretiminde kullanılan sütün çeşidine göre değişmekte olup yağ miktarı %4-6 ve yağsız kurumadde miktarı %10-12 aralığındadır (TÜRKPATENT, 2022c).

Şekil 1. Türkiye'de Cİ almış ayran ve yoğurtlar

1: Susurluk Ayrarı (TÜRKPATENT, 2017), 2: Malatya Pirpirimli (Semizotu) Acılı Ayrarı (TÜRKPATENT, 2022a), 3: Antakya Tuzlu Yoğurt (Anonim, 2022a), 4: Çaycuma Manda Yoğurdu (Anonim, 2022b), 5: Afyon Manda Yoğurdu (TÜRKPATENT, 2021a), 6: Eşmekaya Yoğurdu (TÜRKPATENT, 2021b), 7: Emirdağ Koyun Yoğurdu (TÜRKPATENT, 2021c), 8: Mamak Ravak Yoğurdu (TÜRKPATENT, 2021d), 9: Ereğli Koyun Yoğurdu (TÜRKPATENT, 2021e), 10: Silifke Yoğurdu (TÜRKPATENT, 2022b), 11: Silivri Yoğurdu (TÜRKPATENT, 2022c)

3. Sonuç

Yoğurt ve Ayrarı Türk kültüründe önemli yere sahip geleneksel fermente süt ürünlerimizdendir. Ülkemizde coğrafi koşullar ve kültürel alışkanlıklara bağlı olarak farklı sütlerden (inek, koyun, keçi, manda veya bu sütlerin belirli oranlarda karıştırılmasıyla elde edilen) çeşitli yöresel yoğurtlar üretilmektedir. Geleneksel olarak üretilen yoğurtlardan; Çaycuma Manda Yoğurdu, Afyon Manda Yoğurdu, Eşmekaya Yoğurdu, Antakya Tuzlu Yoğurt, Emirdağ Koyun Yoğurdu, Mamak Ravak Yoğurdu, Ereğli Koyun Yoğurdu, Silifke Yoğurdu ve Silivri Yoğurdu ile ayanlardan Susurluk Ayrarı ve Malatya Pirpirimli (Semizotu) Acılı Ayrarı Cİ tescilli ile koruma altına alınmıştır. Türkiye'nin Eylül 2022 itibarıyla, Cİ ve geleneksel ürün adı başvurusu yapılmış 8 adet yoğurt çeşidi (Ayrancı Yanıksı Yoğurdu, Kandıra Manda Yoğurdu, Karapınar Koyun Yoğurdu, Mazıdağı Yoğurdu, Sandıklı Kесе Yoğurdu, Silivri Yoğurdu, Yoğurt ve İstanbul Manda Yoğurdu) daha TÜRKPATENT tarafından değerlendirme aşamasındadır. Ayrarı için başvuru bulunmamaktadır. Şüphesiz, yoğurt ve ayrarı gibi geleneksel ve orijinal üretim tekniğine sahip gıdalarımızın; benzerlerinden ayrılması, haksız rekabete karşı korunması, kalitesi ve üretim koşullarında sürekliliğin sağlanması, değerinin artırılması, kayıtlara geçirilmesi ve markalaşmasında Cİ tescilinin payı oldukça önemlidir. Ayrıca, her geçen gün tescillenen ve tescil başvurusu yapılan ürün sayısının artması, Cİ kavramının Türkiye genelinde yaygınlaştığını, farkındalığın arttığını ve Cİ'nin işlevlerinin anlaşıldığını/anlaşılmaya başlandığını göstermektedir.

The Effect of Different Drying Techniques and Conditions on Drying Parameters and Thermo-physical Properties of Peach

Burcu Aksüt^{1*}, Hakan Polatcı¹, Adil Koray Yıldız²

¹Tokat Gaziosmanpaşa Üniversitesi

²Yozgat Bozok Üniversitesi

Abstract

Peach is a fruit that contains 78%-85% water and has a very high production. Due to the high humidity it contains, it must be stored to be kept for a long time in a consumable condition without spoiling. In this study, 8 sliced peach fruits were dried in an oven (50, 60, 70 °C) and in an air conditioning cabinet (50, 60, 70 °C at constant 30% relative humidity). In the study, the shortest drying time was found with 12 h at a drying temperature of 70 °C in the oven, while the longest drying time was determined by 41.5 h in the experiment carried out in the air conditioning cabinet at 50 °C and 30% RH. Considering all color values, the method that best preserves the color values of peach fruit was determined in the experiment performed at 60 °C in an oven. While creating the curves, Lewis, Page and Yağcıoğlu drying models, which are the most used in the literature, were selected and the drying data were best estimated by the Yağcıoğlu model (R²: 0.9999). Yağcıoğlu model best modeled the drying data at 60 °C in the oven drying method. The highest specific heat, thermal conductivity, thermal diffusivity and specific mass values of the dried samples were determined in the samples dried in an oven at 60 °C.

Farklı Kurutma Teknikleri ve Şartların Şeftalinin Kuruma parametrelerine ve Termo-fiziksel Özellikler Üzerine Etkisi

Özet

Şeftali %78-85 oranında su içeren ve üretimi oldukça fazla olan bir meyvedir. İçerdiği yüksek nemden dolayı bozulmadan tüketilebilir halde uzun süre tutulabilmesi için muhafaza edilmesi gerekir. Bu çalışmada, 8'e dilimlenmiş şeftali meyvesini etüvde (50, 60, 70 °C) ve iklimlendirme kabininde (sabit %30 bağıl nemde 50, 60, 70 °C) kurutulmuştur. Çalışmada en kısa kuruma süresi 12 saat ile etüvde 70 °C kurutma sıcaklığında bulunurken, en uzun kuruma süresi ise 41.5 saat ile iklimlendirme kabini 50 °C %30 RH nemde yapılan denemede tespit edilmiştir. Tüm renk değerlerine bakıldığında şeftali meyvesi renk değerlerini en iyi muhafaza eden yöntem etüv 60 °C sıcaklıkta yapılan denemede tespit edilmiştir. Eğriler oluşturulurken literatürde en çok kullanılan Lewis, Page ve Yağcıoğlu kurutma modelleri seçilmiştir ve arasında kuruma verilerini en iyi Yağcıoğlu modeli (R²: 0.9999) tahmin etmiştir. Yağcıoğlu modeli etüv kurutma yönteminde 60 °C sıcaklıkta kuruma verilerini en iyi modellemiştir. Kurutulan örneklerin en yüksek özgül ısı, termal iletkenlik, termal difüzyivite ve özgül kütle değerleri etüv 60 °C de kurutulan örneklerde belirlenmiştir.

²Department of Biological and Chemical Sciences, Arts & Sciences, Lebanese International University, Bekaa, Lebanon

Abstract

Labneh is one of the most consumed dairy products in the Lebanese community, on breakfast, as a snack or on dinner, plain or mixed with herbs. Its various health benefits plus its acceptability among people makes it an important part of the Lebanese diet. In both its synthetic and homemade forms, several additives are usually incorporated to enhance its flavor and offer a variety of tastes. The problem with Labneh is its short shelf life, as well as its sensitive sensory profile. That is why most industries mix chemical additives with Labneh to prolong its shelf life and conserve its taste. The aim of this research is to preserve Labneh naturally by adding *Moringa Oleifera* dried leaves to extend its shelf life and inhibit rapid spoilage. Working on a natural preservation of Labneh instead of chemical preservation will be assessed by the survey's results and prepare for studying the overall acceptability of the product by making a sensory analysis. The results of the questionnaire showed that the Lebanese community which is not totally aware of *Moringa Oleifera* benefits and availability, is willing to try fortified Labneh with *Moringa* as a new product with extended shelf life and more health benefits. The results of the sensory analysis showed that the sensory attributes of the samples with *Moringa* after 21 days of storage, were not significantly different than normal plain Labneh, which indicate that adding *Moringa* did not affect the sensory attributes of Labneh giving it more acceptability to consumers.

Key Words: Labneh, *Moringa Oleifera*, fortification, overall acceptability, sensory attributes.

Introduction

Dairy products contribute to the major part of Middle Eastern breakfast due to their nutritional benefits and unique flavor. Benefits of consuming dairy products include providing proteins, vitamins, minerals and fatty acids, muscle building, decreasing blood pressure and low-density lipoprotein cholesterol, and play an important role in prevention of diabetes, cancer, and obesity (Tunick & Van Hekken, 2015). Labneh is one of these dairy products that is obtained mainly from milk, which is fermented to obtain yogurt followed by further concentration.

Labneh, so called in the Middle East, strained yogurt in Greece and Europe or Suzme yogurt in Turkey (Abbas et al., 2015) is widely consumed as a main dish at breakfast worldwide, but more frequently in the Middle Eastern countries such as Lebanon, Iraq and Iran (Tarakci et al., 2011).

Making and consuming Labneh is mainly done in the Middle Eastern countries since ancient times but there is no specified date or history of origin about it. Labneh is made from yogurt as mentioned earlier, and the word 'yogurt' comes from Turkish word "yogurtmak," which means to thicken, coagulate, or curdle. Despite knowing that yogurt is an extremely old dish in the kitchens of our ancestors, no one is completely sure of the exact origins of the dish. The Greek were the first to mention yogurt in a written reference 100 BC, and Indian Ayurvedic scripts mentioned benefits of consuming fermented milk back in 6000BC (Fisberg & Machado, 2015).

Labneh is a semisolid food produced by removing water and its soluble compounds from yogurt (Nsabimana et al., 2005). It has properties of good spreadability, cream/white color and a slightly acidic and clean flavor (M. El-Saye et al., 2017; Nsabimana et al., 2005). From a nutritional point of view, Labneh is considered to have 2.5 times higher protein content, 50% more minerals, and a larger number of viable microorganisms when compared to normal yogurt (Ismail et al., 2016). Labneh is composed of 230-250g/kg total solids, 80-100g/kg fat and acidity of 1.8-2.0g/100 g lactic acid (Tarakci et al., 2011). In many villages of the Lebanese countryside, Labneh can be further concentrated to reach 40% solids and made as balls then placed in jars filled with olive oil. In this shape, people call it Labneh Anbaris or Labneh cheese. This step is usually done to prolong the shelf life of Labneh more due to covering the surface with olive oil and thus inhibition of mold and yeast growth (Ahmad et al., 2013).

Labneh (concentrated yogurt) is prepared by draining whey and part of its soluble compounds by using traditional or modern techniques. The traditional method is still widely used in many dairy plants. It consists mainly of pouring the plain yogurt into a cloth bag or sometimes into an animal skin and allow the whey to drain until the desired semi-solid consistency is reached. After that, the content of the bag is removed and salt is being added in 1-2% and then the product is being filled in containers and refrigerated. Modern techniques include using mechanical separator (centrifugation) or ultrafiltration. Centrifugation is applied to heated yogurt at different speeds to obtain Labneh. (Nsabimana et al., 2005)

Although water, the main contributor of microbial spoilage is removed in Labneh, it still has a short shelf life even under refrigeration. This is mainly due to the growth of large amount of lactic acid bacteria combined with low access to air during storage. These conditions facilitate the growth of yeasts and molds causing deterioration of

the product, and signs of yeast spoilage was observed at 7-14 days in many cases. (Nsabimana et al., 2005). Due to its short shelf life, several artificial preservatives were used during Labneh manufacturing, and those include potassium sorbate and sodium benzoate, and sometimes natamycin to produce Labneh that is yeast and mold-free with a longer shelf life. (Zamani Mazdeh et al., 2017).

According to the World Health Organization WHO, food-borne illness is responsible for 400,000 deaths and 600 million cases of food poisoning per year around the world (Yu et al., 2021). In year 2004, the World Health Organization (WHO), Food and Agricultural Organization (FAO), and the International Food Safety Authorities Network (IFOSAN) addressed this problem by creating a joint program with the purpose of reducing the increasing number of food poisoning cases caused by the wide spread of food contamination by strengthening the food safety systems worldwide (Ritota & Manzi, 2020)

Awareness against harmful effects of chemicals used in food, lead to attempts in replacing those chemical preservatives with natural ones. Natural preservatives can be herbs and spices as well as their oils or extracts which are rich in antioxidants and antimicrobial substances, vitamins and minerals. So their use with Labneh will increase its shelf life without any harm with the advantage of increasing the nutritional value of the product.(El-Tawab et al., 2019).

One of the essential technique to extend shelf life and reduce food poisoning cases is food processing. It is done through several methods, including physical preservation by applying heat (pasteurization) or reducing temperature (freezing), chemical preservation by adding manufactured preservatives, biological preservation by using certain microorganisms with antagonistic effects against targeted pathogens, or natural preservation that has been gaining noticeable attention lately. (Yu et al., 2021).

Moringa tree, composition and health benefits

The Moringaceae family consists of 13 different species of *Moringa*, found originally in Kenya, Ethiopia, Somalia, Namibia, Angola, Madagascar, and the Horn of Africa. *Moringa Oleifera* which is the most widely spread species originates from the sub-Himalayan tracts of Northern India, while the derivatives of *Moringa Oleifera* are now found in the Middle East, African and Asian countries (Leone et al., 2015). *Moringa Oleifera* is also planted for ornamental purposes in several cities such as Mexico, Bolivia and Argentina. (Milla et al., 2021)

Many studies were performed on the Moringa tree to study its composition. One of the latest studies was done on 5 samples of Moringa leaves gathered from 3 distinct areas of Bangladesh (Sultana, 2020). Moringa leaves were shade dried for 3 days, then grinded and sieved to remove debris. Resulted powder was kept in sealed sample bags at the temperature of -20 degrees (Sultana, 2020). Table 1 shows the composition of Moringa leaves. (Leone et al., 2016; Sultana, 2020)

Table 1: Moisture, ash, protein, fat, fiber and carbohydrates content of Moringa dried leaves and Moringa seeds. (Leone et al., 2016; Sultana, 2020)

Component	Moringa Dried Leaves	Moringa Seeds
Moisture	8.13%	7%
Ash	9.34%	6.2%
Crude Protein	25.04%	31.4%
Crude Fat	5.75%	36.7%
Crude Fiber	7.34%	7.3%
Crude Carbohydrates	52.52%	18.4%

Due to the rich nutrient profile and mineral content of *Moringa Oleifera* leaves, it shows a wide range of anti-oxidant, anti-inflammatory, and anti-microbial effects (Anwar et al., 2007; Hodas et al., 2021; Leone et al., 2015). These effects promoted the use of Moringa as a hypoglycemic, hepato and kidney protective, and anti-cancer agent (Anwar et al., 2007; Leone et al., 2015). The phytochemical content of Moringa is responsible for the anti-microbial activity, especially benzyl-isothiocyanate, which acts directly on cell membrane synthesis of the microorganisms, leading to the disruption of its growth (Hodas et al., 2021).

The leaves extract was shown to inhibit the growth of eight pathogenic bacteria and fungi, which are *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Staphylococcus epidermis*, *Staphylococcus aureus*, *Salmonella senftenberg*, *Escherichia coli*, *Bacillus subtilis*, and *Candida albicans*. It also showed anti-microbial effect against gram-positive and gram-negative bacteria (Hodas et al., 2021).

Effect of Moringa on the Shelf Life of Labneh

In the past years, many studies were done on Moringa oil and its use with Labneh. Adding Moringa oil to Labneh increased fat and total solid content, however it decreased protein content and ash as the concentration of oil increased. Acidity was an important factor to take into consideration as it affects the acceptability of the final product. It was shown that acidity increased and pH decreased as the concentration increased; thus the oil had excellent effect on the starter culture and maintained typical sour taste of the product. The Samples mixed with the

highest concentration of Moringa oil had the highest antioxidant activity even after 30 days of storage over the other samples. However, it decreased in all samples as storage period increased.

Mold and yeast count are very important when determining the quality and shelf life of Labneh. When adding Moringa oil, samples remained free from mold and yeast up to 30 days while it was observed in the control after 15 days. This was explained by the presence of phenolic and flavonoid compounds that have antimicrobial activity as explained in table 4. (M. El-Saye et al., 2017)

As such, *Moringa Oleifera* was used as natural preservative since it is highly rich in a wide variety of minerals and vitamins and can serve the intended use as preservative. The Moringa oil was not accessible in the Lebanese markets, therefore, the samples of Labneh were prepared, shaped as balls and covered with dried Moringa leaves. People in the Lebanese countryside usually shape the Labneh in balls and cover it with dried thyme or other herbs, but no one has ever covered Labneh with dried Moringa leaves. In the purpose of studying any change that might occur in the sensory attributes of Labneh. A questionnaire was conducted to study the community's basic knowledge and consumption of Labneh with natural additives, as well as their familiarity of Moringa and its health benefits. Based on the findings, Labneh fortified with dried *Moringa Oleifera* leaves was prepared. Its sensory profile and overall acceptance by the consumers were studied and analyzed.

Materials and Methods

This research was based on the need of the Lebanese communities to work on prolonging the shelf life of Labneh and help preserve it without using chemical substances as preservatives.

After looking at the different herbs available in the Lebanese Markets, we found that Moringa leaves were recently known in the society, and a few people were consuming them as hot drink. Since the profile of the Moringa is rich and suits well the Labneh, it was decided to prepare fresh Labneh and fortify it by covering Labneh balls with dried grinded Moringa leaves. The first step was to prepare a survey to investigate the people's knowledge on Moringa, its uses and benefits, as well as investigate their willingness to try this new product. The second step was to study the sensory profile of Labneh covered with Moringa and compare it to that of plane Labneh.

The questionnaire consisted of three sections. The first one was set to collect demographic information. The second section contained questions about Labneh, it aims to know how often people consume Labneh, in what form, plane or coated with herbs, handmade or industrial and whether or not they know that industrial Labneh contains chemical substances as preservatives. The third section was about Moringa, the first question was whether the respondents have ever heard of Moringa. For those who did, they were asked if they knew the benefits of Moringa and its uses in the food science, how frequent they consume it and in what forms. The final question was set in a separate section that asks respondents if they are willing to try Labneh covered with Moringa. After finishing the validity and reliability steps, the questionnaire was sent to the Institutional Review Board at the Lebanese International University for approval before going public. The IRB approval letter was received in May 2022 under the reference code Ref: LIUIRB-220509-WAB-162. Only then, the questionnaire went public and the collected data from 332 respondents was analyzed via IBM SPSS Statistics Data Editor Version 25.

The next stage in this study was to prepare fresh Labneh, make it in ball shapes, and divide the set prepared into plane balls and balls covered with dried Moringa leaves. The sensory profile was prepared for the panelists to taste and evaluate.

The Sensory evaluation of Labneh fortified with Moringa dried leaves was done 21 days after preparation. The 11 panelists were chosen trained, aged between 22 to 28 years old (all females). The analysis was conducted in the lab premises of the Lebanese International University LIU. Each panelist received the following: 3 samples of the control group designated by 3 random digits presented in dishes, 3 samples of the designated product labelled each by 3 random digits, profile sheet, pen, biscuits, water, tissues, spittoons and a hedonic scale.

Labneh samples were evaluated for their compactness, firmness, cohesiveness, wetness, saltiness, sourness, metallic taste and overall acceptability. Three pieces of each Labneh sample were served on white plastic plates together with detailed information on the procedure and advice to rinse their palates with biscuits and sips of water. The panelists used the hedonic scale for attribute intensity ranging from one (dislike extremely) to nine (like extremely). The data obtained was analyzed using IBM SPSS Statistics Data Editor Version 25.

Results and Discussion

The results of the questionnaire were analyzed and it was found that 65.66% of the respondents consume Labneh the most among other dairy products. 33.34% of dairy products consumers find the health benefits of Labneh of great importance for their bodies, while 55.42% of participants are unaware of chemical preservatives added to industrial Labneh and their negative impact on human health.

52.3% consume home-made Labneh, while 10.8% consume industrial Labneh. On the other hand, 39.46% of participants believe that home-made Labneh has longer shelf-life than industrial Labneh. Out of the 332 participants who filled the questionnaire, 43.7% agreed that the Covid-19 pandemic made them move towards consuming more natural foods.

84.60% of the respondents were familiar with the Moringa and practically use it as hot drink, but unfortunately 73.28% of them were unaware of its use as a natural preservative. The results also showed that 44.83% of the respondents are willing to try *Moringa Oleifera* fortified Labneh.

When analyzing the data of the sensory analysis, the results obtained for the samples with or without Moringa (control) after 21 days of storage, where not significantly different, as shown in tables 2 and 3.

Table 2: Kruskal-Wallis Test applied to compare means of different variables for control samples.

Variable	Total Number	Mean	Std.Deviation
compactness	66	7.33	±2.18
firmness	66	6.81	±1.72
cohesiveness	66	6.27	±1.91
Wetness	66	3.36	±1.81
Saltiness	66	3.12	±2.03
Sourness	66	4.94	±2.56
Metallic taste	66	3.42	±2.16
Overall acceptability	66	3.48	±2.03

Table 3: Kruskal-Wallis Test applied to compare means of different variables for samples of Labneh covered with Moringa.

Variable	Total Number	Mean	Std.Deviation
compactness	66	7.48	±2.01
firmness	66	6.51	±1.56
cohesiveness	66	6.18	±1.91
Wetness	66	3.3	±1.78
Saltiness	66	3.48	±2.14
Sourness	66	5.66	±2.52
Metallic taste	66	3.39	±2.06
Overall acceptability	66	3.97	±2.09

According to the results obtained, p values were greater than 0.05 in the control samples and those with Moringa after 21 days of storage, which indicates that there is no significant difference between samples of Labneh with and without Moringa. Thus, adding Moringa does not affect the sensory attributes of normal Labneh. Therefore, if people buy Labneh fortified with Moringa as a new innovative product, it would not be different for them in terms of sensory attributes of normal Labneh, except that they would be intensifying its health benefits. In previous similar researches, the addition of herbs to Labneh including mint, parsley, diplotaxis, dill, coriander, purslane, cress or rocket was tested for any change in appearance and color, body and texture, flavor, and overall acceptability. The different results showed that coriander and diplotaxis had the lowest flavor scores, appearance and color of mint samples were the lowest, and highest overall acceptability was for purslane, dill, parsley and rocket samples while the lowest score for acceptability was for coriander and diplotaxis. Dill, mint, parsley, coriander, diplotaxis, purslane are more recommended as Labneh preservatives.(Tarakci et al., 2011). In another study, culinary herbs such as mint, poppy seeds, cinnamon, and basil were added to Labneh, and firmness, appearance, color/brightness, surface water, taste, flavor and overall acceptability were assessed. Firmness was the highest in the control sample and lowest in cinnamon added sample but it decreased in all samples with 21 days of storage. Color and appearance of mint were the lowest while it gave the best result regarding firmness. Basil was the lowest in having water on the surface. However, in this study, control samples showed best taste and flavor and overall acceptability decreased during storage and the lowest was in mint while the highest was in the control. Olive dried leaves were also added to Labneh to make an innovative product. Adding 1%, 2%, and 3% of dried olive leaves had the best appearance, flavor, consistency over 4% and 5% , and as concentration and storage period increase , the sensory attributes of Labneh decrease. (Ismail et al., 2016). Consequently, culinary herbs were not recommended as Labneh preservatives.(Ahmad et al., 2013).

Conclusion

The increasing demand on healthy foods especially after the Covid-19 pandemic placed the natural preservatives under spotlight, giving them more attention and appreciation. Dried *Moringa Oleifera* leaves added to Labneh as a natural preservative to increase shelf life while maintaining acceptable quality aspects proved to be a suitable process for a new product in the Lebanese community, where *Moringa Oleifera* is widely available, have no strong effect on sensory attributes of Labneh and the process of making the product is easily applicable. Moreover, it had a similar effect on Labneh as other additives such as thyme which is very popular in the Lebanese communities. The addition of *Moringa Oleifera* as dried herbs to Labneh is a potential new product that can be easily introduced into the Lebanese cuisine as well as others.

Serological Detection of Three Common Tomato Viruses in Tomato Cultivation Areas of Ereğli District in Konya Province

Serkan Yeşil^{1*}

¹ Selçuk University, Faculty of Agriculture, Department of Plant Protection

* Corresponding author: serkanyesil@selcuk.edu.tr

Abstract

Tomato (*Lycopersicon esculentum* Mill.) which is a member of *Solanaceae* family, is one of the commonly growing plant species worldwide and Türkiye as well. The fruits of the tomato plant are consumed both raw and cooked. In addition, being the raw material of tomato paste also causes an increase in the amount of consumption. In addition to producing tomato paste from tomato fruits, it also constitutes an important export item as dried fruit. There are many biotic and abiotic factors that can cause negative effects on yield and quality in tomato cultivation. Virus diseases also have an important place among these factors. In this study, it was aimed to reveal some viruses that are a problem in tomato production areas in the Ereğli district of Konya, where tomato production is common. For this reason, in the 2019 production season, leaf samples were taken from 160 tomato plants showing symptoms similar to virus disease symptoms such as mosaic, deformations, yellowing, blight on the leaves and stunted plants. Possible infections of *Cucumber mosaic virus* (CMV), *Tomato spotted-wilt virus* (TSWV) and *Tomato mosaic virus* (ToMV) on these leaves were tested by serological-based DAS-ELISA (Double Antibody Sandwich-Enzyme Linked Immuno Sorbent Assay) method. According to DAS-ELISA results, it was determined that 66,25% of the samples were infected with at least one of these three viruses. In addition, TSWV was detected as the most common virus with a 48,75 % relative infection rate in the samples, followed by ToMV (28,75 %) and CMV (26,25 %). Mixed infections of the viruses were also detected in the leaf samples tested. CMV + TSWV double infection was detected in 22 samples, ToMV + TSWV double infection was detected in 14 samples, and CMV + ToMV + TSWV triple infection was detected in 12 plant samples.

Key Words: CMV, DAS-ELISA, Tomato, ToMV, TSWV

Konya İli Ereğli İlçesi Domates Ekim Alanlarında Domateste Yaygın Olarak Bulunan Üç Virüsün Serolojik Tespiti

Özet

Solanaceae familyasının bir üyesi olan domates (*Lycopersicon esculentum* Mill.), dünyada ve Türkiye'de de yaygın olarak yetiştirilen bitki türlerinden biridir. Domates bitkisinin meyveleri hem çiğ hem de pişmiş olarak tüketilmektedir. Ayrıca salçanın hammaddesi olması da tüketim miktarının artmasına neden olmaktadır. Domates meyvelerinden salça üretilmesinin yanında, kuru meyve olarak ta önemli bir ihraç kalemini oluşturmaktadır. Domates yetiştiriciliğinde verim ve kalite üzerinde olumsuzluklara sebep olabilen birçok biyotik ve abiyotik etken bulunmaktadır. Virüs hastalıkları da bu etkenler arasında önemli bir yere sahiptir. Bu çalışmada, yoğun olarak domates üretimi yapılan Konya ilinin Ereğli ilçesindeki domates üretim alanlarında sorun olan bazı virüslerin ortaya konulması amaçlanmıştır. Bu sebeple, 2019 üretim sezonunda sürveyler gerçekleştirilerek yapraklarda mozaik, şekil bozuklukları, sararmalar, yanıklıklar, bitkilerde bodurluk gibi virus hastalık belirtilerine benzer belirtiler gösteren 160 domates bitkilerinden yaprak örnekleri alınmıştır. Bu yapraklardaki olası Hıyar mozaik virüsü (*Cucumber mosaic virus*, CMV), Domates lekeli solgunluk virüsü (*Tomato spotted-wilt virus*, TSWV) ve Domates mozaik virüsü (*Tomato mosaic virus*, ToMV) enfeksiyonları serolojik test yöntemlerinde DAS-ELISA (Double Antibody Sandwich-Enzyme Linked Immuno Sorbent Assay) testi ile araştırılmıştır. DAS-ELISA sonuçlarına göre örneklerin % 66,25'inin bu üç virüsten en az bir tanesi ile bulaşık olduğu belirlenmiştir. Ayrıca, TSWV örneklerde % 48,75'lik bulaşıklık oranı ile en yaygın virus olarak tespit edilirken, bu virüsü ToMV (% 28,75) ve CMV (% 26,25) takip etmiştir. Testlenen yaprak örneklerinde söz konusu virüslerin karışık enfeksiyonları da belirlenmiştir. CMV + TSWV ikili enfeksiyonu 22 örnekte, ToMV + TSWV ikili enfeksiyonu 14 örnekte ve CMV + ToMV + TSWV üçlü enfeksiyonu ise 12 bitki örneğinde tespit edilmiştir.

Anahtar Kelimeler: CMV, DAS-ELISA, Domates, ToMV, TSWV

Abstract

Beekeeping is one of the important branches of livestock. Although Turkey is second in the world in the number of colonies, honey production is not in the same order. This is because of the inefficient production. In order to overcome this inefficiency, it is necessary to develop and implement the scientific and modern activities in beekeeping as well as in other animal husbandry branches. Sensitive livestock has become an important issue in animal production. The basic goal in sensitive livestock production is to produce the most efficiently by meeting the needs of the animals adequately and economically. The vital activities of animals must be controlled to determine their needs. This is accomplished by ensuring continuous traceability by using electronic systems and information systems. It is considered that the application of sensitive livestock for beekeeping will reduce workload and increase honey yield. The purpose of Precision beekeeping is to be able to reach all the information needed about the bee colonies grown quickly and to plan the most economical and effective maintenance work by using this information. In order to achieve this, the beekeepers must constantly collect and record data. The reasonable thing about beekeeping is that it does not disturb the colony by opening the beehives as little as possible while performing the examinations and care of the colonies. Frequent opening of the hives and data collection do not give good results in terms of beekeeping. For this reason, there is a need for electronic systems to collect the necessary data for bee colonies. In this project, an electronic hive system was designed to collect data for sensitive beekeeping.

Hassas Arıcılıkta Kullanılması Amacıyla Elektronik Veri Toplama Özellikli Kovan Sisteminin Geliştirilmesi

Özet

Arıcılık hayvancılığın önemli dallarından biridir. Türkiye koloni sayısında dünyada ikinci sırada olmasına rağmen, bal üretiminde aynı sırada değildir. Bunun nedeni verimsiz üretimdir. Bu verimsizliğin giderilmesi için diğer hayvancılık dallarında olduğu gibi arıcılıkta da bilimsel ve modern faaliyetlerinin geliştirilmesi ve en doğru şekilde uygulanması gerekmektedir. Hassas hayvancılık hayvansal üretimde önemli bir konu haline gelmiştir. Hassas hayvancılıkta temel hedef, hayvanların ihtiyaçlarının yeter ve ekonomik şekilde karşılanmasıyla üretimin en verimli şekilde sağlanmasıdır. İhtiyaçların belirlenmesi için hayvanların yaşamsal faaliyetlerini kontrol altında tutulması gerekir. Bu da elektroniğin ve bilişim sistemlerinin kullanılarak sürekli izlenebilirliğin sağlanmasıyla gerçekleştirilmektedir. Hassas hayvancılığın arıcılık için uygulanmasının iş yükünü azaltacağı ve bal verimini arttıracığı düşünülmektedir. Hassas arıcılıkta amaç yetiştirilen arı kolonileriyle ilgili ihtiyaç duyulan tüm bilgiye hızlı bir şekilde ulaşılması ve bu bilgi kullanılarak en ekonomik ve etkili bakım çalışmasının planlanabilmesidir. Bunun sağlanabilmesi için arıcıların muayenelerle sürekli veri toplaması ve kaydetmesi gerekmektedir. Arıcılıkta makul olan, kolonilerin muayene ve bakımlarını yaparken arı kovanlarını olabildiğince az açarak koloniyi rahatsız etmemektir. Kovanların sık sık açılarak veri toplanması arıcılık açısından iyi sonuçlar vermez. Bu nedenle arı kolonilerine ait gerekli verileri toplayacak elektronik sistemlere ihtiyaç vardır. Bu projede hassas arıcılığın veri toplama ihtiyacını gidermeye yönelik elektronik bir kovan sistemi tasarlanmıştır.

Assessment of Durum wheat behavior according to phenology and climatic patterns in the semi-arid region of Setif-Algeria

Rouabhi Amar^{*12}, Djelloul Abdelali¹², Mekhlouf Abdelhamid¹²

1: Department of Agronomy, FSNV- Setif1 University-Algeria

2: Laboratory of improvement and development of plant and animal production- FSNV- Setif1 University-Algeria

Abstract

The study aims to assess the behavior of a set of three durum wheat (*Triticum durum*, Desf) with diverse developmental phenologies: i) *Waha* as an early heading genotype, ii) *Bousselam* as a mid-early genotype and iii) *Mohamed Ben Bachir* (MBB) as a late heading land race. Indeed, the national breeding programs of durum wheat opt for breeding more early heading lines with short vegetative cycles, aiming to escape the thermal stress that often occurred at the end of the season, but this strategy is not often successful given the controversy of the local climate. The experiment was carried out for three seasons: from 2019-20 to 2021-22. The statistical treatment was built on ranking genotypes, based on yield components and the analysis of covariance over the three seasons. Results of the climatic analysis showed three different patterns of the decadal rainfall for the period of March-April-May which is the most effective and sensitive period for cereal crops in Setif region, in addition to some differences for the temperatures (Tmax and Tmin) and evapotranspiration. Results showed that MBB the late heading genotype performed in two seasons (2019-2020 and 2020-2021), by recording the best grain yields of 588.18g/m² and 169.83g/m² in the two seasons respectively. This superiority is supported in both seasons by average biomass of 1361.9g/m², TKW (42.4g) and fertility (29.88). However, *Waha* the earliest heading genotype performed in one year (2021-22) by recording a grain yield of 522.99g/m², supported by a superiority of the density of spikes per squared meter (445 spikes/m²). *Bousselam* genotype has the lowest interannual variability for grain yield (267.3 g/m²±55.01) while *Waha* has the highest variability one (405.2 g/m²±145.51). This findings suggest at least for the study period to review the strategy-based early heading genotypes, by focusing more on genetic stability and land races performances.

The Importance of Animal Products for Nutrition and Health

Nuray Şahinler¹, Sibel Alapala Demirhan²

^{1,2}Department of Animal Science, Agriculture Faculty, Uşak University, Uşak, Turkey

Abstract

The ability of a person to live physically and productively is closely related to nutrition. For an adult to have a balanced diet; It is necessary to consume 2800-3000 calories and at least 75-80 g of protein in a day, and at least 30-35 g of this protein must be of animal origin.

A balanced intake of nutrients is necessary for a person to survive. Nutrients consist of carbohydrates, proteins, vitamins and minerals. All nutrients contain these compounds to a greater or lesser extent. Although there are these compounds in plant-based foods, animal-based foods such as meat, milk, eggs and honey are rich in protein, as well as the biological value of the protein they contain.

When it comes to the use of animal products as a support for the treatment of diseases, the importance of goat's milk should be emphasized. It is known that goat milk is used in the treatment of many diseases. It has been determined by the positive results obtained from the applications that the regular consumption of goat milk and goat milk products is beneficial in the treatment of eczema, asthma, digestive disorders, some diseases related to varicose veins, virus abscesses and some allergic conditions.

“Apitherapy” is a treatment method with bee products and it shows a rapid development in our country. Products obtained from beekeeping activities; products such as honey, pollen, propolis, royal jelly, bee venom. These products are used in many diseases (insomnia, digestive system diseases, upper respiratory tract infections, rheumatic, influenza, orthopedic diseases, skin cancer, eczema, asthma, arteriosclerosis, gastrointestinal diseases, rheumatic diseases, kidney, urinary tract infections, etc.) used as a supplement to treatments. Honey, propolis, royal jelly have excellent antibacterial properties. Bee venom has antirheumatic properties and pollen is used in the treatment of immunological diseases.

The importance of animal products in terms of health should not be ignored and more studies on the subject are needed.

Keywords: Animal product, nutrition, health, treatment.

Hayvansal Ürünlerin Beslenme ve Sağlık Açısından Önemi

Özet

İnsanın bedenlen sağlıklı ve üretken olarak yaşayabilmesi beslenme ile yakından ilgilidir. Yetişkin bir insanın dengeli olarak beslenebilmesi için; bir günde 2800-3000 kalori ve en az 75-80 g protein alması ve alınan bu proteinin de en az 30-35 g'ının hayvansal kökenli olması gerekmektedir.

Bir insanın hayatını sürdürebilmesi için besin maddelerinin dengeli bir şekilde alınması gerekir. Besin maddeleri karbonhidratlar, proteinler, vitaminler ve minerallerden oluşurlar. Bütün besin maddeleri az veya çok bu bileşikleri içerir. Bitkisel kökenli besinlerde bu bileşikler olsa da et, süt, yumurta, bal gibi hayvansal kökenli besinlerde proteince zengin olmasının yanında içerdiği proteinin biyolojik değeri de yüksektir.

Hayvansal ürünlerin hastalıkların tedavilerine destek olarak kullanılması üzerinde durulduğunda da keçi sütünün öneminin belirtilmesi gerekmektedir. Keçi sütlerinden birçok hastalıkların tedavisinde yararlanıldığı bilinmektedir. Keçi sütü ve keçi sütü ürünlerinin düzenli olarak tüketilmesinin egzema, astım, sindirim rahatsızlıkları, varis ile ilgili bazı rahatsızlıklar, virus apseleri ve bazı alerjik durumların tedavisinde yararlı olduğu uygulamalardan alınan olumlu sonuçlarla belirlenmiştir.

“Apiterapi” arı ürünleri ile tedavi yöntemidir ve ülkemizde hızlı bir gelişme göstermektedir. Arıcılık aktivitelerinden elde edilen ürünler; bal, polen, propolis, arı sütü, arı zehiri gibi ürünlerdir. Bu ürünler halk arasında birçok hastalıklarda (uykusuzluk, sindirim sistemi hastalıkları, üst solunum yolu enfeksiyonları, romatizmal, gripal, ortopedik hastalıklar, deri kanseri, ekzema, astım, damar sertliği, mide barsak hastalıkları, romatizmal hastalıklar, böbrek, idrar yolu enfeksiyonları vb.) tedavilere takviye olarak kullanılmaktadır. Bal, propolis, arı sütü mükemmel bir antibakteriyel özelliğe sahiptir. Arı zehirinin antiromatizmal özelliği bulunmakta, polende immünolojik hastalıkların tedavisinde kullanılmaktadır.

Hayvansal ürünlerin sağlık açısından önemi de göz ardı edilmemeli ve konuyla ilgili daha fazla çalışmanın yapılması gerekmektedir.

Anahtar Kelimeler: Hayvansal ürün, beslenme, sağlık, tedavi.

Abstract

Ocimum gratissimum is a perennial herbaceous plant used in the treatment of fungal and bacterial infections. Green synthesis has provided cost effective, environment friendly procedure and raising safe strategies for the synthesis of nanoparticles. This study was aimed at investigating the potential of *O. gratissimum* for the synthesis of selenium nanoparticles (SeNPs) and their antimicrobial activities. Phytochemical screening on aqueous extract was carried out using standard procedures. Selenium nanoparticles was biosynthesized by *O. gratissimum* and characterized using Visual detection, UV-Visible spectroscopy, Scanning Electron Microscope, Transmission Electron Microscope, Energy dispersive X-ray, Fourier Transform Infra-red spectroscopy and X-ray diffraction spectroscopy. Antimicrobial activity of the biosynthesized selenium nanoparticles by *O. gratissimum* was done using agar well diffusion method. Saponins, tannins, cardiac glycosides, terpenoids and phenols were present. The biosynthesized SeNPs had a strong plasmon resonance band at 300 nm, changes in colour from dark brown to ruby red. The SeNPs were spherical and aggregated with varying shapes and size ranged from 20 – 50 nm. Strong signal of selenium element was observed. Hydroxyl, esters, aldehyde, alkane and amine are present and responsible for the efficient stabilization and bioreduction of Selenium nanoparticle. Furthermore, biosynthesized SeNPs by *O. gratissimum* (OGSeNPs) exhibited higher antimicrobial activity against both Gram positive and Gram negative bacteria. Green synthesis of nanoparticles is a promising method in the biomedical field, due to its high bioactive components.

Keywords: *Ocimum gratissimum*, Selenium nanoparticles, phytochemical screening, Inhibitory effect, Green synthesis

Introduction

Nanotechnology is an all-round disciplinary field in science that involves materials at the atomic level or nanoscale level. Nanoparticles are the fundamental components of nanotechnology that differs from various dimensions, to shapes and sizes apart from their material (Minakshiet al., 2020). They are nanometer-sized (<100 nm) atomic or molecular scale solid particles having some excellent physical properties on their size and morphology (Stadler et al., 2019). Metal and metal oxide nanoparticles have been thoroughly examined using science and technology due to their excellent properties such as high surface to volume ratio, high dispersion in solution, etc. Metal and metal oxide nanoparticles displays enhanced antimicrobial properties (Ingle et al., 2020). Among all the metal nanoparticles, Selenium nanoparticles (SeNPs) have attracted numerous research interests due to its nutritional supplementation value and low toxicity (Bhattacharjee et al., 2019). Selenium can be present in nature showing various polymorphic structures, either amorphous or crystalline. It is a trace element present in both plants and mammals (Skalickova et al., 2017). It is effective against different types of cancer and neurodegenerative diseases (Santos et al., 2019) and its deficiency is associated with disease in man (Rajeshkumar et al., 2019). Selenium nanoparticles have been studied for the treatment of several diseases, such as diabetes, Alzheimer's disease (AD) and inflammation-related diseases such as rheumatoid arthritis (Gupta et al., 2019). Also, they are being explored as a protector against potential toxic agents, such as chromium, cadmium, and chemotherapeutics agents, which side effects can be very harmful (Khurana et al., 2019).

Three main methods have been applied for the synthesis of selenium nanoparticles: physical, chemical, and biological methods. In the physical approach for SeNPs synthesis, pulsed laser ablation, vapour deposition, hydrothermal and solvent thermal methods were used. The pulsed laser ablation method has the advantage over other methods due to the lack of contamination with chemical reagents, easy collection of nanoparticles by centrifugation, and their high stability (Tzeng et al., 2020). In chemical approach, chemical reduction of inorganic selenium forms as the precursors is the most commonly used method for the preparation of SeNPs. Ascorbic acid, glucose, fructose, cysteine, glutathione, sodium metabisulfite and ionic liquid 1-ethyl-3-methylimidazolium thiocyanate have been used as reducing agents, usually in the presence of stabilizing agent to prevent aggregation of nanoparticles (Guleria, et al., 2020). Water-soluble polymers, natural polysaccharides, carboxymethyl cellulose or bovine serum albumin have been used for this purpose (Chung et al., 2020). However, some residuals of these chemicals limit the applications of the formed SeNPs in the pharmaceutical and medicinal areas.

The biological approach involves the use of microorganisms and plants for the synthesis of nanoparticles. Different groups of bacterial strains and fungi have the ability to reduce selenite or selenate to nano selenium as a method of detoxification. SeNPs may be formed both within the bacterial cells and/or extracellularly. The utilization of water plant extracts is also a better alternative to chemical methods for the synthesis of selenium nanoparticles. This approach requires non-toxic solvents, mild temperatures, and application of the reducing agents that are easily accessible, cheap, biodegradable, and not harmful to the environment. It also reduces the high cost of microorganism's isolation and a final SeNPs purification, when applied in biomedical sectors. Such green synthesized methods of SeNPs are becoming preferred over the conventional chemical and physical methods due to their reduced toxicity towards the environment which uses living organisms such as plants, microalgae, and other microorganisms. Selenium nanoparticles produced via the green synthesis method can be an alternative to antibiotics (Ingle et al., 2020). Plants are considered to be more suitable compared to microbes for green synthesis of nanoparticles as they are non-pathogenic and various pathways are thoroughly researched. A wide spectrum of metal nanoparticles has been produced using components (including leaves, fruits, roots, stems, and seeds) of different plants (Das et al., 2017). Plant extracts have the ability to produce nanoparticles with defined size, shape, and composition. Furthermore, the presence of a wide array of phytochemicals in their extract may function as natural stabilizing and/or reducing agents for nanoparticles production. It is accepted that plant-derived nanoparticles are less likely to cause harmful side effects in humans when compared to chemically synthesized nanoparticles, and exhibit a high biological potential with applications in agriculture, food science and technology, bioengineering, cosmetic or nanomedicine, and human health protection (Geoffrion et al., 2020).

Ocimum gratissimum is a herbaceous plant popularly known as scent leaf. It is highly cultivated due to its culinary and medicinal importance (Shittu et al., 2016). It belongs to the family of Lamiaceae and is found in Africa, Asia, and South America. It is used as a natural flavouring agent, condiment, or vegetable in the preparation of fish, meat, soup, and stew. It is also used in traditional medicine for the treatment of several ailments such as cough, pneumonia, fever, inflammation, anaemia, diarrhoea, pains, and fungal and bacterial infections (Akara et al., 2021). Scientific reports have shown that *O. gratissimum* has a wide range of bioactive compounds such as flavonoids and polyphenol and essential oils with several beneficial effects (Melo et al., 2019). Furthermore, several studies have also shown that this plant possesses numerous pharmacological properties such as antioxidant, antimicrobial, anti-inflammatory, anthelmintic, cardiovascular, anti-mutagenic and antidiarrheal. However, there have been numerous reports on the use of several members of the *Ocimum* family in the synthesis of Selenium nanoparticles with *Ocimum sanctum* being the most used. (Aderibigbe and Idowu, 2020). The rise in antimicrobial resistance has emerged as a big crisis and a serious threat in every region of the world. It is becoming a worsening problem in recent decades not only in public health, but also in economic and social impacts, which requires the development of new drugs for more effective treatments. Selenium nanoparticles produced via the green synthesis method can be an alternative to antibiotics. SeNPs showed an antibacterial effect toward standard and antibiotic-resistant phenotypes of Gram-negative and Gram-positive bacteria in a dose-dependent manner (Geoffrion et al., 2020). This study is aimed at phytochemical screening, synthesis, characterization, and antimicrobial activity of selenium nanoparticles synthesized from *O. gratissimum*.

Materials and Method

Collection of Plant

Fresh *O. gratissimum* leaves were obtained from Bodija market in Ibadan, Oyo state, South-west, Nigeria. The leaves were identified at the Department of Botany, University of Ibadan, Nigeria. The leaves were labeled and transported to the laboratory for immediate microbiological analysis.

Culture collection

The test organisms used to determine the antimicrobial activity were collected from the department of medical microbiology University College Hospital (UCH), Ibadan. The test organisms were *Escherichia coli*, *Paenibacillus alvei*, *Staphylococcus aureus*, *Streptococcus pneumoniae*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa* and *Candida albicans*. They were revived on nutrient agar (LabM, UK) before subsequently used.

Preparation of *O. gratissimum* extract

O. gratissimum leaves were washed with sterile distilled water to remove the particles and later air dried. 20 g of the leaf was finely cut, put in 250 ml glass beaker along with 100 ml distilled water, crushed and boiled for 5 mins at 90°C. The extract was cooled at room temperature and filtered with Whatman No.1 filter paper. The filtrate was centrifuged for 10 minutes at 10000 rpm. The supernatant was collected and stored at 4°C (Radha et al., 2014).

Phytochemical screening of *O. gratissimum* leaf extract

The phytochemical tests to detect the presence of saponins, tannins, flavonoids, cardiac glycosides, anthraquinones, steroids, terpenoids, alkaloids and phenols was performed according to the procedure described by Harbourne, (1998) and the quantitative analysis was determined according to the method of Dohou et al. (2003).

Green synthesis of Selenium Nanoparticles using *O. gratissimum* leaf extract

The synthesis of Selenium nanoparticles (SeNPs) using *O. gratissimum* was done using the modified method of Alagesan and Venugopal, (2019). 10 mls of *O. gratissimum* leaf extract was added to 90 mls of 5 mM sodium selenite solution and heated up to 90°C for 5 minutes, the immediate colour change indicate the formation of Selenium nanoparticles. The Selenium nanoparticles solution thus obtained were purified by repeated centrifugation at 10000 rpm for 15 minutes. The supernatant was transferred to a clean dry beaker for further settlement of particles and repeated centrifugation was carried out. The particles obtained were used for further characterization.

Characterization of Greenly synthesized SeNPs

Visual Detection and UV –Visible spectrophotometric analysis of SeNPs

The SeNPs synthesized using *O. gratissimum* was observed visually for the change in colour from the initial colour (brown) of the sample to ruby red colour indicating the formation of selenium nanoparticles.

The bioreduction of Sodium selenite to selenium nanoparticles was monitored using UV-visible spectrophotometer (752 UV - Vis Spectrophotometer) with a resolution of 0.5 nm. 1 ml of each sample was taken and the absorbance was read at the wavelength ranging from 200 – 700 nm (Alagesan and Venugopal, 2019).

Scanning Electron Microscopic (SEM) and Transmission Electron Microscopic (TEM) analysis of SeNPs

The shape and morphology of the synthesized SeNPs was determined using Scanning Electron Microscopic (SEM) machine. The biosynthesized samples were freeze dried and mounted on a cover slip, coated with gold using a coater. Images of the selenium nanoparticles were taken in a SEM (JEOL - JSM - 7600F US). The details of the applied voltage and magnification used were also implanted on the images. (Wadhwani et al., 2017).

A thin film of the sample was prepared on a carbon coated copper grid by dropping a very small amount of the sample on the grid. The biosynthesized SeNPs were subjected to centrifugation at 13000 rpm for 10 min. The pellet thus recovered was subjected to washing by its re-suspension in de-ionized water followed by centrifugation at 13000 rpm for 10 min, to remove possible organic contamination present in nanoparticles. Finally, the pellets were freeze dried using a lyophilizer. Transmission electron micrographs and recorded was done using TEM-ARM200F-G Verios 460L, USA instrument operated at an accelerating voltage of 15kV with a resolution of 0.23 nm (Kumar et al., 2014).

Energy Dispersive X-ray (EDX) and X-Ray Diffraction analysis of SeNPs

The elemental composition of the sample was determined using Energy Dispersive X-ray (EDX) (JEOL - JSM - 7600F, US). The centrifuged sample was drop coated on a carbon film and a spot-profile mode was done by focusing the electron beam onto a region on the surface of the biosynthesized selenium nanoparticles sample. It was done at a voltage of 40.0Kv and current of 350µA (Kumar et al., 2014).

The crystalline size and purity were characterized by an X-ray diffractometer (Rigaku D/ Max111c, pw1800, China) using Cu K α radiation of wavelength $\lambda = 1.541 \text{ \AA}$. The crystalline size of the prepared SeNPs nanoparticles was determined by using Scherrer's equation as follows $D \approx 0.9\lambda/\beta\cos\theta$, where D is the crystal size, λ is the wavelength of X-ray, θ is the Bragg angle in degree, and β is the full width at half maximum of the peak in radians (Alagesan and Venugopal, 2019).

Fourier Transform Infra-red (FTIR) analysis of SeNPs

FTIR was used to determine the functional groups in the synthesized SeNPs. 2 mg of the nanoparticles were encapsulated in 100mg of KBr pellet in order to prepare translucent sample discs. The pelleted samples were subjected to Fourier transform infrared (FT-IR) spectroscopy in the range of wavelength 350 to 4400 cm^{-1} . The FT-IR spectrum was recorded using Nicolet iS10 FT-IR Spectrophotometer, China (Alagesan and Venugopal, 2019).

Effects of Physicochemical Parameters on the greenly synthesized SeNPs

Effect of incubation time, temperature, sodium selenite concentration and pH on the biosynthesis of SeNPs was investigated. The effect of temperature (27°C, 37°C and 45°C), incubation time (24, 48 and 72 hrs), different concentrations of Na_2SeO_3 (2 mM, 4 mM, 6 mM, and 8 mM) and pH (2, 5, 7, 9 and 11) on SeNPs synthesis was evaluated and characterized using UV-visible spectrophotometer at wavelengths ranging from 200 - 700 nm.

Antimicrobial Potential of the synthesized SeNPs using *O. gratissimum* leaf extract

The antimicrobial activity of the synthesized SeNPs was tested against selected pathogenic organisms using agar well diffusion method. Mueller Hinton agar was used as the growth media and was prepared and sterilized at 121°C for 15 minutes. The sterile media was allowed to cool to about 45°C, poured into sterile Petri dishes. Standardized inoculum of the test organisms were swabbed onto the surface of the sterile and solidified Mueller Hinton agar in separate Petri dishes. The plates were then allowed to dry. A 5 mm standard cork borer was used to bore uniform wells in the agar. SeNPs were introduced into each well on the agar. The plates were incubated at 37°C for 24 hrs after which the plates were observed for zone of inhibition of growth. The zones of inhibition were measured and recorded excluding the wells (Yusuf et al., 2021).

Results and Discussion

O. gratissimum is one of the discovered medicinal plants with the potential to serve as an alternative therapy for the treatment of various ailments. Scientific reports have shown that *O. gratissimum* has a wide range of bioactive compounds which possess unique antibacterial activities against the plant and human bacterial pathogens. The

qualitative and quantitative phytochemical analysis of *O. gratissimum* leaf extract is shown in Table 1. The result revealed that Saponins, Tannins, Cardiac glycosides, Terpenoids and Phenols are present in the leaf extract. Flavonoids and Alkaloids are abundantly present while Anthraquinones and Steroids were absent. These phytochemicals rich in polysaccharide galactomannan, act as good reducing and capping agents for the stability of selenium nanoparticles and may have played a role in reducing sodium selenite to SeNPs. Similar studies have also been reported by Olamilosoye *et al.* (2018) that the aqueous extract of *O. gratissimum* leaves contains alkaloids, flavonoid, tannins, saponins, cardiac glycoside and terpenoid. Melo *et al.* (2019) reported that aqueous extract of *O. gratissimum* is a rich source of flavonoids and phenolics. This is in line with the work of Usunomena and Eseosa, (2016) who reported the presence of tannins, saponins, flavonoids and alkaloids in *O. gratissimum* leaves.

Table 1: Qualitative and quantitative phytochemical composition of *O. gratissimum*

S/N	Phytochemical parameters	Qualitative	Quantitative (mg/100g)
1	Alkaloids	++	875
2	Flavonoids	++	615
3	Saponins	+	65
4	Tannins	+	122
5	Phenols	+	70
6	Cardiac glycosides	+	-
7	Terpenoids	+	90
8	Anthraquinones	-	-
9	Steroids	-	-

Key: ++: Abundantly present, +: Present, -: Absent

Green synthesis and Characterization of SeNPs

O. gratissimum leaf extract used for the synthesis of selenium nanoparticles produced nanoparticles which were evident in the change of colour from dark brown to ruby red indicating the formation of SeNPs in the reaction mixture. Plate 1 shows the visual characterization of SeNPs produced. The changes in colour from dark brown to ruby red may be due to the excitation of surface plasmon vibrations of selenium nanoparticles. This is in accordance with the work of Alagesan and Venugopal, (2019) who reported that the color change observed after adding *Withania somnifera* leaf extract to selenious acid solution is ruby red. Similarly, coloration changes from the colourless solution of sodium selenite to brick red have also been reported in the phytofabrication of Selenium nanoparticles using *Emblica officinalis* fruit extract (Gunti *et al.*, 2019).

The green synthesized SeNPs was further characterized using the UV-Visible spectrophotometer. The spectra obtained from the synthesized SeNPs using *O. gratissimum* is shown in Figure 1. A strong surface plasma resonance peak (SPR) was obtained at 300 nm for the synthesized SeNPs which indicated the formation of the nanoparticles with a broad band at 200 - 400 nm while *O. gratissimum* extract did not show any characteristic SPR peak. Similar studies have been reported by Ramamurthy *et al.* (2013) who stated that the UV-Visible spectra of their SeNPs showed absorption maximum at 200 nm – 400 nm with small peak observed at 300 nm in the UV region which may be due to the small organic molecules present in the reaction mixture.

Figure 1: UV-Visible absorption spectrum of synthesized SeNPs using *O. gratissimum*
Key: O.G: *O. gratissimum* extract
SeNPs: Greenly synthesized SeNPs using *O. gratissimum*

The scanning electron microscopic analysis was carried out to determine the morphology of the synthesized SeNPs. Plate 2 shows the SEM micrograph of the synthesized SeNPs using *O. gratissimum* extract. The SeNPs in this study presented a monodispersed spherical morphology without forming aggregates. This result may be due to the presence of capping agents in the extract that act as stabilizers or binding molecules to provide colloidal stability along with preventing agglomeration and inhibit uncontrolled growth of nanoparticles. Similar sizes and morphologies of SeNPs have been reported by Fardsadegh *et al.* (2019) using *Pelargonium zonale* extract. Ojeda *et al.* (2020) also obtained spherical shaped particles with the synthesis of selenium using *Juglans regia*. On the contrary, Alagesan and Venugopa (2019) reported that the SEM image of SeNPs showed greater numbers of agglomerated spherical particles.

The TEM analysis was further used to characterize the SeNPs produced by determining the size of the nanoparticle. The TEM analysis of synthesized SeNPs using *O. gratissimum* extract is shown in Plate 3. The particles size ranged from 20 nm - 100 nm. Changes in the size of SeNPs may be due to different nucleation and growth mechanisms related to factors such as temperature and reaction. This is in accordance with the work of Alagesan and Venugopa (2019) who reported that the nanoparticles produced were spherical particles within the diameter range 45 – 90 nm. Gunti *et al.* (2019) reported that the size of the biosynthesized SeNPs ranged from 15 – 40 nm.

Plate 2: SEM micrograph of synthesized SeNPs using *O. gratissimum* extract

Plate 3: TEM micrograph of synthesized SeNPs using *O. gratissimum* extract

The SeNPs was characterized by EDX to determine the elemental composition of the sample. The EDX analysis of synthesized SeNPs using *O. gratissimum* extract is shown in Figure 2. The presence of a strong selenium signal was observed and it was as a result of the surface plasmon resonance indicating that the SeNPs obtained were of high purity. The weak signal from Silicon, Carbon, and Oxygen may be due to mixed precipitate present in the extract. This is similar to the work of Miglnai and Tani-ishii (2021) who reported that there were strong signals from selenium atoms in the selenium nanoparticles. Vyas and Rana, (2017) reported that Selenium had the highest proportion in nanoparticles followed by Oxygen, Carbon, Sodium, Phosphorus and Chlorine.

To evaluate the crystalline nature of the synthesized SeNPs, it was characterized by the XRD technique. Figure 3 shows the X-ray diffraction analysis for the synthesized SeNPs using *O. gratissimum*. The XRD analysis for the biosynthesized SeNPs indicated five diffraction peaks in the whole spectrum of 2θ values ranging from 35 to 80. All diffraction peaks corresponded to the characteristic crystalline face-centered cubic (FCC). Sharp peaks were observed indicating the formation of crystalline SeNPs. All the peaks could be indexed according to the trigonal phase of elemental selenium. This corresponds to the work of El-Deeba *et al.*, (2018) who reported the pure crystalline form of selenium. This result contradicts the work of Filipovic *et al.*, (2021) who reported that the diffraction peaks which indicate the crystalline phase of selenium were not observed.

Figure 2: EDX analysis of synthesized SeNPs using *O. gratissimum* extract

Figure 3: XRD analysis of synthesized SeNPs using *O. gratissimum*

FTIR was used to determine the functional groups present in the sample. The FTIR spectrum of *O. gratissimum* extract is shown in Figure 4a. Peaks were present at 3778.31, 3376.00, 2918.00, 2853.01, 2360.17, 1595.00, 1369.00, 1032.00 and 367.33 cm^{-1} . The peaks at 3376.00 cm^{-1} and 3778.31 cm^{-1} were observed to have the strongest and broadest absorption peak indicating a stretching vibration of hydroxyl group (OH). The characteristic peaks appearing at 2918.00 cm^{-1} corresponds to C – H asymmetrical stretching of alkanes. The peak at 2853.01 cm^{-1} indicated the O-H stretching of carboxylic acid. The peak at 1595.00 cm^{-1} corresponds to C=C stretching of cyclic alkene. The peak at 1369.00 cm^{-1} attributed to O-H bending of alcohol. The peak observed at 1032.53 cm^{-1} and 1032.00 cm^{-1} was due to C-N stretching of amine. These characteristics absorption peak indicated that hydroxyl, aldehyde, amine and ester may be responsible for the ability of *O. gratissimum* extracts to adhere to the surface of nanoparticles as a form of stabilization.

The FTIR spectrum of biosynthesized SeNPs is shown in Figure 4b. Peaks appeared at 3458.00, 2929.45, 2355.16, 1737.50, 1637.33, 1449.00, 1387.40, 1111.33, 1032.53, 540.00 and 458.73 cm^{-1} . The peak at 3458.00 cm^{-1} was observed to have the strongest and broadest absorption peak indicating a stretching vibration of hydroxyl group (OH). The characteristic peaks appearing at 2929.45 cm^{-1} corresponds to C – H asymmetrical stretching of alkanes. The peak at 1737.50 cm^{-1} attributed to C=O stretching of esters. The peak at 1595.00 cm^{-1} corresponds to C=C stretching of cyclic alkene. The peak at 1387.40 cm^{-1} was assigned to C-H bending of aldehyde. The peak at 1111.33 cm^{-1} corresponds to C-O stretch of secondary alcohol and aliphatic ether. The peak observed at 1032.53 cm^{-1} was due to C-N stretching of amine while the peak at 540.00 cm^{-1} represents the C-I and C-Br stretching of halo compounds. These characteristics absorption peak indicated that hydroxyl, aldehyde, amine and ester may be responsible for the efficient stabilization and bioreduction of Sodium selenite (Na_2SeO_3) into Selenium nanoparticles (SeNPs). These functional groups are present as a result of the presence of biomolecules in the extract which was involved in the synthesis process. This is in accordance with the work of Alagesan and Venugopa, (2019) who reported that the presence of various functional groups as biomolecules may be responsible for both reduction and stabilization of the SeNPs. These functional groups are present as a result of the presence of biomolecules in the extract which was involved in the biosynthesis process. Previous reports have also suggested the role of phytochemicals as a stabilizing agent for the synthesis of metal nanoparticles (Coccia *et al.*, 2012).

Temperature is one of the most important physical parameter on the synthesis of SeNPs. Effect of temperature on the synthesis of SeNPs was evaluated. The UV-Visible absorption spectrum of the effect of temperature on the synthesis of SeNPs is shown in Figure 5a. Strong SPR peak was observed at 300 nm for all the temperatures and broad bands ranging from 200 nm – 400 nm. The result showed that the nanoparticles biosynthesis increased by enhancing temperature to 37°C and no appreciable production of nanoparticles was attained at 45°C. The ability of 37°C to be the best temperature for the synthesis of SeNPs may be due to the fact that the biomolecules or proteins responsible for the reduction of sodium selenite are only active around 30°C and at 37°C. So, 37°C was considered as the optimum temperature. Also, at higher temperature denaturation of proteins capping may occur and this leads to higher rate of agglomeration. This result is in agreement with the work of Lortie *et al.* (1992) who reported that there was no synthesis of SeNPs at higher temperature. Correa-Llantenet *et al.* (2014), reported that synthesis of SeNPs by *Citrus reticulata* peel extract was found to be efficient at 40°C

Figure 4a: FTIR spectrum of *O. gratissimum* extract

Figure 4b: FTIR spectrum of synthesized SeNPs using *O. gratissimum* extract

The effect of physicochemical parameters on the synthesis of SeNPs

The effect of incubation time on the biosynthesis of SeNPs using *O. gratissimum* extract was studied and the UV-Visible spectrum was recorded after time intervals of 24 hrs, 48 hrs and 72 hrs. Figure 5b shows the UV-Visible absorption spectrum of the effect of incubation time on the biosynthesis of SeNPs. SPR peak was observed at 300 nm and a broad band ranging from 200 nm – 400 nm for all the incubation time. Maximum absorbance was recorded at 72 hrs while the least absorbance was recorded at 24 hrs for the biosynthesis of SeNPs. The ability of the biosynthesized SeNPs to increase in absorbance with time may be as a result of continued reduction of the selenium ions and the collision frequency between the particles. This is in accordance with the work of Sani-e-Zahra et al. (2022) who reported that after 96 hr maximum absorbance was observed. Sarkar *et al.* (2022), who reported that the synthesis of SeNPs depends on time.

The effect of different concentration (2 mM, 4 mM, 6 mM, 8 mM) of Na_2SeO_3 on the biosynthesis of SeNPs was evaluated and is shown in Figure 5c. The SeNPs showed strong SPR peak at 300 nm with broad band at 200 nm - 400 nm for all concentrations. The highest absorbance was recorded at 8 mM while the least absorbance was recorded at 2 mM. It was observed that the best concentration for SeNPs synthesis was 8 mM. The ability of 8 mM Na_2SeO_3 concentration to produce the highest SeNPs biosynthesis may be due to the fast rate of bio-reduction with increase in concentration of the salt. This result is in agreement with the work of Sani-e-Zahra et al. (2022) who reported maximum amount of SeNPs as the concentration of sodium selenite increased.

The effect of pH on the biosynthesis of SeNPs using *O. gratissimum* extract was evaluated at different range (2, 5, 7, 9 and 11) and monitored with the UV-Visible spectrophotometer. The UV-Visible absorption spectrum of the effect of different pH levels on the biosynthesis of SeNPs is shown in Figure 5d. SPR peak was observed at 300 nm and broad bands ranging from 200 nm – 400 nm for the pH levels with pH 9 and 11. The highest absorbance was recorded against pH 11 indicating the increased synthesis of selenium nanoparticles under alkaline conditions which may be as a result of more availability of bio-reductions while the lowest absorbance was recorded at pH 2. The decreased reduction rate in acidic medium could be ascribed to the denaturation and /or degradation of bioactive compounds present in the *O. gratissimum*. This report is in agreement with the work of Sani-e-Zahra *et al.* (2022) who reported that a maximum absorption was observed at pH 7 and no reaction occurred at pH 5. Similarly, Roopan *et al.* (2011) also reported the formation of highly dispersed nanoparticles at pH 11 whereas, no reaction occurred at pH 2.

Figure 5: UV-visible absorption spectra of synthesized SeNPs; (a) at different incubation temperature; (b) at different incubation time; (c) at different pH of reaction mixture; (d); at different Na₂SeO₃ concentration.

Antimicrobial activity of greenly SeNPs using *O. gratissimum* (OGSeNPs)

One of the most remarkable and peculiar properties of selenium nanoparticles is their antimicrobial activities. The ability of the biosynthesized SeNPs to inhibit the growth of selected pathogens was investigated and the biosynthesized SeNPs exhibited an excellent antimicrobial activity against the selected pathogens. They were also found to have a broad spectrum of activity against the pathogens. The gram negative bacteria were more susceptible to the SeNPs than the gram positive bacteria which may be due to the composition of bacterial cell wall. Gram negative bacteria are significantly protected with a cytoplasmic membrane and outer cell membrane, containing a thin layer of the peptidoglycan between them with periplasmic compartment, while all gram positive bacteria are bound by only a single unit lipid membrane and thick layer of peptidoglycan. The result is similar to the work of Hidayat *et al.* (2020), who reported that the inhibitory effects of SeNPs were more pronounced on gram negative compared to gram positive bacteria due to the thickness of the cell wall and cell components. Eswarapriya and Jegatheesan (2015) reported that there was an antifungal activity of biosynthesized SeNPs against *Candida albicans* and *Aspergillus niger*. Also, Zonaro *et al.* (2015) reported that SeNPs exhibit more inhibitory actions against gram positive bacteria species as a result of the lesser surface charges of nanoparticles that effectively enable them to bind to the bacterial cell membrane. This study is in accordance with the work of Hernández-Díaz *et al.* (2021) which reported that selenium nanoparticles had a wide range of activities against *B. subtilis*, *E. coli*, and *S. aureus*.

Table 2: Antimicrobial activity of greenly SeNPs using *O. gratissimum* (OGSeNPs) on some pathogens

Zone of inhibition (mm)				
Test organisms	Na ₂ SeO ₃	OGE	OGSeNPs	CPR
<i>S. pneumoniae</i>	-	18	26	28
<i>E. coli</i>	-	19	28	26
<i>K. pneumoniae</i>	-	15	27	24
<i>P. aeruginosa</i>	-	-	22	24
<i>S. aureus</i>	-	20	27	28
<i>C. albicans</i>	-	14	24	24

Abstract

The current study aimed to evaluate the effect of extraction solvents on the anti-bacterial and anti-fungal efficacy of the stem and roots of *Ajuga bracteosa* Wall ex. Benth. Extracts were prepared in different solvents and tested against fungi and bacteria species including, *Agrobacterium tumefaciens*, *Xanthomonas oryzae*, *Citrobacter freundii*, *Alternaria alternata*, *Alternaria solani* and *Aspergillus niger*. Antibacterial efficacy of the *Ajuga bracteosa* was carried out by disc diffusion susceptibility method and antifungal efficacy by well diffusion susceptibility method. Methanol stem extract revealed efficacy against *Citrobacter freundii* by producing a 63% zone of inhibition at 3mg/disc while methanol roots extract produced 77% ZI against *Agrobacterium tumefaciens*. Methanol root and stem extracts produced an equal zone of inhibition (97%) at 100µl/well concentration against *Alternaria alternata* and *Alternaria solani*. The results of the study clearly stated that the polarity of the solvents used in the extraction procedure affects the bioactivities of the extracts.

Eggplant (*Solanum melongena* L.) Drying Kinetics and Color Change

¹Hakan Polatcı¹, Mehmetcan Olgaç¹, Hüsne Gök

¹Tokat Gaziosmanpaşa Üniversitesi Ziraat Fakültesi, Biyosistem Mühendisliği Bölümü Tokat, TÜRKİYE

Abstract

Eggplant is used intensively in addition to its fresh consumption, as well as dried. With the drying process, it can be stored for a longer time and can be consumed in four seasons. In this study, the color criteria and drying kinetics, which are important quality parameters, were determined by drying the eggplant oven in a laboratory type convective dryer at 40, 50, 60, 70 °C and in the shade environment. Before the drying process, the products were sliced in equal sizes and dried in a thin layer drying model and color measurements were made. When the drying data were examined, the longest drying time was 124 hours in the shade environment, while the shortest drying process was 3 hours 45 minutes in the laboratory type convective dryer at 70 °C. Page, Midilli Küçük, Lewis and Jenedas models were used for drying modeling. The reliability level in modeling was found to be $p < 0.001$ for all models. The highest R^2 value was found to be 0.9998 in the drying models, at 40 °C in the laboratory type convective dryer in the Page model, and at 60 °C in the laboratory type convective dryer in the Midilli Küçük model. The Croma value, which is closest to fresh in color properties calculated in terms of color values, was found at 60 °C in the oven dryer, the Hue angle at 60 °C in the laboratory type convective dryer, and the total color change and browning index at 70 °C in the laboratory type convective dryer.

Key Words: *Eggplant, Drying, Color Change*

Patlıcan (*Solanum melongena* L.) Kuruma Kinetiği ve Renk Değişimi

Özet

Patlıcan taze tüketiminin yanı sıra kurutularak da yoğun bir şekilde kullanılmaktadır. Kurutma işlemi ile daha uzun süre muhafaza edilerek dört mevsim tüketim imkânı sağlanabilmektedir. Bu çalışmada patlıcan etüvde, laboratuvar tipi konvektif kurutucuda 40, 50, 60, 70 °C sıcaklıklarda ve gölge ortamında kurutularak önemli kalite parametrelerinden olan renk kriterleri ve kuruma kinetiği belirlenmiştir. Kurutma işlemi öncesi ürünler eşit boyutlarda dilimlenerek ince tabaka kurutma modelinde kurutularak renk ölçümleri yapılmıştır. Kurutma verileri incelendiğinde en uzun kuruma süresi 124 saat süren gölge ortamında kurutmaya en kısa süren kurutma işlemi 3 saat 45 dakika ile laboratuvar tipi konvektif kurutucuda 70 °C sıcaklıkta bulunmuştur. Kurutma modellemesinde Page, Midilli Küçük, Lewis ve Jenedas modelleri kullanılmıştır. Modellemede güvenilirlik seviyesi tüm modeller için $p < 0.001$ olarak bulunmuştur. Kurutma modellerinde en yüksek R^2 değeri 0.9998 olarak Page modelinde laboratuvar tipi konvektif kurutucuda 40 °C sıcaklıkta, Midilli Küçük modelinde ise laboratuvar tipi konvektif kurutucuda 60 °C sıcaklıkta tespit edilmiştir. Renk değerleri açısından hesaplanan renk özelliklerinde tazeye en yakın olan Croma değeri etüv kurutucuda 60 °C sıcaklıkta, Hue açısı laboratuvar tipi konvektif kurutucuda 60 °C sıcaklıkta, toplam renk değişimi ve kahverengileşme indeksi ise laboratuvar tipi konvektif kurutucuda 70 °C sıcaklıkta bulunmuştur.

Abstract

Cataract is a major cause of blindness due to the cloudiness of the lens. Approximately 37 million people are suffering from cataracts worldwide and about 50% of people are blind worldwide due to cataracts. We investigated the association of single nucleotide polymorphism in Gap Junction Alpha 8 Gene and the effects of different demographic factors like age, sex, diabetes, smoking, radiation, vitamins, and use of steroids medication with age-related cataract in 200 individuals suffering from of any type of age-related cataract and 159 healthy individuals. The polymerase chain reaction technique was used with TETRA-ARMS primers to investigate the single nucleotide polymorphism, and genotypes of individuals in the GJA8 gene. There is a significant difference in the genotypic frequency of SNP G/A (rs9437983) and SNP T/G (rs1495960) in patients and normal individuals ($P < 0.05$). These results indicated that the GJA8 gene is significantly associated with the disease

Non-Thermal Technologies In Fruit Juice Processing

İkbal abdullah Şahin¹, Hande Baltacıoğlu¹

¹Food Engineering Department, Faculty of Engineering, Niğde Ömer Halisdemir University, Niğde, Türkiye
Corresponding Author ✉: handebaltacioglu@ohu.edu.tr

Abstract

In parallel with the changing consumer demands in the food industry, new techniques have emerged in food processing, especially as an alternative to heat treatment, in recent years. These processes, which are used as an alternative to heat treatment in the food industry, are applied to prevent microbiological development, reduce enzyme activity and increase food quality, as well as to preserve physical, nutritional bioactive compounds and organoleptic properties. Current food processing techniques, which are seen as a good alternative to heat treatment, can be adapted to all foods and types to be applied, and even in combination with traditional thermal techniques, the operable effect can be increased (improved). In the researches, microbial inactivation, decrease in enzyme activity and losses in nutritional values are evaluated and it is tried to determine the appropriate process parameters. The main purpose of all non-thermal techniques applied is to produce products that have a long shelf life and preserve their nutritive and sensory qualities until the expiry date. In this study, the effects of ultrasound, pulsed electric field (PEF), high hydrostatic pressure, ultraviolet radiation (UV), gamma and X-Ray, pulsed electric field (PEF) and ohmic heating technologies on juice production will be discussed.

Key Words: *Fruit Juices, Enzyme Inactivation, Microbial Inactivation, Non-Thermal Technologies, Nutritional Value*

Meyve Suyu İşlemede Isıl Olmayan Teknolojiler

Özet

Gıda endüstrisindeki tüketici taleplerinin değişmesine paralel olarak son yıllarda gıdaların işlenmesinde, özellikle ısıtma işlemi alternatif olarak yeni teknikler ortaya çıkmıştır. Gıda endüstrisinde ısıtma işlemi alternatif olarak kullanılan bu işlemler, mikrobiyolojik gelişimi önlemenin, enzim aktivitesini azaltmanın ve gıda kalitesini artırmanın yanı sıra fiziksel, besinsel biyoaktif bileşiklerin ve organoleptik özelliklerin de korunması amacıyla uygulanmaktadır. Isıtma işlemi iyi bir alternatif olarak görülen, güncel gıda işleme teknikleri uygulanacak olan tüm gıdalar ve tiplerine göre uyarlanabilir hatta geleneksel termal tekniklerle kombine olarak çalıştırılabilir etkisi yükseltilebilir (iyileştirilebilir). Yapılan araştırmalarda mikrobiyal inaktivasyon, enzim aktivitesindeki azalma ve besin değerlerindeki kayıplar değerlendirilerek uygun işlem parametrelerinin belirlenmesine çalışılmaktadır. Uygulanan termal kaynaklı olmayan tüm tekniklerin temel amacı raf ömrü uzun ve son tüketim tarihine kadar besleyici ve duyu niteliklerini koruyan ürünler üretmektir. Bu çalışmada ultrason, vurgulu elektrik alan (PEF), yüksek hidrostatik basınç, ultraviyole ışın (UV), gamma ve X ışını, vurgulu (atımlı) ışık ve ohmik ısıtma teknolojilerinin meyve suyu üretimindeki etkisinden bahsedilecektir.

Anahtar Kelimeler: *Besleyici, değer, Enzim İnaktivasyonu, Isıl Olmayan Teknolojiler, Meyve suyu, Mikrobiyal İnaktivasyon*

1. Giriş

➤ Isıl Olmayan Yeni Teknikler

Gıda güvenliği ve kalitesi açısından biyolojik ve kimyasal aktivitelerin kontrol altına alınması gerekmektedir. Gıdanın üretilmesi sırasında bu durum genellikle geleneksel ısıtma teknikleri kullanılarak (sterilizasyon, pastörizasyon, haşlama, evaporasyon, pişirme ve kurutma gibi) sağlanmaktadır. Ancak bu geleneksel ısıtma yöntemlerinin uygulanmasıyla enzim ve mikroorganizma inaktivasyonu yanında, vitaminler ve mineraller gibi besin öğeleri ile renk, doku ve lezzet gibi duyu unsurlarında kayıplar görülebilmektedir. Bu nedenle günümüzde gıda üreticileri gerek gıdanın raf ömrünü uzatabilmek gerekse gıdanın besin değerini koruyabilmek için yeni teknoloji ve yöntem arayışı içine girmişlerdir. Bu tip olumsuzlukları engellemek amacıyla üzerinde yoğunlukla çalışılmaya başlanan bu tekniklerin bir kısmını da termal olmayan yöntemler (ultrason, PEF, yüksek basınç, radyasyon vb.) ve elektriksel ısıtma (mikrodalga, ışınlama, ohmik ısıtma ve radyo dalgalarıyla ısıtma gibi) yöntemleri oluşturmaktadır (Demirdöven ve Baysal, 2008).

2. Ultrases (Ultrason) Teknolojisi

Ultrason mekaniksel nitelikte olan insanların işitebildiği 20 kHz'nin üzerindeki frekanslara sahip bir enerji biçimidir ve ısıtma olmayan, emniyetli, etkili, ekstrakt üretimi ve hücre parçalanması için kullanılabilen bir gıda işleme metodudur (Piyasena vd., 2003). Ultrason tekniğinin geleneksel tekniklerle kombinasyonlarının uygulama etkinliğini arttırdığı bilinmektedir. Termosonikasyon tekniği sıcaklık ve ultrason tekniklerinin kombinasyonu

sonucu proses sıcaklığı ve süresini azaltarak pastörizasyon ve sterilizasyon amacıyla kullanılabilir. Manosonikasyon ise basınç uygulaması (600 kPa'a kadar) ve ultrason tekniklerinin bir arada kullanıldığı ve mikroorganizmalar üzerine geleneksel uygulamadan daha yüksek letal etki sağlayan bir yöntemdir. Manotermosonikasyon; basınç, sıcaklık ve ultrason uygulamalarının kombinasyonu olarak ifade edilmekte ve daha etkin enzim ve mikroorganizma inaktivasyonu sağlamaktadır (Knorr vd., 2004). Ultrases sıvı içerisinde uygulandığında sonikasyon olarak adlandırılabilir (Tiwari ve Mason, 2011) ve sonikasyonun temel etki mekanizması kaviteasyon ile açıklanmaktadır: Ses dalgası sıvının içerisinde geçerken boyuna dalgalar oluşturur ve ardışık olarak kasılıp gevşeme olayları gerçekleşir. Ses dalgası gevşeme pozisyonuna geçerken negatif basınç sıvının noktasal çekme kuvvetini aştığı zamanlarda mikro kabarcıklar ve boşluklar oluşur. Sıvı içindeki küçük kabarcıklar ultrases dalgalarının gevşeme-sıkışma hareketleri ile hızlı bir şekilde gelişir ve kritik bir değere ulaştığında patlamaktadır ki buna kaviteasyon denir. Bu olayda meyve suyu işlemede ultrases kullanımı noktasal olarak çok yüksek sıcaklık (5000 °C) ve basınç (100 MPa) oluşur (Piyasena vd., 2003; Tiwari ve Mason, 2011). Meyve sebze işleme alanında enzim ve mikroorganizma inaktivasyonu, renk maddelerinin ekstraksiyonu, karıştırma, homojenizasyon, partikül küçültme, köpük kırma, temizleme yüzey dekontaminasyonu, şeker kristalizasyonu ve kabuk soyma amacıyla kullanılabilir (Betts vd., 1999). Ultrasonun gıdalardaki bazı uygulamaları Tablo 1' de gösterilmektedir. Ultrases işleminin temel etki mekanizması kaviteasyondur. Kaviteasyon; sıvılarda bulunan mikro kabarcıkların kritik büyüklüğe ulaşması sonucunda patlamalarıyla meydana gelen önemli bir etkidir (Ashokkumar vd., 2010). Diğer taraftan ultrasesin etkileri, uygulanan ultrases gücü, hedef alınan mikroorganizma cinsi ve gıda matrisine göre oldukça farklılık göstermektedir. Bu nedenle ultrases işlemi her gıda matrisi için ayrı ayrı incelenmeli ve endüstriyel tasarımlar için şartlar ürün bazında optimize edilmelidir. Ultrases uygulaması meyve sularında askorbik asit, karotenoidler ve fenolik bileşikler gibi biyoaktif bileşiklerin; elektriksel iletkenlik, bulanıklık, renk, pH, asitlik, briks ve viskozite gibi özelliklerde değişime neden olabilmektedir. Söz konusu özelliklerdeki değişimlerin uygulanan ultrases gücü, uygulama süresi ve sıcaklığının yanında meyve suyu çeşidi ve içeriğine göre farklılıklar gösterebilmesi kaçınılmazdır (Dinçer ve Topuz, 2018). Baltacıoğlu (2022) şeftali suyunda farklı sıcaklık (40, 50 ve 60 °C) ve sürelerde (10, 20 ve 30 dk) termosonikasyon işleminin (125, 170 ve 210 µm genlik) PPO ve POD inaktivasyonuna etkisini araştırmıştır. Enzim inaktivasyonunun artan güç, sıcaklık ve süreye bağlı olarak artış gösterdiği bildirilmiştir. 170 µm genlikte, 60 °C'de 10 dakikalık işlem sonrası PPO enziminde %97,14'lük bir inaktivasyon sağlanırken, POD enziminde %92,16'lık bir inaktivasyon sağlandığını belirlenmiştir. Sonuçlar ısı ile işleme karşılaştırıldığında (70 °C 10 dk), şeftali suyunda termosonikasyonla daha düşük sıcaklıkta enzim inaktivasyonunun sağlandığı belirlenmiştir. Baltacıoğlu ve Doğanay (2021) farklı sıcaklık (40, 50, 60, 70 ve 80 °C) ve sürelerde (5, 10, 15, 20, 25, 30 dakika) uygulanan ısı ile işleme elma suyunda PPO ve POD enzim aktivitesi üzerine etkisini incelemiştir. Enzim inaktivasyonunun genellikle artan sıcaklık ve zamanla arttığı belirlenmiştir. PPO enziminde 80 °C'de 20 dakika sonunda % 99 inaktivasyon sağlanırken, aynı koşullarda POD enziminde % 93,29'luk bir inaktivasyon sağlandığı bildirilmiştir. Bir başka çalışmada termosonikasyon (TS) uygulamasının farklı genlik (%60, 80, 100), sıcaklık (40, 50, 60 ve 70 °C) ve sürelerde (5, 10, 15, 20, 25 ve 30 dakika) elma suyunda bulunan PPO ile POD enzimlerine etkisi incelenmiştir. Genel olarak artan güç, sıcaklık ve süre ile enzim inaktivasyonunun arttığı belirlenmiştir. Termosonikasyon uygulama sonucunda PPO enzimi için %100 genlik 70 °C sıcaklıkta 15 dakika sonunda %99 inaktivasyon sağlanırken, aynı koşullarda POD enzimi için %94,5 oranında inaktivasyon sağlandığı belirlenmiştir. Elma POD enziminin PPO' a göre ısıya daha dirençli olduğu bildirilmiştir (Şahin 2019).

3. Vurgulu Elektrik Alan (PEF)

PEF iki elektrot arasında bulunan gıda maddesinin çok kısa süreyle (1-100 µs) yüksek voltaj elektriksel alan (80-100 kV/cm) etkisi altında bırakıldığı bir işlemdir. Mikrobiyolojik ve enzimatik inaktivasyon ile bitkisel dokunun parçalanması amacıyla kullanılır. Ayrıca düşük sıcaklıklarda çalışılması ürünün fiziksel ve besinsel özellikleri ile renk tat ve koku korunumu açısından da diğer tekniklere göre üstünlük sağlamaktadır (Heinz vd., 2003). PEF tekniğinde mikroorganizma inaktivasyonunun hücre zarının elektromekanik stabilitesinin bozulmasıyla gerçekleştiği belirtilmektedir (Ramaswamy ve Chen, 2002). Bu teknolojiye özellikle sıvı ve yarı sıvı gıdalar düşük sıcaklıkta ve kısa sürede işlenerek raf ömürleri uzatılabilir, meyve-sebzelerde ekstraksiyon verimi ve kurutmada kütle transfer hızı artırılabilir. Hücre zarı parçalanmasının amaçlandığı bu ön işlem uygulaması sonrasında elde edilen ekstraktların kalite açısından ısısal ve enzimatik olarak ön işleme tabi tutulmuş ürünlere göre daha iyi özelliklere sahip olduğu belirlenmiştir (Toepfl, 2015). Ekstraktların daha saf ve berrak olması gıda üretiminde gereksinim duyulabilecek fazladan işlem basamaklarının gereksinimi azaltmaktadır. Meyve ve sebzelerde hücre zarının parçalanması için gereken elektrik alan şiddetinin 0,5-1 kV/cm olmasının yeterli olduğu bilinmektedir (Bouzzara, 2001).

Gıda sanayinde PEF uygulamalarında kritik elektrik alan parametreleri doğru olarak seçilmelidir. Sularda ve sıvı gıdalarda mikrobiyal inaktivasyonu için kullanılan elektrik alan şiddeti genellikle 10-60 kV/cm, vurgu süresi ise mikro ile milisaniye arasında değişim göstermektedir (Lebovka vd., 2004). Elektrik alan şiddetine göre PEF Düşük ($E \leq 100-200$ V/cm), Orta ($E = 300-1500$ V/cm) ve Yüksek ($E > 1500$ V/cm) olarak sınıflandırılmıştır. (Bazhal ve Vorobiev, 2000). Ekstrakt veriminin belirlendiği çalışmalarda havuç suyu üretiminde ekstrakt verimi hiç ön işleme

tabi tutulmadan preslenen hammaddeye göre %60,1 ile 66,4 artış gösterirken üzümlerle yapılan çalışmada üzüm suyu verimi enzimatik maserasyon sonrası elde edilen verimle (%87) aynı bulunurken PEF ile gerçekleşen hücre parçalanmasından dolayı çözünen madde ve pigment miktarının arttığı belirlenmiştir (Eshtiaghi ve Knorr, 2000).

Tablo 1. Ultrasonun gıdalardaki bazı uygulamaları (Tavman vd., 2009)

Uygulama	Etki
Mikrobiyal İnaktivasyon	Sıcaklık ve basınçla kombine edildiğinde daha düşük sıcaklıklarda ve daha kısa sürede inaktivasyon sağlar.
Enzim İnaktivasyonu	Daha düşük sıcaklıklarda enzim inaktivasyonu sağlar.
Ekstraksiyon	Ekstraksiyon hızı ve etkinliğini artırır
Canlı hücrelerin uyarılması	Hücreye zarar vermeden hücre etkinliğinin artırılması (yoğurt, balık yumurtası oluşumu, tohum çimlenmesi)
Dondurma	Buz kristallerinin oluşumu için geçen sürede kısalma
Kurutma	Düşük sıcaklık ve düşük hava hızında kurutma sağlar.
Filtrasyon, Seperasyon	Akış hızında ve ayırma etkinliğinde artış
Kristalizasyon	Katı yağ ve şekerlerin kristalizasyon akısını artırır.
Gaz uzaklaştırma	Fermentasyon sonrası CO ₂ gazını giderir.
Köpük kırma	Sıvıların doldurulması sırasında oluşan köpüğün giderilmesini sağlar.
Kesme	Yumuşak/ kırılğan ürünlerin kesilmesinde kayıpları azaltır.
Viskozite değiştirme	Katkı maddelerinin kullanımını azaltarak proses özelliklerini geliştirir
Emülsiye etme ve homojenizasyon	Geleneksel uygulamalara göre maliyeti azaltır.
Temizleme ve yüzey dekontaminasyonu	Boru iç yüzeyi ve kesimhanelerde kullanılan sistemlerin temizliğinde kolaylık sağlar.

Min vd. (2003a) ticari ölçekte yaptıkları çalışmada vurgulu elektrik alan teknolojisi ile işlenen portakal suyunun ısıl işleme göre doku, aroma ve toplam kabul edilebilirlik bakımından üstün olduğunu bildirmişlerdir (Min vd., 2003). Min ve Zhang (2003) ticari ölçekte yaptıkları çalışmada vurgulu elektrik alan teknolojisi ile işlenen domates suyunun ısıl işleme göre aroma bileşenlerinin daha zengin, enzimatik kararmanın daha az ve kırmızı rengin daha iyi nitelikte olduğunu belirtmişlerdir (Min ve Zhang, 2003). Min vd. (2003) ticari ölçekte yaptıkları çalışmada vurgulu elektrik alan teknolojisi ile işlenen domates suyunun ısıl işleme göre duyu kalite bakımından daha iyi olduğunu fakat likopen konsantrasyonu, briks, pH ve vizkozite bakımından aralarında istatistiksel olarak anlamlı bir fark bulunmadığını bildirmişlerdir (Min vd., 2003b).

4. Yüksek Hidrostatik Basınç Uygulaması

Bu yöntem, ısıl işlemlerin tersine ürünün büyüklüğünden ve şeklinden bağımsız ve gecikmesiz olarak etki göstermektedir. Yüksek basınç uygulaması oda sıcaklığında gerçekleştirildiğinden, konvansiyonel yöntemlerdeki gibi termal enerjiye ihtiyaç duyulmamakta ve ürün yapısında yüksek sıcaklığın neden olduğu olumsuz durumlar gerçekleşmemektedir. (Gökmen ve Acar 1995).

Yüksek hidrostatik basınç elde etme yöntemleri, ikiye ayrılmaktadır. Bunlar; dolaylı sıkıştırma yöntemi ve doğrudan sıkıştırma yöntemidir. Dolaylı sıkıştırma yönteminde; bir piston vasıtasıyla içinde basınç iletici sıvı bulunan kapta basınç oluşturulur. Ürün bu sıvı içinde ambalajlı olarak bulunur. Endüstriyel olarak ambalajlı ürünlerde bu yöntem kullanılır. Doğrudan sıkıştırma yönteminde ise, bir piston yardımıyla sıkıştırma uygulanır. Kap içindeki basınç bu piston tarafından oluşturulur. Meyve suyu gibi sıvı ürünlerde bu yöntem uygulanır. (Mertens ve Deplace, 1993).

Yüksek hidrostatik basınç sistemlerinin temel prensibi gıdayı çevreleyen suyu sıkıştırmaktır. Basınçlı kaba konan paketlenmiş haldeki gıda maddesi, çevresindeki suya uygulanan basınç ile her noktadan eşit olarak etkilenmektedir. Suyun basınç ileten ortam olarak kullanılmasının nedenleri; yüksek basınçlara çıkıldığında bile hacim azalmasının ihmal edilebilir olması, gıdalar için güvenilir, saf ve ucuz olmasıdır (Tülek ve Filizay 2006). Yüksek basınç yöntemi oda sıcaklığında gıdaların renk, lezzet ve besin öğeleri gibi kalite özelliklerini değiştirmez veya çok az değiştirir. İşlemin etkinliği üzerine ürünün boyut ve geometrisinin hiçbir etkisi yoktur. Gıdalarda bozulmaya neden olan saprofit mikroorganizmaları yok ederek gıdaların raf ömürlerini artırır. Genellikle 250-300MPa'da 10dk.'lık bir uygulama birçok gıdadaki vejetatif hücreleri tamamen inaktive edebilir. Bu işleme soğuk pastörizasyon da denir (Yemencioğlu ve Özkan, 2004).

Préstamo vd., (2000) kivi ve elma suyu 400 MPa, 30 dk, -7°C/5°C/20°C'de yüksek basınç uygulamasının polifenol oksidaz aktivitesi üzerine pozitif etkiye sahip olduğunu tespit etmiştir (Préstamo vd., 2000). 300- 400 MPa 10 dakika portakal suyunu Bacillus sp sporu öldürülmemesine rağmen, vegetative mikroorganizmaların sterilizasyonu için yeterlidir. Meyve suyunun güzel tadını ve lezzetini 5 ay oda sıcaklığında muhafazasını sağlar. Basınç 45°C de uygulandığında, sonuçlar oda sıcaklığından çok daha iyidir (Hayashi, 1989).

Basınçlanmış meyve suyu taze aromasını ve tadını muhafaza için soğuk ortamda korunmalıdır. Düşük sıcaklık pektin esteraaz aktivitesini düşük tuttuğu için, düşük sıcaklık tortu gelişimini azaltmaya yardımcı olur; böylece, pektin esteraaz tortu oluşumuna katkıda bulunmaz. Düşük sıcaklıkta depolamada diğer basınç uygulanmış gıdalarda da önemlidir; örneğin, basınç uygulanmış reçeller soğukta muhafaza edildiğinde taze tadı ve lezzeti uzun süre muhafaza ederler (Gould, 2000).

5. Ultraviyole Işın (UV) Teknolojisi

UV uygulaması, zararlı mikroorganizmaları inaktive etmek amacıyla uygulanan bir dezenfeksiyon metodudur. (Tran ve Farid, 2004).

UV ışınlarının kullanımı hava, su ve yüzey dezenfeksiyonunda iyi tanımlanmış olmasına rağmen, sıvı gıdalara uygulanmasındaki kullanımı hala sınırlıdır. Su ile karşılaştırıldığında, sıvı gıdaların çeşitli optik ve fiziksel özellikleri ve farklı kimyasal kompozisyonları UV ışının geçirgenliğini, doz aktarımını ve sonuç olarak mikrobiyal inaktivasyonu etkilemektedir. Bununla birlikte, fiziksel bir muhafaza metodu olarak UV ışınlama üzerine yapılan araştırmalar, bu teknolojinin çeşitli sıvı gıdaların ve ingredientlerin (meyve suları, içecekler, süt, sıvı yumurta, şeker şurupları vs.) pastörizasyonu için geçerli bir alternatif olarak oldukça ümit verici olduğunu göstermektedir (Koutchma, 2008).

Ultraviyole ışınları, elektromanyetik spektrumun 100-400 nm aralığında yer alan küçük bir kısmını kapsamaktadır. Ultraviyole ışınları, insan vücudunun bronzlaşmasından sorumlu UV-A (320-400 nm), cilt yanıkları ve cilt kanserine neden olan UV-B (280-320 nm), germisidal etkili UV-C (200-280 nm) ve tüm maddeler tarafından absorbe edilebildiğinden sadece vakum altında yayılabilen Vakum UV (100-200 nm) olarak alt sınıflara ayrılmaktadır. Bu sınıflar arasından UV-C bakteri, virüs, protozoa, maya, küf ve alg gibi mikroorganizmalara karşı öldürücü etkiye sahiptir. En yüksek öldürücü etki 250-270 nm arasında gözlenmekte olup, yüzey dezenfeksiyonu ve meyve suyu, gibi çeşitli akışkan gıda ürünlerinin dezenfeksiyonunda 254 nm dalga boyu kullanılmaktadır. (Keyser vd., 2008).

Bir UV reaktörünün dizayn edilmesinde ve performansının optimizasyonunda, meyve suları gibi sıvı gıda ürünlerinin fiziksel, kimyasal ve optik özellikleri büyük önem taşımaktadır. Fiziksel özelliklerden viskozite ve yoğunluk, sistemde sıvının transferi ve akış modelinin etkinliğini belirlemektedir. Optik özellikler ise, UV ışınının geçirgenliğini ve bunun sonucu olarak sıvı gıdalardaki mikrobiyal inaktivasyonu etkileyen başlıca faktördür. Diğer yandan, kimyasal kompozisyon, briks ve su aktivitesi gibi özellikler de UV ışınlarının inaktivasyon etkinliğini değiştirebilmektedirler (Koutchma, 2008).

Taze meyve suları ve içecekler gibi sıvı gıdalarda bulunan renk bileşenleri ve organik bileşenler ve süspanse maddeler de bu ürünlerin suya göre daha az UV ışını geçirmesine neden olmaktadır. Dolayısıyla bu düşük geçirgenlik, UV pastörizasyonun etkinliğini azaltmaktadır (Koutchma, 2009).

Keyser vd., (2008) çeşitli meyve sularının (portakal suyu, elma suyu, guava ve ananas suyu, mango nektarı ve tropikal meyve suyu) mikroorganizma yüklerinin azaltılması amacıyla 10 lambalı türbülent akışlı bir UV sistemi kullanmışlar ve UV ışınlarının, incelenen meyve suyu ve nektarlarında mikrobiyal yükü azaltmada etkili olduğunu, ancak her meyve suyu için optimizasyonun gerekli olduğunu bildirmişlerdir.

Walkling-Ribeiro vd. (2008) elma suyunda UV uygulaması (20°C'de 30 dakika) sonucunda, elma suyunun pH ve briks değerlerinin çok az düzeyde etkilendiğini, buna karşın askorbik asit içeriğinin 5,4 mg/100mL'den 4,0 mg/100mL'ye düştüğünü saptamışlardır. Uysal Pala ve Kırcı Toklucu (2009), portakal suyunda 9 lambalı bir UV reaktörü kullanarak yapılan UV uygulaması sonucunda, portakal suyunun pH, titrasyon asitliği, brix ve toplam fenol içeriğinde önemli bir değişikliğin olmadığını, buna karşın askorbik asit içeriğinin sistemden 4 geçiş sonucunda %10,6 oranında azaldığını belirlemişlerdir. Guerrero-Beltran vd., (2009) üzüm, cranberry ve greylift sularında, UV ışın uygulama süresi uzadıkça her üç meyve suyunda da toplam renk farkının (ΔE) arttığını saptamışlardır.

6. Gamma ve X Işını Teknolojisi

Radioaktif maddeler, atomlarının sürekli olarak parçalanması sırasında çevreye bazı ışınlar (örn., alfa, beta, gama, X-ışınları) yayarlar. Bu ışınlar çarptıkları materyalde elektrik yüklü iyonların oluşmasına neden olurlar. Bu ışınlara iyonize ışın adı verilir. İyonize ışın; iyonize olmayan görünür ışık, televizyon ve radyo dalgaları ile mikrodalgadan daha fazla enerjiye sahiptir. (Acar, 1999). Gıda ışınlama; gıdaların iyonize enerji olarak da adlandırılan iyonize ışınlarla muamele edilmesidir (Lacroix ve Ouattara, 2000).

Gıdaların muhafazasında gama ışınları, X ışınları ve hızlandırılmış elektron ışınları kullanılmaktadır. Bunlardan endüstride en yaygın olarak kullanılanı gama ışınlarıdır (A.D.A., 2000). Gama ışınları, Kobalt 60 (Co60) ve Sezyum 137 (Cs137) kaynaklarından üretilen ışınlardır. Işınlar direkt olarak ısınlanacak gıdanın üzerine verilir. Fakat gıda hiçbir zaman kobalt veya sezyum ile direkt temas ettirilmez (Lacroix ve Ouattara, 2000). X-ışınları 5 MeV (milyon elektron volt) ve daha düşük enerjide çalışan kaynaklardan üretilmektedir. X ışınlarının malzemeye giriciliği ve doz hızı yüksek olduğu için ışınlama süresi kısadır (A.D.A., 2000).

Gıda ışınlamada “doz” gıda maddesine ilave edilen bir madde değildir. Doz; gıda maddesinin radyasyona maruz bırakıldığı süre içerisinde absorbe ettiği radyasyonun miktarıdır. Işınlama gıdalarda radyoaktiviteye neden olmayan fiziksel bir proses, bir enerji girdisidir (Lacroix ve Ouattara, 2000).

Gıda ışınlama arzu edilen birtakım etkileri (örn., patojenleri öldürmek, raf ömrünü uzatmak, bozulmayı kontrol etmek, kimyasal fumigasyonun yerine kullanmak) elde etmek için iyonize radyasyon ile gıdaların muamele edilmesini kapsar. Bu uygulama; gıdaların ısısında önemli bir artışa sebep olmadığından termal olmayan bir işlem olarak bilinir (A.D.A., 2000).

Işınlama hiçbir atık içermeyen fiziksel bir proses olması nedeniyle taze ve kolay bozulabilen gıdaların korunmasında uygulanan etkin bir yöntem olmakla birlikte her gıdaya uygulanması mümkün değildir (Lagunas-Solar, 1995).

7. Vurgulu (Atımlı) Işık

Vurgulu ışık (PL) teknolojisi; gıda maddelerinin sterilizasyonu amacıyla geniş spektrumlu beyaz ışığın yüksek güçte çok kısa sürelerde vurgular şeklinde uygulanmasıdır. Vurgulu ışık yönteminde, infrared bölgeye yakın olan UV bölgedeki geniş spektrumlu dalga boyları (200 nm-1 mm) kullanılmaktadır (Senorans vd., 2003). İşlem sırasında üründe önemli bir sıcaklık artışı gerçekleşmediği için, bu yöntem ısı olmayan muhafaza yöntemi olarak kabul edilmektedir (Yıldız, 2012)

PL teknolojisi, meyve suları, et ürünleri, sebzeler ve meyveler gibi gıdaların dekontaminasyonunun kısa bir süre için yüksek yoğunluklu ışık darbeleri kullanılarak elde edildiği termal olmayan bir teknolojidir. Bu işlemten sonra patojen bakterilerin anlamlı bir şekilde azaldığı çalışmalar mevcuttur. Çok kısa muamele süresinde önemli mikrobiyal azalma, düşük çevresel etki ve yüksek esnekliği PL'nin en önemli faydalarından bazılarıdır. PL sistemleri az miktarlarda katı atık üretir (Bhavya ve Umesh Hebbar, 2017).

Çeşitli katı ve sıvı gıda ürünleri, PL işleme ile dekontamine edilir ve bu da raf ömrünü uzatır. Bakterilerin PL'ye duyarlılığı türlerine ve hücre zarı kalınlığına bağlı olarak değişir. Aynı zamanda gıdanın yüzeyindeki pürüzlülük vb. gibi etkenler de dekontaminasyonu olumsuz yönde etkileyebilir. Pürüzsüz, düz yüzeye sahip gıdalarda daha etkili olmaktadır. PL teknolojisi, gıda ürünlerinin beslenme kalitesini arttırmak için de kullanılmaktadır. Lipitlerin oksidatif stabilitesini arttırmakla birlikte, bazı meyvelerde antioksidan kapasiteyi ve toplam fenolik miktarını da arttırabilir (John ve Ramaswamy, 2018).

8. Ohmik Isıtma

Joule yasasına göre bir direnç üzerinden geçen elektrik akımı direncin içerisinde ısı oluşumuna neden olmaktadır. Ohmik ısıtma işleminde gıda direnç görevini görmekte, gıda maddesinden alternatif akım geçirilmekte ve elektrik enerjisi ısı enerjine dönüştürmektedir (Baysal vd., 2011).

Ohmik ısıtma hızlı ve homojen ısıtma sağlaması, daha iyi ürün kalitesi sağlaması, ısıtma süresini kısaltması, düşük sermaye maliyeti gerektirmesi, enerji verimliliğinin yüksek olması ve çevreci bir ısıtma işlemi olması gibi birçok avantaja sahiptir (Varghese vd., 2014).

Yüksek elektriksel iletkenlik değerine sahip gıdalar daha hızlı ısınmaktadır. Gıdaların elektriksel iletkenlik değerleri gıdanın bileşimi ve fiziksel yapısıyla farklılık göstermektedir. İyonik çözeltilerde sıcaklık ve iyon konsantrasyonu arttıkça elektriksel iletkenlik değeri artmakta ve böylelikle ısınma için gereken süre kısaltılmaktadır. Katı-sıvı karışımlarında ise parçacık boyutunun artması veya azalması ile birlikte efektif elektriksel iletkenlik değeri değiştirilebilmektedir (Baysal vd., 2011). Ohmik ısıtma işlemi günümüzde ön ısıtma, pastörizasyon, sterilizasyon, çözündürme, pişirme, haşlama, ekstraksiyon gibi birçok amaçla uygulama yeri bulunmaktadır. Ohmik ısıtmanın kullanıldığı bazı çalışmalar Tablo 2’de gösterilmektedir (Baysal, T., 2011).

10. SONUÇ

Gıda endüstrisinde yeni teknolojilerle birlikte ısı işleme alternatif olarak doğan yeni teknik ve metotların mikrobiyolojik gelişimi önlemenin ve gıda kalitesini artırmanın yanı sıra fiziksel, besinsel biyoaktif bileşiklerin ve organoleptik özelliklerin de; geliştirmesi ve mevcut özelliklerinin işleme aşamalarından olumsuz etkilenmesini minimal düzeyde tutarak uygulanmaktadır. Tüm gıda türleri ve tipine göre uyarlanabilir hatta geleneksel termal tekniklerle kombine olarak çalıştırılarak etkisinin yükseltilebilir oluşu açısından geniş bir kullanım alanına sahip olmaları, mikrobiyal inaktivasyon ve besin değerlerindeki kayıplar değerlendirilerek uygun işlem parametrelerinin saptanmasıyla birlikte tekniklerden en yüksek aktivitede faydalanılabilir. Metotların gelişen endüstriyel üretim aşamaların hızlı ve gıda güvenliği açısından arzulanan ürünlerin elde edilmesini kolaylaştırması; ekolojik ve düşük maliyetli tekniklerin global çapta ısı olmayan teknikler üzerine taleplerin yoğunlaşacağını göstermektedir. Elde edilen ürünlerin tüketiciler üzerinde oluşturdukları metabolik etkilerin araştırılması tekniklerin, ısı olmayan teknolojiler arasında tercih edilme potansiyellerini yükseltebilir.

Tablo 2. Ohmik ısıtmanın kullanıldığı çalışmalar

Boru hattı sistemlerinde ohmik ısıtmanın kullanıldığı bazı çalışmalar		
Ürün	Güç / Voltaj Gradyanı	Sonuç
Portakal Suyu	50 kW	Portakal suyunda pektin esteraz aktivitesinde %98 azalma ve C vitamininde ise %15 azalma meydana gelmiştir.
Domates Suyu	25 - 40 V/cm	40 V/cm değerinde ısıtılan domates suyunda 30 s sonunda örneklerde incelenen mikroorganizmaların tespit limitinin altında olduğu saptanmıştır.
Elma suyu	26.7 V/cm	100°C'de 30 s ohmik ısıtma uygulaması, örneklerle inoküle edilen tüm mikroorganizmaların inaktivasyonunu sağlamıştır.

Ohmik ısıtmanın diğer gıda işleme uygulamalarında kullanımına yönelik bazı çalışmalar		
İşlem	Ürün	Sonuç
Ohmik Evaporasyon	Nar suyu, Vişne suyu	Yüksek voltaj gradyanlarında ohmik ısıtma destekli vakum evaporasyon uygulamasının enerji verimliliğinin geleneksel vakum altında evaporasyona göre daha yüksek olduğu ve konsantrasyon işleminin süresinin kısaltıldığı belirlenmiştir.
Ohmik Ekstraksiyon	Pektin	Portakal suyu atıklarından elde edilen pektinin daha yüksek verimde ekstrakte edilmesi sağlanmıştır.

Teşekkür

Önüme çıkan her sorunun aşılmasında bilgi, birikim ve değerli tecrübeleri ile bana yol gösteren, kıymetli vaktini ayırarak yardımlarını esirgemeyen değerli hocam Sayın Doç. Dr. Hande BALTACIOĞLU'na teşekkür ederim.

Abstract

Macrofungi have long been used as food and medicinal purposes by humankind. This study aimed to identify a macrofungus sample collected from Niğde, Türkiye in 2019 via molecular techniques and determine the content of total phenolic compounds, antioxidant and antimicrobial activities. According to data obtained from the sequence analysis of ITS fragment of rDNA the macrofungus sample was identified as *Bjerkandera adusta* (Willd.) P. Karst (1880). The sample was extracted with ethanol and methanol. Total phenolic compound content, antioxidant activity via DPPH scavenging method and antimicrobial activity via disc diffusion method of *B. adusta* was determined by using these extracts. The amount of total phenolic compounds was found as 772.28 µg GAE/mL for a methanolic extract of *B. adusta*. The ethanol extract of *B. adusta* showed 79.66% scavenging activity of 0.1 mM DPPH solution. The highest inhibition zone diameter was measured as 28±1 mm against *P. aeruginosa* by ethanolic extract, while the lowest antimicrobial activity was found in 15 µL methanol extract against *S. typhimurium* with an inhibition zone diameter of 8.7±1.2 mm.

Key Words: Macrofungi, *Bjerkandera adusta*, antioxidant, total phenolic, antimicrobial

Abstract

This study highlights the national and international achievements of the UNESCO Creative Cities Network and Expo cities, their relationships with their communities, and their influence on shaping the future. Looking at the developments that have shaped the history of Expo, which began in 1851, it is clear that today's World's Fairs will also pave the way for the first inventions of the technologies of the future. International cultural recognition is also strengthened by the UNESCO Creative Cities Network, which ensures that the cultural heritage, architectural structures, diverse geographical features and culinary cultures of cities are passed on in a healthy way to future generations. For this reason, the close relationship between living heritage and creative urban approach should be clarified and cities should be included in local development plans. In conclusion, this study emphasizes that the cultural heritage of cities can be the source for the development of countries through UNESCO Creative Cities Network and the future technologies through Expo Cities.

Key Words: *Unesco Creative Cities Network, World Expos, Cultural heritage, Future technology, Local development*

Yaratıcı Şehirler Ve Expo Şehirleri Arasındaki İlişki

Özet

Bu çalışmada UNESCO Yaratıcı Şehirler Ağı'nda yer alan şehirler ile Expo şehirlerinin ulusal ve uluslararası düzeyde kazanımları, çevresiyle ilişkileri ve geleceğin şekillenmesinde etkileri üzerinde durulmuştur. 1851 yılında başlayan Expo tarihinin iz bırakan gelişmeleri ele alındığında günümüz Dünya Expo'larının da geleceğin teknolojilerinin ilk buluşlarına zemin hazırlayacağı görülmektedir. Şehirlerin sahip olduğu kültürel mirası, mimari yapıları, farklı coğrafi özellikleri ve mutfak kültürlerini gelecek nesillere de sağlıklı aktarılmasını sağlayan Unesco Yaratıcı Şehirler Ağı ile ülkeler arası kültürel tanınırlık da artırılmaktadır. Bu sebeple yaşayan kültürel miras ve yaratıcı şehir yaklaşımı arasındaki güçlü ilişkinin belirlenmesi, şehirlerin yerel kalkınma planları içerisinde de yer alması gerekmektedir. Özetle bu çalışmada şehirlerin sahip olduğu kültürel mirasının UNESCO Yaratıcı Şehirler Ağı ile gelecek teknolojilerin de Expo Şehirleri vasıtasıyla ülkelerin kalkınmalarının kaynağı olabileceği üzerinde durulmaktadır.

Anahtar Kelimeler: *Unesco Yaratıcı Şehirler Ağı, Dünya Expo'ları, Kültürel miras, Gelecek Teknoloji, Yerel Kalkınma*

UNESCO Yaratıcı Şehirler Ağı (UCCN)

Yaratıcı şehirler kavramı literatürde ilk kez 1988 yılında David Yencken tarafından Meanjin isimli bir dergide yayınlanan makalesinde kullanılmıştır. Yencken (1988), yaratıcı şehirleri yaşam standartları yüksek, kültürel geçmişe sahip, vatandaşlarının sıra dışı deneyimler yaşayabileceği şehirler olarak ifade etmiştir (Gülduran ve Arıkan Saltık, 2020). Birleşmiş Milletler Eğitim, Bilim ve Kültür Kurumu (UNESCO) Yaratıcı Şehirler Ağı (UNESCO Creative Cities Network-UCCN), 2004 yılında yaratıcılığın kentlerin sürdürülebilir kentsel gelişim süreçleri içerisinde stratejik bir faktör olarak tanımlanması ve kentlerin birbirleriyle yaratıcı faaliyetlerde iş birliği yapabilmesi için kurulmuş bir network ağıdır. Dünya geneli 295 şehrin katılımıyla bu ağ altında toplanan şehirler uluslararası düzeyde yaratıcı faaliyetler ve kültür endüstrisinde iş birliği içerisinde bulunmakta ve bu aktif çalışmaları yerel düzeyde kalkınma planlarına dâhil etmektedirler.

UNESCO Yaratıcı Şehirler Ağı'na katılan şehirler, bu alanda başarılı olan uygulamalarını paylaşmayı ve sivil toplumu da içerisine alan kamu ve özel sektör ortaklıklarını geliştirmeyi taahhüt etmektedir. Taahhüt edilen maddeler içerisinde kültür ve yaratıcılığın yerel sürdürülebilir kalkınma planlarına tam olarak entegre edilmesi, özellikle marjinalleştirilmiş veya savunmasız gruplar ve bireyler için kültürel yaşama katılımının ve erişimin iyileştirilmesi, yaratıcılık ve yenilik merkezlerinin geliştirilmesi ve kültür sektöründeki yaratıcılar ve profesyoneller için fırsatların genişletilmesi, kültürel faaliyetlerin/ürünlerin/servislerin yaratılması, üretilmesi, dağıtılması ve yaygınlaştırılmasının güçlendirilmesi öne çıkmaktadır. Yaratıcı Şehirler Ağı, yalnızca sürdürülebilir kalkınmanın güçlendirilmesinde yaratıcılığın etkin rolü üzerine düşünmek için bir platform olarak değil, aynı

zamanda 2030 Sürdürülebilir Gelişim Gündemi'nin uygulanması için UNESCO'nun efektif bir kuruluşu olarak önem kazanmıştır UCCN yedi yaratıcı alanı kapsamaktadır (Creative Cities Network, 2022):

- ✓ El Sanatları ve Halk Sanatları
- ✓ Medya Sanatları
- ✓ Film
- ✓ Tasarım
- ✓ Gastronomi
- ✓ Edebiyat ve Müzik

Türkiye'den Yaratıcı Şehirler

Türkiye'den 7 şehir UNESCO Yaratıcı Şehirler Ağı'na katılmıştır (Şekil 1) (TRT Haber, 2022).

Şekil 1. Türkiye'nin UNESCO'da ki yaratıcı şehirleri ve yaratıcılık alanları (TRT Haber, 2022)

2015 yılında Gaziantep, Yaratıcı Şehirler Ağı'na gastronomi alanında Türkiye'den katılan ilk şehir olmuştur. Farklı medeniyetlere ev sahipliği yapmış olan Gaziantep çok kültürlü yapısı ve zengin mutfakıyla dikkat çekmektedir (Akın ve Bostancı, 2017). Gaziantep'ten sonra zengin mutfak kültürüyle gastronomi alanında seçilen ikinci şehir Hatay olmuştur ve 2017 yılında UNESCO Yaratıcı Şehirler Ağı listesine girmeyi başarmıştır. 2016'da UNESCO Somut Olmayan Kültürel Miras Listesine girmeye hak kazanan Kütahya, çini sanatıyla 2017 yılında zanaat ve halk sanatları alanından UNESCO Yaratıcı Şehirler Ağı'na Türkiye'den katılan ilk şehir olmuştur (Şekil 2) (UNESCO Yaratıcı Şehirler Ağı, 2022).

Şekil 2. Kütahya çini sanatı (Anonim, 2022)

Tasarım alanında ise 2017 yılında İstanbul seçilmiştir. İstanbul köklü tarihi, çok kültürlü yapısı, usta ve zanaatkarların emekleriyle şekillenen tarihi yapıları ve doğal güzellikleriyle tasarım alanında dikkat çeken unsurlara sahiptir (Şekil 3) (UNESCO Yaratıcı Şehirler Ağı, 2022).

Şekil 3. Valide Han ve Rumeli Hisarı'ndan İstanbul manzarası (Yıldırım, 2017)

UNESCO Yaratıcı Şehirler Ağı'na müzik alanında Türkiye'den katılan ilk şehir Kırşehir'dir. 2019 yılında katılımı gerçekleşen Kırşehir, Anadolu kültüründeki abdalılık ve bozlak geleneğinin önemli isimlerinden Neşet Ertaş, Muharrem Ertaş, Hacı Taşan ve Çekiç Ali gibi halk ozanlarıyla ünlenmiştir (T.C. Kırşehir Valiliği, 2019). Yöresel tariflerle zenginleşmiş mutfak sanatına sahip olan Afyon 2019 yılında gastronomi alanında listeye katılan üçüncü şehir olmuştur (UNESCO Afyonkarahisar Gastronomi Şehri, 2020). 2014'te UNESCO Dünya Mirası Listesi'ne Hanlar Bölgesi, Sultan Külliyesi ve Cumalıkızık'la giren Bursa şehri, çini sanatı ve ipek işlemeciliği ile zanaat ve halk sanatları alanından UNESCO Yaratıcı Şehirler Ağı'na 2021 yılında dâhil olan ikinci ve son şehirdir (Şekil 4) (Bursa Büyükşehir Belediyesi, 2021).

Şekil 4. Bursa şehri çini sanatı ve ipek işçiliği (Bursa Büyükşehir Belediyesi, 2021)

Dünya Expo'ları

Expo, İngilizce "exposition" kelimesinin kısaltmasıdır ve Türkçe'de "sergi, fuar" anlamına gelmektedir. Fuar kelimesinin kökeni ise Fransızca "foire" kelimesinden gelmektedir. Kelime anlamı "panayır, fuar" olarak bilinmekte ve Türk Dil Kurumu kaynaklarında tanımı "belli zamanlarda, belli yerlerde ticari mal sergilemek amacıyla açılan büyük sergi" olarak yer almaktadır (Hür, 2019). Diğer bir ifadeyle Expolar kültür, tarih, eğitim, sanat, eğlence ve ticaret alanlarında düzenlenen büyük olimpiyatlardır. "Dünya Fuarı" ya da "Dünya Sergisi" olarak da isimlendirilen Expolar Dünya tarihinde 19. yüzyılın ortalarına kadar uzanmaktadır (Kaya vd., 2019). Günümüzden 171 yıl önce gerçekleştirilen ilk Expo Londra, Hyde Park, Kristal Palas'ta 1851 yılında "Bütün Milletlerin Büyük Sanayi Eserleri Sergisi" temasıyla düzenlenmiş ve sanayi devriminin icatları sergilenmiştir.

Uluslararası Sergiler Bürosu (BIE) tarafından gerçekleştirilen bu organizasyonlarda 3-6 ay arası süren 4 çeşit fuar düzenlenmektedir: Dünya EXPO'su, Uluslararası özel temalı EXPO, Bahçecilik EXPO'su ve Milano Trienal. Uluslararası düzenlenen fuarların yanı sıra BIE onayı olmadan ülkelerin kendi içerisinde organize ettikleri 'fuat' ya da 'sergi'ler de düzenlenmektedir (URL-1, 2022). Düzenlenen Expo kategorilerine göre sergi süreleri, minimum sergi alanları ve başvuru süreleri değişmektedir (Tablo 1) (DOĞAKA, 2022).

Tablo 1. Expo kategorilerine göre fuar süreleri, minimum sergi alanları ve başvuru süreleri (DOĞAKA, 2022)

Kategori	Resmi İsim	Süre	Minimum Alanı	Sergi Başvuru
A1	Büyük Uluslararası Bahçe Bitkileri Sergileri	3-6 ay	50 ha	2-6 yıl önce (BIE onayı gerekli)
A2	Uluslararası Bahçe Bitkileri Sergileri-Kısa Süreli	8-20 gün	15.000 m ²	En az 4 yıl öncesinde
B1	Uluslararası Katılımlı Sergiler- Uzun Süreli	3-6 ay	25 ha	3-7 yıl öncesinde
B2	Uluslararası Katılımlı Sergiler- Kısa Süreli	8-20 gün	6.000 m ²	2 yıl öncesinde
A2/B1	Uluslararası Katılımlı Sergiler- Uzun Süreli	3-6 ay	25 ha	3-7 yıl öncesinde

Expolar, 1851 yılından bugüne kadar yeniliğin, gelecek teknolojilerin, farklı Dünya kültürlerinin ve yaratıcı endüstrilerin paylaşıldığı interaktif eğitim ve eğlence alanları haline dönüşmüştür. İnsanlık tarihinde iz bırakan önemli gelişmeler bu fuarlarda ziyaretçilere açılmıştır. Örneğin ilk canlı tv yayını 1939 yılında New York Dünya Fuarı'nda, "Ultra High Definition Video(UHDV)" olarak isimlendirilen Süper Hi-Vision Sineması Japonya'da 2005 Expo'da tanıtılmıştır (URL-2, 2022). Expoları ölümsüzleştiren diğer yanı da sergi alanları ve yapılarıdır. Sergi alanlarında kullanılan pavyonların çoğunluğu süreç sona erdikten sonra sökülmüş veya sahibi olduğu ülkeye geri gönderilmiştir. Gelecek zamana ulaşmayı başaran yapıların başında Paris şehrinin anıtsal mimari eserlerinden Eiffel Kulesi örnek gösterilebilir. 1889 Paris Evrensel Sergisinin merkezinde bulunan yapı 300 metre yüksekliği ile döneminde yapılmış en yüksek kuledir. Dökme demirden oluşturulan strüktürüyle döneminin mühendislik eseridir (Madran, 2000). Yaşanılan dönemin kültürü, teknoloji seviyesi, mimari akımları ve dönemi etkileyen tarihi süreçler Expo'ların tasarımından temalarına kadar belirleyici olmuştur. Tarihte Sanayi Devriminin getirdiği yeni rekabet ortamı, I. Dünya Savaşı (1914-1918), II. Dünya Savaşı (1939-1945) ve II. Sanayi Devrimi gibi önemli dönemler expolarda seçilen temaları birebir etkilemiştir (Özkelle, 2006; Hür, 2019).

Evrensel EXPO olarak ifade edilen Dünya Expo'ları 5 yılda bir düzenlenmekte ve 6 ay sürmektedir. Yakın geçmişte organize edilmiş olan Dünya Expo'ları 2000-Hannover (Almanya), 2005-Aichi (Japonya), 2010-Şanghay (Çin), 2015-Milano (İtalya), 2020-Dubai (Birleşik Arap Emirlikleri) şehirlerinde gerçekleştirilmiştir. 2025 yılı için de Japonya'nın Osaka şehri fuara ev sahipliği yapacaktır. "Hayatlarımız İçin Geleceğin Toplumunu Tasarlamak" ana temasıyla 13 Nisan-13 Ekim 2025 tarihleri arasında düzenlenmesi planlanmaktadır. Orta Doğu'da ilk ke gerçekleştirilen Expo 2020 Dubai, Covid-19 Pandemisi nedeniyle bir yıl sonra 1 Ekim 2021'de açılmıştır. Expo 2020 Dubai'nin "Zihinleri Birleştirmek ve Geleceği Yaratmak" sloganıyla katılımcı ülkeler sergi alanlarını tasarlamıştır. Katılan pavyonların ana temaları "mobilité-hareketlilik", "sürdürülebilirlik" ve "olanak-fırsat" olmuştur (Şekil 5) (URL-3, 2022).

Expolar sayesinde çeşitli alanlarda bilgi birikimi ve uzman görüşlerinin paylaşımı interaktif bir ortamda gerçekleştirilmektedir. Ülkeleri temsil eden ürünleri, sahip oldukları değerli varlıkları, tarihi ve kültürü gerçekleştirilen Expo temasına uygun şekilde çarpıcı mimari yapılarda katılımcılara sunulmaktadır. Dönemlik sergiler olmasına rağmen Dünya Expo'ları; şehirleri değiştirmiş ve bazılarını kentsel imge haline dönüşen eşsiz anıtsal yapılar da kazandırmışlardır.

Türkiye'nin Düzenlediği Expolar

Uluslararası Botanik Sergisine Türkiye, 23 Nisan-30 Ekim 2016 tarihleri arasında Antalya'da "Çiçek ve Çocuk" temasıyla ev sahibi ülke olmuştur. "Gelecek nesiller için yeşil bir dünya" hedefiyle düzenlenmiş A1 kategorisinde Botanik bir expodur. 112 hektarlık bir alan üzerinde gerçekleştirilen Expo 2016 Antalya'nın alt temaları "tarih", "biyo-çeşitlilik", "sürdürülebilirlik" ve "yeşil şehir" dir (Hür, 2019). Botanik Expo'ları Uluslararası Çiçek Üreticileri Birliği (AIHP) ile Uluslararası Sergiler Bürosu (BIE) onayı ile gerçekleştirilmektedir. AIPH Konseyi tarafından kabul edilen projeler düzenlenme hakkının onaylanması için BIE Genel Kurulu'nda değerlendirilmektedir. İki kurumun da onayından sonra ev sahibi ülkeye ve şehre Botanik Expo'su düzenleme yetkisi verilmektedir. Şekil 6'da Expo 2016 Antalya'dan bazı görseller sunulmuştur (URL-4, 2022).

Şekil 5. Dubai Expo 2020 Pavyonlar (URL-3, 2022)

Şekil 6. Expo 2016 Antalya (URL- 5, 2017)

Antalya'dan sonra Türkiye'den Hatay şehri 2021 Botanik Expo'su için ev sahipliği yapmaya hak kazanmıştır. "Medeniyetler Bahçesi" temasıyla ev sahibi olmayı hak kazanan Hatay'da organizasyon pandemi nedeniyle 1 Nisan 2022 – 29 Ekim 2022 tarihlerinde gerçekleştirilmesi kararı alınmıştır. B1 kategorisinde 6 ay sürmesi planlanan botanik dalındaki Expo 2021 Hatay içerisinde Gastronomi Köyü, açık ve kapalı fuar alanları, Medeniyetler Bahçesi, tıbbi ve aromatik bitki parkı, biyolojik gölet, kültür ve sanat sokağı yer almaktadır (Şekil 7) (URL-6, 2022).

Şekil 7. Expo 2021 Hatay (URL- 6, 2022)

Sonuç

Çağımız teknolojisi ve yeni keşifler günümüz Dünya'sında hızla ilerlememize olanak sağlarken gelişime ayak uydurabilmek için ülkeler ortak akılda birleşmeye son yıllarda daha çok önem vermişlerdir. Ülkelerin uzmanlaşmış oldukları alanlarda ki bilgi birikimlerini ve deneyimlerini paylaşmaya olanak sağlayan Expo'lar katılımcılar için interaktif sergilerle eğlenceli ve eğitici sahalar sunmaktadır. 1851 yılıyla başlayan Expo tarihi ilk zamanlarda daha çok yeni teknolojik ürünlerin tanıtımı üzerinde yoğunlaşırken özellikle 2000 yılı sonrasında düzenlenen Dünya Expo'larının ana temalarının içerisinde daha yaşanılabilir, ekolojik ve sürdürülebilir gelecek Dünya üzerinde durulmaktadır. Türkiye'nin de sahip olduğu doğal, kültürel, sosyal zenginliğinin daha tanınabilir hale getirilmesi için bu etkinliklerde yer alması ülke imajını güçlendirecektir. Medeniyetler şehri Hatay'ın 2017 yılında Unesco Yaratıcı Şehirler Ağı'na katılımının arkasından Expo 2021'i düzenlemeye hak kazanması hiç şüphesiz farklı amaçlara hizmet etse de yaratıcı şehirler ve Expolar arasındaki güçlü bağı işaret etmektedir. Dünya'dan bu ilişkiye diğer bir örnekte Dubai'dir. Dubai 2018 yılında "Tasarım" alanında Unesco Yaratıcı Şehirler Ağı'na dahil olmuş ve iki yıl sonra da Expo 2020 Dubai'ye ev sahipliği yapmayı kazanmıştır. Türkiye'den de 2017 yılında "Tasarım" alanında Unesco Yaratıcı Şehirler Ağı'na katılan İstanbul'un gelecekte Dünya Expo'suna ev sahibi şehir olabileceğini öngörebiliriz. Bu amaçla, şehirlerin kalkınma planları içerisinde gelecek organizasyonlara ev sahipliği yapabilmesi için önünde ki engeller kaldırılmalı ve alt yapı, ulaşım ağları, yenilikçi merkezler, kültürel etkinlikler ve akıllı tasarımlar artırılmalıdır.

Teşekkür

100/2000 Doktora Burs Projesi'nden dolayı YÖK'e ve desteklerinden dolayı TÜBİTAK'a teşekkür ederiz.

Abstract

Although epidemics have occurred many times in human history, each pandemic has different characteristics and brings with it difficulties that change according to its era. The Covid-19 outbreak emerged at a time when a significant portion of the world's population lived in cities. Factors such as spatial use and population density in cities have increased the spread of the virus and the severity of the epidemic. Scientists predict that outbreaks like Covid-19 will become more frequent due to factors such as global warming, etc. In this context, the necessity of integrating the measures to be taken against the pandemic with other disaster risk reduction measures was emphasized by The United Nations Office for Disaster Risk Reduction (UNDRR), and pandemic measures were also included in the studies to strengthen the resilience of cities to disasters. The spatial planning and design approaches of cities need to be re-examined in order to create a sustainable environment without breaking the Nature-Human-City relationship in emergencies such as pandemics. The aim of this study is to examine the changes in urban systems during the post-pandemic period and to reveal new standards in urban living, working and socializing spaces. For this purpose, cities with different sizes and population density are selected and it is aimed to examine how they experience the pandemic process, the environmental and political decisions taken, the use of spatial open spaces, the adaptation process of the city residents to the new conditions, the gains/losses of this new normal to nature and the inner-city socio-cultural environment. As a result of on-site observations and analyzes, data on how urban components such as urban transportation axes, nodal points, public spaces, recreational areas, residential areas and open green lands should be planned in case of new pandemics or natural disasters can be obtained.

Key Words: Covid-19, spatial planning and design, pandemic, healthy cities, open-green lands

Covid-19 Pandemisi Sonrası Dünya Yeni Bir Pandemiye Hazır mı?

Özet

Salgınlar insanlık tarihinde pek çok kez yaşanmasına rağmen, her pandemi ayrı özellik göstermekte ve yaşanan döneme göre değişen zorlukları da beraberinde getirmektedir. Covid-19 salgını dünya nüfusunun önemli bir kısmının kentlerde yaşadığı bir dönemde ortaya çıkmıştır. Kentlerdeki mekânsal kullanım ve nüfus yoğunluğu gibi faktörler virüsün yayılmasını ve salgının şiddetini artırmıştır. Bilim insanları Covid-19 benzeri salgınların küresel ısınma vb faktörlerin etkisiyle sıklaşacağı öngörüsünde bulunmaktadır. Bu bağlamda BM Afet Risklerini Azaltma Özel Temsilciliği (UNDRR) tarafından pandemiye karşı alınacak tedbirlerin diğer afet risklerini azaltma tedbirleriyle bütünleştirilmesi gerekliliğine vurgu yapılmış, kentlerin afetlere dirençliliğinin artırılmasına yönelik çalışmaların arasına pandemi tedbirleri de dahil edilmiştir. Doğa-İnsan-Kent ilişkisinin pandemi vb. acil durumlarda kopmamasını sağlayacak sürdürülebilir bir çevrenin yaratılabilmesi için kentlerin mekânsal planlama ve tasarım yaklaşımlarının yeniden incelenmesi gerekmektedir. Bu çalışmada amaç, pandemi sonrası süreçte kentsel sistemlerin değişimlerini incelemek ve kent içi yaşama, çalışma ve sosyalleşme mekânlarında yeni standartları ortaya çıkarmaktır. Bu amaçla büyüklükleri ve nüfus yoğunluğu farklı olan kentler seçilerek pandemi sürecini nasıl yaşadıkları, alınan çevresel ve politik kararlar, mekânsal açık alanların kullanımı, kent sakinlerinin yeni şartlara uyum süreci, bu yeni normalin doğaya ve kent içi sosyo-kültürel çevreye kazanımları/kayıpları ekseninde incelenmesi hedeflenmektedir. Literatür araştırması neticesinde kent içi ulaşım aksları, düğüm noktaları, kamusal alanlar, dinlenme alanları, yerleşim alanları ve açık yeşil alanlar gibi kent içi bileşenlerin gelecekte yaşanabilecek yeni pandemiler ya da doğal afetlerde nasıl planlanması gerektiğine yönelik veriler incelenmiştir.

Anahtar Kelimeler: Covid-19, mekânsal planlama ve tasarım, pandemi, sağlıklı kentler, açık-yeşil alanlar

Giriş

İnsanlık tarihi boyunca önemli enfeksiyon hastalıklar yaşanmış ve dünya düzenini yeniden şekillendirmiştir. Geçmişte iz bırakan hastalıkların başında veba, kolera, verem, çiçek, frengi, sıtma, ebola, HIV / AIDS, influenza ve sarıhumma gelmektedir (Sherman, 2013). 21. yüzyılın ilk küresel salgını (pandemisi) olan Domuz Gribi (H1N1 İnfluenza) 8.238, 2014'te Batı Afrika'da yaşanan Ebola Virüsü 11.325 kişinin ölümüne neden olurken, 1918'de New York ve Mexico City'de yaşanan İnfluenza (İspanyol Nezlesi) nedeniyle yaklaşık 30 milyon kişi ölmüştür

(Şanlı, 2010; Sherman 2013). 17 Kasım 2019 tarihinde Çin'in Hubei eyaleti başkenti olan Wuhan kentinde hayvansal enfeksiyon etkenli ilk vakanın ortaya çıkmasıyla başlayan (Yılmaz, 2020) ve çok hızlı bir şekilde yayılan yeni tip korona virüsün neden olduğu 2019 Koronavirüs hastalığı (Covid-19) Dünya genelinde küresel bir sağlık krizine neden olmuştur (Kabakcı, 2020; Page vd., 2021). Hastalık SARS Co-V'a benzerliği nedeniyle SARS CoV-2 olarak adlandırılmıştır (Sağlık Bakanlığı, 2020). 11 Mart 2020 tarihinde Dünya Sağlık Örgütü (DSÖ) küresel salgın (pandemi) ilan ettiğini açıklamış ve Türkiye'de de ilk vaka 17 Mart 2020 tarihinde bildirilmiştir (Billur ve Billur, 2020; Yılmaz, 2020; WHO, 2021). 16 Eylül 2022 tarihi itibarıyla Dünya genelinde 616.228.663 onaylanmış vaka, 595.431.698 iyileşen varken, Covid-19 nedeniyle 6.526.150 kişi hayatını kaybetmiştir (Worldometers, 2022). Bu hastalıklarda ölüm oranının fazla olmasının sebeplerinin başında kent içi sirkülasyonda sağlıklı sosyal çevrenin oluşturulamaması, yüksek nüfus yoğunluğu ve dikey kentsel planlama gibi faktörlerle bulaş oranının çok yüksek olması yer almaktadır. Ülkeler bulaşın azaltılabilmesi için çeşitli yaptırımlar, zorunlu kurallar ve caydırıcı cezalar uygulamaya çalışmış ama hastalığın yayılmasını engelleyememişlerdir. Bilim insanları Covid-19 benzeri salgınların küresel ısınma vb. faktörlerin etkisiyle sıklaşacağı öngörüsünde bulunmaktadır. Bu bağlamda Birleşmiş Milletler Afet Risklerini Azaltma Özel Temsilciliği tarafından pandemiye karşı alınacak tedbirlerin diğer afet risklerini azaltma tedbirleriyle bütünleştirilmesi gerekliliğine vurgu yapılmış, kentlerin afetlere dirençliliğinin artırılmasına yönelik çalışmaların arasına pandemi tedbirleri de dahil edilmiştir (The United Nations Office for Disaster Risk Reduction, 2021). Geçmişte de yaşanan benzer hastalık ve salgınlarda, kentler yeniden şekillendirilmiş ve sağlıklı çevreler oluşturulmaya çalışılmıştır. Özellikle, insanların sosyal mesafe kurallarına ceza ve yaptırımlarla uyulmasının sağlanması, zorlama bir yöntem olarak karşımıza çıkmaktadır. Bu nedenle doğa, insan ve kent ilişkisinin pandemi sürecinde kopmadan sürdürülebilir bir çevrenin yaratılabilmesi için kentlerin mekânsal planlama ve tasarım yaklaşımlarının yeniden incelenmesi gerekmektedir. Çalışmanın temel amacı, pandemi sonrası kentlerde mekânın mevcut biçimden, sağlıklı ve sosyal mesafeli çevreler sunan yeni formuna dönüşümünün nasıl olacağıdır; bu dönüşümde, mekânsal gereksinimler neler olmalıdır, vb. sorulara cevap aranmaktadır. Çalışma kapsamında ülkelerin pandemiyle mücadele yolları, mekânların insan sirkülasyonunu çok fazla kesintiye uğramadan aldığı yeni yaratıcı çözümler ve devletlerin aldığı kararlar incelenmiştir.

İklim değişikliği ve benzeri faktörlerle Covid-19 benzeri salgın riskinin giderek artacağı ve sıklaşacağı yönünde öngörüler bulunmaktadır. Covid-19 pandemisinin ülkesel farklılıklarının yanısıra farklı büyüklükteki kentsel alanlarda ve kırsal alanlarda etkileri de birbirinden farklı gerçekleşmiştir. Kırsal alanlarda yerleşim yerlerinin daha seyrek konumlanması, yatay yerleşimin çoğunlukta olması ve kişi başına düşen yeşil alanların oranı dikkate alındığında pandemiye uygulanması gereken sosyal mesafe kurallarına daha kolay adapte olduğu izlenmektedir. Kentlerde ise durum daha karmaşık ve zorlayıcı hale dönüşmüştür. 21. yy da nüfusun önemli bir kısmı kentlerde yaşamaktadır. Özellikle büyük kentlerde dikey yerleşimin çoğunlukta olduğu kalabalık binalar, yoğun toplu taşıma noktaları, sokaklar, parklar, meydanlar, vb. yoğun kent hareketliliğinin yaşandığı, bulaş oranı yüksek merkezlerde yeniden düzenlemeler getirilmesi zorunluluk halini almıştır. Bu nedenle pandemi sonrası kentsel hareketliliği ve hareket modellerini anlayabilmek için ihtiyaçlara göre sağlıklı kentsel alanlar oluşturulması amaçlanmaktadır. Bu çalışma ile gelecekte de olabilecek yeni pandemi, epidemiy ya da başka felaketlerin yaşanması durumunda hızla alınması gereken kararların neler olduğu ve hastalıklara karşı mekânsal planlama ve tasarım stratejilerinin geliştirilmesine katkı sağlanması ve merkezi/yerel kent planlamalara yol göstermesi hedeflenmektedir.

Araştırma yöntemini literatür araştırması ve karşılaştırma oluşturmaktadır. Covid-19 sürecinin tüm Dünya genelinde etkileri ve yapılan çalışmaların bilimsel değerlendirmesi için salgının ilk çıktığı günden bugüne kadar yapılmış yerli ve yabancı literatür taramasıyla çalışmalar (makaleler, bildiriler, güncel bilimsel veriler, kitaplar, internet siteleri) incelenmiştir. Çalışmada ülkelerin yönetim sistemleri, kendilerine özgü pandemi uygulamaları, kentlerde Covid-19 virüsünün farklı etkileri, yetkililerinin pandemiyle mücadele için aldıkları önlemler, kentlerin pandemi sonrası için hedefledikleri mekânsal planlama ve tasarım yaklaşımları, farklı ölçekteki kentler arasında ki uygulama farklılıkları incelenmiş ve örnekler toplanmıştır.

Ülkelerin Pandemiyle Mücadele Yöntemleri

Ülkelerin pandemiyle mücadele etmek için geliştirdikleri yöntemler farklıdır. Hepsinin ortak amaçları sağlıklı sosyal çevrenin oluşturulması, insanların gereksinimlerini sosyal mesafe kurallarına göre karşılamalarının sağlanması, bulaş riskini azaltıcı yapısal malzemelerin ve kişisel korunma ekipmanlarının kullanılmasının sağlanmasıdır. Çalışmalar, Covid-19 virüsünü bünyesinde daha az ve daha çok tutan malzemelerle ilgili önemli sonuçlar çıkarmıştır. Örneğin paslanmaz çelik, plastik, vb. materyaller yerine kimyasal işleme maruz kalmamış ham haldeki ahşap yüzeylerin tercih edildiği mekânsal planlamaların virüs yoğunluğunun azaltılmasında daha etkili olduğu ortaya çıkarılmıştır (Dietz vd., 2020). Kent kullanıcılarının maruz kaldığı yoğun pandemi korkusuyla psikolojik problemlerin artmaya başladığı gerçeği de sosyalleşme mekânlarının önemini bir kez daha kanıtlamaktadır. Bu nedenle insanları dış çevreyle yeniden sosyalleşebileceği hızlı ve yaratıcı çözümlerle güvenli ortamlar oluşturulması için projeler geliştirilmiştir. Amsterdam (Hollanda)'da bulunan bir sanat merkezine

ait restoran farklı amaçlar için yapılan beşgen biçimli seraları yemek odalarına dönüştürerek, farklı masalardaki müşterilerin birbirleriyle temasının kesilmesi ve insanların kendilerini güvende hissetmeleri amaçlanmıştır (Şekil 1) (Dinç, 2020).

Şekil 1. Küçük seraların güvenli restoran bölümüne dönüştürülmesi, Amsterdam-Hollanda (Dinç, 2020)

Bir diğer örnekte de New York Kenti (ABD)'nde tasarımcı David Rockwell ve ekibi tarafından barların ve restoranların pandemi sonrası yeniden açılmasına yardımcı olmak için açık havada yemek yeme şablonu olan bir açık sokak girişimi önerilmektedir. Parça seti formülü ile bir restoranın iç yemek alanı küçük müdahalelerle kaldırımlara ve hatta cadde ortasına taşınarak genişletilmiştir (Şekil 2 ve 3). Bu tasarım stratejileriyle insanların kendini güvende hissetmesini sağlayacak pratik çözümler sunulması hedeflenmiştir (Dinç, 2020; Harrouk, 2020).

Şekil 2. Açık sokak girişim önerileri-1, Rockwell Group (Harrouk, 2020)

Şekil 3. Açık sokak girişim önerileri-2, Rockwell Group (Harrouk, 2020)

Açık alanı teşvik etmek, sosyal mesafeyi artırmak ve pandemi koşullarında ticaretle uğraşan kesimin ekonomik toparlanmalarına yardımcı olmak için restoranların açık havada oturma seçeneklerini genişletmek için New York Kent'i ne yönelik Açık Restoran Programı başlatılmıştır (Şekil 4) (The City of New York, 2021). Pandemi sürecinde mevcut işlevlerinin yanında çok farklı kullanımlarla topluma hizmete açılan kent içi alanların başında sokaklar, meydanlar ve park alanları gelmektedir. Yürüme, bisiklet sürme, sosyalleşme, yemek yeme, dinlenme alanları olarak tercih edilen bu mekânlar pandemiyle beraber sosyal hizmetlerin kişilere ulaştırılmasında istasyon görevi gördüğü mekânlar haline dönüşmüştür. Gezici sağlık merkezleri, hızlı test istasyonları, hijyen istasyonları, gıda/içme suyu/ilaç dağıtım noktaları ve aşılama merkezlerine kolay ve güvenli ulaşımın anahtar noktaları olmuşlardır. Bu nedenle Covid-19 sonrası için mahalle içi ara sokaklar (konut ağırlıklı), mahalle içi ana sokaklar (ticari, kurumsal, eğitim, vb.), kentsel ana arterler (toplu taşıma koridorları, ticari, ofis, vb.) ve sahil yollarında yeni standartların planlanması ve tasarımı için çalışmalar yürütülmektedir (The Global Designing Cities Initiative, 2020).

Şekil 4. Açık yemek alanı yerleşim gereksinimleri (The City of New York, 2021)

Ülkelerin Covid-19 Salgınıyla Sağlıklı Başa Çıkmasını Sağlayan Etmenler

Covid-19 salgını keskin sonlandırarak etkili bir aşı veya ilaç tedavisi geliştirilemediği için ülkelerin de bu süreci daha başarılı yönetmesini sağlayan etmenleri şu şekilde sıralayabiliriz (Dinç, 2020);

- ✓ Sağlık sisteminin yeterliliği
- ✓ Sosyal politika adımları
- ✓ Doğru zamanlama ve erken müdahale

- ✓ Etkin takip ve karantina uygulamaları
- ✓ Siyasi sistemler ve yasal uygulamalar
- ✓ Eğitim düzeyi ve halkın bilinçlenmesi
- ✓ Sosyal medya araçlarının etkin kullanımı
- ✓ Mekânların salgına uyumlu yeni formlara dönüştürülebilir olması

Tüm Dünyada alınan önlemlerin başında toplu karantina, kısıtlamalar ve toplu etkinliklerin iptali göze çarpmaktadır. Ülkelere göre alınan ilk önlemler Tablo 1’de verilmiştir.

Tablo 1. Ülkelerin Covid-19 Salgınıyla Mücadelesinde İlk Aldıkları Önlemler

Ülke İsmi	Alınan Önlemler
Çin	✓ Toplu Karantina ✓ Sosyal alanların kapatılması ✓ Olimpiyat vs. etkinliklerin iptali ✓ Stadlar ve geniş açık alanların kitlesel karantina merkezleri haline dönüştürülmesi ✓ Yeni pandemi hastanelerinin inşası ✓ Karantina kurallarına uymayanlar için 3 ile 7 yıl arası hapis cezası ✓ Yurt dışından ülkeye giriş yapanlar için zorunlu karantina (URL-1, 2022)
Türkiye	✓ 65 yaş üstü ve devamında 20 yaş altı için sokağa çıkma yasağı ✓ Okulların kapatılması, uzaktan eğitime geçiş ✓ Sosyal alanların kapatılması ✓ Toplu Karantina ✓ Yurt dışı uçuşların iptali ✓ Çalışma saatlerinin azaltılması ✓ Evden çalışma sisteminin başlatılması (Güngör, 2020)
İtalya	✓ Avrupa’da karantina uygulaması başlatan ilk ülke ✓ İzin belgesi ile sokağa çıkabilme (Kaçak ve Yıldız, 2020)
Fransa	✓ Kısmi karantina ✓ Kalabalık etkinliklerin iptali ✓ Spor, kültür ve sanat etkinlikleri iptali ✓ Okulların kapatılması ✓ Ordunun gerekli hallerde sağlık sistemi içerisinde görevlendirilmesi ✓ İzin belgesi ile sokağa çıkma ✓ Yurt dışı girişlerine yasak ✓ Fransa pasaportu olanların 15 gün karantinada kalması koşuluyla ülkeye alınması (Kaçak ve Yıldız, 2020)
Almanya	✓ Kısmi karantina ✓ 2 kişi arası mesafenin en az 1,5 m olması ✓ Aile üyeleri ve aynı adreste ikamet edenler hariç 2 kişiden daha fazla toplanılma yasağı ✓ Okulların kapatılması ✓ Sosyal alanların kapatılması ✓ Spor, kültür ve sanat etkinlikleri iptali (URL-1, 2022)
ABD	✓ ABD vatandaşları ve sürekli oturma izni bulunanlar hariç ülkeye girişin yasaklanması ✓ Yurt dışından ülkeye giriş yapanlar için evde zorunlu karantina uygulanması ✓ Eyaletlerden yoğun vaka sayısına sahip olanlarda okulların kapatılması ✓ Üniversite eğitimlerinin uzaktan eğitimle sürdürülmesi ✓ Spor, kültür ve sanat etkinlikleri iptali ✓ 10 kişiden fazla toplanılmaması (Aydoğmuş, 2020)
İngiltere	✓ ‘Sürü Bağışıklığı’ uygulamasını tercih eden ilk ülke ✓ Üniversitelerin uzaktan ya da yüz yüze eğitim uygulamalarını tercih etme özgürlüğü sunulması ✓ Spor etkinliklerinin durdurulması ✓ İlk ve orta dereceli okulların kapatılması (Aydoğmuş, 2020)
Avustralya	✓ Toplu karantina ✓ Sosyal alanların kapatılması ✓ 5 kişiden fazla toplanılma yasağı ✓ Yurtdışından ülkeye giriş yapanlar için 14 gün zorunlu karantina ✓ Avustralya vatandaşları, sürekli oturma izni olanlar ve aileri hariç ülkeye girişlerin yasaklanması (Aydoğmuş, 2020)

Sonuç

Dünya, tarih boyunca salgın kriziyle savaşmak zorunda kalmış, büyük kayıplar vermiş ve gelecek afet, salgın ve felaketlere karşı hızla müdahale etmek ve önlemek için hazırlıklı olunması gerektiği gerçeğiyle yüzleşmiştir. Küresel bir sağlık krizine dönüşen salgın hastalıklarla beraber mekânların kullanımları da yeniden sorgulanmaktadır. Sağlıklı bir insan-doğa-kent ilişkisinde olması beklenenlerin başında kişi başı düşen yeşil alanların miktarı, kent parklarının herkes için erişilebilir olması, karbon emisyon oranlarının düşürülmesi için kent içi bisiklet ağlarının yaygınlaştırılması vb. sağlıklı çevreler oluşturulması beklenirken pandemiyle beraber yeni düzenlemeler ve standartlar zorunlu hale gelmiştir. Pandemi sonrası kentlerin bulaş riskini azaltıcı önlemlerle sosyal mesafe kurallarına göre yeniden planlanması ve tasarlanması geleceğin sağlıklı kentlerine yatırım olacaktır. Araştırma bu bağlamda ele alındığında hem yeni yetişecek mimarlık, planlama ve tasarım (mimarlık, peyzaj mimarlığı, şehir ve bölge planlama, iç mimarlık, endüstri ürünleri tasarımı) programlarında eğitim alacak öğrencilerin hem eğitim-öğretimleri hem de Dünya’da ve Türkiye’de gelecekte yaşanabilecek olası felaketlere karşı alınacak önlemler için önem arz etmektedir.

Ülkelerin gelişmiş, gelişmekte ya da gelişmemiş bir ülke olmasını belirleyen kriterlerin başında kişi başına düşen milli gelir miktarı, sağlık olanakları, eğitim durumu, teknolojik gelişimi, ulaşımı, hukuku gibi birçok faktör belirleyici olmaktadır. Türkiye gelişmekte olan ülkeler arasında yer almaktadır. Pandeminin etkileri sadece ülkelere göre değil farklı büyüklük ve nüfus yoğunluğuna sahip olan kentlerde bile farklılıklar göstermektedir. Her ülke yönetimsel olarak kendi politikalarını uygulamış, kentsel yerleşimler içerisinde pandeminin kamusal alanlar, açık yeşil alanlar, sosyal mekânlar, insan sirkülasyonunun sürekli olduğu kent içi ulaşım ağları, cadde/sokak ve meydanlar üzerinde ki etkileri incelenmiştir. Bu incelemeler neticesinde görülmektedir ki yeni nesil akıllı teknolojiler ve akıllı kentsel uygulamalar salgınla baş etme yöntemlerinin başında gelmelidir. Özellikle nüfusu 10 milyonun üzerinde ki mega kentlerde sosyal düzen ve sağlık hizmetlerinin aksamaması için çeşitli afetlere ve pandemilere dirençli kentsel planlama ve tasarımlara ihtiyaç duyulmaktadır.

Teşekkür

Abstract

In this study, the effect of enriched cage system and free-raising system on egg quality of ATA-S layer hybrid was investigated. The research was carried out in Niğde Ömer Halisdemir University Ayhan Şahenk Agricultural Research and Application Centre. In the study, there were 3 replications in enriched cages and 20 animals were used in each replication. In addition, 12 replications were used in the free- range system and 30 animals were used in each replication. In total, 60 layer hybrid from the cage system and 360 layer hybrid from the free- range system were used. The study started when the layers were 29 weeks old and continued until 41 weeks old, and egg samples were collected every 4 weeks. For egg quality analysis, 36 eggs were collected from the enriched cage system and 95 eggs from the free-range system. While the effect of the breeding system on egg weight, yolk index and yolk score was found to be significant ($P<0.01$), the effect of other quality characteristics was not statistically significant ($P>0.05$).

As a result, layers in enriched cages have an advantage in terms of egg weight and yolk score, while layers in free-range system have an advantage in terms of yolk index.

Key Words: *Breeding system, Layer hybrid, Egg quality*

Farklı Yetiştirme Sistemlerinin Yumurta Kalitesine Etkisi

Özet

Araştırmada zenginleştirilmiş kafes sistemi ve serbest yetiştirme sisteminin ATA-S yumurtacı hibritlerin yumurta kalitesine etkisi araştırılmıştır. Araştırma Niğde Ömer Halisdemir Üniversitesi Ayhan Şahenk Tarımsal Araştırmalar Uygulama ve Araştırma Merkezinde yürütülmüştür. Araştırmada, zenginleştirilmiş kafeslerde 3 tekerrür vardır ve her tekerrürde 20 hayvan kullanılmış. Bunun ile birlikte serbest sistemde 12 tekerrür ve her tekerrürde 30 adet hayvan kullanılmıştır. Toplamda kafeste sisteminden 60 hayvan, serbest sistemden ise 360 hayvan kullanılmıştır. Araştırma, yumurtacılar 29 haftalık yaşta iken başlanmış ve 41 haftalık yaşa kadar sürmüştür ve her 4 haftada bir yumurta örnekleri toplanmıştır. Yumurta kalite analizi için zenginleştirilmiş kafes sisteminden 36 adet yumurta ve serbest sistemden 95 adet yumurta toplanmıştır. Araştırmada yetiştirme sisteminin yumurta ağırlığına, sarı indeksine ve sarı skoruna etkisi önemli bulunurken ($P<0,01$), ele alınan diğer kalite özellikleri ise etkisi istatistiki olarak önemli çıkmamıştır ($P>0,05$).

Sonuç olarak, zenginleştirilmiş kafeslerdeki yumurtacılar, yumurta ağırlığı ve sarı skoru bakımından avantajlıdır, öte yandan serbest sistemdeki yumurtacılar sarı indeksi bakımından avantajlıdır.

Anahtar Kelimeler; *Yetiştirme sistemi, Yumurtacı hibrit, yumurta kalitesi*

Abstract

In this study, it was carried out to investigate the effects of different irrigation levels on yield and growth parameters of 3 different strawberry cultivars (Monterey, Albion and Sanandaras) that can be grown in Niğde climatic conditions and to determine the most suitable strawberry cultivar for the region. Within the scope of the research, three different strawberry varieties suitable for the climatic conditions of the region were used and the study was carried out as a field trial in the research area of Niğde Ömer Halisdemir University, Faculty of Agricultural Sciences and Technologies. Within the scope of growing strawberries under field conditions and setting up the experiment, random blocks were planned according to the experimental design with 3 replications of each strawberry variety and the amount of irrigation water to be applied, and 30 plants in each replication. For the irrigation water to be applied to the plants, a drip irrigation system with a flow rate of 2L/h and a dripper range of 40 cm has been arranged. The experiment was carried out on May 7, 2021 by planting strawberry seedlings on the 3 m long furrow ridges created under field conditions using black mulch. In the study, I₁₀₀ full irrigation and I₇₅ and I₅₀ limited irrigation were applied to each strawberry variety by considering open surface evaporation. Due to the limited water resources in the region and also due to the predicted decrease in water resources due to climate change in the future, the cut-off levels have been determined as 75% and 50%. The first products taken in the experiment were not taken into account for the adaptation of the plant to the soil, and the yield and quality parameters of the strawberry after the harvest in September were examined. Plant diameter and number of branches, average fruit size and weight were determined for each applied subject. The results were evaluated statistically, the dimensions of the change between the groups and the level of relationship were determined. Accordingly, it was seen that Albion cultivar had the highest fruit weight, fruit length and fruit diameter in I₁₀₀ full irrigation, followed by Monterey and Sanandaras cultivars, respectively. The cultivars from the largest to the smallest in the average plant diameter and number of branches were determined as Monterey, Albion and Sanandaras, respectively. According to irrigation issues, all varieties were listed as I₅₀, I₁₀₀ and I₇₅ from largest to smallest in all parameters except the number of plant branches.

Keywords: *Strawberry Varieties, Irrigation Range, Deficit Irrigation, Niğde Province*

Niğde İklim Koşullarında Çilek Çeşitlerine Uygulanacak Farklı Sulama Düzeylerinin Meyve Ve Bitki Gelişim Parametrelerine Etkisinin Araştırılması

Özet

Bu çalışmada Niğde iklim koşullarında yetiştirilebilecek olan 3 farklı çilek çeşidinde (Monterey, Albion ve Sanandaras) farklı sulama düzeylerinin verim ve gelişim parametreleri üzerine etkilerinin araştırılması ve bölgeye en uygun çilek çeşidinin belirlenmesi amacıyla yürütülmüştür. Araştırma kapsamında Bölgeye iklim şartlarına uygun üç farklı çilek çeşidi kullanılmış olup çalışma Niğde Ömer Halisdemir Üniversitesi, Tarım Bilimleri ve Teknolojileri Fakültesi araştırma sahasında tarla denemesi şeklinde yürütülmüştür. Çileklerin tarla şartlarında yetiştirilmesi ve denemenin kurulması kapsamında tesadüfi blokları deneme desenine göre her bir çilek çeşidi ve uygulanacak sulama suyu miktarı konularından 3 tekerrürlü ve her tekerrürde de 30 bitki olacak şekilde planlanmıştır. Bitkilere uygulanacak sulama suyu için ise 2L/h debi verebilen ve 40 cm damlatıcı aralığında damla sulama sistemi tertip edilmiştir. Deneme 7 Mayıs 2021 tarihinde çilek fidelerinin tarla koşullarında oluşturulan 3 m uzunluğundaki karık sırtlarına siyah malç kullanılarak dikilmesiyle gerçekleştirilmiştir. Çalışmada her bir çilek çeşidine açık yüzey buharlaşması dikkate alınarak I₁₀₀ tam sulama konusu ile I₇₅ ve I₅₀ kısıntılı sulama konuları uygulanmıştır. Bölgede su kaynaklarının kısıntılı olması ve ayrıca gelecekte iklim değişikliğine bağlı olarak su kaynaklarında azalma öngörülmesinden dolayı kısıntı seviyeleri %75 ve %50 olarak belirlenmiştir. Denemede alınan ilk ürünler bitkinin toprağa adaptasyonu için dikkate alınmayıp, Eylül ayında yapılacak hasat sonrasında çilekteki verim ve kalite parametreleri incelenmiştir. Uygulanan her bir konuda bitki çapı ve dal sayısı, ortalama meyve büyüklüğü ile ağırlığı ortaya konulmuştur. Sonuçlar istatistiki olarak değerlendirilmiş gruplar arasındaki değişimin boyutları ve ilişki düzeyleri belirlenmiştir. Buna göre I₁₀₀ tam sulama konusunda en yüksek meyve ağırlığı, meyve boyu ve meyve çapına Albion çeşidinin sahip olduğu bunu sırasıyla Monterey ve Sanandaras çeşitlerinin takip ettiği görülmüştür. Ortalama bitki çapı ve dal sayısında ise büyükten küçüğe doğru çeşitler sırasıyla Monterey, Albion ve Sanandaras olarak belirlenmiştir. Sulama konularına göre ise tüm çeşitler bitki dal sayısı haricinde tüm parametrelerde büyükten küçüğe doğru I₅₀, I₁₀₀ ve I₇₅ olarak sıralanmıştır.

Anahtar sözcükler: *Çilek Çeşitleri, Sulama Aralığı, Kısıntılı Sulama, Niğde*

Abstract

Today's cities show an unplanned and rapid development in direct proportion to the development of technology. As a result of rapid and unplanned development, the natural silhouette of the cities has deteriorated and the proportion of reinforced concrete structures has increased day by day. Green areas have been destroyed in cities where there is intense work tempo and high consumption. A city should exist with both its structures and open green spaces (urban forests, neighborhood and pocket parks, road trees, agricultural areas, urban parks, university campuses, green buildings, vertical gardens, green roofs, etc.). Destroying green areas and putting them in the second plan cause air, water, noise, etc. causes ecological problems. It is aimed to contribute to the formation of new generation cities by associating this problem of cities with the concept of sustainability at the international level. With the concept of sustainability, climate control in cities, protecting biodiversity, creating recreational opportunities for urban people living in the monotonous and intense pace of the city, ecological sustainability, etc. It is intended to contribute to problems such as For the sustainability of cities, it is necessary to use renewable energy sources, reduce waste consumption, switch to smart city and smart transportation model, as well as ensure ecological sustainability.

In this study, "Selçuk University Alaeddin Keykubat Campus" located within the provincial borders of Konya, which was evaluated as a small scale city model with its own units, was chosen as the study area. The aim of the study is to determine the shadow lengths created by the buildings in the "Selçuk University Alaeddin Keykubat Campus" on the green areas and the new building or open green areas, and to determine the correct light, shade and water requirements of the plants in the open green areas in line with the data obtained. The aim is to evaluate its contribution to ecological sustainability and green campus studies by revealing whether it is placed in areas with 2D (2D)-3D (3D) software and with different analysis techniques.

Üniversite Yerleşkelerinde Gölge Analizi ile Sürdürülebilirlik İlişkisi: Selçuk Üniversitesi Alaeddin Keykubat Yerleşkesi Örneği

Özet

Günümüz kentleri teknolojinin gelişmesi ile doğru orantılı olarak plansız ve hızlı bir gelişim göstermektedir. Hızlı ve plansız gelişme sonucunda kentlerin doğal silüeti bozulmuş, her geçen gün betonarme yapıların oranı artmıştır. Yoğun çalışma temposu ve tüketimin çok olduğu kentlerde yeşil alanlar tahrip edilmiştir. Bir kent hem yapıları hem de açık yeşil alanları (kent ormanları, mahalle ve cep parkları, yol ağaçları, tarım alanları, kent parkları, üniversite kampüsleri, yeşil binalar, dikey bahçeleri, yeşil çatılar vb.) ile birlikte var olmalıdır. Yeşil alanların tahrip edilip ikinci plana atılması hava, su, gürültü vb. ekolojik sorunlara yol açmaktadır. Uluslararası düzeyde kentlerin bu sorunu sürdürülebilirlik kavramı ile ilişkilendirilip yeni nesil kentlerin oluşumuna katkı sağlanması hedeflenmektedir. Sürdürülebilirlik kavramı ile kentlerde iklim kontrolü, biyoçeşitliliği koruma, kentin monoton ve yoğun temposunda yaşayan kent insanına rekreasyon imkanı oluşturma, ekolojik sürdürülebilirlik vb. gibi sorunlara katkı sunulması amaçlanmaktadır. Kentlerin sürdürülebilirliği için yenilenebilir enerji kaynaklarının kullanımı, atık tüketimlerinin azaltılması, akıllı şehir ve akıllı ulaşım modeline geçilmesinin yanında ekolojik sürdürülebilirliğinin de sağlanması gerekmektedir.

Bu çalışmada, kendi içerisinde yer alan birimleri ile küçük ölçekte kent modeli olarak değerlendirilip Konya il sınırları içerisinde yer alan "Selçuk Üniversitesi Alaeddin Keykubat Yerleşkesi" çalışma alanı olarak seçilmiştir. Çalışmanın amacı "Selçuk Üniversitesi Alaeddin Keykubat Yerleşkesi" içerisinde yer alan yapıların, yeşil alanlar ve yeni yapılacak olan yapı veya açık yeşil alanlar üzerinde oluşturduğu gölge uzunluklarını tespit etmek ve elde edilen veriler doğrultusunda açık yeşil alanların içerisinde bulunan bitkilerin ışık, gölge ve su isteklerine göre doğru alanlara yerleştirilip yerleştirilmediğini 2 boyutlu (2B)-3 boyutlu (3B) yazılımlar aracılığı ve farklı analiz teknikleri ile ortaya koyarak ekolojik sürdürülebilirlik ve yeşil kampüs çalışmalarına katkısı değerlendirilmiştir.

Lipophilic antioxidants of milk and their benefits to human health

Songül Çakmakçı, Mehmet Ali Salık

Department of Food Engineering, Faculty of Agriculture, Atatürk University, Erzurum, Türkiye

Abstract

Milk and its products are the most basic foods in human nutrition. Milk is also rich in antioxidant compounds. Milk antioxidants are divided into two groups: lipophilic and hydrophilic. Lipophilic milk antioxidants are conjugated linoleic acid (CLA), α -tocopherol, β -carotene, vitamin A, vitamin D₃, and phospholipids. Lipophilic antioxidants have high thermal stability and are active in all dairy products. Antioxidants neutralize free radicals in the body and protect the body against diseases. The negative relationship between milk consumption and the incidence of diet-related diseases confirms that consumption of milk and dairy products has health benefits. The importance of milk consumption, especially the consumption of fatty milk and its products, is understood and in this review, lipophilic antioxidants in milk fat and their health benefits are explained.

Key Words: *Milk, Milkfat, Antioxidant, Lipophilic antioxidant, Health*

Sütün lipofilik antioksidanları ve insan sağlığına yararları

Özet

Süt ve ürünleri insan beslenmesinde en temel gıdalardır. Süt antioksidan bileşiklerce de zengindir. Süt antioksidanları lipofilik ve hidrofilik olmak üzere iki grupta incelenir. Lipofilik süt antioksidanları konjuge linoleik asit (KLA), α -tokoferol, β -karoten, A vitamini, D₃ vitamini ve fosfolipitlerdir. Lipofilik antioksidanların termal stabiliteeleri yüksek olup tüm süt ürünlerinde aktiftirler. Antioksidanlar vücuttaki serbest radikalleri nötralize ederek vücudu hastalıklara karşı korur. Süt tüketimi ile diyetle bağlı hastalıkların insidansı arasındaki negatif ilişki, süt ve süt ürünleri tüketiminin sağlığa çok yararı olduğunu göstermektedir. Süt tüketimi, özellikle yağlı süt ve ürünleri tüketiminin, önemi anlaşılmış ve bu derlemede, süt yağındaki lipofilik antioksidanlar ve sağlığa faydaları açıklanmıştır.

Anahtar Kelimeler: *Süt, Süt yağı, Antioksidan, Lipofilik antioksidan, Sağlık*

1. Giriş

Süt, bileşiminde bulunan laktoz, kalsiyum, fosfor, magnezyum, esansiyel aminoasitler ve yağ asitleri, B₂ vitamini, süt türüne göre A vitamini ve/veya β -karoten, fosfolipitler vb. birçok bileşen ve özelliği nedeniyle mükemmel yakın bir sıvıdır/gıdadır (Çakmakçı, 2016). Sütün önemli bir bileşeni olan süt yağı %96 trigliserit (1 molekül gliserin ve 3 yağ asidi), %2-3 kadar digliseritler, %1 kadar fosfolipitler ve monogliseritler, serbest yağ asitleri ve yağda çözünen maddeler [(kolesterol, yağda çözünen vitaminler (A, D, E, K)] ve karotenoidlerden oluşmaktadır (IDF, 2008). Süt yağı, süt ürünlerine başka hiçbir yağda olmayan hoş bir aroma ve pürüzsüz bir yapı kazandırarak bileşik/bileşendir. Süt, antioksidan etkili bileşikler bakımından zengin olup en önemlileri; konjuge linoleik asit (KLA), α -tokoferol, β -karoten, A vitamini, D₃ vitamini, fosfolipitler, proteinler ve peptidlerdir.

Sütte bulunan antioksidanlar, hem lipofilik (KLA, α -tokoferol, β -karoten, A ve D₃ vitaminleri, koenzim Q₁₀ ve fosfolipitler) hem de hidrofilik antioksidanlar (proteinler, peptitler vb) insan vücudunda prooksidan ve antioksidan dengeleri korumada anahtar rol oynamaktadır. Lipofilik antioksidanlar, yüksek termal stabilite ile karakterize edilir ve tüm süt ürünlerinde aktiftirler. Lipofilik ve hidrofilik antioksidanlar, reaktif oksijen türlerinin ve lipit peroksidasyonunun son ürünlerinin etkisiz hale getirilmesi sürecinde etkileşime girer. Süt tüketimi ile diyetle bağlı hastalıkların oluş sıklığı arasındaki negatif korelasyon, süt ve süt ürünleri tüketiminin sağlık açısından ne kadar yararlı olduğunu doğrulamaktadır (Grażyna *et al.*, 2017). Hücrelerin, dokuların ve organların lipid yapılarında hidrofilik antioksidanlar aktif değildir. Lipofilik ortamda aktif olan süt yağı antioksidanları, oksidatif stresi önlemede savunma sistemini desteklemektedir. Oksidatif stres yaygın olarak Alzheimer hastalığı, Parkinson hastalığı gibi nörodejeneratif hastalıkların patogeneğinde rol oynar. Bu nedenle, A vitamini, karotenoidler, E vitamini, koenzim Q₁₀, dokosaheksaenoik asit ve eikosapentaenoik asit gibi lipofilik antioksidanlar, nörodejeneratif hastalıklar için terapötik ve önleyici olarak artan ilgi görmüştür (Grażyna *et al.*, 2017).

Özellikle yetersiz miktarda lipofilik antioksidan tüketimi kardiyovasküler vakalar, kanser, nörolojik ve nörodejeneratif hastalıkların ana nedenidir (Nicco *et al.*, 2005). Süt yağındaki en aktif antioksidan, konjuge çift bağ ile karakterize edilen sütün benzersiz bir bileşeni olan ve ruminantların etinde de bulunan KLA'dır. Süt yağındaki ana antioksidanların KLA başta olmak üzere A ve E vitaminleri, β -karoten ve koenzim Q₁₀ olduğu, ayrıca D₃ vitamini, fosfolipitler vb. antioksidan özellikleri olduğu belirtilmiştir (Grażyna *et al.*, 2017).

2. Sütün Lipofilik Antioksidanları

Lipofilik süt antioksidanları, yüksek düzeyde termal stabilite ile karakterize edilir ve uygulanan termal işleme yönteminden bağımsız olarak tüm süt ürünlerinde aktif olarak bulunur. Başka hiçbir gıda ürünü, süt yağı kadar faydalı bileşenler içermemektedir. Yağ asitlerinin doğal trans izomerleri (vaccenic asit ve KLA) ruminant (sığır, koyun, keçi) lipidlerinde bulunur ve toplam yağ asitlerinin % 4-6'sını oluşturur (Grażyna *et al.*, 2017). Rumen lipazları tarafından yem trigliseridleri hidroliz olunca *cis* konfüğürasyondaki serbest yağ asitleri serbest kalır ve bakteriler tarafından biyoyararlı formlara dönüştürülür (Wang and Lee, 2015).

Süt yağının antioksidan içeriği, özellikle lipofilik antioksidan içeriği, büyük ölçüde hayvan diyetinin bileşimi ile ilgilidir. Araştırmacılar, yeşil yemle beslenen ineklerin sütündeki β -karoten ve yağda çözünen vitamin içeriğinin, monodietle beslenen ineklerin sütünden 2-4 kat daha yüksek olduğunu tespit etmiştir. İsviçre'de yapılan bir çalışmada, organik tarım sisteminde yetiştirilen süt inekleri ile geleneksel yüksek yem diyeti ile beslenen inekler arasında; organik süt, daha yüksek konsantrasyonlarda dallanmış zincirli PUFA'lar, özellikle de n-3 yağ asitleri ve KLA ile karakterize edilmiştir. Diyetle bağlı metabolik hastalıkların (obezite, tip-2 diyabet, ateroskleroz, kanser, nörolojik ve nörodejeneratif hastalıklar) dünya genelinde artan insidansının uzun süreli lipofilik antioksidan eksikliğine bağlanabileceği belirtilmiştir. Sayılan olumsuzlukların nedenleri olarak; temel olarak düşük süt yağı tüketimi ve süt sığırları işletmelerinde karışık rasyon kullanımı gösterilmiştir (Grażyna *et al.*, 2017).

2.1. Konjuge linoleik asit

Süt yağındaki en aktif antioksidan, konjuge çift bağ ile karakterize edilen KLA'dır. KLA, sütün benzersiz bir bileşeni olup ruminantların etinde de bulunur. KLA'nın biyolojik değeri yüksek izomerleri; *cis*-9, *trans*-11 ve *trans*-10, *cis*-12 KLA'dır (Badr El-Din and Omaye, 2007; Wang and Lee, 2015; Salık ve Çakmakçı, 2021).

Süt ürünleri (toplam tüketimin %70'i) ve sığır eti (toplam tüketim miktarının %25'i) en bol bulunan KLA kaynaklarıdır (Grażyna *et al.*, 2017). Koyun sütünün KLA içeriği inek sütüne göre iki kat daha fazladır. Keçi sütü, inek sütünden daha az miktarda KLA içerir (Tsiplakou *et al.*, 2009). İnek sütü, rumenik asit olarak bilinen *cis*-9, *trans*-11 KLA'nın (%85-90) en iyi kaynağıdır (Grażyna *et al.*, 2017). KLA'nın sağlığa önemli yararları şu şekilde sıralanabilir: yüksek seviyelerde antioksidan aktivite (α -tokoferolden yaklaşık 100 kat daha yüksek; Badr El-Din and Omaye 2007), *in vitro* ve *in vivo* çalışmalar, *cis*-9, *trans*-11 KLA'nın tümör hücrelerinin gelişimini engelleyebileceğini, sklerotik değişiklikleri ve tip-A diyabeti geciktirebileceğini, yağ dokusunu azaltabileceğini, kemik mineralizasyonunu iyileştirebileceğini ve immünostimülatör ve bakteriyostatik etkiler gösterebileceğini göstermiştir (Parodi, 2003). KLA düşük konsantrasyonlarda bile, α -tokoferolden daha etkili bir serbest radikal süpürücüdür ve aktivite seviyeleri, yağ ve yağlı gıdalarda kullanılan sentetik bir antioksidan olan butil hidroksi tolüen (BHT) ile karşılaştırılabilir.

Yüksek düzeyde antioksidan aktivitesi nedeniyle KLA'nın anti-inflamatuar, antisklerotik ve antikanserojenik etkileri vardır (Lee *et al.*, 2009). KLA içeriği zengin olgunlaştırılmış peynirlerin fazla tüketildiği ülkelerde, bu ürünlerin daha az popüler olduğu ülkelere göre meme kanseri ölüm oranlarının daha düşük olduğu belirlenmiştir (Zlatanos *et al.*, 2002; Larsson *et al.*, 2005). Doğal KLA'nın antikanserojenik etkileri sentetik KLA'dan daha yüksektir (Ip *et al.*, 1999).

KLA, bağışıklık sistemi hücrelerinin üretimini artıran ve fagositik aktiviteyi artıran bir bağışıklık uyarıcıdır (Corino *et al.*, 2009; Menon *et al.*, 2010). KLA'nın çok yönlü sağlık yararları vardır ve araşidonik asit dönüşümlerini kontrol ederek iltihabı önler ve yüksek antioksidan aktiviteyi teşvik eder. Bu etkiler ateroskleroz, kanser ve nörolojik bozukluk riskini azaltır. KLA, kan lipid profilinin düzenlenmesinde, hipertrigliseridemi, obezite ve tip-2 diyabetin önlenmesinde önemli bir rol oynar (Grażyna *et al.*, 2017).

Vaksenik asit (*cis* ve *trans* konfüğürasyonlu C18:1 n-7) *cis*-9, *trans*-11 KLA izomerlerinin bir öncüsü olup biyolojik olarak aktif bir hücre zarı lipidi olarak (fosfolipidlerde ve glikolipidlerde bulunur) vücut organlarının ve dokularının bütünlüğü ve işlevinden sorumludur. KLA'ya benzer şekilde, vaksenik asit de antisklerotik ve antikarsinojenik aktivite göstermektedir (Jakobsen *et al.*, 2006).

2.2. E vitamini

Süt E vitamini bakımından zengin bir kaynak değildir. Süt yağının E vitamini (tokoferol) içeriği 5 ila 45 μ g/g yağ arasında değişmekte, vitamin aktivitesinin %90'dan fazlasını α -tokoferol sağlamaktadır (Parodi, 2004). E vitamini, hücre antioksidan savunma sistemindeki başlıca yağda çözünen bileşendir ve yalnızca diyetten elde edilir (Rizvi *et al.*, 2014). Antioksidan aktivitesi nedeniyle vücutta çok sayıda önemli rolü vardır. Oksidasyon, kanser, yaşlanma, artrit ve katarakt dahil olmak üzere çok sayıda olası durum ve hastalıkla bağlantılıdır; E vitamininin bunlara karşı etkili olduğu gösterilmiştir (Rizvi *et al.*, 2014). UHT süt gibi uzun süre depolama sırasında süt ürünlerinin E vitamini içeriğinin azaldığı belirtilmektedir (Michlová *et al.*, 2015). Süt ve süt ürünlerindeki düşük

E vitamini seviyelerine rağmen, E vitamini, süt yağını oksidasyona karşı koruyucu bir antioksidandır (Öztürk ve Çakmakçı, 2006; Rizvi *et al.*, 2014). Sütün E vitamini içeriği yemdeki tokoferol seviyesine bağlıdır. Yeşil yemle beslenen ineklerin sütü, karma rasyonla beslenen ineklerin sütünden çok yüksek miktarda E vitamini içermektedir (Grega *et al.*, 2005). E vitamininin biyolojik aktivitesi sadece α -tokoferolde gözlenmekte, diğer izomerler ise tamamen emilseler bile insan vücudunda aktif α -tokoferol'e dönüşmezler. (Grażyna *et al.*, 2017).

Güçlü bir antioksidan olan E vitamininin eksikliği; yaşlanmayı hızlandırabilir ve ateroskleroz, kardiyovasküler hastalıklar, kanser ve nörodejeneratif hastalık riskini artırabilir (Alzheimer hastalığı, Parkinson hastalığı, amyotrofik lateral skleroz) (Farris and Zhang, 2003; Berman and Brodaty, 2004; Niki, 2014). Sentetik E vitamini, hücre membran yapıları için daha fazla afinitye sahip olduğu ve doğal diyet antioksidanlarını ortadan kaldırdığı için toksik etkiler gösterebilir (Miller *et al.*, 2005).

2.3. β -karoten ve A vitamini

Süt ürünleri, özellikle yağca zengin olanlar, iyi bir β -karoten ve/veya A vitamini kaynaklarıdır. İnek sütünün hem A vitamini hem de β -karoten içerdiği; koyun ve keçi sütlerinin ise A vitamini içerdiği belirlenmiştir (Tahmas Kahyaoğlu ve Çakmakçı, 2018). En yüksek A vitamini seviyesi (0.150-1.5 mg/100 g) olgunlaşmış peynirler ve tereyağında bulunurken, süt, süzme peynir ve yoğurt daha düşük miktarda A vitamini içerir (0.015-0.150 mg/100 g). A vitamini ve β -karoten miktarları sığır diyetine bağlıdır. A vitamini öncülleri, sığır yemi ile sağlanan karotenoidler, özellikle β -karotendir (Tahmas Kahyaoğlu ve Çakmakçı, 2018). Retinal ve retinoik asit, A vitamininin biyolojik olarak başlıca aktif formlarıdır. Retinal görme sağlığına katkıda bulunur. Retinoik asit, epiteli doğrudan etkiler ve mide-bağırsak, idrar, üreme ve solunum sistemlerinde cilt, kornea ve mukoza zarlarını yeniler. Retinoik asit, bağışıklık sistemini ve beyaz kan hücrelerinin üretimini uyarır (Kim, 2011).

Karotenoidlerin ve özellikle β -karoten ve A vitamininin en önemli biyolojik işlevlerinden birisi antioksidan aktivitedir. Bu özellik, LDL (düşük yoğunluklu lipoprotein) fraksiyonunun oksidasyonunu önler ve düşük oksijen basıncı olan dokularda lipid peroksidasyonunu engeller. Karotenoidler, özellikle β -karoten, A, E ve C vitaminlerinden daha etkilidir (Müller *et al.*, 2011; Fiedor and Burda, 2014). Düşük moleküler ağırlıklı antioksidanlar olarak β -karoten ve A vitamini ateroskleroz ve kanseri önleyen önemli gıda bileşenleridir. Antikarsinojenik etkileri, moleküllerinde (özellikle karotenoidlerde) tekli oksijeni emen birçok konjuge çift bağın olmasına atfedilir. Bu, UV radyasyonunun neden olduğu belirli cilt kanseri türlerinin önlenmesinde önemli bir husustur. Tekli oksijeni absorbe etme yetenekleri nedeniyle karotenoidler, DNA'yı oksidasyona karşı etkili bir şekilde korur. A vitamini, özellikle retinoik asit, vücudu kanserin erken evrelerine karşı korurken, β -karoten neoplastik gelişmeyi önler (Paloza *et al.*, 2002; Sharoni *et al.*, 2012; Tanaka *et al.*, 2012).

2.4. D₃ Vitamini

D₃ vitaminin ön maddesi, cilt yüzeyindeki yağ bezleri tarafından salgılanan 7-hidroksikolesteroldür. Deride üretilen kolekalsiferol, kan yoluyla karaciğere ve böbreklere taşınır ve burada 1,25-dihidroksikolekalsiferole dönüştürülür (Zhang and Naughton, 2010).

D₃ vitamini de α -tokoferol, β -karoten ve retinol gibi, sütün enzimatik olmayan antioksidan sisteminin bir parçasıdır. D₃ vitamininin en aktif formu olan 1,25-dihidroksikolekalsiferol, lipid peroksidasyonunu engelleyerek antioksidan etki gösterir (Mutlu *et al.*, 2013; Saedisomeolia *et al.*, 2013). İnek sütünün D₃ vitamini içeriği, yaz aylarında sonbahar ve kış aylarında çok daha yüksektir. Süt yağı, tereyağı, olgunlaşmış peynir, krema D₃ vitamininin iyi kaynaklarıdır (Jakobsen and Saxholt, 2009). İnsan vücudunda D₃ vitamini esas olarak kalsiyum ve fosfor dengesinin düzenlenmesinden sorumludur. D₃ vitamini ince bağırsakta kalsiyum ve fosfor emilimini etkiler ve parathormon ve kalsitonin ile birlikte kemiklerde kalsiyum ve fosforun emilmesinden sorumludur. D₃ vitamini idrarla atılan kalsiyum ve fosfor miktarını azaltır, bu da kemiklerin ve dişlerin sağlıklı mineralizasyonunu destekler (Zhang and Naughton, 2010; Hossein-nezhad and Holick, 2013). D₃ vitamini paratiroid bezlerinin ve böbreklerin sağlıklı çalışması için gereklidir. Epidemiyolojik araştırmalara göre kolorektal, yumurtalık, meme ve prostat kanseri prevalansı, kan serumundaki D₃ vitamini konsantrasyonu ile ters orantılıdır (Zhang and Naughton, 2010). Güneş ışığına daha az maruz kalan bölgelerde multipl skleroz ve romatoid artrit prevalansı daha yüksek bulunmuştur (Grażyna *et al.*, 2017).

2.5. Koenzim Q₁₀

Süt yağı az miktarda koenzim Q₁₀ içerir. Koenzim Q₁₀, elektron taşıma zincirindeki elektronları taşır ve hücrelerde ve dokularda enerji verimliliğini artıran ATP sentezine katılır. Kalp kası koenzim Q₁₀ eksikliğine çok duyarlıdır (Bank *et al.*, 2011). Koenzim Q₁₀ oldukça aktif bir antioksidan olup indirgenmiş formu, hücre zarlarını ve LDL'leri peroksidasyona karşı α -tokoferol ve β -karotenden daha iyi korur (Borekova *et al.*, 2008).

3. Süt Yağı Globül Membranı

Süt yağ globül zarında bulunan fosfolipidler, sfingolipidler, kolesterol ve proteinlerin sağlığa önemli faydaları vardır. Süt fosfolipidleri olarak fosfatidilkolin (lesitin), sefalin, sfingomiyelin, fosfatidilinositol, fosfatidilserin sayılabilir (IDF, 2008; Lopez *et al.*, 2010; Metin, 2015).

Fosfolipidlerin doymamış yağ asidi içeriği, trigliseritlere göre daha fazladır. Bu yağ asitleri hücreler ve organlarda metabolik reaksiyonlarda önemli rol oynamaktadır. Doymamış yağ asitleri membranlara likidite ve geçirgenlik kazandırmakta, besin maddelerinin ve metabolitlerin taşınmasını teşvik etmekte ve kolesterol metabolizmasını artırmaktadır (Kelley *et al.*, 2007). Protein sentezine ve hücre yenilenmesine katılmakta ve ATP sentezi için bir fosfat kaynağı olmaktadır (Starks *et al.*, 2008; Schubert *et al.*, 2011). Fosfolipitler çoklu doymamış yağ asitlerini (PUFA) içerir ve katyonları bağlayabilir; dolayısıyla gastrointestinal mukozayı, beyni, karaciğeri, dalak ve böbrekleri serbest radikallerin toksik etkilerine karşı koruyan antioksidanlardır (Spitsberg, 2005). Süt yağı fosfolipidleri, linoleik ve α -linolenik asit içerir (Patterson *et al.*, 2012). Süt fosfolipidleri nöroprotektif etkiler sergiler: beyin aktivitesini kontrol ederler, hafızayı ve strese karşı direnci geliştirirler ve depresyon ve nörodejeneratif hastalık riskini azaltırlar. Süt fosfolipidlerinin baskın fraksiyonları olan fosfatidilkolin (lesitin) ve sfingomiyelin, kolinin tek kaynaklarıdır. Kolin, hücrelerin işlevini ve yapısal bütünlüğünü artırır, sinir sistemini uyarır, hafızayı geliştirir ve yoğun fiziksel aktivite sonrası toparlanmayı hızlandırır (Osella *et al.*, 2008).

Fosfolipid eksikliği ile nörolojik bozukluklar arasında korelasyon olduğu tespit edilmiştir (Oliveira and di Paolo, 2010; Kosicek and Hecimovic, 2013). Sinir sinyal iletiminde anahtar rol oynayan fosfatidilserin, beyin yaşlanmasının önlenmesinde etkilidir. Fosfatidilserin, eksikliği Parkinson hastalığında görülen tirozin hidroksilazı aktive eder (Spitsberg, 2005; Oliveira ve di Paolo, 2010). Fosfolipitler antiviral özelliklere sahiptir ve β -glukuronidazı inhibe ederler. Patojenlerin gelişmesini önleyerek gastrointestinal sistem enfeksiyonlarını önler (Sprong *et al.*, 2002). Sfingomiyelinlerin antikanserojenik özelliği çok sayıda klinik çalışmada ispat edilmiştir (Dillehay *et al.*, 1994; Magnusson and Haraldsson, 2011). Fosfolipidlerin koroner kalp hastalığı, iltihaplanma gibi hastalıklara olumlu etkileri olduğu, bazı ilaçların yan etkilerini azalttığı belirtilmiştir (Grażyna *et al.*, 2017).

4. Sonuç ve öneriler

Sütün, özellikle süt yağının, beslenme ve sağlıkta ne kadar önemli olduğu anlaşılmaktadır. Ancak günümüzde, gerçekçi bir nedeni olmayan, tüketicilerin de yağsız süt ve ürünleri tüketiminin gittikçe arttığı görülmektedir. Özellikle tereyağı ve yağlı süt ürünleri tüketiminin azaltılıp yerine bitkisel yağ ve margarin tüketilmesi nedeniyle beslenmede A, E, D₃ vitaminleri ve KLA, Q₁₀ ve fosfolipit alımı azalmaktadır. Kardiyovasküler, kanser, nörolojik hastalıklar ile obezite ve tip-2 diyabetin ana nedeninin düşük antioksidan tüketimi, özellikle uzun süreli yetersiz lipofilik antioksidan tüketimiyle ilgili olduğu belirtilmektedir. Bu sonuç, çeşitli nedenlere bağlı olarak, az süt yağı tüketimi ve uygun olmayan hayvan besleme rejimlerinden kaynaklanabilir. İnsan sağlığı ve beslenmesi için süt yağı ve yağlı süt ürünleri, dolayısıyla süt tüketimi artırılmalı, bu yönde tüketici bilinçlendirilmelidir.

Determination of the frequency of g.1267 G >A polymorphism in the MC4R gene in Berrichon du Cher Sheep

Deniz Dinçel¹

¹Department of Genetics, Faculty of Veterinary Medicine, Bursa Uludağ University, Bursa, Türkiye

Abstract

Melanocortin 4 receptor (*MCR4*) gene, which has only one exon and is located at chromosome 23 in *Ovis aries*, is known to regulate the Leptin hormone. Leptin is associated with bodyweight control, energy balance, also food intake. Thus, the *MC4R* gene is one of the significant candidates for growth traits in mammals. The *MC4R* gene polymorphisms were studied in Karachai, Tibetan, Hu, Awassi, Arabi, German Merino, and East Friesian sheep breeds, but not in Berrichon Du Cher, especially g.1267 G >A polymorphism up to now. The Berrichon du Cher, a meat sheep breed of France, is raised in a wide geographical area in terms of meat production. The aim of the study was to determine the genotypic frequencies of g.1267 G >A polymorphism in the *MC4R* gene in Berrichon du Cher Sheep. For this aim, the polymorphism of the *MC4R* gene was studied by the PCR-RFLP method in Berrichon sheep (n=44). The genomic DNA was extracted by the phenol-chloroform method from blood samples. After the amplification of PCR products (836 bp) of the *MC4R* gene, they were digested by the NdeI restriction enzyme for genotyping. Then, the RFLP products were separated by agarose gel electrophoresis and displayed by DNR's MiniLumi bio-imaging system. As a result, a single band (836 bp) was observed in all individuals. Therefore, all investigated Berrichon du Cher sheep were found monomorphic for g.1267 G >A polymorphism of *MC4R* gene with GG genotype. As a consequence, this is the first report that presents the G >A polymorphism of the *MC4R* gene in Berrichon Du Cher sheep, to the best of our knowledge. This study contributes to the literature on this aspect. On the other hand, the other mutations or single nucleotide polymorphisms of *MC4R* gene should be researched in further studies.

Key Words: Sheep, polymorphism, growth, PCR-RFLP, *MC4R*, Berrichon

Berrichon Du Cher ırkı koyunlarda MC4R geni g.1267 G >A polimorfizmi sıklığının belirlenmesi

Özet

Ovis aries türü canlılarda 23. kromozomda yer alan ve tek bir ekzona sahip Melanokortin 4 reseptör (*MCR4*) geninin, Leptin hormonunu düzenlediği bilinmektedir. Leptin vücut ağırlığı kontrolü, enerji dengesi ve yem tüketimi ile ilişkilidir. Bu nedenle, *MC4R* geni, memelilerde büyüme özellikleri açısından önemli aday genlerden biridir. *MC4R* gen polimorfizmleri, özellikle de g.1267 G >A polimorfizmi bu güne kadar; Karachai, Tibet, Hu, İvesi, Arap, Alman Merinosu ve Doğu Frizya koyun ırklarında çalışılmış, ancak Berrichon Du Cher 'de, çalışılmamıştır. Fransa'nın etçi koyun ırklarından olan Berrichon du Cher, et üretimi açısından geniş bir coğrafyada yaygın olarak yetiştirilmektedir. Bu çalışmanın amacı; Berrichon du Cher koyunlarında *MC4R* geni g.1267 G >A polimorfizmine ilişkin genotip frekanslarını belirlemektir. Bu amaçla, Berrichon koyunlarında (n=44) *MC4R* gen polimorfizmi PCR-RFLP yöntemi ile incelenmiştir. Genomik DNA, kan örneklerinden fenol-kloroform yöntemiyle izole edilmiştir. *MC4R* genine ait PCR ürünlerinin (836bp) amplifikasyondan sonra, genotiplendirme için *NdeI* restriksiyon enzimi ile kesilmiştir. Sonrasında RFLP ürünleri, agaroz jel elektroforezi ile ayrılarak; DNR MiniLumi biyo-görüntüleme sistemi ile görüntülenmiştir. Sonuç olarak tüm bireylerde tek bir bant (836 bp) gözlenmiştir. Bu nedenle, incelenen tüm Berrichon du Cher koyunları (GG genotipi ile) *MC4R* geni g.1267 G >A polimorfizmi açısından monomorfik bulunmuştur. Sonuç olarak, mevcut çalışma Berrichon Du Cher ırkı koyunlarda *MC4R* geni G >A polimorfizmini sunan ilk çalışmadır. Çalışma bu yönüyle literatüre katkı sağlamaktadır. Diğer yandan, ileride *MC4R* genine ilişkin diğer mutasyonlar veya tek nükleotid polimorfizmler de çalışılmalıdır.

Anahtar Kelimeler: Koyun, polimorfizm, büyüme, PCR-RFLP, *MC4R*, Berrichon

Solid Waste Landfill Site Selection; Konya City Sample

Büşra Altay¹, Zekeriya Can Erbil¹

¹Selçuk University, Architecture and Design Faculty, Department of Landscape Architecture, Konya, Türkiye

*Corresponding Author: busra.altay@selcuk.edu.tr

Abstract

In developing countries, consumption habits have changed with the increase in population, the development of technology and industrialization. For this reason, good management of the increase in the amount of solid waste by municipalities is very important for the health and sustainability of nature. The location of the facility to be established is important for the regular storage and efficient disposal of solid wastes. Site selection of landfill facilities in the 'Site Management and Operation Guide for Landfill Facilities' published by the General Directorate of Environmental Management; The ratio of the volume to the area, the distance to the buildings, the wind direction, the external view (landscape), the effect on the traffic on the side, the profit from the finished facility, and the effect on the water are evaluated under the sub-headings. With the 'Konya Solid Waste Management Project', 'Aslım Sanitary Landfill', which was used until 2017, was closed. Instead, the 'Konya Solid Waste Landfill Site', which was established in a different region to meet the need, was put into operation. In the study to be carried out in this context; Both fields were evaluated according to the specified criteria and compared with each other using the Analytical Hierarchy Method. As a result, it is aimed that the success rate of the location selection of the new solid waste storage area will be revealed and it will be a base for similar studies to be done in the future.

Key Words: *Solid waste storage, site selection, Konya*

Katı Atık Düzenli Depolama Sahası Yer Seçimi; Konya Kenti Örneği

Özet

Hızla gelişmekte olan ülkelerde artan nüfus miktarı, gelişen teknoloji alternatifleri ve sanayileşme ile birlikte tüketim alışkanlıkları da değişmiştir. Bu nedenle katı atık miktarında meydana gelen artışların belediyelerce iyi yönetilmesi, canlılarla birlikte içerisinde bulundukları doğanın sağlığı ve sürdürülebilirliği için şarttır. Katı atıkların düzenli depolanması ve verimli bir şekilde bertaraf edilmesi için kurulacak olan tesisin konumu öncelikli öneme sahiptir. Çevre, Şehircilik ve İklim Değişikliği Bakanlığı, Çevre Yönetimi Genel Müdürlüğü tarafından yayımlanan Düzenli Depolama Tesisleri Saha Yönetimi ve İşletme Kılavuzu'nda düzenli depolama tesisleri yer seçimi; hacmin alana oranı, yapılara olan uzaklık, rüzgâr istikameti, dış görünüş (manzara), yandaki trafiğe tesiri, bitmiş tesisten kazanç, suya tesiri alt başlıklarında değerlendirilmeye alınmaktadır. 'Konya Katı Atık Yönetimi Projesi' ile 2017 yılına kadar kullanılan Aslım Düzenli Depolama Sahası'nın kapatılıp, ihtiyacı karşılamak üzere farklı bir bölgede kurulan 'Konya Katı Atık Düzenli Depolama Sahası' faaliyete geçirilmiştir. Bu kapsamda yapılacak olan çalışmada her iki saha belirtilen kriterlere göre değerlendirilerek, Analitik Hiyerarşi Yöntemi ile birbirleriyle karşılaştırılmıştır. Sonuç olarak yeni katı atık depolama alanının yer seçiminin başarı oranı ortaya konularak daha sonra yapılacak benzer çalışmalara altlık olması hedeflenmektedir.

Anahtar Kelimeler: *Katı atık depolama, yer seçimi, Konya*

Testing the Biological Control Potentials of Fungi Associated Within Potato Crop in Higher Lands of Rwanda

Ismael Niyokwizigirwa

University of Rwanda, College of Agriculture, Animal Sciences and Veterinary Medicine, Rwanda

Abstract

The potato grows well in the highlands of northwestern Rwanda, and it is the country's main food reservoir. Currently, potato faces many pests and diseases in Rwanda. To control these diseases, farmers rely on the overuse of chemical pesticides, which have negative impacts on people and the environment. The aim of the current study was to investigate the potential of potato-associated fungi as biological control agents against major potato diseases. To this end, nine potato farms in each of the three major potato growing districts of Burera, Musanze and Nyabihu, were selected to collect potato diseased samples. In the laboratory, 17 fungal isolates were found in potato farms with the genera *Alternaria* spp. (11.76%), *Aspergillus* spp. (23.53%), *Colletotrichum* spp. (11.76%), *Fusarium* spp. (11.76%), *Penicillium* spp. (11.76%), *Phytophthora* spp. (17.65%) and unknown genera (11.76%). In testing the potential of biological control, *Aspergillus* species, many from soil, were found to be highly inhibitory to the growth of *Phytophthora* spp. with 66%, *Colletotrichum* species from stems and tubers controlled the growth of *Fusarium* spp. at 68.7%. From all these findings, it is recommended that further studies to be conducted to explore potato diseases in other areas of Rwanda and to model plant disease dynamics for predictions. In addition, continued testing of the isolates from this study for biological control agents and their molecular levels is highly encouraged.

Determination of Some Virus Diseases Infecting *Dahlia* Species Grown for Landscape Purposes in Konya Province Parks and Home Gardens by Serological Methods

Serkan Yeşil^{1*}

¹ Selçuk University, Faculty of Agriculture, Department of Plant Protection

* Corresponding author: serkanyesil@selcuk.edu.tr

Abstract

Dahlias (*Dahlia* spp.), which are members of the *Asteraceae* family, are named as “star flower” in Turkish. Around 30 species of this genus have been identified in the world, and it is known that these species have around 20.000 varieties. They are especially preferred in home gardens and landscaping areas due to the covering feature of the plant habitus and huge variation in colours, sizes, and shapes of flowers. In addition, the fact that it can bloom from summer to late autumn and can be used as a cut flower causes an increase in the interest in this genus. There are many biotic and abiotic factors that can cause negative effects on yield and quality in *Dahlia* cultivation. Virus diseases also have an important place among these factors. In this study, it was aimed to reveal some viruses that are a problem in *Dahlia* plants grown for ornamental plants in parks and home gardens in Selçuklu, Karatay and Meram districts of Konya. For this reason, in the 2019 summer, leaf samples were taken from 152 *Dahlia* plants showing symptoms similar to virus disease symptoms such as mosaic, deformations, yellowing, blight on the leaves and stunted plants. Possible infections of *Cucumber mosaic virus* (CMV), *Tomato spotted-wilt virus* (TSWV) and *Impatiens necrotic spot virus*, (INSV) on these leaves were tested by serological-based DAS-ELISA (Double Antibody Sandwich- Enzyme Linked Immuno Sorbent Assay) method. According to DAS-ELISA results, it was determined that 46,71% of the samples were infected with at least one of these three viruses. In addition, TSWV was detected as the most common virus with a 38,82% relative incidence in the samples, followed by CMV (27,63%). Mixed infections of the viruses were also detected in the leaf samples tested. As a result of the tests, only CMV + TSWV double infection was detected in a total of 30 samples. On the other hand, INSV infection was not detected in any of the leaf samples tested. As a result of survey studies, the average of prevalence rate of virus diseases in *Dahlia* plants grown in Konya was calculated as 69.56%. Moreover, it was determined that virus diseases were most common in Selçuklu district (75,47%). This is the first report of CMV and TSWV on *Dahlia* spp. in Türkiye.

Key Words: CMV, *Dahlia* spp., DAS-ELISA, Konya, TSWV

Konya İli Park ve Ev Bahçelerinde Peyzaj Amaçlı Yetiştirilen *Dahlia* Türlerinde Enfeksiyon Yapan Bazı Virüs Hastalıklarının Serolojik Yöntemlerle Belirlenmesi

Özet

Asteraceae familyasına bağlı olan *Dahlia* türleri dilimizde yıldız çiçeği olarak isimlendirilmişlerdir. Dünya’da bu cinse ait 30 kadar tür belirlenmiş olup, ayrıca bu türlerin 20.000 civarında çeşide sahip olduğu bilinmektedir. Bitki habitusunun örtücü özellikte olması, boylanabilmesi ve iri, gösterişli ve renk çeşitliliğine sahip çiçeklerinden dolayı özellikle ev bahçeleri ve peyzaj alanlarında tercih edilmektedirler. Bunun yanında, yaz aylarından başlamak üzere sonbaharın sonlarına kadar çiçek açabilmesi ve kesme çiçek olarak ta kullanılabilmesi bu cinse olan ilginin artmasına sebep olmaktadır. *Dahlia* yetiştiriciliğinde verim ve kalite üzerinde olumsuzluklara sebep olabilen birçok biyotik ve abiyotik etken bulunmaktadır. Virüs hastalıkları da bu etkenler arasında önemli bir yere sahiptir. Bu çalışmada, Konya ilinin Selçuklu, Karatay ve Meram ilçelerindeki park ve ev bahçelerinde süs bitkisi amaçlı yetiştirilen *Dahlia* bitkilerinde sorun olan bazı virüslerin ortaya konulması amaçlanmıştır. Bu sebeple, 2019 üretim sezonunda surveyler gerçekleştirilerek yapraklarda mozaik, şekil bozuklukları, sararmalar, yanıklıklar, bitkilerde bodurluk gibi virüs hastalık belirtilerine benzer belirtiler gösteren 152 *Dahlia* bitkilerinden yaprak örnekleri alınmıştır. Bu yapraklardaki olası Hıyar mozaik virüsü (*Cucumber mosaic virus*, CMV), Domates lekeli solgunluk virüsü (*Tomato spotted-wilt virus*, TSWV) ve Camgüzeli nekrotik leke virüsü (*Impatiens necrotic spot virus*, INSV) enfeksiyonları serolojik test yöntemlerinden DAS-ELISA (Double Antibody Sandwich-Enzyme Linked Immuno Sorbent Assay) testi ile araştırılmıştır. DAS-ELISA sonuçlarına göre örneklerin % 46,71’inin bu üç virüsten en az bir tanesi ile bulaşık olduğu belirlenmiştir. Ayrıca, TSWV örneklerde % 38,82’lik bulaşıklık oranı ile en yaygın virüs olarak tespit edilirken, bu virüsü CMV (% 27,63) takip etmiştir. Testlenen yaprak örneklerinde söz konusu virüslerin karışık enfeksiyonları da belirlenmiştir. Testlemeler sonucunda sadece CMV + TSWV ikili enfeksiyonu toplam 30 örnekte tespit edilmiştir. Bununla birlikte testlenen hiçbir yaprak örneğinde INSV enfeksiyonu belirlenmemiştir. Survey çalışmaları neticesinde, Konya ilinde yetiştirilen *Dahlia* bitkilerindeki virüs hastalıklarının yaygınlık oranı % 69,56 olarak hesaplanmıştır. Ayrıca, virüs hastalıklarının Selçuklu ilçesinde (% 75,47) en yaygın olarak görüldüğü belirlenmiştir. Gerçekleştirilen bu çalışma ile CMV ve TSWV enfeksiyonları *Dahlia* spp.’de Türkiye için ilk kez belirlenmişlerdir.

Anahtar Kelimeler: CMV, *Dahlia* spp., DAS-ELISA, Konya, TSWV

Some Bioactive Properties of Tea Waste

Büşra Sena Savaş¹, Şebnem Şimşek²

¹Food Engineering Department, Engineering Faculty, Ege University, İzmir, Turkey

²Food Engineering Department, Engineering Faculty, Ege University, İzmir, Turkey

Abstract

Tea is one of the most consumed beverages in Turkey, and the processing and consumption of tea generates a considerable amount of waste. Tea waste is a lignocellulosic biomass with high content of cellulose, hemicellulose, lignin, proteins, polyphenols, and tannins. In this study, black tea waste generated after brewing was studied for its total phenolic and protein content and *in vitro* protein digestibility. The total phenolic content was determined by the Folin-Ciocalteu method. Protein digestibility was assessed by quantifying total nitrogen using the Kjeldahl method after *in vitro* digestion with the Infogest protocol. It was found that tea waste contains phenolic compounds and these compounds mainly consist of bound forms (43.2 ± 0.7 mg GAE/g). The free soluble phenolics content was 4.07 ± 0.5 mg GAE/g, with about 50% of this amount consisting of tannins (2.29 ± 0.5 mg GAE/g). The protein content of the tea waste was 22%, suggesting that tea waste is a promising source of protein recovery. Nevertheless, it should be noted that only 12% of the protein content was found to be digestible. The results suggest that tea waste has considerable potential for use as a protein- and phenolic-rich functional ingredient in the formulation of functional foods.

Key Words: *in vitro* protein digestibility, phenolic content, tea waste

Çay Atığının Bazı Biyoaktif Özellikleri

Özet

Çay, Türkiye'de en çok tüketilen içeceklerden birisi olup işlenmesi ve tüketimi sırasında önemli miktarda atık oluşmaktadır. Çay atığı, yüksek oranda selüloz, hemiselüloz, lignin, protein, polifenoller ve tanen içeriğine sahip lignoselülozik bir biyokütledir. Bu çalışmada, demleme sonrası oluşan siyah çay atığının toplam fenolik madde ve protein içeriği ile *in vitro* protein sindirilirliği incelenmiştir. Toplam fenolik madde içeriği Folin-Ciocalteu yöntemi ile belirlenmiştir. Protein sindirilirliği ise Infogest protokolüne göre uygulanan *in vitro* sindirim sonrası toplam azot içeriğinin Kjeldahl yöntemiyle belirlenmesine dayalı olarak saptanmıştır. Çay atığının fenolik bileşikler içerdiği ve bu bileşiklerin temel olarak bağlı formlardan (43.2 ± 0.7 mg GAE/g) oluştuğu görülmüştür. Serbest çözünür fenolik madde içeriği 4.07 ± 0.5 mg GAE/g olarak saptanmış ve bu miktarın yaklaşık %50'sinin tanenlerden (2.29 ± 0.5 mg GAE/g) oluştuğu belirlenmiştir. Çay atığının protein içeriği %22'dir ve bu sonuç çay atığının protein geri kazanımı için umut verici bir kaynak olduğunu göstermektedir. Yüksek protein içeriğine sahip olmasına rağmen, proteinin sadece %12'sinin sindirilebilir olduğu saptanmıştır. Çalışma sonuçları, çay atığının, fonksiyonel gıdaların formülasyonuna fayda sağlayabilecek protein ve fenolik madde bakımından zengin fonksiyonel bileşen olarak kullanım için yüksek bir potansiyele sahip olduğunu göstermektedir.

Anahtar Kelimeler: *in vitro* protein sindirilirliği, fenolik içeriği, çay atığı

Applications of Organomineral and Chemical Fertilizers in Strawberry Production Effects on Plant Growth

Hülya Saygı¹

¹Department of Plant and Animal Production, Yumurtalık Vocational School, Çukurova University, Adana, Türkiye

Abstract

Strawberry (*Fragaria x ananassa* Duch.), which is widely grown all over the world, can be consumed fresh and processed and suitable for family business, is one of the commercially important fruit species with increasing production. This study was carried out to determine the effects of some organomineral fertilizers on the vegetative growth and fruit quality of strawberry plants under greenhouse conditions. The study was carried out in an unheated glass greenhouse in Çukurova University Yumurtalık Vocational School Research and Application Field between 2019-2021. In the study, 'Albion' cultivar, which is a day-neutral cultivar as plant material, was carried out as organomineral fertilizer in Trial, Random Blocks Trial Design with 4 replications. Research application pattern 1) Control 0 kg/ha without fertilizer, 2) 30 kg/ha Agrotolia® 15.15.15+15 + SO₃ + 15 + OM + 1 Zn+1 Fe organomineral fertilizer, 3) 30 kg/ha Agrotolia®10.25. 10+(15 SO₃)+1 Zn organomineral fertilizer, 4) 30 kg/da Agrotolia® NPK+S+Humic Acid + 15 OM organomineral fertilizer, 5) Agrohüm 30 kg/da inorganic compound fertilizer and 6) 30 kg/ha Azurite 6 different application patterns of chemical fertilizers were created. In order to determine the effects of the applications on the vegetative development of the plants throughout the experiment, stem diameter, plant height, leaf number measurements and fruit quality analyzes throughout the season (fruit weight, fruit diameter, ŞÇKM, pH, titratable acid values) were made at weekly intervals. The mean values of the measurements made at the end of the study were evaluated statistically. When the results of the applications were compared with the control plots, statistically significant differences were detected and it was concluded that compost-containing organomineral fertilizer applications can be recommended in strawberry cultivation.

Çilek Üretiminde Organomineral ve Kimyasal Gübre Uygulamalarının Bitki Gelişimi Üzerine Etkileri

Özet

Tüm dünyada yaygın olarak yetiştirilen, taze ve işlenmiş olarak tüketilebilen ve aile işletmeciliğine de uygun olan çilek (*Fragaria x ananassa* Duch.) ticari açıdan önemli ve üretimi artan meyve türlerinden birisidir. Bu çalışma örtüaltı koşullarında bazı organomineral içerikli gübrelerin çilek bitkisinin vegetatif gelişimi ve meyve kalitesi üzerine olan etkilerini belirleyebilmek amacıyla yürütülmüştür. Çalışma 2019-2021 yılları arasında, Çukurova Üniversitesi Yumurtalık Meslek Yüksekokulu Araştırma ve Uygulama Arazisinde ısıtmasız cam serada gerçekleştirilmiştir. Çalışmada bitkisel materyal olarak gün nötr bir çeşit olan 'Albion' çeşidi, organomineral gübre olarak Deneme, Tesadüf Blokları Deneme Desenine göre 4 tekerrürlü olarak yürütülmüştür. Araştırma uygulama deseni 1) Kontrol 0 kg/ha gübresiz, 2) 30 kg/da Agrotolia® 15.15.15+15 + SO₃ + 15 + OM + 1 Zn+1 Fe organomineral gübre, 3) 30 kg/da Agrotolia®10.25.10+(15 SO₃)+1 Zn organomineral gübre, 4) 30 kg/da Agrotolia® NPK+S+Humik Asit + 15 OM organomineral gübre, 5) Agrohüm 30 kg/da inorganik kompoze gübre ve 6) 30 kg/da Azurit kimyasal gübre 6 farklı uygulama deseni oluşturulmuştur. Deneme boyunca uygulamaların bitkilerin vejetatif gelişimine olan etkilerini tayin edebilmek amacıyla haftalık aralıklarla bitkilerde gövde çapı, bitki boyu, yaprak sayısı ölçümleri, sezon boyunca meyve kalite analizleri (meyve ağırlığı, meyve çapı, ŞÇKM, pH, titre edilebilir asit değerleri) yapılmıştır. Çalışma sonunda yapılan ölçümlerin ortalama değerleri istatistiksel olarak değerlendirilmiştir. Uygulamalara ait sonuçlar kontrol parselleri ile kıyaslandığında istatistiksel anlamda önemli düzeyde farklılıklar tespit edilmiş ve kompost içerikli organomineral gübre uygulamalarının çilek yetiştiriciliğinde tavsiye edilebileceği sonucuna varılmıştır.

Anahtar Kelimeler: Albion 1, organomineral gübre 2, Üzümsü Meyveler 3, Örtüaltı 4 Bitki Besleme

Giriş

Çilek iştah açıcı tat ve aroması ile yılın her döneminde tüketilebilen ve yoğun bir talebi olan meyvedir. Bu özelliği ile önemli bir gelir kaynağı olarak çileğin yetiştiriciliği küçük, orta ve büyük her düzeydeki tarım işletmesi için uygundur. Çilek çoğunlukla taze olarak tüketilmekle birlikte farklı gıda sanayi kollarında meyve suyu, marmelat, reçel, ve pasta gibi ürünlerin üretiminde girdi olarak değerlendirilmesi çileğe olan talebi arttırmıştır. Bu faydaları yanında günlük beslenme diyetlerinin önemli bir unsuru olan antioksidanların alımı açısından çilek önemli bir kaynaktır (Wang, 2014; Giampieri ve ark., 2014).

Ekonomik değeri yüksek olan çilek 8.861.381 tonluk üretim miktarı ile dünyada en çok yetiştirilen üzüksü meyvelerden biridir (FAO, 2020). Ülkemizde 2020 yılı verilerine göre 179.780 da alanda 546.525 tonluk çilek

üretimi yapılmış ve ortalama verim 3,04 ton/da olarak gerçekleşmiştir (FAO, 2020). Bu veriler, Ülkemizin çilek üretiminde istenilen verimlilik seviyesine ulaşamadığını kanıtlamaktadır.

Çilek yetiştiriciliğinde verimlilik ve meyve kalitesi çok önemli iki unsurdur. Çilekte meyve kalitesini etkileyen başlıca unsur çeşitlerin genetik özellikleri kabul edilmekle birlikte meyvenin kalite özellikleri, (tat, koku, meyve büyüklüğü vb.), bitki büyümesi ve gelişmesi üzerinde yetiştiricilik koşulları da etki etmektedir (Kays, 1999). Verimlilik artışı ve meyve kalitesini sağlamak için dengeli bir gübreleme yapılmalıdır. Ancak aşırı ve yanlış gübreleme toprakların tuzluluğunun artmasına neden olmakta, toprağın fiziksel, kimyasal ve biyolojik aktivitesini üzerine olumsuz yönde etkilemektedir. Yapılan yanlış uygulamalar insan ve hayvan sağlığını olumsuz etkilemektedir. Kimyasal gübreler yoğun kullanımı bu olumsuz etkilerin başında yer almaktadır. Kimyasal gübreler yüksek verim ve üretim miktarında artış sağlarken, toprakların yapısını bozarak verimlilikte önemli olan organik madde miktarını azaltmaktadır (Singh, 2018). Son zamanlarda dünya nüfusunun artmasına paralel olarak kimyasal gübre kullanımı da artmıştır. Kimyasal gübrelerin bilinçsizce kullanımının neden olduğu problemlerin, insan sağlığı ve çevre üzerindeki olumsuz etkilerinin anlaşılması, sürdürülebilir tarımsal üretim için yoğun uygulamaların yapıldığı tarım alanlarında alternatif bitki besleme uygulamalarının araştırılmasına neden olmuştur (Nicolopoulou-Stamati ve ark., 2016).

Toprak verimliliğini ve organik madde miktarını yükseltmek için organik atıkların kullanılması büyük önem taşımaktadır (Goss ve ark., 2013). Toprakta organik madde miktarının artırılması ve kültür bitkilerinin gelişimleri için gerekli olan besin maddelerinin karşılanması bakımından organomineral gübreler, sürdürülebilir tarım uygulamaları için alternatif olarak görülmektedir. Bu sebeple insanların ve çevrenin sağlığını korumak, toprakların sürdürülebilir verimliliğini sağlamak, topraktaki organik madde miktarını artırmak, ürünlerde verimliliği ve kaliteyi yükseltmek amacıyla alternatif üretim sistemleri geliştirilmeye çalışılmıştır (Bettiol ve ark. 2004). Üretimde kullanılan gübrelerin genellikle yavaş salınımlı olması, içeriğinde bulunan besin maddelerinin dağılımının değişken yapıda olması sebebiyle organik gübreler birbirinden farklı olabiliyor. Organomineral gübreler ise farklı olarak kimyasal gübre içeriğinde bulunan besin maddeleri ile organik madde birlikte bulunduğundan besin maddesi içerikleri daha standart halde bitkiye verilebilmektedir.

Bu çalışmanın amacı çilek yetiştiriciliğinde farklı organomineral ve kimyasal gübrelerin meyve verimi, kalitesi ve besin maddesi alımı üzerine olan etkilerini belirlemektir.

Materyal ve Yöntem

Çalışma; Adana ili Yumurtalık ilçesinde 2019-2021 yılları arasında yürütülmüştür. Yumurtalık ilçesi; Adana iline 80 km uzaklıkta, deniz seviyesinde olan Çukurova Üniversitesi Yumurtalık Meslek Yüksekokulu Araştırma ve Uygulama Arazisi'nde (36.75° kuzey enlem, 35.71° Doğu meridyen") yürütülmüştür. Denemede bitkisel materyal olarak "Albion" çilek çeşidi kullanılmıştır. "Albion" Kaliforniya üniversitesi tarafından 1999'da ıslah edilen bir çeşit olup Diamante x Cal 94.16-1 arasındaki çaprazlamadan selekte edilmiştir. Nötr gün bir çeşittir. Fenotipik özellikleri yetiştirme koşullarına göre değişiklik gösterebilmektedir (Shaw ve Larson, 2009). Deneme alanı, genişliği 75 cm ve yüksekliği 20-25 cm olan siyah polietilenle kaplı masuralar üzerine 30x30 cm aralıklar ile 28.09.2019 tarihinde yaz dikim yöntemiyle dikilmiştir.

Araştırmanın yürütüldüğü alandan 0-30 cm derinliğinden alınan toprak örneğinin kimyasal özellikleri Çizelge 1'de verilmiştir. Deneme alanına ait toprağın yapısı killi tınlı, kireçli (30.2) ve organik madde miktarı 1.82 toprak yapısına sahiptir

Çizelge 1. Deneme alanına ait toprağın bazı kimyasal özellikleri.

Yıl	pH	N (%)	P (mgkg ⁻¹)	K (mgkg ⁻¹)	Ca (mgkg ⁻¹)	Mg (mgkg ⁻¹)	Mn (mgkg ⁻¹)	Cu (mgkg ⁻¹)	Fe (mgkg ⁻¹)
2019-2021	7.42	0.18	1.58	170	4395	642	1.96	0.90	1.85

Denemenin başlangıcından itibaren bitkilere kültürel işlemler uygulanmış, gerekli hastalık ve zararlı kontrolleri yapılmış, denemenin sağlıklı bir şekilde yürütülmesi sağlanmıştır. Deneme, Tesadüf Blokları Deneme Desenine göre 4 tekerrürlü olarak yürütülmüştür. Araştırmada 6 farklı uygulama konusu; 1) Kontrol 0 kg/ha gübresiz, 2) 30 kg/da Agrotolia® 15.15.15+15 + SO₃ + 15 + OM + 1 Zn+1 Fe organomineral gübre, 3) 30 kg/da Agrotolia®10.25.10+(15 SO₃)+1 Zn organomineral gübre, 4) 30 kg/da Agrotolia® NPK+S+Humik Asit + 15 OM organomineral gübre, 5) Agrohum 30 kg/da inorganik kompoze gübre ve 6) 30 kg/da Azurit kimyasal gübre uygulamaları değerlendirilmiştir. Çilek dikiminden önce sonbaharda, kontrol parselleri hariç konulara göre farklı organomineral ve kimyasal gübreler ilgili her parselin yüzeyine deneme desenine göre dekara 30 kg doz hesabıyla homojen bir biçimde elle uygulanmış ve toprakla iyice karıştırılmıştır.

Araştırma kapsamında farklı gübrelerin etkilerini belirlemek amacıyla; yetiştirme sezonu boyunca bitkilerde ayda dört kez olmak üzere bitki boyu, gövde çapı ve yaprak sayısı ölçümleri yapılmıştır. Ayrıca yetiştirme sezonunda toplamda dört kez hasat edilen meyvelerde meyve kalite kriterlerinden, meyve ağırlığı, meyve eni, suda çözünabilir kuru madde oranı (SÇKM), titre edilebilir asit oranı (TAA) ve pH tayini yapılmıştır. Her bir tekerrürden elde edilen 10 adet meyvede hassas terazi ile meyve ağırlığı ve dijital kumpas ile meyve eni belirlendikten sonra örnekler homojenize edilerek, dijital refraktometre ile SÇKM değeri ayrıca pH metre ile pH değeri belirlenmiştir. TA

ölçümleri için her bir tekerrürde elde edilen meyve suyundan 10 ml alınmış, üzerine 10 ml saf su ilave edilerek pH 8.1 değerine ulaşana kadar 0.1 N sodyum hidroksit (NaOH) ile titrasyonda harcanan NaOH miktarı esas alınarak g malik asit 100 mL⁻¹olarak ifade edilmiştir.

Çalışma sonucunda elde edilen verilere varyans analizleri, SPSS 23 paket programında, değerlendirilmiş olup, ortalamalar arasındaki fark p<0,05 önem seviyesinde verilmiştir.

Bulgular ve Tartışma

Çalışma süresince değerlendirilen ‘Albion’ çilek çeşidine farklı mikrobiyal gübreuygulamalarının yetiştirme sezonu boyunca bitki boyu, gövde çapı ve yaprak sayısı üzerine etkileri Şekil 1. Şekil 2. ve Şekil 3.’de sunulmuştur. İncelenen parametrelerden bitki boyu üzerine yapılan uygulamaların etkilerinin değerlendirildiği Şekil 1’de görüldüğü gibi tüm ölçümlerde uygulamaların bitki boyu üzerine olan etkileri arasında istatistiksel anlamda farklılıklar belirlenmiştir. Ekim (14,10 cm), kasım (14,82 cm) ve aralık (16,20 cm) ayı boyunca yapılan ölçümlerde SimBacil uygulaması en yüksek bitki boyu sonucunu verirken ocak ayında OrgaStar uygulamasından diğer uygulamalara kıyasla daha yüksek ortalama bitki boyu değeri (21,30 cm) elde edilmiştir. Yapılan tüm ölçümlerde en düşük bitki boyu ortalama değeri kontrol uygulamasında tayin edilmiştir (Şekil 1). Aras (2009), benzer şekilde organik madde içerikli ticari gübrelerin, bitki boyu üzerine etkisinin önemli olduğunu, Camarosa çilek çeşidinde bitki boyu üzerine en olumlu etkinin 29,64 cm ile Nidoplant isimli preparattan elde edildiğini en düşük değerlerin ise Nidominhumat (27,0 cm) ve Kontrol (26,7 cm) uygulamalarından elde edildiğini bildirmiştir.

Çizelge 2. Uygulamaların Bitki Gelişimine etkisi

Doz (ton/da)	Gövde Sayısı (adet)	Yaprak sayısı (adet)	Bitki Boyu (cm/bitki)	Bitki Eni (cm/bitki)	Yaprak Alanı (cm ²)
Kontrol	3.75c	82.88c	25.96c	13.90c	47.86c
N:%20+NO ₃ -N:%5+NH ₄ -N:%5+Üre:%10	4.63bc	84.65bc	27.17bc	16.75b	54.11bc
Hümk+Fülvik Asit:%10+ K ₂ O:%2+OM:%20	4.88bc	102.00ab	31.30ab	16.88b	59.17ab
Agrotolia® NPK+S+Humik Asit + 15 OM	5.00ab	106.00a	31.57ab	18.63ab	61.52ab
Agrotolia® Hümk+Fülvik Asit:%10+ K ₂ O:%2+OM:%20	5.75ab	107.13a	31.77ab	18.83ab	62.77ab
Agrotolia® Hümk+Fülvik Asit:%40+ K ₂ O:%2+OM:%30	6.13a	107.50a	33.17a	20.08a	65.81a

Aynı sütunda yer alan farklı harfler P < 0.05 önem seviyesinde farklı bulunmuştur.

Gübre uygulamalarının ortalama meyve ağırlığına olan etkisi değerlendirildiğinde, Agrotolia® Hümk+Fülvik Asit:%40+ K₂O:%2+OM:%30 (17.00 g/meyve), Agrotolia® Hümk+Fülvik Asit:%10+ K₂O:%2+OM:%20 (14.92 g/meyve), Agrotolia® NPK+S+Humik Asit + 15 OM (13.86 g/meyve) uygulamaları, Hümk+Fülvik Asit:%10+ K₂O:%2+OM:%20 (12.62 g/meyve), N:%20+NO₃-N:%5+NH₄-N:%5+Üre:%10 (12.62 g/meyve) ve kontrol (10.24 g/ meyve) arasında istatistiksel anlamda önemli düzeyde fark tayin edilmiştir (Çizelge 3). En yüksek ortalama meyve ağırlığı değeri organomineral gübre uygulamaları arasında Agrotolia® Hümk+Fülvik Asit:%40+ K₂O:%2+OM:%30 uygulamasında belirlenmiş en düşük değer ise kontrol uygulamasında belirlenmiştir (Çizelge 3). Albion çilek çeşidinin ortalama meyve ağırlığı değerleri ise çeşitli çalışmalarda 23,1 g/meyve (Çekiç ve Aksu, 2012), 16.15 –18.81 (Ateş, 2015) aralığında bildirilmektedir. Bu değerler bizim çalışmamızdan elde edilen değerler ile örtüşmektedir.

Farklı gübre uygulamalarının meyvelerin meyve eni, SÇKM ve TAA oranına olan etkisi önemli olurken; pH üzerine etkisi olmamıştır (Çizelge 3). Bu veriler incelendiğinde en yüksek meyve eni Agrotolia® Hümk+Fülvik Asit:%40+ K₂O:%2+OM:%30 (33.75 cm) organomineral gübre uygulamasından alınırken, en düşük değer kontrol uygulamasından (12.00 cm) alınmıştır. Uygulamaların SÇKM üzerine olan etkisi değerlendirildiğinde Agrotolia® Hümk+Fülvik Asit:%40+ K₂O:%2+OM:%30 (%8.77), Agrotolia® Hümk+Fülvik Asit:%10+ K₂O:%2+OM:%20 (%8.63), Agrotolia® NPK+S+Humik Asit + 15 OM (% 8.53), Hümk+Fülvik Asit:%10+ K₂O:%2+OM:%20 (%8.16) ve N:%20+NO₃-N:%5+NH₄-N:%5+Üre:%10 (%7.87) uygulamalarından elde edilen ortalama SÇKM değerlerinin istatistiksel anlamda kontrol (% 7.65) uygulamasından farklı olduğu görülmektedir. TAA değerleri incelendiğinde en yüksek ortalama TAA değerinin Agrotolia® Hümk+Fülvik Asit:%40+ K₂O:%2+OM:%30 (%1.16)) uygulamasında en düşük ise %0.18 ile kontrol uygulamasında belirlendiği görülmektedir (Çizelge 3). Çileklerde kabul edilebilir bir lezzet için SÇKM değerinin en az % 7 olması gerektiği vurgulanmıştır (Mitcham ve ark, 1996). Galletta ve ark (1995), çeşide bağlı olarak SÇKM değerlerinin % 7 - % 12 arasında değiştiğini belirlemişlerdir. Bildirilen bu değerler bu çalışmadan elde edilen verilere yakın değerler sergilemektedir. Meyvelerde yeme kalitesini etkileyen parametre ise, meyve suyunda belirlenen asit miktarıdır. Gidemem (2003) %0.67; Kadioğlu ve ark. (2009) %0.7–0.9 arasında değerler elde etmişlerdir. Taghavi ve ark. (2019), olgun çilek meyvesinin asit içeriğinin beslenme ya da ışık gibi çevre koşullarından da etkilenebildiğini bildirmişlerdir. Arada bulunan farklılığın ise ekolojikkoşullardan ve yetiştirme koşullarından kaynaklanabileceği düşünülmektedir.

Çizelge 3. Uygulamaların Meyve Kalitesi Üzerine Olan Etkisi

Doz (ton/da)	Meyve Ağırlığı (g)	Meyve Eni (cm)	pH (%)	SÇKM (%)	TAA (%)
Kontrol	10.24d	12.00d	3.29	7.65b	0.18c

Aynı sütunda yer alan farklı harfler P < 0.05 önem seviyesinde farklı bulunmuştur.

Sonuç

Sonuç olarak, Adana ili Yumurtalık ilçesinde 2019-2021 yılları arasında Albion çilek yetiştiriciliğinde üç adet “Agrotolia® NPK+S+Humik Asit + 15 OM, Agrotolia® Hümkik+Fülvik Asit:%10+ K₂O:%2+OM:%20, Agrotolia® Hümkik+Fülvik Asit:%40+ K₂O:%2+OM:%30” isimli compost içerikli organomineral gübrelerle birlikte kimyasal gübre uygulaması olarak N:%20+NO₃-N:%5+NH₄-N:%5+Üre:%10, Hümkik+Fülvik Asit:%10+ K₂O:%2+OM:%20 kompoze gübreleri ve gübresiz standart olmak üzere 6 farklı uygulama konusuyla yapılan iki yıllık deneme sonucunda; organomineral gübre uygulamalarından kimyasal gübreye göre sırasıyla, Agrotolia® Hümkik+Fülvik Asit:%40+ K₂O:%2+OM:%30, Agrotolia® Hümkik+Fülvik Asit:%10+ K₂O:%2+OM:%20 ve Agrotolia® NPK+S+Humik Asit + 15 OM yüksek değerler alınmıştır. Yapılan bu çalışmada da organomineral ve kimyasal gübre uygulamalarının Albion çilek çeşidinde; bitki gelişimi ve meyve kalitesi üzerine etkileri değerlendirildiğinde organomineral gübre uygulamasının kimyasal gübreye göre olumlu yönde etkilediği belirlenmiştir. Sonuç olarak, organomineral gübreler bitki gelişimi ve meyve kalitesini pozitif yönde etkilediği belirlenmiştir. Bu gübreler, kimyasal gübreye alternatif olarak önerilebileceği sonucuna varılmıştır.

Abstract

Propionic acid bacteria (PAB) are extremely important because of the metabolites they produce (vitamins, propionic acid, conjugated linoleic acid, bioactive peptides). Nowadays, the increasing interest in healthy nutrition has led to the formation of the concepts of probiotics, postbiotics and functionality with studies.

Vitamin B12 is one of the postbiotics produced by PAB and is known to be beneficial for human health. Due to its coenzyme feature, it plays a key role in the body process, as well as shows anti-inflammatory properties. The recommended dietary intake of vitamin B12 for adults is 4 µg/day. Although it is highly found in meat products, it is known that the bioavailability of B12 in dairy products is higher. Fermented dairy products, especially products that contain PAB in their natural microflora, are good tools for the production and intake of vitamin B12. In this study, the factors affecting the microbial production of vitamin B12 were examined.

Key Words: Vitamin B12, *Propionibacterium*, Postbiotics, Cobalamin, Probiotics

Propiyonik Asit Bakterileri ile B12 Vitamini Üretimi

Özet

Propiyonik asit bakterileri (PAB) ürettikleri metabolitler nedeniyle (vitaminler, propiyonik asit, konjuge linoleik asit, biyoaktif peptidler) son derece önemlidir. Günümüzde sağlıklı beslenmeye yönelik olarak günden güne artan ilgi çalışmalarla birlikte probiyotikler, postbiyotikler ve fonksiyonellik kavramlarının oluşmasına neden olmuştur. B12 vitamini PAB'ın ürettiği postbiyotiklerden olup, insan sağlığına faydalı olduğu bilinmektedir. Koenzim özelliği taşımasından dolayı vücutta önemli olaylarda rol oynamasının yanında, antiinflatuar özellik göstermektedir. Yetişkinler için önerilen diyetle B12 vitamini alımı 4 µg/gün'dür. Hayvansal gıdalarda bulunmasına rağmen süt ürünlerinde bulunan B12'nin biyoyararlılığının daha fazla olduğu bilinmektedir. Fermente süt ürünleri özellikle PAB'ı doğal mikroflorasında bulunduran ürünler B12 vitaminin üretiminde ve alınmasında iyi birer araç olmaktadır. Bu çalışmada PAB'ın B12 vitamini üretim sürecini etkileyen pH, sıcaklık, aerasyon, inoculum tipi ve oranı gibi faktörler irdelenmiştir.

Anahtar Kelimeler: B12 vitamini, *Propionibacterium*, Postbiyotikler, Kobalamin, Probiyotikler

1. Giriş

Propiyonik asit bakterileri *Pseudomonas* ve *Actinomyces* gibi B12 vitamini üretiminde kullanılan mikroorganizma gruplarının yerini endüstriyel olarak kullanılmaya başlamaları ile almıştır (Özer vd., 2014). Son zamanlarda probiyotiklere olan ilginin artması araştırmacıların propiyonik asit bakterilerinin probiyotik özellikleri üzerine çalışmalarına neden olmuştur. *Propionibacterium*'un probiyotik etkisi, yararlı metabolitleri ve antimikrobiyal bileşenleri üretme, zararlı bakterilere karşı direnç gösterme, antikarsinojen ve antikolesterolemik etki gösterme bağırsak mikroflorasının stabilizasyonuna dayanmaktadır (Mantere-Alhonen, 1995).

Probiyotik taşıyıcı ürünler içinde en büyük oranı yoğurt ve peynir gibi fermente süt ürünleri oluşturmaktadır (Zahed vd., 2022). Probiyotik özellik gösteren mikroorganizmaların fermente süt ürünlerine ilavesi fonksiyonel özelliklerini artırırken, süt ise bu mikroorganizmalar için ideal bir ortam yaratmaktadır.

2. Propiyonik Asit Bakterileri

İlk kez Eduard von Freudenreich, Orl-Jensen ve van Niela tarafından izole edilen ve tanımlanan *Propionibacterium* cinsi bakteriler Gram pozitif ve katalaz pozitif basillerdir. Aynı zamanda bakteri sporları üretmezler ve 1-5 µm uzunluğa sahiptirler (Piwowarek vd., 2018).

Propiyonik asit bakterileri, elde edildiği kaynağa göre deri kökenli ve klasik olmak üzere iki ana gruptan oluşur. Deri kökenli grup insanlar için birincil patojenler olarak kabul edilirken, klasik PAB peynirlerin olgunlaşma süreci başta olmak üzere gıda ve ilaç endüstrilerinde yaygın olarak kullanılmaktadır (Meile vd., 2008). PAB'ın teknolojik açıdan sağladığı faydaların en önemlileri karbon kaynağı olarak laktoz ve laktatları kullanabilmeleri, gıdalar için koruyucu özelliklere sahip bileşikler (propiyonik asit, asetik asit ve bakteriyosinler vb.) üretebilmeleri, aroma ve tat bileşenlerini sağlamalarıdır (Guan vd., 2015). Tablo 1'de süt ve süt ürünleri kaynaklı *Propionibacterium* cinsi bakteriler ve izolasyon kaynakları verilmektedir.

Tablo 1. Süt ve Süt Ürünleri Kaynaklı Propiyonik Asit Bakterileri (Özer vd., 2014)

Türler	İzolasyon kaynağı
<i>Propionibacterium freudenreichii</i>	Çiğ süt İsviçre peynirleri Diğer süt ürünleri
<i>Propionibacterium jensenii</i>	Süt ürünleri Silaj Enfeksiyonlar
<i>Propionibacterium thoenii</i>	Emmental peyniri Diğer süt ürünleri
<i>Propionibacterium acidipropionici</i>	Süt ürünleri
<i>Propionibacterium cyclohexanicum</i>	Bozulmuş portakal suyu
<i>Propionibacterium coccoides</i>	Süt ve taze peynir

Aynı zamanda B12 vitamini üretme yetenekleri vardır. Bu nedenle endüstriyel olarak takviye ve farmasötik tüketim için kullanılmaktadır (Calvillo vd., 2022). B12 vitamini üretiminde PAB'dan yararlanılmaktadır. *Propionibacterium freudenreichii* B12 vitamini üreten mikroorganizmalar arasında GRAS (generally recognized as safe) statüsüne sahip tek bakteridir. Bazı suşlarının probiyotik özellikleri bulunmaktadır (Altieri, 2016). İsviçre tipi peynirlerde ve Emmantel peynirinin olgunlaştırılmasında PAB büyük rol oynamaktadır (Bücher vd., 2021). Ülkemize özgü bir peynir olan, Balıkesir-Bursa bölgesinde yoğun olarak üretilen Mihaliç peynirinde karakteristik tat-aroma ve gözenek oluşumunda propiyonik asit bakterileri önemli rol oynamaktadır (Tirpanci Sivri & Öksüz, 2019).

B12 üretiminde kullanılan *Propionibacterium* suşları şu şekildedir: *Propionibacterium acidipropionici* DSM 8250, *P. freudenreichii* subsp. *shermanii* DSM 20270, *P. freudenreichii* subsp. *shermanii* OLP-5, *P. freudenreichii* NCIB 1081, *P. shermanii* FRDC Pr1, *P. shermanii* PZ-3, *P. freudenreichii* CICC 10019 (Massoud vd., 2018).

3. B12 Vitamini

B12 vitamini (kobalamin) suda çözünen ve merkezinde kobalt iyonu bulundurduğundan tek metalloprotein olan vitamindir (H. Wang vd., 2019). Şekil 1'de B12 vitaminin kiyasal yapısı yer almaktadır.

Şekil 1. B12 Vitaminin Kimyasal Yapısı (Gröber vd., 2013)

B12 vitamini yapısında bulunan R grubunun hidroksil grubu (OH-) olması durumunda hidroksikobalamin, glutatyonil (GS) grubu olması durumunda glutatyonilkobalamin, siyanid (CN) grubu olması durumunda siyanokobalamin, metil grubu (CH₃) olması durumunda metilkobalamin ve 5'-deoksiadenozin grubu olması durumunda ise deoksiadenozilkobalamin olmak üzere farklı şekillerde isimlendirilir (Özkanay Yörük, 2020). Hidroksikobalamin, glutatyonilkobalamin ve siyanokobalamin inaktif formlar olmasının yanında B12 vitamininin aktif formları için prekürsör olma özelliği taşımaktadır (Uzun, 2021).

B12 vitamininin vücutta protein, yağ ve karbonhidrat metabolizması, sinir sisteminin normal fonksiyonları ve kırmızı kan hücrelerinin oluşumu gibi önemli görevleri vardır (Repossi vd., 2017). İnsan hücreleri tarafından sentezlenemeyen B12 vitamini esansiyeldir ve dışarıdan alınması gerekmektedir (Sezgin, 2019).

Avrupa Gıda Güvenliği Otoritesi (EFSA) yetişkinler için günlük diyetle birlikte alınması gereken B12 vitamini alımı 4 µg/gün olarak tavsiye etmektedir. Hamilelik ve laktasyon süresince yeterli miktarın daha fazla olması tavsiye edilmektedir (Rampazzo vd., 2022). Karaciğer, et, yumurta, balık ve süt ürünleri B12 vitamini kaynaklarıdır. Süt ve süt ürünlerinin B12 vitamini içeriği etten daha düşük olsa da, süt ürünlerindeki B12 vitamininin biyoyararlılığı daha yüksektir (Gille & Schmid, 2015; Xu vd., 2020).

Türkiye’de B12 vitamini eksikliği yaygın olarak görülen bir halk sağlığı problemidir (Yazan Şahan & Erdoğan Mergen, 2019). Kadınlardaki B12 vitamini eksikliği erkeklere göre üç kat daha fazla görülmektedir (Uzun, 2021). Beslenme yetersizliği, metabolik bozukluklar ve emilim bozukluğu B12 vitamini eksikliğine ve ciddi sağlık sorunlarına neden olmaktadır (Öncel Van, 2022). B12 vitamini eksikliği aneminin yaygın bir nedenidir. Aynı zamanda nörolojik, gastrointestinal, psikiyatrik, kardiyovasküler, dermatolojik ve nöropsikiyatrik hastalıklara neden olabilmektedir (Oh & Brown, 2003).

Endüstriyel olarak B12 vitaminin kimyasal sentezinin teknik olarak zorlayıcı ve ekonomik olarak maliyetinin yüksek olması nedeniyle üretim mikrobiyal fermentasyon ile yapılmaktadır (Martens vd., 2002). B12 vitamini üretme yeteneği olan başka mikroorganizmalar olmasına rağmen, *P. freudenreichii*, B12 vitamininin aktif formunu sentezleyebilmesi ve GRAS statüsünde kullanılan tek mikroorganizma olması nedeniyle öne çıkmaktadır (Piwowarek vd., 2018).

Son yıllarda fermentasyon yoluyla gıda ürünlerinde B12 vitamini düzeyinin artırılmasına yönelik çalışmalar artmıştır. Bu nedenle B12 vitamini üretim şartlarının iyileştirilmesi elzemdir.

4. B12 Vitamini Üretimini Etkileyen Faktörler

4.1 pH ve sıcaklık

Propiyonik asit bakterilerinin gelişimi çeşitli ortam şartlarından etkilenmektedir. Bunların başında ise sıcaklık ve pH gelmektedir. Sıcaklık ve pH’ı kontrol etmek, fermentasyon işleminin verimliliğini arttırmada iki önemli faktördür.

Propionibacterium türlerinin büyümesi için uygun ortam pH 6 - pH 7 aralığındayken, gelişim için minimum pH 4,6’dır (Ahmadi vd., 2017). Süt ürünlerinde PAB herhangi mevcut ortam asitliğinde B12 vitamini üretebilmektedir. Coral ve diğer araştırmacılar tarafından yapılan çalışmada *P. acidipropionici* ile propiyonik asit üretiminin optimum olduğu sıcaklık değeri 30°C, biyokütle artışının optimum olduğu değer ise 36°C’dir (Coral vd., 2008). Hedayati ve diğer araştırmacıların yaptığı çalışmada B12 vitamini üretimin için optimum sıcaklık değerinin 38,3°C olduğu ancak, bu sıcaklık değerinin altında PAB gelişimi ile artan biyokütle artışının B12 vitamininin üretimini desteklediği görülmüştür (Hedayati vd., 2020).

4.2 Besi ortamına eklenen ve gelişimi stimüle edici bileşenler

B12 vitamini üretimini ortamdaki amino asitler ve bileşikler etkilemektedir. Azot kaynağının ortamda yer alması biyokütleyi ve B12 vitamini üretimini etkilemektedir (Santos vd., 2009). PAB için amino asitler, protein hidrolizatları gibi organik azot kaynakları iyi birer stimüle edici faktördür.

Kosmider ve diğer araştırmacılar tarafından yapılan çalışmada *Propionibacterium freudenreichii* subsp. *shermanii* ile B12 vitamini üretimi optimizasyonu üzerine yapılan çalışmada kalsium pantotenat, NaH₂PO₄·2H₂O, FeSO₄·7H₂O ve kazein hidrolizatın B12 vitamini üretimini önemli derecede artırıcı etkiye sahip olduğu görülmüştür (Kosmider vd., 2012).

Marwaha ve diğer araştırmacılar tarafından yapılan çalışmada 11 farklı amino asitin *Propionibacterium shermanii* 566 ile B12 vitamini üzerine en iyi sonuçların glutamik asit başta olmak üzere L-lösin ve L-fenilalanin ile alındığı görülmektedir. Bunun yanında L-aspartik asit, glisin ve L-lisinin gelişimi biyokütle ve B12 vitamini artışını inhibe ettiği görülmektedir (Marwaha vd., 1983).

4.3 Farklı karbon kaynaklarının etkisi

PAB tarafından üretilen B12 vitamini miktarına fermentasyon süresince kullanılan karbon kaynağının da etkisi vardır. Wang ve diğer araştırmacılar tarafından yapılan çalışmada *Propionibacterium freudenreichii* ile B12 vitamini üretilirken çeşitli kütle oranlarında (1:1, 1,5, 2, 2,5, ve 3) gliserol-glikoz karışımı kullanılmıştır. Araştırma sonuçlarına göre gliserol-glikoz oranındaki artış propiyonik asit verimini artırsa da B12 üretimini düşürmüştür. En iyi sonuçlar B12 vitamini için 1:2,5 kütle oranında 0,37 mgL⁻¹ olarak kaydedilmiştir. Bu değer yalnızca gliserol ya da yalnızca glikoz olan ortamda elde edilen sonuçlardan daha yüksektir (P. Wang vd., 2014). Liu ve diğer araştırmacılar tarafından yapılan çalışmada ise glukoz (40 gL⁻¹) ve glisinin (2 gL⁻¹) kullanımının B12 vitamini düzeyini artırdığı görülmektedir (Liu vd., 2021).

4.4 İnokulum tipi ve oranı

Van Wyk ve diğer araştırmacıların yaptığı çalışmada farklı *P. freudenreichii* suşları ile B12 vitamini üretimi yapılmıştır. Çalışmada en yüksek üretim olan, *P. freudenreichii* subsp. *shermanii* J15’in ürettiği B12 vitamini miktarı 68,05 µg 100 mL⁻¹’dir. Farklı suşların ürettiği B12 vitamini miktarlarının arasında anlamlı fark olduğu görülmüştür (van Wyk vd., 2011). İnokulum tipi, mikroorganizmanın cins, tür ve suşuna bağlı olarak B12 vitamini üretimi üzerine etkilidir.

İnokulum oranı B12 üretiminde verimi etkileyen bir faktördür. İnokulum oranının yeterli miktardan az ya da fazla olması mikrobiyal üretimi etkilemektedir. Örneğin inokulum oranının belirli bir seviyeden az olması adaptasyon

sürecinin uzamasına neden olurken; fazla olması ise şeker tüketiminin artmasına ve hücre birikmesine neden olmaktadır. B12 vitamini fermentasyonunda ideal inokulum oranı fermentasyon hacminin yaklaşık %1 ila %5'i kadar olmalıdır (Massoud vd., 2018).

4.5 Fermentasyon süresi

Madhu ve diğer araştırmacılar tarafından yapılan çalışmada *Lactobacillus plantarum* ile B12 vitaminin mikrobiyal fermentasyonla üretiminde 48-120 saat aralığında izlendiğinde 96. saat sonrası ortamdaki B12 vitamini konsantrasyonunda %25 civarında düşme görülmüştür (Madhu vd., 2010). B12 vitamininin üretimi fermentasyon süresi uzadıkça ortamda PAB'ın ürettiği metabolitlerin birikmesi nedeniyle azalmaktadır.

4.6 Aerasyon

Propionibacterium cinsinden bakteriler, vitamin B12'yi etkili bir şekilde üretmek için hem anaerobik hem de aerobik koşullara ihtiyaç duyarlar. PAB'lar fakültatif anaerob olmasına rağmen oksijene karşı toleransları yüksektir (de Assis vd., 2022).

Ye ve diğer araştırmacılar tarafından yapılan çalışmada anaerobik ve aerobik koşulların avantajından yararlanmak için fermentasyon dönüşümlü şartlar altında uygulanmıştır. Bu şekilde B12 vitamini üretimi anaerobik fermentasyon ile üretilene kıyasla 2 kart arttırılabilmektedir. Aerobik fermentasyon 6 saatten fazla uygulandığında sitokrom sentezi üzerindeki oksijenin inhibisyonu nedeniyle hücre gelişimini olumsuz etkilemektedir. Diğer yandan çözünmüş oksijen konsantrasyonun düşük olduğu (0,5-1 ppm) durumda ise propiyonik asit tüketimini arttırdığından ve asetat üretimini düşürdüğünden hücre gelişimine avantaj sağlar. Dönüşümlü olarak uygulanan aerasyon şartları B12 vitamini üretimini arttırmaktadır (Ye vd., 1996).

5. Sonuç

Propionibacterium ürettiği postbiyotikler nedeniyle son derece önemlidir. Özellikle metaboliti olan B12 vitamini Türkiye'de eksikliği yaygın olarak görülen bir vitamindir (Yazan Şahan & Erdoğan Mergen, 2019). *Propionibacterium* cinsi bakterilerin ürün oluşmasında etkin olduğu fermente süt ürünleri, B12 vitamini düzeyinin artırılmasına yönelik çalışmalara iyi bir araç olma potansiyeli taşımaktadır. Bu çalışmada propiyonik asit bakterilerinin kültür koşullarını etkileyen faktörlere ve B12 vitaminine yönelik olarak yapılan uygulamalarına değinilmiştir. B12 vitamini üretimi üzerine etkili olan faktörler araştırılarak en etkili parametrelerin optimizasyonu ile B12 üretimi maksimize edilebilir ve bu koşullar fermente süt ürünlerine uygulanabilir.

Determination of Factors Affecting Red Meat Consumption Habits in Duhok Province (Northern Iraq)

İsmail İbrahim İsmail Al-Barwari¹, Murat Turan², Ferda Karakuş²

¹Zootekni Anabilim Dalı, Fen Bilimleri Enstitüsü, Van Yüzüncü Yıl Üniversitesi, Van, Türkiye

²Zootekni Bölümü, Ziraat Fakültesi, Van Yüzüncü Yıl Üniversitesi, Van, Türkiye

Abstract

In this study, it was aimed to determine the factors affecting red meat consumption habits in Duhok province of Northern Iraq. For this purpose, questionnaire forms consisting of questions to determine the demographic characteristics and red meat consumption habits of the participants (n=100) were used. To the question “Do you find the red meat you buy reliable?” 3.7% of women and 12.3% of men answered no ($p<0.05$). The relationship between education level and the amount of red meat purchased monthly ($p<0.05$) and the number of employees in the household ($p<0.05$) was found to be statistically significant. Similarly, the education level of the participants was determined as an important factor affecting the frequency of red meat consumption ($p<0.05$). While the majority of high school and university graduates (55.2% and 76%, respectively) consumed red meat 1-3 times a week, 55.6% of primary school graduates stated that they consumed red meat 1-3 times a month. The work of the participants affected the amount of red meat purchased monthly ($p<0.01$), and the majority of the self-employed (85.7%) stated that they purchased ≥ 2 kg of red meat per month. While 69.2% of the workers stated that they did not consume red meat due to its high price, this rate was 32.5% in the self-employed workers ($p<0.01$). Again, while 53.8% of the workers consumed red meat 1-3 times a month, 68.8% of the self-employed workers stated that they consumed red meat 1-3 times a week ($p<0.05$).

Key Words: Red meat, Consumption, Habit, Duhok

Duhok İlinde (Kuzey Irak) Kırmızı Et Tüketim Alışkanlıklarını Etkileyen Etmenlerin Belirlenmesi

Özet

Bu çalışmada, Kuzey Irak’ın Duhok ilindeki kırmızı et tüketim alışkanlıklarını etkileyen etmenleri belirlemek amaçlanmıştır. Bu amaçla, katılımcıların (n=100) demografik özelliklerini ve kırmızı et tüketim alışkanlıklarını belirlemeye yönelik sorulardan oluşan anket formları kullanılmıştır. “Satın aldığınız kırmızı eti güvenilir buluyor musunuz?” sorusuna kadınların %3.7’si, erkeklerin ise %12.3’ü hayır cevabını vermiştir ($p<0.05$). Eğitim düzeyi ile aylık satın alınan kırmızı et miktarı ($p<0.05$) ve hanedeki çalışan sayısı ($p<0.05$) arasındaki ilişki istatistiksel olarak önemli bulunmuştur. Benzer şekilde katılımcıların eğitim düzeyi, kırmızı et tüketim sıklığını etkileyen önemli bir faktör olarak belirlenmiştir ($p<0.05$). Lise ve üniversite mezunlarının çoğunluğu (sırasıyla %55.2 ve %76) haftada 1-3 defa kırmızı et tüketirken ilköğretim mezunlarının %55.6’sı ayda 1-3 defa kırmızı et tükettiklerini belirtmiştir. Katılımcıların yaptığı iş, aylık satın alınan kırmızı et miktarını etkilemiş ($p<0.01$) ve serbest çalışanların büyük çoğunluğu (%85.7) ayda ≥ 2 kg kırmızı et satın aldıklarını belirtmiştir. Mesleği işçi olanların %69.2’si yüksek fiyattan dolayı kırmızı et tüketmediklerini belirtirken serbest meslek çalışanlarında bu oran %32.5 olmuştur ($p<0.01$). Yine işçilerin %53.8’inin kırmızı et tüketim sıklığı ayda 1-3 defa olurken serbest meslek çalışanlarının %68.8’i haftada 1-3 defa kırmızı et tükettiklerini belirtmiştir ($p<0.05$).

Anahtar Kelimeler: Kırmızı et, Tüketim, Alışkanlık, Duhok

The Effect of Indole Acetic Acid on Forage Soybean under Drought Stress

Gizem Aksu¹

¹Canakkale Onsekiz Mart University, Faculty of Agriculture, Department of Soil Science and Plant Nutrition, Canakkale, Türkiye

Abstract

Drought is an important environmental stress that limits crop production in the world. Its importance has increased with global warming and it has become one of the most important factors limiting plant production. Soybean is the source of obtaining more and cheaper protein per unit area. Soybean has a widespread use in livestock because it contains valuable amino acids as well as high protein quality. The objective of this research is to reduce negative effect of drought stress in the forage soybean with indole acetic acid application. The experiment was carried out in the growth chamber according to a randomized block design with 4 different doses (0,5,10,20 µM IAA) of indole acetic acid, 2 drought levels (0 and -0.5 MPa PEG-6000) and 3 replicate. Leaf length, leaf width, leaf proportional water content, cell membrane damage and malondialdehyde (MDA) content of the plants were determined. The data were evaluated by analysis of variance using a statistical package program. According to the analysis of variance, all parameters were found to be statistically significant in drought x indole acetic acid interaction. Indole acetic acid applied to the forage soybean plant alleviated the damage caused by drought. For this reason, it is thought that it may be important to ensure less damage to plants grown under stress.

Key Words: *Indole acetic acid, Drought stress, Forage soybean*

Kuraklık Stresi Altında İndol Asetik Asidin Yemlik Soya Fasulyesine Etkisi

Özet

Kuraklık, dünyada bitkisel üretimi sınırlayan önemli bir çevresel strestir. Küresel ısınmayla birlikte önemi daha da artmış ve bitkisel üretimi sınırlayan en önemli faktörlerden biri olmuştur. Soya birim alandan daha fazla ve daha ucuz protein elde etmenin kaynağıdır. Soya fasulyesi, yüksek protein kalitesinin yanı sıra değerli amino asitler içerdiğinden hayvancılıkta yaygın bir kullanıma sahiptir. Bu araştırmanın amacı, indol asetik asit uygulamasıyla yemlik soya fasulyesinde kuraklık stresinin olumsuz etkisini azaltmaktır. Deneme, 4 farklı doz (0,5,10,20 µM IAA) indol asetik asit, 2 kuraklık seviyesi (0 ve -0,5 MPa PEG-6000) ve 3 tekrarla tesadüf blokları deneme desenine göre kurulmuş yetiştirme odasında yürütülmüştür. bitkilerin yaprak boyu, yaprak eni, yaprak oransal su içeriği, hücre membran zararı ve malondialdehit (MDA) içeriği belirlenmiştir. Veriler, istatistiksel paket program kullanılarak varyans analiziyle değerlendirilmiştir. Varyans analizine göre, kuraklık x indol asetik asit interaksyonunda tüm parametreler istatistiksel olarak önemli bulunmuştur. Yemlik soya bitkisine uygulanan indol asetik asit kuraklığın yarattığı hasarı hafifletmiştir. Bu nedenle stres altında yetiştirilen bitkilerin daha az zarar görmesini sağlamak için önemli olabileceği düşünülmektedir.

Anahtar Kelimeler: *İndol asetik asit, Kuraklık stresi, Yemlik soya fasulyesi*

Agriculture 4.0 and Its Applications in Turkey

Hasan Asil¹

¹ Medicinal and Aromatic Plants Program, Altınözü Vocational School of Agricultural Sciences, Hatay Mustafa Kemal University, Hatay, Turkey

Abstract

Agriculture is one of the elements that play the most important role in the transition to a settled order. The needs that emerged over time and the new discoveries made to facilitate human life have an important place in cultural evolution. Cultural evolution has led to the use of different methods in agriculture. With the fusion of agriculture and information technologies, technology has begun to enter the operation of agricultural production in some way. Manufacturers have sought innovation to facilitate their work, reduce costs, and increase production and efficiency in various ways. Agriculture 4.0 aims to prevent the waste of resources, increase the gross return of the product, and minimize environmental pollution caused by the production. Smart farming techniques can be used in almost every period of plant production, from tillage to harvest. In this study, the techniques of Agriculture 4.0 applied by the producers will be mentioned. Applications such as smart spraying, herbal diseases, monitoring of crops and soil, and smart harvesting should be used in the strategies of agricultural enterprises in agricultural production. Recently, the low number of young populations in agriculture and the increase in the average age is seen as significant disadvantages. With Agriculture 4.0 applications, the return of young people to agriculture should be ensured.

Key Words: Agriculture 4.0, Application areas, Profitability, Technology

Türkiye’de Tarım 4.0 ve Uygulamaları

Özet

Tarım, yerleşik düzene geçilmesinde en önemli rolü oynayan unsurlardan bir tanesidir. Zaman içerisinde ortaya çıkan ihtiyaçlar ve insanın yaşamını kolaylaştırması amacıyla ortaya konulan yeni keşifler kültürel evrimde önemli bir yer tutmaktadır. Kültürel evrim tarımda da farklı yöntemlerin kullanılmasına neden olmuştur. Tarım ve bilgi teknolojilerinin kaynaştırılmasıyla teknoloji, tarımsal üretimin işleyişine bir şekilde girmeye başlamıştır. Üreticiler işlerini kolaylaştırmak, gideri azaltmak, üretim ve verimi çeşitli yollarla arttırmak için yenilik arayışına girmişlerdir. Tarım 4.0 kaynak israfının önüne geçmeyi, ürünün brüt getirisini arttırmayı ve üretimden kaynaklanan çevresel kirliliği en aza indirmeyi amaçlamaktadır. Akıllı tarım teknikleri, toprak işlemeden hasata kadar, bitkisel üretimin hemen her döneminde kullanılabilir. Bu çalışmada Tarım 4.0’ın üreticiler tarafından uygulanan tekniklerinden bahsedilecektir. Tarımsal işletmelerin tarımsal üretimdeki stratejilerinde akıllı ilaçlama, bitkisel hastalıklar, ürün ve toprağın izlenmesi, akıllı hasat gibi uygulamalar kullanılmalıdır. Son zamanlarda tarımda genç nüfus sayısının az oluşu, yaş ortalamasının yükselişi önemli bir dezavantaj olarak görülmektedir. Tarım 4.0 uygulamaları ile gençlerin tarıma dönüşü sağlanmalıdır.

Anahtar Kelimeler: Tarım 4.0., Uygulama alanları, Karlılık, Teknoloji

Giriş

Tarım, yerleşik düzene geçilmesinde en önemli rolü oynayan unsurlardan bir tanesidir. İnsanoğlu bitkileri ilk evcilleştirdiği zamandan bu yana çeşitli biçimlerde tarım yapmıştır. Zaman içerisinde ortaya çıkan ihtiyaçlar ve insanın yaşamını kolaylaştırması amacıyla ortaya konulan yeni keşifler kültürel evrimde önemli bir yer tutmaktadır. Kültürel evrim tarımda da farklı yöntemlerin kullanılmasına neden olmuştur.

Üreticiler işlerini kolaylaştırmak, gideri azaltmak ve üretim ve verimi çeşitli yollarla arttırmak için yenilik arayışına girmiştir. Tarım 4.0 teriminden önce tarımdaki dijitalleşme, hassas tarım gibi birçok kavramın kullanıldığı bir dönemde üreticiler tarımda işçilik maliyetlerini düşürme, tarımda sürekli tekrarlanan işlerin olması ve bunun can sıkıcı bir hale gelmesiyle tarımda robotik ve dijital uygulamaların arayışı artmıştır (Kaya, 2019; Şahin, 2022). Tarımsal üretimde geleneksel olarak uygulanan yöntemlerde üretimi arttırmak için teknolojiden faydalanmak gerekiyor. Bu da kısaca akıllı tarımla üretim yapmaktan geçmektedir (Öcel ve ark., 2022). Tarım sektörü, teknoloji ve inovasyonu iyi değerlendirmeli, çok acil eylem planlarını hayata geçirmelidir (Klavuz ve Erdem 2019). Akıllı tarım uygulamaları, tarımsal ürün tedarikinde verimliliği arttırmakla birlikte, sosyal ve çevresel faydalar da sağlamaktadır. Pestisit ve herbisit kullanımını engelleyen robotik yabancı ot ayıklama uygulamaları ve hassas püskürtücü sistemler gibi uygulamalar da doğrudan pozitif çevresel bir etkiye sahiptir. Sürdürülebilir tarımsal kalkınmayı gerçekleştirmek için bu kaynakların daha verimli kullanılması bir zorunluluktur. Verimi arttırmak için de geleneksel tarım ve enerji yaklaşımlarından vazgeçilip hızla dijital ve akıllı teknolojilerin geliştirilerek çiftçinin hizmetine sunulması gerekmektedir. Tarım 5.0’ın konuşulmaya başlandığı bu dönemde Tarım 4.0 uygulamalarının entegrasyonu bir an önce sağlanmalıdır. Dünyanın en büyük tarımsal ekonomileri içinde yer alan ülkemizin Tarım 4.0’ ile ilgili uygulamaları ve kullanımının yaygınlaştırılması için örnek uygulamalardan bahsedilecektir.

Materyal ve Yöntem

Çalışmada, Tarım 4.0 ve Türkiye Uygulamaları ile ilgi üretici uygulamaları değerlendirilecektir.

1. İklim ve topografya uygunluğuna göre bitki deseni belirlenmesi
2. Ekim ve dikimde tarla haritalama ve tohum hesabı
3. Yabancı otların İHA kullanılarak tespit edilmesi, ilaçlanması ve mücadelesi
4. İHA'lar ile tarımsal ürünlerin takibi ve verim tahmini
5. Tarımsal Sulama otomaları ile digital sulama
6. İHA'lar ile hastalık ve zararlı tespiti
7. Konukçu takibi ve entegre ilaçlama
8. Hasat

Bulgular ve Tartışma

Tarımsal gelişmenin ön koşulu, tarımda yenilikleri uygulamaya ve geliştirmeye bağlıdır. Tarımsal karlılık üzerinde teknolojik yeniliklerin ve entegrasyonun önemli bir etkisi vardır. Özellikle tarımın en çok yapıldığı kırsal alanlarda teknolojik yeniliklerin uygulanma oranının yükseltmek ve yeni tarımsal üretim yöntemlerinin uygulanmasını sağlamak üreticileri ürünlerini sanayinin farklı kollarını sunmasını sağlayacaktır.

Tarımsal üretimde robotik, otomatik kontrol ve yapay zekâ teknikleri içerisinde farmbots ve farmdronelar da dâhil olmak üzere her türlü uygulama sürecini kapsar. Tarımsal robotlar, üreticiler için işlerini kolaylaştırmak, gideri azaltmak ve üretim ve verimini çeşitli yollarla artırmak için tasarlanmışlardır. İHA'lar, otonom traktörler ve tarım aletleri vb. tarımsal robotlar, çiftçiler için iş gücünü azaltmak, zaman tasarrufu sağlamak ve toplam üretim verimini artırmayı amaçlamıştır.

İklim ve topografya uygunluğuna göre bitki deseni belirlenmesi

Tarım arazilerinde bitki deseninin belirlenmesi ve ayırt edilmesi çalışmalarında uzaktan algılama yoğun olarak kullanılmaktaydı. Uzaktan algılamada, uyduların gerek her zaman aynı yerden görüntü elde edememesi tarımsal bitki deseni belirlenmesinde yetersiz kalmaktadır (Doğan, 2019).

İHA'ların kolay kullanımı ve istenilen zaman ve yer örnekleme aralığına uygun yükseklikte uçurulabilmesiyle beraber esnek hareket kabiliyetine sahip olmasını büyük avantajlar sağlamaktadır. İHA'lar üzerine yerleştirilen multispektral kameradan elde edilen görüntüler ile belirli bir tarımsal alanda bitki deseni tespitinin rahatlıkla yapılmasına veya bir tarım arazisinde hangi bitkinin yetiştirilebileceği konusunda öneriler sunabilmektedir. Ayrıca ulaşım imkânının zor olduğu yamaç arazilerindeki tıbbi ve aromatik bitkilerin kolay bir şekilde tespit edilmesi sağlamaktadır (Jurado-Expósito ve ark., 2019).

Bitki örtüsü tespiti, küresel iklim değişikliğinin olası etkilerinin değerlendirilmesinde, tarımsal sulama projelerinin değerlendirilmesin, arazi toplulaştırma projelerinin etkin bir şekilde yapılması için oldukça önemli bir unsurdur. bitki deseninin uzaktan algılama yöntemleri veya İHA'lar kullanarak arazi kullanımının sınıflarının belirlenmesinde yüksek hassasiyet ve doğruluklu haritaların üretilmesine bağlıdır.

İHA'lara monte edilen multispektral kameralar ile arazi kullanım durumları ve bitki deseni tespiti yapılabilmektedir. İHA kullanılarak elde edilen yakın kızılötesi (NIR) Kırmızı Yeşil Mavi (NIR-RGB) bant veri setlerinden bitkilerin ayırt edilebilmesi için bu veri kümelerinin hem tek başına hem de kombinasyonun kullanıldığı, rastgele orman temelli bir yöntem ile analiz edildiği ve özellik faktör yüklemesine dayalı farklı bant azaltma yöntemlerinin analiz edildiği bildirilmiştir (Özgüven ve ark. 2022).

Ekim, Dikim, Hasat, İlaçlama ve Toplama işlemleri otomasyonu

Tarımsal Faaliyetleri Kontrolü

Modern tarımsal alanda tohumlamada uçaklar ve İHA'lar kullanılmaktadır. İHA'lar uçaklara göre daha ucuz ve basit çalışma mekanizması ile daha uygun bir alternatif olduğunu, hassas sensör ve kamera sistemi sayesinde tarımsal üretim alanlarında sürdürülebilirliğin gelişimine katkı sunmaktadır. Tarımsal çalışmalarda, maliyet girdi miktarını azaltacak yenilikleri çiftçiler tarafında azda olsa kullanımına başlanmıştır. Bunlardan toprak işleme, tohum yatağı hazırlama ve ekim ve dikim işleminin GPS "li traktörlerle yapılması, otomatik dümenleme sistemlerinin ve hasat öncesinde anlık verim, nem ve kalite ölçüm değerlerini alabilen otonom sistemler kullanılmaktadır. Buna ek olarak toprak haritalaması uygulamaların başlaması inovasyonun daha geniş alanları yayılabileceğinin göstergesi olmuştur (Akıllı ve ark., 2019). Akıllı tarım sistemlerinde kullanılan teknolojik makineler özellikle hassas ekim mibzerleri elektronik sensörler aracılığıyla işlem yapmakta ve her tohum uygun miktarda ve uygun derinlikte ekim yapabilmektedir. Fazladan tohum atımı ve derine ekimlerde çıkış probleminin önüne geçmektedir.

GPS ile tarla hazırlığı ve Hasat Kontrolü

Hastalık, Zararlı ve Yabancı ot kontrolü otonomları

•Püskürtme ve inceltme,

• Yeni nesil drone ilaçlama (70 Lt kapasite)

Akıllı Üretim ve Çiftlik sistemleri

Sonuç

Akıllı Tarım, Dijital tarım ve Tarım 4.0, tarımsal makine, robotlar, İHA'lar, robotik hasat makineleri vb birçok uygulamanın tarımdaki karşılığıdır. Ayrıca entegre üretim sisteminin temelinden tarımsal süreçlerin tamamında otomasyonların kullanımı sonucunda verim artışı, çevreyi koruma, zaman tasarrufu ve karlılık gibi birçok faydayı beraberinde getiren sistem Tarım 4.0'dan Tarım 5.0 evrilmeye başlamıştır. Bu sektöre uyumluluk sağlayan tüm tarım işletmeler güvenli, sürdürülebilir ve yüksek verimli gıda üretiminde karlılığı artırmaktadır. Tarımsal işletmelerin tarımsal üretimdeki stratejilerinde akıllı ilaçlama, bitkisel hastalıklar, ürün ve toprağın izlenmesi, akıllı hasat gibi uygulamalara geçilmelidir. Son zamanlarda tarımda genç nüfusun az oluşu yaş ortalamasının yükselişi önemli bir dezavantaj olarak görülmektedir. Genç ziraatçıları tarım 4.0 uygulamaları ile tarıma dönüşü sağlanmalıdır.

Determination of The Ratio of Essential Oils and Components of *Lavandula stoechas* spp. (Karabaş) at Different Harvest Times

Hasan Asil¹

¹Medicinal and Aromatic Plants Program, Altınözü Vocational School of Agricultural Sciences, Hatay Mustafa Kemal University, Hatay, Turkey

Abstract

The aim of this study was to determine the essential oil content and composition of Karabaş plant (*Lavandula stoechas* spp.) collected from its natural environment in Altınözü district, Hatay Province, in two different periods, flowering and during seed formation. GC-MS was used to analyze the essential oil content of the plant. The dry flowers of Karabaş plant used in this study were obtained by water distillation to obtain the essential oil, and the essential oil content was determined to be 1.28% in the flowering period and 1.39% in the seed-forming period. The main components obtained from Karabaş plant were determined as fenchone (65.79%) in the mean flowering period and fenchone(68.15%) in the seed-forming period.

Key Words: *Karabaş, Harvest Time, Essential Oil, Lavandula stoechas* spp.

Farklı Toplanma Zamanında *Lavandula stoechas* spp (Karabaş) Bitkisinin Uçucu Yağ Oran ve Bileşenlerinin Belirlenmesi

Özet

Çalışmada, Hatay ilinden Altınözü ilçesinden doğal ortamından toplanan Karabaş (*Lavandula stoechas* spp.) bitkisinin çiçeklenme dönemi ve tohum bağlama döneminde olmak üzere iki farklı dönemdeki uçucu yağ oran ve kompozisyonlarını belirlemek amacıyla yapılmıştır. Bitkinin uçucu yağ içeriklerini analiz etmek için GC-MS cihazı kullanılmıştır. Bu çalışmada kullanılan karabaş bitkisinin kuru başak çiçekleri uçucu yağ elde etmek amacıyla su distilasyonu yöntemiyle elde edilmiş ve uçucu yağ oranı çiçeklenme döneminde %1.28 ve tohum bağlama döneminde ise %1.39 oranında belirlenmiştir. Karabaş bitkisinden elde edilen ana bileşenler, çiçeklenme döneminin ortasında Fenchone (%65.79) ve tohum bağlama döneminde Fenchone (%68.15) olarak tespit edilmiştir.

Anahtar Kelimeler: *Karabaş, harvest time, essential oil, Lavandula stoechas* spp.

Giriş

Lamiaceae familyası, dünyada yaklaşık 236 cins ve 7200 tür içerir ve insanlar için yararlı olan uçucu yağlar ve antioksidan özelliklere sahip yabani aromatik bitki türleri bakımından zengindir. Türkiye florasında 256 tanesi endemik olmak üzere toplam 574 Lamiaceae türü bulunmaktadır. *Lavandula* L. (Lamiaceae) cinsi Türkiye’de 3 takson ile temsil edilmektedir; *Lavandula stoechas* L. subsp. *stoechas*, *Lavandula pedunculata* subsp. *cariensis* (Boiss.) Upson & S.Andrews ve L. *angustifolia* Mill. subsp. *Angustifolia*’dır. Türkiye’de *angustifolia* yerel olarak “lavanta” olarak, *pedunculata* “karan” ve *stoechas* “karabaşotu, karan, gargan, keşişotu” olarak bilinir.(Baytop, 1984). Karabaş otu halk arasında genellikle birbirinin yerine tıbbi amaçlarla yüzyıllardır kullanılmaktadır (Mill, 1982; Erik ve Tarıkahya, 2004;Küçük ve ark., 2019; Çatav ve ark., 2021; Sevindik ve ark., 2022). *Lavandula stoechas* esansiyel yağı, en önemlileri linalil asetat, sineol, linalool, nerol ve borneol olan 40’tan fazla farklı bileşik içerir. Ayrıca büterik asit, propiyonik asit, valerik asit, germbulin, tanenler ve flavonoidler gibi bileşikler içerir (Cherrat ve ark., 2014).*Lavandula stoechas*, Fas da dahil olmak üzere Akdeniz ülkelerinde geleneksel olarak enflamatuvar hastalıklar, sistit, nefrit ve romatizmal artrit gibi ağrılı hastalıkların tedavisi için kullanılan çoğu bitkiden biridir. Birçok çalışma, L. *stoechas*’ların sulu ve alkollü ekstraktlarının çeşitli biyolojik etkilerle karakterize olduğunu bildirmiştir. Bitkinin, antifungal, antioksidan, antihiperglisemik aktiviteler, antikonvülsan, antispazmodik ve yatıştırıcı etkiler ve anti-enflamatuvar aktiviteyesahip olduğu bildirilmiştir. (Yassine ve ark., 2016; Karabagias ve ark., 2019; Fadil ve ark., 2021)

Bu çalışmada Karabaş (*Lavandula stoechas* spp.) bitkisinin çiçeklenme dönemi ve tohum bağlama döneminde olmak üzere iki farklı dönemdeki uçucu yağ oran ve kompozisyonlarını belirlemek amacıyla yapılmıştır.

Materyal ve Yöntem

2.1. Materyal

Çalışmada, Hatay ilinden Altınözü ilçesinden doğal ortamından toplanmış ve oda sıcaklığında kurutma işlemi yapılmıştır.

2.2. Metot

2.2.1. Bitki Uçucu Yağlarının Elde Edilmesi

Çalışmamızda kullanılan uçucu yağlar bitki kuru çiçek herbalarından (1000 g) su distilasyonu yöntemiyle ve clevenger sisteminde 3 saatlik işlem sonucunda elde edilmiştir. Distilasyon sonucu elde edilen uçucu yağlar analizleri için koyu renkli cam şişelerde konulup, Namık Kemal Üniversitesi Merkez Araştırma Laboratuvarına analiz için teslim edilmiştir (Türkmen, 2021).

2.2.2. Uçucu Yağ Bileşenlerinin Belirlenmesi

Analizi Namık Kemal Üniversitesi merkez araştırma laboratuvarında, Hewlett-Packard 6890 serisi GC-MS MS analiz cihazı kullanılarak gerçekleştirilmiştir. Cihazın kolonu HP-5MS fused silica column (5% phenyl methyl polysiloxane 30 m 0.25 mm i.d., film thickness 0.25 µm) ve dedektörü Hewlett-Packard mass selective detector 6890'dır. GC-MS MS analizi literatürde belirtilen prosedüre göre gerçekleştirilmiştir. Fırın 60 °C'ye ısıtılıp bu sıcaklıkta 2 dakika beklenir. Daha sonra sıcaklık dakikada 4 derece artırılarak 180 °C'ye, oradan dakikada 2 derece artırılarak 210 °C'ye ve dakikada 5 derece artırılarak 230 °C'ye yükseltilir ve 1 dakika bekletilir. Son olarak sıcaklık dakikada 1 derece artırılarak 280 °C'ye yükseltilir Helyum (%99.9999) taşıyıcı gaz olarak ve 1 mL/dakika akış hızında kullanılmıştır. Enjektör sıcaklığı 200 °C'de tutulmuştur. Ayrılma oranı 1:5'dir (Asil, 2021).

Bulgular ve Tartışma

Çalışmada, Karabaş (*Lavandula stoechas* spp.) bitkisinin çiçeklenme dönemi ve tohum bağlama döneminde olmak üzere iki farklı dönemdeki uçucu yağ oran ve kompozisyonlarını belirlemek amacıyla yapılmıştır. Bitkinin çiçeklenme dönemindeki uçucu bileşenleri dağılımı Tablo 1'de gösterilmiştir.

Karabaş bitkisinin çiçeklenme dönemindeki analiz sonucunda en yüksek sırasıyla Fenchone % 65.79, Linalyl acetate % 10.76 ve Silene % 3.01 oranında elde edilmiştir. Uçucu yağ oranı çiçeklenme dönemini ortasında %1.28 olarak hesaplanmıştır.

Tablo. 1. Karabaş bitkisinin çiçeklenme dönemindeki uçucu bileşenleri dağılımı (%)

No	RT	Kimyasal adı	Area (%)
1	47.81	Fenchone	65.79
2	16.52	Linalyl acetate	10.76
3	67.34	Silane	3.01
4	16.70	Benzene	2.39
5	76.13	Ledol	2.25
6	32.50	Eucalyptol	1.87
7	73.30	Azulene	1.85
8	27.41	D-Limonene	0.99

Karabaş bitkisinin tohum bağlama dönemindeki analiz sonucunda en yüksek sırasıyla Fenchone % 68.15 Linalyl acetate % 9.06 ve Alpha.-Pinene % 6.97 oranında elde edilmiştir. Uçucu yağ oranı çiçeklenme dönemini ortasında %1.39 olarak hesaplanmıştır.

Tablo. 2. Karabaş bitkisinin tohum bağlama dönemindeki uçucu bileşenleri dağılımı (%)

No	RT	Kimyasal adı	Area (%)
1	21.21	Fenchone	68.15
2	59.40	Linalyl acetate	9.06
3	19.09	Alpha.-Pinene	6.97
4	27.75	D-Limonene	2.89
5	42.76	Cyclopentane, 2-propenyl-	2.31
6	72.93	Ledol	2.24
7	68.19	Benzenemethanol, alpha,alpha,4-trimethyl-	1.43
8	21.87	Camphene	1.34
9	32.40	Eucalyptol	1.28

Çalışma ile ilgili literatür çalışmaları incelendiğinde, fenkon ve ökaliptol ve linalol ve linalil asetat içerdiği olduğunu bildirmişlerdir (Öztürk ve ark., 2005; Bousta ve Farah, 2020). Bu çalışmada benzer uçucu bileşenler farklı oranlarda bulunmuştur.

Sonuç

Karabaş otunun farklı toplama zamanlarındaki uç yağ oranı ve bileşenleri üzerine yapılan çalışmada, elde edilen bulgular dikkate alındığında her iki toplama döneminde de en yüksek oranda Fenchone ve Linalyl acetate uçucu bileşenleri olarak ön plana çıkmaktadır. Bu bileşenlerin geleneksel kullanımı, antimikrobiyal ve antioksidan potansiyeli düşünüldüğünde ilaç ve gıda sanayinde değerlendirilebilir. Aynı zamanda tıbbi ve aromatik bitkilerin toplanma zamanlarının bitkinin içeriğini değiştirebileceği ve dolayısıyla bu konudan çalışmaların yapılması gerektiği sonucu çıkmıştır.

Essential Oil Components of Çalba Plant in Altınözü

Hasan Asil¹

¹Medicinal and Aromatic Plants Program, Altınözü Vocational School of Agricultural Sciences, Hatay Mustafa Kemal University, Hatay, Turkey

Abstract

The aim of this study was to determine the content and composition of essential oils in the leaves and flowers of Çalba plant (*Phlomis longifolia* var. *bailanica*) collected in its natural environment in the Altınözü district, Hatay province. GC-MS was used to analyze the essential oil content of the plant. The flowers and leaves of Çalba plant used in this study were obtained by water distillation to obtain the essential oil. Alpha.-cubebene (50.88%) and caryophyllene (49.12%) were determined as the main constituents in the flowers of Çalba plant. Bis(p-tolylthio)methane (25.25%) and 2-(3,7-dimethyl-octa-2,6-dienyl)-4-methoxy-phenol (17.81%) were determined as the main components of the essential oil of leaves.

Key Words: Çalba, Şalba, essential oil, *Phlomis longifolia* var. *bailanica*

Altınözü'deki Çalba Bitkisinin Uçucu Yağ Bileşenleri

Özet

Çalışmada, Hatay ili Altınözü ilçesinden doğal ortamından toplanan Çalba (*Phlomis longifolia* var. *bailanica*) bitkisinin yaprak ve çiçeğinin uçucu yağ oran ve kompozisyonlarını belirlemek amacıyla yapılmıştır. Bitkinin uçucu yağ içeriklerini analiz etmek için GC-MS cihazı kullanılmıştır. Bu çalışmada kullanılan çalba bitkisinin çiçekleri ve yaprakları uçucu yağ elde etmek amacıyla su distilasyonu yöntemiyle elde edilmiştir. Çalba bitkisinden elde edilen çiçeğinde ana bileşen olarak, alpha.-Cubebene (%50.88) ve Caryophyllene (%49.12) tespit edilmiştir. Yaprak uçucu yağında ise, ana bileşen olarak Bis(p-tolylthio)methane (%25.25) ve 2-(3,7-Dimethyl-octa-2,6-dienyl)-4-methoxy-phenol (%17.81) tespit edilmiştir.

Anahtar Kelimeler: Çalba, Şalba, Uçucu yağ, *Phlomis longifolia* var. *bailanica*

Giriş

Tıbbi ve aromatik bitkilerin yeni terapötik ajanlar olarak ve değerli biyositler için bir kaynak olarak kullanılması talebine artan bir ilgi vardır. Bitkilerden elde edilen uçucu yağlar, mantar önleyici, antibakteriyel, antiviral ve böcek öldürücü özelliklerinden dolayı gıda, baharat, gıda muhafaza, halk hekimliği, ilaç endüstrisi ve koku gibi birçok alanda kullanılmaktadır (El Mokni vd., 2019).

Lamiaceae, 236 cins ve 6900-7200 tür ile dünyadaki en büyük ve en yaygın familyalardan biridir. Lamiaceae familyasındaki bitkilerin çoğunun tıbbi özelliklere sahip olduğu iyi bilinmektedir. Lamiaceae familyasına ait çok yıllık bir bitki cinsi olan *Phlomis*'in tıbbi özellikleri olduğu bilinmektedir.

Türkiye florası *Phlomis* cinsinin Huber-Morath (1982) tarafından 34 tür ve 10 melez içerdiği belirlenmiştir. 34 türden 22'sinin endemik olduğu bilinmektedir (Huber, 1982; Çelik ve ark., 2015; Aghakhani ve ark., 2018). *Phlomis* türleri *Flomoides* ve *Phlomis* olmak üzere iki ana cinse ayrılır ve *Flomoides* ve *Phlomis* dahil 100'den fazla tür içerir (Moench, 1874; Albaladejo ve ark., 2015).

Phlomis üç alt cins içerir (*Dendrophlomis*, *Gymnophlomis* ve *Oxyphlomis*) ve esas olarak Akdeniz bölgesinde bulunur. Türkiye, bu ana cins türlerinin ana habitatlarından biri olarak kabul edilmektedir (Huber., 1982; Henge, 1986). Son zamanlarda yapılan araştırmalar, Türkiye'de ve bazı ülkelerde toplanan farklı *Phlomis* türlerinden elde edilen uçucu yağların ana bileşenlerinin heksahidrofarneasil aseton, spathulenol, germacrene D, β-karyofilin ve karyofilin oksit olduğunu göstermiştir.

Çalışmada kullanılan çalba (*Phlomis longifolia* var. *bailanica* (Vierh.) Hub.-Mor.) Hatay-Altınözü bölgesi çevresinde bol miktarda bulunmaktadır. Endemik değildir. Coğrafi dağılımda C6 koridorunda yer alır (Yüzbaşıoğlu vd., 2009).

Çalışma, Hatay Altınözü doğal ortamından toplanan Çalba (*Phlomis longifolia* var. *bailanica*) bitkisinin yaprak ve çiçeğinin uçucu yağ oran ve kompozisyonlarını belirlemek amacıyla yapılmıştır.

Materyal ve Yöntem

2.1. Materyal

Çalışmada, Hatay ilinden Altınözü ilçesinden doğal ortamından toplanmış ve oda sıcaklığında kurutma işlemi yapılmıştır.

2.2. Metot

2.2.1. Bitki Uçucu Yağlarının Elde Edilmesi

Bu çalışmada kullanılan çalba bitkisinin çiçekleri ve yaprakları uçucu yağ elde etmek amacıyla (200 g) su distilasyonu yöntemiyle elde edilmiştir. Bitkilerin uçucu yağları clevenger sisteminde 3 saatlik buhar distilasyonu ile elde edilmiştir. Distilasyon sonucu elde edilen uçucu yağlar analizleri yapılmaya kadar +4 °C'de koyu renkli cam şişelerde saklanmıştır. Distilasyon sonucu elde edilen uçucu yağlar analizleri için koyu renkli cam şişelerde konulup, Namık Kemal Üniversitesi Merkez Araştırma Laboratuvarına analiz için teslim edilmiştir (Türkmen, 2021).

2.2.2. Uçucu Yağ Bileşenlerinin Belirlenmesi

Analizi Namık Kemal Üniversitesi merkez araştırma laboratuvarında, Hewlett-Packard 6890 serisi GC-MS MS analiz cihazı kullanılarak gerçekleştirilmiştir. Cihazın kolonu HP-5MS fused silica column (5% phenyl methyl polysiloxane 30 m 0.25 mm i.d., film thickness 0.25 µm) ve dedektörü Hewlett-Packard mass selective detector 6890'dır. GC-MS MS analizi literatürde belirtilen prosedüre göre gerçekleştirilmiştir. Fırın 60 °C'ye ısıtılıp bu sıcaklıkta 2 dakika beklenir. Daha sonra sıcaklık dakikada 4 derece artırılarak 180 °C'ye, oradan dakikada 2 derece artırılarak 210 °C'ye ve dakikada 5 derece artırılarak 230 °C'ye yükseltilir ve 1 dakika bekletilir. Son olarak sıcaklık dakikada 1 derece artırılarak 280 °C'ye yükseltilir Helyum (%99.9999) taşıyıcı gaz olarak ve 1 mL/dakika akış hızında kullanılmıştır. Enjektör sıcaklığı 200 °C'de tutulmuştur. Ayrılma oranı 1:5'dir (Asil, 2021).

Bulgular ve Tartışma

GC-MS MS analizi ile Çalba bitkisinin çiçek ve yaprak yağ verimi ve uçucu bileşenlere ait analiz sonuçları incelenmiş olup, çiçekte iki uçucu bileşen ve yaprakta ise 10 adet uçucu bileşen tespit edilmiştir.

GC-MS MS kütüphanesinde bulunan elde edilen bileşenlerin eşleşme faktörleri ve bunların toplam pik alanları Tablo 1'de özetlenmiştir. Elde edilen sonuçları göre çiçek uçucu yağında %50.88 oranında alpha.-Cubebene ve %49.12 oranında ise Caryophyllene uçucu bileşenleri tespit edilmiştir (Tablo 1). Çiçekte uçucu yağ oranı eser miktarda bulunmuştur.

Tablo. 1. Çalba bitkisinin çiçek uçucu bileşenleri dağılımı (%)

No	RT	Kimyasal adı	Area (%)
1	41.13	.alpha.-Cubebene	50.88
2	52.41	Caryophyllene	49.12
	Toplam		100.00

Çalba bitkisinin yaprak uçucuyağ analiz sonucunda en yüksek sırasıyla Bis(4-methylphenylthio)-methane % 25.25, 2-(3,7-Dimethyl-octa-2,6-dienyl)-4-methoxy-phenol % 17.81 ve 2-Propanone, 1-phenylthio-1-methyl % 15.49 oranında elde edilmiştir. Yapraktaki uçucu yağ oranı %1.00 olarak hesaplanmıştır.

Tablo. 2. Çalba bitkisinin yaprak uçucu bileşenleri dağılımı (%)

No	RT	Kimyasal adı	Area (%)
1	16.73	Caryophyllene	7.85
2	16.86	2-Nonanone, 9-hydroxy-	0.43
3	38.74	Thiirane	5.16
4	69.87	2-(3,7-Dimethyl-octa-2,6-dienyl)-4-methoxy-phenol	17.81
5	72.39	1-Hydroxy-4,8-dimethylspiro[4.5]dec-7-en-6-one	12.39
6	73.94	2-Propanone, 1-phenylthio-1-methyl	15.49
7	74.40	Androstane	8.77
8	74.53	Anethofuran	1.23
9	75.82	Bis(4-methylphenylthio)-methane	25.25
10	100.29	4,5,6,6a,6b,7,8,12b-Octahydrobenzo[j]fluoranthene	5.62
	Toplam		100.00

Sonuç

Tıbbi ve aromatik bitkilerin uçucu yağ ve bileşenlerinin belirlenmesine yönelik artan bir ilgi ve araştırma vardır. Bu tür bitkilerin potansiyel kullanımlarını keşfetmek için hala daha fazla çaba gerekiyor. Bu çalışma, Çalba bitkisinin potansiyel uçucu yağ oran ve bileşenlerini ortaya çıkardı. Daha ileri çalışmalar, bu bileşenlerin ilaç, farmakolojik ve biyoaktivite uygulamaları olarak olası kullanımını araştıracaktır.

Identification of Traded Medicinal Plants and their Socioeconomic Impact on Local Community of Astore District

Lubna Ansari

Pir Mehr Ali Shah-Arid Agriculture University Rawalpindi, Pakistan Department of Forestry and Range Management, Pakistan

Abstract:

Background: Medicinal plants are those plants that have chemicals in one or more of their parts that can be used to treat ailments. Medicinal plants are used by the local people of the study area for the treatment of numerous ailments from prehistoric time. The study was conducted to assess the status, availability of traded medicinal plants for local and national demand. Secondly, to identify the traded medicinal plants and their socioeconomic impact on local community of Astore district, Gilgit Baltistan.

Methods: Different economically important traded medicinal plants belonging to 19 families were collected from different villages by random sampling method. Apiaceae was the most abundant family. The collected traded medicinal plants were pasted on herbarium sheets for identification purpose. These Sample plants were identified by Flora of Pakistan and they were also confirmed by the Arid Agriculture University Botany Department expert. Ethanomedicinal uses were also documented and the collected data was analyzed by using ethnobotanical indices i.e. Use value, Relative frequency citation, Fidelity level and Pearson correlation coefficient. Questionnaire survey was conducted to access the socioeconomic impact of traded medicinal plants, their current status, and availability for local and national demand. 80 respondents were interviewed consisting 66 men and 14 women. SPSS software was used to find out percentage and frequency of respective medicinal plants after field survey.

Results: About 26 economically important medicinal plants were identified from the study area and their ethanomedicinal uses were also documented. Use value and Relative frequency citation shows statistically significant relation. Survey results showed that the traded medicinal plants played pivotal role by enhancing socio-economic condition of local communities and they earned stipulated amount of income from sale of traded medicinal plants. Currently the traded medicinal plants are gradually decreasing due to anthropogenic activities like improper method of collection, uprooting and unsustainable use. Overall survey findings indicated that the traded medicinal plants are easily available for local demand but they are not easily available for national demand due to over exploitation, illegal trade, lack of protection and conservation measures.

Conclusion: Local people don't have sufficient information about identification of traded medicinal plants due to this only few economically important medicinal plants are traded in the area. The knowledge about medicinal plants is also limited to old age people. Traded medicinal plants have great role in improving economic condition of people. They are easily available for local demand but their availability for national demand is low because the traded medicinal plants are gradually decreasing due to unsustainable use and improper method of collection. Therefore, there is pressing need to create awareness among local people for the sustainable use and conservation of traded medicinal plants.

Seed Handling And Extraction In *Dacryodes edulis* And Its Implications On Seed Germination: Prospect For Food Security

Alaje Veronica Ifeoma¹, Amadi Joyce Okama¹, Alaje Musibau Adewale¹, Geplu Olufunke Ajoke and Appah Ogechukwu Rose²

¹Forestry Research Institute of Nigeria, P.M.B. 5054, Ibadan, Oyo State, Nigeria.

²Federal College of Forestry Ibadan

Corresponding author address: alajeveronica@gmail.com +2348035267527

Abstract

Dacryodes edulis is an African indigenous fruit tree with potential for food security that needs adequate knowledge in handling the seed for high germination and production of seedlings of good vigour. The various studies in this report were aimed at achieving high germination with good seedling vigour. Mature fruits were collected and subjected to various extractions and handling techniques. Data were collected on mean germination count and number of days to germination and results were analyzed using descriptive statistics. The results show that The seeds soften natural before extraction had the highest germination of 83.33 after 18 DAS in this same vein seeds sown vertically with the pointed tip facing downward direction recorded the highest percentage of germination of 100% after 19 days. Total removal of the seed coat to expose the seed gave the highest percentage of 94% after 27 days of sowing. The damaging effect of the seeds of *D. edulis* did not affect its germination as clearly observed in this study as the seeds damaged at both end produced germination percentage of 88 with its first germination recorded on the 14th DAS. High germination were recorded in all the media used, however the highest seed germination 93% was observed in seeds sown in river sand after 21 DAS. The study concluded that seed handling and processing have proven to be important factor in seed germination of *D. edulis*.

Key words: *Dacryodes edulis* seeds extraction, handling, positioning, pulp softening

Introduction

Food security is a condition in which all people at all times have physical, social and economic access to sufficient, safe, nutritious and affordable food as foundation for active healthy and productive life (Agbetoye, 2016). Food is very vital to everyday life for without food, it is almost impossible to live a normal life. The quality and quantity of food consumed also is very vital because healthy and balance diet is the prerequisite for a healthy living.

The forest houses the plants which are important sources of food ranging from staple items like fruit pulp and condiments of *Parkia biglobosa* seeds to leafy vegetables of *Vitex doniana*, edible fruits of *Dacryodes edulis* and seeds of *Plukenetia conophora* and many others. Wild fruits and leaves from trees and shrubs provide good nutritious supplements to diet such as protein, vitamins and roughages (Schreckenberget al., 2006; Omonhinmin, 2012). They also provide income and employment opportunities to rural and urban households (Tee and Popoola, 2007). Latiff et al.,(2002) reported that forest resources contributed directly up to 80% of the livelihoods of the rural people living in extreme poverty.. They also provide environmental and social benefits but these forests had been treated in the users as inexhaustible (Ladipo, 2010). It is however, obvious that forest is currently at the point of extinction if nothing is done to reverse the unsustainable use. Therefore, there is an urgent need to enrich the forest with good planting materials to meet the demand of the ever increasing population that depends of the forest. To do this, there is the need for better understanding of the handing of the seeds which will be used for the mass production of good planting materials.

The Nigeria forest is enriched with useful plant genetic resources that are food and fruit producing plants which are of immense benefits to the growing population most especially the rural people who depend on them for their livelihood. Among these resources is the *Dacryodes edulis* fruit, a multipurpose agroforestry food species.

Dacryodes edulis (G. Don) H. J. Lam belongs to the family *Burseraceae* is an important fruit tree at the national and international levels, has high nutritional values and plays an important role in food security (Ajayi and Adesanwo, 2009; Duru et al., 2012). The fruit form an important part of the diet of people in West and Central Africa being rich in vitamins and containing 63.5% fat, 24.2% protein and 9.2% carbohydrate (Mbofung et al., 2002).The fruit is an ellipsoidal drupe which varies in length from 4 to 12 cm (Plate 1). The skin colour of the mature fruit is dark blue to violet while the immature colour is pink (Anegbe et al., 2005).The fruit is the edible part which can be eaten boiled, roasted or raw along side with maize or bread. The fruits contain considerable amount of fatty acids such as palmitic acids, linoleic acid and oleic acids (Iyare, 2009).because the fruit is rich in protein and oil, it can help to make diets more balanced in and in turn plays an important role in combating mal-nutrition among poor populations who have little access to protein rich diet (Obame et al., 2008; Ajiwe et al., 1997; Ikhouria and Maliki, 2007; Kapseu and Tchiegang, 1996). Oil from the fruit is rich in amino acids and

triglycerides and can augment common household oils (Ajayi and Adesanwo, 2009; Ikhouria and Maliki, 2007; Ajibesin, 2011). The pulp also contains substantial amounts of carbohydrates, minerals, vitamins and fibres (Obame *et al.*, 2008). Iyanre (2009) reported that the result of physiochemical indicated that the seeds have valuable functional attributes of industrial interests. This therefore placed a high demand in the production of this multipurpose tree species.

Plate 1: Fruits of *D. edulis* with various sizes and colour

Most tropical tree plants are propagated by seed (Bowes, 1999; Adebisi *et al*, 2011). However, propagation of these species is usually limited by unavailability of seeds, failure to germinate among other factors (Adebisi *et al.*, 2011). Owing to the important of seed in the life cycle of plant, it is therefore appropriate to know the proper techniques in seed handling through the processes of ripening or maturation, collection, processing, as well as germination in order to obtain high germination with good vigour. Planting materials with good vigour is required for success for the continuity of such species. Often, these seeds are scarce and in high demand for various users while some species do not produce seeds all year round. Seed handling is therefore vital to maximize the limited seed that is available in order to secure the supply of good quality and quantity seedlings for planting.

Pulp softening of edible fruit tree eaten when fermented such as *D. edulis* remains a key factor both for the nursery managers and the populace who depend on this species for food and other vital needs, therefore finding a common ground becomes a necessity. Therefore it is necessary to find out the possibility of germinating seeds from fermented fruits so that the soften fruits could be eaten while the seeds from the fermented or softened pulp could be used in the regeneration of *D. edulis* for mass production of seedlings for rapid domestication the species.

D. edulis is often valued for its fruit which has the edible flesh/pulp. The fruit houses the seed which are often soften in hot water or roasted for consumption. However a few others eat the pulp raw. In the propagation of *D. edulis* by seeds, seed extraction is often carried out. The seed can be extracted from the fresh fruit (Plate 2A) or fermented fruit (Plate 2B). The freshly collected mature fruits which are often purple, blue, blue-black, violet or lilac in colour are carefully extracted manually with the use of knife (Plate 3) to obtain the fragile seeds which contain the cotyledon attached to lobes (Plate 4) which are often between 8-11 in number. However, due to the loose nature of the seeds, varying degree of seed damages is often recorded. it is therefore of a necessity to determine how these levels of damages affect seed germination in *D. edulis*.

This study was therefore thoughtfully designed and carried out to determine the various seed handling and extraction procedures and how they affect seed germination in *D. edulis* in order to provide a data base for the propagation of this choice specie.

Plate 2: Seeds of *D. edulis*: Fresh (A) and fermented (B)

Plate 3: Process of manual extraction of *Dacryodes edulis* seeds

Plate4: Extracted seed of *D. edulis* showing the lobes attached to the cotyledon

Plate 5: Damaged seeds of *D. edulis*

Materials and method

Sources of seeds for the experiment

Mature fruits of *Dacryodes edulis* were collected from Forestry Research Institute of Nigeria, Ibadan, Nigeria at the peak of fruiting time in July, 2021 and 2022.

Experimental site and set up

The experiment was set up at the screen house of nursery section of Tree Physiology and Breeding section of Sustainable Forest Management of Forestry Research Institute of Nigeria (FRIN), Ibadan. FRIN is located on the

longitude 070 23'18''N to 070 23'43''N and latitude 03051'. The rainfall distribution pattern is bimodal with peak in June and July. The dry season occurs between November and March while the wet season is usually between April and September. The mean minimum and maximum temperatures are 19.5° C and 34.9° C while relative humidity was between 50 and 86.7% (FRIN, 2015)

Seed extraction and sowing were done according to the different studies and germination count was assessed once germination occurs until no further germination was observed. In each study, the experiment was replicated five times in a completely randomized design arranged in a nursery shed. Data collected were average using descriptive statistic. Germination is said to occur when the radical pushes the seed above the soil with the emergence of plumule. Germination percentage derived from the germination count as well as the mean days to germination is determined.

Plate 6: Seed germination pattern in *D. edulis*

Plate 7: Stages of seed germination in *D. edulis*

Study 1

Effect of method of fruit softening on the germination of *D. edulis*

Experimental procedure

The collected fruit were subjected to the following means of softening the pulp before seed extraction.

T1 Natural softening (allowed the pulp to soften naturally)

T2 Warm water softening (50oc water to soften the pulp)

T3 Hot water softening (1000c water to soften the pulp)

T4 No pulp softening (No pulp soften, extracted immediately after collection)

The extracted seeds were sown in a germination sieve containing top soil at ten seeds per sieve replicated five times. Data were collected on germination count and days to germination. Germination percentage was derived from the germination count.

Study 2

Seed positioning effect on germination of *D. edulis*

The collected fruits were manually extracted with the used of knife to obtain the seeds

The seeds were sown in nursery polythene pots containing topsoil collected from the FRIN arboretum. The seeds were placed at one seed per pot in the following directions (Plate 4):

- A Seeds sown vertically with the pointed tip facing upward direction
- B Sown vertically with the pointed tip facing downward direction
- C Seeds sown horizontally face up with the pointed tip sideways direction
- D Seeds sown horizontally face down with the pointed tip sideways direction.

Plate 8: Seed positioning in planting of *D. edulis*

Each of the above consisted of 50 pots (seeds) arranged in completely randomized design with five replicates. These are kept in nursery shed and monitored daily for commencement of germination.

Study 3

Level of seed extraction on germination ability of *D. edulis*

The collected fruit were heaped together to soften the pulp. The seeds were extracted from the soften pulp according to the following levels of extraction (Plate 12).

- A Total (100%) removal of the seed coat to exposure the extracted seeds
- B Partial removal of the seeds coat to exposure the extracted seeds
- C No removal of the seed coat, without exposure of the seeds
- D soften (fermented) pulp without extraction

Plate 9: Levels of seed extraction of *D. edulis*

Study 4: Effect of seed extraction damage on germination

The level of damage of the extracted seeds of *D. edulis* on seed germination was evaluated by grouping the extracted seeds into three based on the level of damage observed (Plate 11). It is of importance to state that totally damaged seeds (Plate 10) are not included in the study.

- A seeds damaged at both end
- B Seeds damaged at one end
- C whole seeds without damage

Plate 10: Totally damaged seeds not included in the study.

Plate 11: Levels of seeds damage in seed extraction of *D. edulis*

Study 5

Effect of sowing media on seed germination of *D. edulis* seeds

The collected fruits heaped together to soften the pulp for easy extraction of seeds. The seeds were extracted manually and a total of 300 undamaged seeds were retained for the study.

These were subjected to three different media which comprised of top soil collected from FRIN arboretum, River sand collected from the flowing river at FRIN and a mixture of both media at 50:50 ratio contained in a germination sieve at 50 seeds per sieve. Watering and monitoring of seeds for germination was done daily. This continued until no further germination occurs.

Results and discussion

Providing appropriate technique that can be easily understood and adopted by local farmers who are mostly the regeneration agents remain a veritable tool for rapid domestication of useful tropical species (Leakey *et. al.*, 2004). Gbademosi (2013), also stated that this is very important in nursery and field establishment of forest crops and further stated that this method will be easily demonstrated to peasant farmers. Achieving high germination does not only have its importance among farmers and nursery men, it is also important to scholars and policy makers. According to Eyo (2009), seed germination is important in propagation and breeding programme as well as for testing and using germplasms.

Study 1

Effect of method of fruit softening on the germination of *D. edulis*

The seeds soften natural before extraction had the highest germination of 83.33% after 18 DAS closely followed by fresh seeds manually extracted before sowing which gave a germination percentage of 81.30% after 21 days of sowing (Table 1). Seeds soften in hot water gave a very low germination percentage of 0.07% after 37 DAS. The low germination of seed soften in water and near to zero germination of seeds soften in hot is a clear indication that the seed of *D. edulis* is heat dependent, which resulted in seed death. This may be due to inhibition, oxygen

starvation and high temperature. This agrees with Hartmann *et al.* (2007) and Kramer (1983) who noted the harmful effect of restriction of oxygen supply during some critical metabolic stage of germination. A higher percentage germination and lesser days of germination of natural and no softening seeds is an indication that *D. edulis* naturally can germinate and establish quickly by just allowing the fruits to soften before seed extraction or extract the seeds from freshly collected fruits before sowing. The low germination and increase in days of germination from warm water fruit softening to hot water fruit softening further indicate that *D. edulis* seeds is not high temperature tolerant, this is in line with Amira and Mohamed, (2013) who reported negative relationship between increasing water temperature and time to germinate of seeds.

This invariably implies that seeds from boiled or roasted fruits consumed cannot be used for regeneration purposes. Fruits of *D. edulis* are often softened by heat through roasting or boiling in hot water before consumption, when this happens, the resultant seed from such process will not germinate if eventually planted due to the effect of heat on the seeds.

Table 1: Effect of fruit softening on germination and days of germination

Fruit softening	Mean germination percentage (%)	Days of germination (days)
Natural softening	83.33	18
Warm water softening (50oC)	35.81	25
Hot water softening (100oC)	0.07	37
No softening (freshly manure extraction)	81.30	21

Study 2

The manner at which the seed of *D. edulis* is positioned in planting has effect on the result of germination obtained as clearly observed in this study. Sown vertically with the pointed tip facing downward direction recorded the highest percentage of germination of 100% after 19 days of sowing whereas the least percentage of germination 25.50% was observed in Seeds sown vertically with the pointed tip facing upward direction after 45 days of sowing (Table 2). The seeds of *D. edulis* when placed wrongly in the soil will take longer time to emerge as revealed in this study. In extracted seeds of *D. edulis*, the radical is the pointed tip as against the normal occurrence in some seeds whereby the plumule is seen when the seed coat is removed. When the radical is placed facing up, the seed will need much energy and time to re position itself for germination and when there is no enough energy to do, the seed will not germinate hence the low germination and when it eventually germinated, the emerged seedling vigour is adversely affected.

Seed positioning in *D. edulis* also has effect on the vigour and quality of seeds produced (Plate 12). The seeds positioned vertically with the pointed tip facing downward as well as the those placed horizontally performed well in terms of the number of seed germinated as well as the quality of seeds produced.

Plate 12: Seedling from Seeds sown vertically with the pointed tip facing upward (A) and Seedling from Seeds sown vertically with the pointed tip facing downward (B)

Table 2: Effect of seed positioning on germination of *D. edulis*

Treatment code	Treatment narration	Germination percentage (%)	Days to first germination	Days to last germination	Days to 50% germination
A	Seeds sown vertically with the pointed tip facing upward direction	25.50	25	62	45
B	Sown vertically with the pointed tip facing downward direction	100.00	12	19	16
C	Seeds sown horizontally face up with the pointed tip sideways direction	90.25	14	25	21
D	Seeds sown horizontally face down with the pointed tip sideways direction.	80.00	15	23	17

Study 3

Level of seed extraction effects on germination ability of *D. edulis*

The level of seed extraction in *D. edulis* affects both its germination percentage as well as the number of days for the commencement as well as completion of seed germination. Total removal of the seed coat to expose the seed gave the highest percentage of 94% closely followed by seed partially removal of seed coat with a germination percentage of 90% after 27 days of sowing (Table 3). The least germination of 42% was observed in seeds from softened pulp that were not extracted after 48 days of sowing. When the seeds are totally exposed, they absorb water quickly and faster than the unexposed seeds. When this happens, the embryo is quickly activated to commence the process of cell division, differentiation and multiplication to grow into a seedling. This according to Sabongari and Aliero, 2004 is due to hydrolysis of complex into simple sugars that are readily utilized in the synthesis of auxins and proteins. The auxins produced help to soften cell walls quickly and to facilitate growth and the proteins are readily utilized in the production of new tissues (Sabongari and Aliero, 2004). The low germination recorded in unextracted seeds which were simply allowed to ferment and decomposed is an eye opener that the seeds of *D. edulis* must be extracted before sowing for optimum results in germination. It is a known fact that heat is generated during the process of decomposition. This heat affects the fragile seeds of *D. edulis* therefore causing adverse effect on the seeds.

Table 3: Effect of level of seed extraction on germination ability of *D. edulis*

Treatment code	Narration	Germination percentage (%)	Days to first germination	Days to last germination	Days to 50% germination
A	Total (100%) exposure of the extracted seeds	94	14	26	19
B	Partial exposure of the extracted seeds	90	18	27	19
C	No exposure of the seeds	78	19	36	26
D	soften (fermented) pulp without extraction	42	21	48	29

Study 4: Effect of seed extraction damage on germination

The different levels of damaging effect of extraction on germination showed a high percentage of 88% and above for all the categories. The damaging effect of the seeds of *D. edulis* did not affect its germination as clearly observed in this study as the seeds damaged at both end produced the germination percentage of 88 with its first germination recorded on the 14th DAS which was the earliest record when compared to the other categories of damage (Table 4). It took the three categories of seed damage the same number of days to complete their germination though the whole seed had the highest seed germination percentage.

Table 4: Effect of seed extraction damage on germination percentage of *D. edulis*

Treatment code	Seed extraction damage	Germination percentage (%)	Days to first germination	Days to last germination	Days to 50% germination
A	Damaged at both end	88	14	22	16
B	Damage at one end	92	15	22	18
C	Whole seeds	94	15	22	18

Study 5: Effect of sowing media on seed germination of *D. edulis* seeds

High germination were recorded in all the media used, however the highest seed germination 93% was observed in seeds sown in river sand after 21 days of sowing the seeds followed by seed sown in a mixture of topsoil and river sand at the ration 50:50 with average germination of 89% after 23 days of sowing the seeds (Table 5). The least seed germination of 84% was observed in seeds sown in topsoil after 25 days of sowing. The high seed germination by the growth media used in this study may be explained by Diaz-Zorita *et al.* (2005), and Cernac *et al.* (2006) who stated that germination and seedling emergence is independent of soil nutrient status, but rather depends totally on the cotyledons still attached to the seedling which are rich in stored food reserves until the seedling becomes autotrophic and the ability of the seedlings to utilize these food reserves.

Table 5: Effect of sowing media on seed germination of *D. edulis* seeds

Treatment code	Germination percentage (%)	Days to first germination	Days to last germination	Days to 50%
Topsoil	84	15	31	25
Topsoil + river sand	89	16	28	23
River sand	93	17	26	21

Conclusion

D. edulis is an edible fruit tree with prospect for food security. However, seed handling and processing have proven to be important factor in seed germination of *D. edulis* as revealed from the results gotten from the different studies carried out in this report. The methods of softening the pulps of *D. edulis* before seed extraction and planting had effects on its germination. The seeds soften natural before extraction had the highest germination of 83.33after 18 DAS

The manner at which the seed of *D. edulis* is positioned in planting has effect on the result of germination obtained as well as the vigour and quality of seeds produced. Total removal of the seed coat to expose the seed gave the highest percentage of 94%.

Damaging effect of the seeds of *D. edulis* did not affect its germination as clearly observed in this study as all the categories of damage on the seeds recorded a high percentage of 88% and above.

The highest seed germination 93% was observed in seeds sown in river sand after 21 days

Recommendations

The use of warm water as well as hot water in softening the pulp of *D. edulis* before extraction should be discouraged. The pulp should be softened naturally before seed extraction.

To obtain high germination as well as seedling with good vigour and quality in *D. edulis*, seed should be sown vertically with the pointed tip facing downward direction

In the extraction of seeds of *D. edulis*, total removal of the seed coat and exposure of the seeds will hasten the germination as well as produced the highest seed germination percentage

Although all the three media used are good for the propagating of *D. edulis*, however, river sand has proven to be the best. Damaged seeds as a result of seed extraction, as long as it retain it cotyledon should not be discarded.

Acknowledgment

The authors acknowledge the Director General and FRIN management for providing the facilities used in this study.

Uses of Lupine (*Lupinus angustifolius* L.) Plant

Derya Güloğlu¹

¹Plant and Animal Production Department, Atabey Vocational School, Isparta University of Applied Sciences, Isparta, Turkey

Abstract

Lupine is an annual herbaceous plant belonging to the Leguminosae family. Some species have begun to be cultivated 3000 years ago. Most of the wild species grow around the Mediterranean and in North America. Some species are planted in fields for soil improvement as green manure or in gardens as ornamental plants. Its seeds are generally used as provender. Turkey abounds in terms of both cultivated species and their wild forms, and lupine species cultivated for limited purposes.

The plant which is also known as lupine, is becoming more and more important due to its soil-improving, plant-preserving (bio-insecticide) and growth-promoting (bio-stimulator) properties, especially in organic farming practices carried out for natural and healthy nutrition, as well as its use in human and animal nutrition. In this study, the usage opportunities of the lupine plant were examined under the titles.

Key Words: *Lupine, thermia, lupine, bio insecticide, bio stimulator*

Acı Bakla (*Lupinus angustifolius* L.) Bitkisinin Kullanım Olanakları

Özet

Acı bakla (*Lupinus angustifolius* L), Leguminosae familyasına bağlı, tek yıllık, otsu bir bitki cinsidir. 3000 yıl önce bazı türlerinin tarımına başlanmıştır. Yabani türlerinin çoğu Akdeniz çevresinde ve Kuzey Amerika'da yetişir. Bazı türleri yeşil gübre olarak toprak ıslahı amacıyla tarlalara ya da süs bitkisi olarak bahçelere ekilir. Tohumları ise genellikle hayvan yemi olarak kullanılır. Türkiye hem kültürü yapılan türler ve onların yabani formları, hem de sınırlı amaçlarla kültürü yapılan acı bakla türleri açısından oldukça zengindir

Lüpen olarak da bilinen bitki, özellikle insan ve hayvan beslenmesindeki kullanımı yanında, doğal ve sağlıklı beslenme amacıyla yürütülen organik tarım uygulamalarında, toprak iyileştirici, bitki koruyucu (biyo insektisit) ve büyümeyi teşvik edici (biyo stimülatör) özelliklerinden dolayı gittikçe değer kazanmaktadır. Bu çalışmada lüpen bitkisinin kullanım olanakları başlıklar halinde incelenmiştir.

Anahtar Kelimeler: *Lüpen, termiye, acı bakla, biyo insektisit, biyo stimülatör*

Giriş

Lüpen (*Lupinus sp.*), yüksek protein ve yağ içeriğine sahip bir baklagil bitkisidir. Diğer baklagillerin yetişmediği marjinal alanlarda yetişebilme kabiliyetiyle bu familyanın önemli cinslerinden birini oluşturmaktadır (Baytop, 1994; Tanur Erkoyuncu ve ark., 2015). Termiye, gavur baklası ve Yahudi baklası olarak da tanınır. (Hakkı ve ark. 2007). Acı bakla tohumlarının % 33-47 oranındaki protein içeriği, soya proteinine eşdeğerdir (Yorgancılar ve Atalay 2009) Ayrıca diğer baklagillerin % 50'ye kadar nişasta içermesine karşılık, acı bakla tohumlarında bu oran % 5' dir (Schuster-Gajzágó, 2004). Lüpen olarak da adlandırılan acı bakla, yüksek protein oranı, omega 3 ve omega 6 yağ asitleri, antioksidan, karbonhidrat ve yüksek lif içeriklerine sahip olması nedeniyle insan sağlığı üzerinde oldukça önemli kullanım alanına sahiptir (Hodgson ve Lee, 2008).

İnsan beslenmesine ve insan sağlığına yararları nedeniyle lüpen bitkisi ve tohumundan elde edilen ürünlerin gıda olarak tüketimi son yıllarda artış göstermiştir. (Sandoval-Muniz ve ark., 2018).

Dünyada ekmek, bisküvi, kek, makarna, şekerleme, soya sosu gibi ürünlerde hammadde olarak kullanılmasına rağmen Türkiye'de genellikle çerezlik olarak faydalanılmaktadır (Mülayim ve Acar, 2008). Lüpen taneleri acıdır. Bu nedenle haşlanıp, suda bekletilerek tatlandırılır ve tuzlanarak tüketilir. Yaygın olmamakla beraber, tohumlarının kavrulup öğütülmesi ile kahve olarak da tüketilmektedir. (Yorgancılar ve Bilgiçli, 2019).

Ülkemizde, hayvan beslemek amacıyla çoğunlukla yonca, fiğ, korunga, mısır ve üçgül bitkileri yetiştirilmektedir. Ancak, silajlık, yeşil yem ve dane yemi olarak kullanıma uygun olan lüpen bitkisi, hayvan beslemede alternatif yem kaynağı olarak değerlendirilmektedir (Okuyucu ve Okuyucu, 2008). Ayrıca, lüpen tohumları, kanatlı hayvan ve balık yemi rasyonlarında da kullanıma potansiyelinde bir baklagildir.

Lüpen tohumlarında bulunan yağ, oleik ve linoleik asitlerce oldukça zengindir. Aynı zamanda tohumları, önemli miktarda polifenoller, karotenoidler, fitosteroller, tokoferoller, antimikrobiyal, anti-kanserojen ve antienflamatuvar aktivitelere sahip peptitler içerir (Khan ve ark. 2015). Alkaloid olarak ise lupinin, lupanin, spartein, hidroksilupanin ile angustifolin ve glikozit olarak da lupinil ve vernin içermektedir. Bünyesinde bulunan bu bileşikler sayesinde lüpen, farmakolojik olarak büyük değer taşımaktadır (Tüzün 2013).

Doğal ve sağlıklı beslenme amacıyla yürütülen organik tarım uygulamalarında, lüpen bitkisi toprak iyileştirici, bitki koruyucu (biyo insektisit) ve büyümeyi teşvik edici (biyo stimülatör) özelliklerinden dolayı tercih edilmektedir.

Bu çalışmada lüpen bitkisinin kullanım olanakları başlıklar halinde incelenmiştir.

Lüpen Bitkisinin Gıda Olarak Tüketimi

Lüpen tohumunun protein içeriği (%33-47) diğer baklagillerden daha yüksektir ve soya proteini içeriğine yakındır (Dervas ve ark. 1999). Diğer baklagiller %50'ye kadar nişasta içerirken lüpenin nişasta içeriği (%0-5) oldukça düşüktür (SchusterGajzágó, 2004).

Genel olarak %5-20 yağ içermekte olup, bu yağ oleik ve linoleik asitlerce zengindir (Yorgancılar ve Bilgiçli, 2014). İstenen oranlarda omega 6, omega 3'e sahip yağ asitleri, oligosakkaritler, antioksidanlar, düşük karbonhidrat ve %30-40 lif oranıyla insan sağlığına oldukça yararlı bileşenlere sahiptir (Gorecka ve ark. 2000). Yüksek protein ve düşük karbonhidrat içeriğine sahip olan lüpenin, bu bağlamda sporcu diyetlerinde proteinli bar olarak kullanım potansiyeli bulunmaktadır (Adıgüzel, 2018).

Lüpen bitkisinden bulgur üretimi üzerine çalışmalar yapan Yorgancılar ve Bilgiçli, 2010, tatlı lüpen türlerinin bulgur üretimi açısından daha üstün teknolojik ve duyuşsal özellikler gösterdiğini bildirmişlerdir. Bu bulgurun çölyak hastalarının tüketimine sunulmasının önemli bir adım olduğunu bildirmişlerdir.(Yorgancılar ve Bilgiçli, 2013).

Geleneksel bir gıda olan tarhanada, lüpen unu bileşenlerden biri olarak kullanılmıştır (Çevik ve Ertaş, 2019). Ayrıca, fermente edilen yoğurt tarhana yapımında da kullanılmış ve damak tadına uygun olduğu bildirilmiştir (Ertaş ve ark. 2014).

Lüpen Bitkisinin Hayvan Beslenmesinde Kullanım Olanakları

Lüpenin hayvan beslemede kullanımını sınırlayan en önemli etken içerdiği alkaloit ve glikozitlerdir. Acı lüpen taneleri alkaloit olarak lupinin, lupanin, spartein, hidroksilupanin ile angustifolin; glikozit olarak da lupinil ve vernin içerirler. Söz konusu alkaloitler hayvanlar tarafından yüksek seviyede tüketildiklerinde “lupinus” denilen bir hastalığa sebep olurlar. Ancak günümüzde kültürü yapılan lüpen çeşitleri daha önceki yıllarda üretilen lüpen çeşitlerine oranla genetik olarak çok daha üstün kompozisyondadır ve alkaloit içeriği de azaltılmıştır (Leeson ve Summer, 1997). Bu özelliklere sahip lüpen çeşitleri, kontrollü olmak koşuluyla, hayvan beslemede güvenle kullanılmaktadır.

Aalkaloit oranları düşük, tatlı olarak adlandırılan, ak lüpen (*L. albus* L.), sarı lüpen (*L. luteus* L.) ve mavi lüpen (*L. angustifolius* L.) gibi orijinini Akdeniz ülkelerinden alan türler hayvan beslemede önemli rol oynamaktadır. (Okuyucu ve Okuyucu, 2008).

Lüpen tohumları tek yıllık bitkilerle karışık ekilerek otlatmak suretiyle veya otsu gövdesi çiçeklenme öncesi biçilmek suretiyle yeşil yem olarak veya hasat olgunluğundan 3–4 hafta önce hasat edilmek suretiyle silaj olarak veya tohumları yem rasyonlarına katılmak suretiyle çeşitli hayvanların beslenmesinde kullanılmaktadır. Örneğin, protein bakımından zengin olan lüpen tanelerinin etlik piliç beslenmesinde kullanılabileceği belirtilmiştir (Tüzün, 2013). Balık yemi rasyonlarında ise lüpenin alternatif ürün niteliği taşıdığı bildirilmiştir.(Yiğit ve Koca, 2011). Tanelerinin arzulan düzeyde protein, yağ, mikro elementler ve vitaminler içermesi nedeni ile bazı kriterlere uyulmak şartıyla hayvan beslenmesinde güvenilir biçimde kullanılması mümkündür.

Lüpen Bitkisinin İnsan Sağlığı Açısından Önemi

Lüpen tohumları önemli miktarda polifenoller, karotenoidler, fitosteroller, tokoferoller, antimikrobiyal, anti-kanserojen ve antienflamatuar aktivitelere sahip peptitler içerir (Khan ve ark. 2015). Bünyesinde bulunan lupanin, spartein ve anagyrine gibi alkaloitler lüpenin hem sağlık açısından hem de farmakolojik olarak değerini artırmaktadır (Bilgiçli ve ark. 2012; Tüzün 2013; Yorgancılar ve Bilgiçli, 2014).

Acı baklanın günlük tüketiminin hipertansiyon ve insülin direnci gibi sorunlara olumlu etkide bulunduğu gözlenmiştir (Arnoldi 2005). Yüksek oranda içerdiği arginin aminoasidi sayesinde kandaki şeker ve kolesterol seviyelerinin düşürülmesine yardımcı olmaktadır (Yorgancılar 2013).

Öğütülmüş tatlı lüpen tanelerinin, yüksek tansiyon, şeker hastalıkları, kemik erimesi ve kalp hastalıklarında iyileştirici özelliklere sahip olduğu saptanmıştır (Wink, 2006). Tohumlarında bulunan alkaloitlerin kolorektal kanser, meme, prostat, deri ve karaciğer kanseri gibi birçok kanser hücrelerinde gösterdiği sitotoksik etkiden dolayı antikarsinogenik olduğu belirlenmiştir (Okuyucu ve ark. 2004). Lüpenin magnezyum ve potasyum içeriği kalp - damar sağlığını korumakta olumlu etkide bulunmaktadır. Obezite sorunundaki olumlu rolünün yanı sıra lif ve protein içeriğinin yüksek oluşu diyabeti de kontrol etmede yardımcıdır. Lüpen, prebiyotik özelliğiyle düzensiz bağırsak sendromu gibi bağırsak komplikasyonlarının giderilmesine, bağırsak hareketliliğine destek olmaktadır (Akalin ve ark 2009). Olgun tohumları kaynar suda haşlanarak tüketildiğinde, kurt düşürücü etki yapar. Ayrıca, idrar söktürür ve idrar yollarını temizler. Böbrek iltihabını giderir, böbrek taş ve kumlarının düşürülmesine yardımcı olur. Baş ağrılarını dindirir. Romatizma, lumbago ve siyatik ağrılarını keser. Albümin miktarını düşürür ve vücutta biriken tuzu atar.

Lüpen Bitkisinin Organik Tarım Uygulamalarında Önemi

Artan dünya nüfusunun beslenme ihtiyacının karşılanması tarımsal üretimin artırılmasıyla mümkündür. Ancak, yeterli üretimin sağlanması sentetik kimyasal tarım ilaçlarının kullanılması zorunluluğunu da beraberinde getirmektedir. Toprak ve su kirliliğine neden olan kimyasal yabancı ot öldürücüler, zararlılara karşı kullanılan insektisitler, sentetik besin maddeleri ve gübre kullanımı, büyüme düzenleyiciler ve hormonlar, son yıllarda insan sağlığı ve doğaya olumsuz etkilerde bulunmaktadır.

Baklagil bitkileri, toprağı havalandırması yanında köklerindeki rhizobium bakterileri yardımıyla havanın serbest azotunu toprağı tespit etmekte ve toprağı azotça zenginleştirmektedir. Lüpen bitkisi de kazık köke sahip bir baklagil bitkisi olduğundan, toprak yapısını iyileştirir, toprağın havalanmasını sağlar, toprak derinliklerinden alınması zor besin maddelerinden yararlanabilir (Hanett, 2006). Bu nedenle lüpen, son yıllarda güncel olan organik tarımda bitkisel ürün elde edilmesi bakımından geniş kullanıma olanağı bulmuştur (Okuyucu ve ark., 2004)

Bilinçli toplumlarda doğal ve sağlıklı beslenme amacıyla bitkisel ürün yetiştirmede kimyasal içeriklerden uzak durulmaktadır. Bu amaçla yapılan, organik tarım uygulamalarında lüpen (*Lupinus sp.*) tohumlarından elde edilen ekstraktın toprak nematodlarına ve böceklerle karşı bitki koruma amacıyla biyo-insektisit (biyolojik kökenli böcek öldürücü) olarak uygulanmasının öldürücü etki yaptığı bildirilmiştir (Yıldız, 2011). Yine biyo-insektisit niteliğindeki lüpen tohumu ekstraktı, çeşitli dozlarda Brukus (*Callosobruchus maculatus* F.) ergini bulunan tohumlara uygulanmış ve kontak etki sonucu böceklerin hemen hemen tamamını öldürdüğü görülmüştür (Elmalı ve Cetin, 2018) Böylece, doğaya zarar vermeden ve ürün üzerinde kalıntı riski olmadan zararlı mücadelesi sağlanabilmektedir (Yorgancılar, 2013).

Ayrıca, lüpen tohum ekstraktı marul, havuç, pancar ve lahanada yapraklara püskürtülmüş, lahanada dışında diğer bitkilerde büyümede olumlu etki yapmıştır (Van der Watt ve Pretorius, 2011). Bu da organik tarımda büyümeyi teşvik edici madde (biyo-stimülatör) olarak kullanımına olanak tanımaktadır.

Sonuç

Acı bakla (*Lupinus angustifolius* L.), zengin protein ve yağ içeriğinin yanı sıra zengin besin bileşenleri ile insan ve hayvan beslenmesine olan olumlu katkıları ve aynı zamanda toprak ıslah etmedeki değeri dolayısıyla son yıllarda oldukça önem kazanan bir baklagil bitkisidir. Bu durum, özellikle alkaloid içeriği ıslah yoluyla azaltılmış, üstün kompozisyona sahip türlerin geliştirilmesi ve yetiştirilmesi, alternatif kullanım alanlarının artırılması, toplum düzeyinde gıda olarak tüketimi konusunda farkındalık oluşturulması ve sağlık üzerine olan olumlu etkileri konusunda bilinçlendirme çalışmaları yapılmasının önemini göstermektedir.

Abstract

Nitrogen is an essential plant nutrient and is one of the production limiting elements. With the increase in the use of nitrogen fertilizers in agriculture, the yield of agricultural products has been increased worldwide and the food increase needed by the rapidly increasing population has been provided. Nitrogen fertilizers have increased the yield in agricultural production, but have also led to the release of greenhouse gases. This has not only reduced the effectiveness of nitrogen use, but also caused climate change and loss of biodiversity. It has been reported that the use of nitrification and urease inhibitors, which have become increasingly important in recent years, can increase the efficiency of nitrogen use and reduce the emission of greenhouse gases. In addition, nitrogen cycle inhibitors are applied with nitrogen fertilizers as they slow the conversion of urea to ammonium and the conversion of ammonium to nitrate, minimizing nitrate leaching and gas losses through nitrification and denitrification. This situation reduces the damage to the environment by reducing nitrogen leakage and increasing the efficiency of nitrogen use, as well as increasing the profits of the farmers.

Key Words: Nitrogen, Fertilizer, Inhibitor, Nitrification, Urease

Nitrifikasyon ve üreaz inhibitörlerinin etkinliğinin genel değerlendirmesi

Özet

Azot, temel bir bitki besin maddesidir ve üretimi sınırlayıcı elementlerin başında gelmektedir. Tarımda azotlu gübrelerin kullanımının artmasıyla dünya çapında tarımsal ürünlerin verimi artırılmış ve hızla artan nüfusun ihtiyacı olan gıda artışı sağlanmıştır. Azotlu gübreler tarımsal üretimde verimi arttırmış ancak aynı zamanda sera gazlarının salınımına da yol açmıştır. Bu durum azot kullanımının etkinliğini azaltmakla kalmamış, aynı zamanda iklim değişikliğine ve biyolojik çeşitliliğin kaybolmasına da neden olmuştur. Son yıllarda önemi giderek artan nitrifikasyon ve üreaz inhibitörlerinin kullanımının, azot kullanım etkinliğini artırabileceği ve sera gazlarının emisyonunu azaltabileceği bildirilmiştir. Ayrıca, azot döngüsü inhibitörleri, üreinin amonyuma dönüşümünü ve amonyumun nitrata dönüşümünü yavaşlatarak nitratin sızmasını, nitrifikasyon ve denitrifikasyon yoluyla gaz kayıplarını en aza indirdiğinden azot gübreleri ile birlikte uygulanmaktadır. Bu durum, azot sızıntısını azaltıp azot kullanım etkinliğini artırarak çevreye verilen zararı da azalttığı gibi çiftçilerin karını da arttırmaktadır.

Anahtar Kelimeler: Azot, Gübre, Inhibitör, Nitrifikasyon, Üreaz

Giriş

Azot, temel bir bitki besin maddesidir ve üretimi sınırlayıcı elementlerin başında gelmektedir. Tarımda azotlu gübrelerin kullanımının artmasıyla dünya çapında tarımsal ürünlerin verimi artırılmış ve hızla artan nüfusun ihtiyacı olan gıda artışı sağlanmıştır (Burney ve ark., 2010). Dünya nüfusu artmaya devam ederken azotlu gübrelerinin küresel kullanımının düşmesi olası değildir (Bakken ve Frostegard, 2017).

Dünya çapında, yılda baklagiller tarafından atmosferden sabitlenen tahmini 33-46 milyon ton N' ye ek olarak (Herridge ve ark. 2008), mevcut üretim seviyelerini sürdürmek için dünya genelinde bitkisel üretimde yaklaşık 115 milyon tondan fazla N' u gübre uygulanması yapılmaktadır (Heffer ve Prud'homme, 2012). Yıllar geçtikçe atmosferik nitrojen kullanımını en üst düzeye çıkarma stratejisi olarak Baklagil bitkileri ile ürün rotasyonundan, daha yüksek verim elde etmek için hem organik hem de sentetik formlarda azotlu gübre kullanımına geçiş önemli ölçüde artmıştır (Lassaletta ve ark., 2014). Bunun başlıca nedeni, dünya nüfus hızındaki artışın ardından, hızla artan küresel gıda talebi ve iklim değişikliğinin tarımsal üretim üzerindeki etkisinin artmasıdır. Her yıl, artan dünya nüfusuna ayak uydurabilmek için ticari azot üretimine yaklaşık 44 milyar dolar harcanmaktadır. Bitkiler tarafından azotlu gübrelerin geri kazanımı düşüktür. Örneğin, dünyada en önemli yetiştirilen çeltik, buğday ve mısır gibi tahılların yetiştirme döneminde uygulanan azotun sadece % 30-50'si (Herrera ve ark., 2016), sonraki yıllarda kalıntı azotun ise < %10'u (Ladha ve ark., 2005) geri kazanılmaktadır. Topraklardaki azot dönüşümünün karmaşık doğası, optimal olmayan gübre yönetimi uygulamalarıyla birleştiğinde, birçok durumda düşük azot kullanım etkinliğine yol açmaktadır. Azotlu gübrelerin sistemden nitrat (NO₃⁻) olarak veya amonyak (NH₃), nitröz oksit (N₂O) ve moleküler nitrojen (N₂) gibi gaz halindeki kayıpları, üreticiler için büyük ekonomik kayıplara neden olmaktadır. Düşük maliyeti ve erişilebilirliği nedeniyle en yaygın kullanılan ticari azotlu gübreler üre ve üre içeren gübrelerdir. Üre, dünya da azotlu gübre üretiminin yaklaşık %56'sını oluşturmaktadır (Suter ve ark., 2016). Üre, yüksek Azot içeriğine (%46) sahip katı bir gübredir. Depolanması ve bitkilere uygulanması kolaydır ve diğer azotlu gübrelerle

birlikte toprağa kolaylıkla uygulanabilir. 2017 yılında, dünya çapında tarımda uygulanan azotlu gübrenin yaklaşık %72'sini üre oluşturmuştur (FAO, 2019). Bununla birlikte, azotun büyük bir kısmı çevreye kaybının yüksek olması nedeniyle üre ile gübreleme oldukça verimsizdir. Üre özellikle amonyak (NH_3) şeklinde buharlaşarak kaybolmaktadır. Bunun nedeni, toprakta üre, üreaz enzimi aracılığıyla amonyum (NH_4^+) oluşturmak üzere hızla hidrolize olur. Bu reaksiyonda, üre granülünü çevreleyen alanın toprak pH'ını artıran protonlar tüketilir. Böylece, NH_3 ve NH_4^+ arasındaki denge, NH_3 formuna yönlendirilir, bu nedenle gaz halinde kaybolmaya karşı hassastır. Dünyada üre şeklinde uygulanan azotun yaklaşık %10-19'unun NH_3 buharlaşması yoluyla kaybolduğu tahmin edilmektedir (Bouwman ve Boumans, 2002). Bununla birlikte, özellikle yüksek sıcaklık ve/veya yüksek pH'lı topraklarda bu kayıplar koşullara bağlı olarak yaklaşık % 30'a kadar artabilmektedir (Silva ve ark. 2017; Cantarella ve ark., 2018). Bu, yalnızca gübrelere yapılan yatırımın üçte birinin buharlaşma yoluyla kaybolması değil aynı zamanda önemli ekonomik kayıpların olması anlamına gelmektedir. Ayrıca, NH_3 biriktilğinde asitleşme, ötrofikasyon ve nitröz oksit emisyonlarına neden olabilmektedir (Zhu ve ark., 2016).

Üreaz ve nitrifikasyon inhibitörlerinin kullanımı, tarımda gübre etkinliğini arttırmak ve üre ve azot kirleticilerinin emisyonunu azaltmak için benimsenen bir yaklaşımdır. Nitrifikasyon ve üreaz inhibitörlerinin geliştirilmesi, özellikleri nedeniyle zaman alıcı ve pahalı bir süreçtir. Fakat, yeni nesil gübrelere, tarımsal sistemlerden azot kayıplarını azaltma potansiyeline sahip olduğu bilinmektedir (Chen ve ark., 2008).

Üreaz İnhibitörleri

Üre, yüksek azot içeriği ve birim azot başına nispeten düşük maliyeti nedeniyle dünya çapında en yaygın kullanılan azotlu gübrelere biri olarak kabul edilmektedir (Papangkorn ve ark., 2008). Topraktaki üreazın ardından üre, üreaz enzimi veya buharlaşma yoluyla hidrolize olmaktadır. Bu şekilde, granülleri çevreleyen toprağın pH'ını artırır ve dünya çapında uygulanan azotun %16'sına kadar NH_3 kayıplarına neden olur. Hatta, NH_3 kayıpları, sıcak ve nemli koşullarda %40'a veya daha fazlasına ulaşabilmektedir (Cantarella ve ark., 2018). Üreaz, ürenin hidrolizini iki mol amonyak ve bir molar karbon dioksit (CO_2) katalize eden nikel bağımlı bir enzimdir. İlk aşama, bitkilerin onları alabilmesi için toprak suyunda amonyuma dönüştürülen NH_3 sağlayan ürenin hidrolizidir; ikinci aşama, azotun NH_3 olarak buharlaşmasıdır (Artola ve ark., 2011). Üreaz inhibitörlerinin etkisi, ürenin NH_4^+ 'ya dönüşümünü yavaşlatmak ve NH_3 'ün uçuculuğunu azaltmaktır. Sonuç olarak, uygulanan ürenin önemli bir yüzdesi bu şekilde toprağa yayılabilmektedir (Saggar ve ark., 2013). Fiziksel ve kimyasal birçok bileşik, toprak üreaz aktivitesini inhibe etme potansiyelleri açısından araştırılmıştır (Singh ve ark., 2018). En başarılı ve en sık kullanılan üreaz inhibitörü tiyofosforik-triamid (NBPT) (Kakabouki ve ar., 2020) olarak belirtilmiştir. Son 10 yılda NBPT pazarı, üre ile karşılaştırıldığında önemli ölçüde düşük NH_3 kayıpları nedeniyle yılda %16 büyümeye göstermiştir (Cantarella ve ark., 2018). Etkinliği onaylansa da, araştırmacılar NBPT ile takviye edilen ürenin inhibisyon süresini ve raf ömrünü artırma konusunda çalışmalarını sürdürmektedir (Cantarella ve ark., 2018). NBPT kullanımı, üreden NH_3 kaybını %66'ya kadar azalttığı bildirilmiştir (Panel, 2015).

Nitrifikasyon İnhibitörleri

Nitrifikasyon inhibitörlerinin rolü, ilk olarak amonyumun nitrata dönüşümünü azaltmaktır, bu da tarımda nitrat sızıntısını önlemenin önemli bir yolu olarak kabul edilmektedir. İkinci olarak, bir sera gazı olarak kabul edilen nitröz oksit emisyonlarının atmosfere indirgenmesidir. Ancak, nitröz oksit emisyonu, düşük nitrojen kayıp miktarları nedeniyle bitki besleme için önemli bir faktör değildir (Soares ve ark., 2016). Nitrifikasyon inhibitörleri normal olarak NH_3 buharlaşmasını artırır ve üreaz inhibitörleri ile karıştırıldığında NH_3 kaybındaki azalma kısmen dengelenmektedir (Cantarella ve ark., 2018). Yapılan bir çalışmada, üreaza nitrifikasyon inhibitörlerinin eklenmesiyle buğday tarlasındaki NH_3 kayıplarını % 38 oranında azaldığı belirlenmiştir (Pan ve ark., 2016). Çeltik tarlalarında gaz halindeki azot emisyonu, uygulanan azotlu gübrenin %10-60'ı kadar olduğu bildirilmiştir (Xu ve ark., 2013). Çeltik tarlasında kontrollü salımlı üre kullanılarak amonyak ve azot oksit %90'a kadar düşürülmüştür (Yang ve ark., 2013). Ayrıca, nitrifikasyon inhibitörleri toprak asitleşmesini azaltabilmekte; bu düşüş nitrifikasyonu bloke ederek NH_3 kaybını azaltmaya yardımcı olmaktadır (Soares ve ark., 2012). 3,4-Dimetilpirazol fosfat (DMPP), üre veya diğer katı azotlu gübrelere harmanlanan düşük ekotoksik, oldukça avantajlı özelliklere sahip yeni bir nitrifikasyon inhibitörüdür.

Dünyada yaygın olarak kullanılan iki inhibitör, nitrifikasyon inhibitörü 3,4-dimetil pirazol fosfat (DMPP) ve üreaz inhibitörü N-(n-butil) tiyofosforik triamiddir (NBPT). DMPP ve NBPT içeren yavaş salımlı gübrelere, azot kaynağı ile ürünün azot talebi arasındaki uyumu artırarak azotlu gübrenin geri kazanımını artırmak ve azot kayıplarını azaltmak için geliştirilmiştir. Bu etki, amonyumun bakteriyel oksidasyonunu veya ürenin hidrolizini geciktirerek elde edilmektedir.

DMPP, amonyumun (NH_4^+) NO_3^- 'e mikrobiyal dönüşümünü ve nitrifikasyon ve denitrifikasyon yoluyla gaz halindeki azot formlarının üretimini yavaşlatır. Bir dizi inhibitörün bu dönüşümü geciktirebileceğini ve böylece N_2O emisyonlarını azaltabileceğini gösteren bazı çalışmalar bildirilmiştir (Menéndez ve ark., 2012). NBPT'nin kullanımı, özellikle mera altındaki yüksek karbonlu topraklarda bol miktarda bulunan üreaz enzimini engellemeyi amaçlamakta (Chen ve ark., 2008), böylece ürenin NH_4^+ 'ya dönüşümünü yavaşlatmakta ve uçuculuk yoluyla N kayıplarını en aza indirmektedir (Watson ve ark., 1994).

Azot Kullanım Etkinliği

Yaygın olarak kullanılan azot kullanım etkinliği, azot kullanımının nasıl artırılacağını, yani ürüne ne kadar azot uygulandığını ve bitkiler tarafından ne kadar kullanıldığını gösteren bir göstergedir. Azot verimliliği iklim koşulları, bitki hastalıkları, gaz olarak topraktan azot kayıpları, azotun sızması veya azotun organik formlarda hareketsizleştirilmesi nedeniyle azalmaktadır. Azot kayıplarını ve maliyetini azaltmanın en etkili yolu azot kullanım etkinliğinin geliştirilmesidir (Raza ve ark., 2018). Azotlu gübre kullanımının artmasıyla azotlu gübrelerin etkinlik derecesi azalmış ve bu artan uygulamanın zararlı etkileri ortaya çıkmıştır (Shi ve ark., 2012). Ayrıca, sel, toprak sıkışması gibi birçok faktör azot kullanım etkinliğini etkilemektedir (Lian ve ark., 2020). Bitki ıslahçıları geliştirdikleri yeni çeşitlerin azot kullanım etkinliğini iyileştirerek (Kumar ve ark., 2019) verimi arttırmayı amaçlamaktadır. Baklagiller, atmosferik azotufikse edebilme yeteneklerinden dolayı yüksek azot kullanım etkinliğine sahiptirler (Hocking ve Reynolds, 2012). Yapılan farklı çalışmalarda azot kullanım etkinliğinin mevsime, kuraklığa, sıcaklığa, infiltrasyona, sulama şekline, yağış miktarına, yağışın rejimine, ön bitkiye, toprak işlemeye bağlı olarak değiştiği bildirilmiştir (Attia ve ark., 2015; Chilundo ve ark., 2016; Lu ve ark., 2019). Son yıllarda birçok üründe azot kullanım etkinliği artmış ve bunun sonucu olarak tarımsal üretimden kaynaklanan azot kaybı azalmıştır. Özellikle son yıllarda, inhibitörlü gübrelerin sisteme dahil edilmesiyle azot kullanım etkinliğinin arttığı da belirlenmiştir.

Azot kullanımının çevreye etkisi

Yoğun tarımın iklim değişikliği ve çevre üzerinde önemli bir etkisi olduğundan, son birkaç yılda daha çevre dostu uygulamalar benimsenmiştir. Bitkisel üretimde verim ve kaliteyi artırmak için ekim nöbeti uygulamaları, arazi ve doğal kaynak yönetiminin iyileştirilmesi gerekmektedir (Bouwman ve ark., 2002). Aynı zamanda, gübre sanayisi önemli ölçüde değişmiş olmasına rağmen, azot ticari gübrelerde kullanılan ana element olmaya devam etmektedir (Ravishankara ve ark., 2009). Bununla birlikte, sürdürülebilir tarım sistemleri tasarlamak için ürünlerde geliştirilmiş azot kullanım etkinliğine duyulan ihtiyaç zorunludur (Lassaletta ve ark., 2014). Artan nüfusun sürdürülebilir beslenmesini sağlarken, istenmeyen ve zararlı çevresel bozulmayı en aza indirmek için azot yönetimi iyileştirilmelidir. Uygulanan azotun verimliliği bölgeler, iklimler ve ürünler arasında büyük farklılıklar gösterir (Fan ve ark., 2018). Genellikle toprak-bitki sistemlerinde azot fazlalığı ne kadar fazlaysa, çevreye verdiği zararın da o kadar büyük olduğu kabul edilmektedir. Çevresel sonuçlar arasında, su yollarının ötrofikasyonu (NO_3^- sızıntısı ve NH_3 birikimi), sera gazı emisyonları (N_2O) ve ozon tabakasının incilmesi (Ravishankara ve ark., 2009) yer almaktadır. Amonyak ve nitroz oksit, küresel ısınmaya doğrudan ve dolaylı katkıları ile bilinen iki büyük zararlı azot kirleticidir (Recio ve ark., 2018). Bu azot emisyonlarının yaygın nedeni, yüzeye uygulanan gübre ile üre ve amonyum bazlı gübrelerdir. Sonuç olarak, azot sızıntısını azaltmak ve azot kullanımını artırmak için küresel pazarda inhibitörlü yeni gübreler ve yeni teknolojiler kullanımı arttırılmıştır (Giltrap ve ark., 2010).

Sonuç

Son 50 yılda dünya nüfusu neredeyse iki katına çıkarken öngörülen gıda talebini karşılamak için tarımsal üretimde de bir artış gerekmektedir. Bu nedenle bitkisel üretimde verimin artırılması gerekmektedir. Son yıllarda, aşırı miktarda azot uygulaması yoluyla ürün veriminin artırılması sağlanmıştır. Şu an için birçok araştırmacı, bitkilere uygulanan azotlu gübrenin yarısından fazlasının çevreye kaybolduğunu gözlemlemiştir. Gübre inhibitörleri, gübre pazarının ayrılmaz bir parçası olarak kabul edilmektedir. İnhibitörler uzun zamandan beri, topraktan yıkanma ve denitrifikasyon nedeniyle azot kayıplarının önlenmesi ve NH_4^+ iyonlarının toprak pH'sı üzerindeki etkinliğinin uzun süre devam etmesi amacıyla, üre ve amonyum formunda azot içeren gübrelere nitrifikasyon inhibitörü olan bileşikler eklenerek kullanılmaktadır. Kullanılan inhibitörler ile üre uygulanan topraklarda, ürenin NH_4^+ formuna dönüşmesinde etkili olan üreaz enzimi aktivasyonu; NH_4^+ formunda uygulanan azotun ise nitrifikasyon olayı ile nitrata dönüşerek yıkanması engellenmektedir. Azot arzı talep eden ürünlerin büyüme aşaması, düzensiz veya yanlış gübreleme ve uygun olmayan gübre ürünlerinin kullanımı, işletme maliyetlerini yükseltmekte ve çiftçilerin net kârını azaltmaktadır. Üreaz ve nitrifikasyon inhibitörlerinin, azot kullanım etkinliğini artırma potansiyeli ile birlikte azotun etkin kullanımı sağlanarak kârın arttırılmasına olanak sağlayacaktır. Ayrıca, inhibitörlü gübreler azot sızıntısını azaltılıp azot kullanım etkinliğini artırması nedeniyle çevreye zararı da azaltılmış olacaktır.

Özet

Amaç: Bu çalışma da Kütahya bölgesindeki sokak kedilerin de bulunan *Cryptosporidium* spp. yaygınlığının mikroskopik ve moleküler yöntemlerle araştırılması amaçlanmıştır.

Materyal ve Metot: Çalışmanın hayvan materyalini Kütahya bölgesindeki 100 sokak kedisi oluşturmaktadır. Kedilerin dışkılamalarını takiben dışkı örnekleri alınarak dışkı kabına alındı. Dışkı örnekleri ilk olarak mikroskopik olarak carbol fuchsin boyama yöntemi ile *Cryptosporidium* ookistleri yönünden incelendi. Daha sonra 100 örneğin tamamından DNA ekstraksiyonu yapıldı. Ardından uygun primerlerle Nested PCR yapıldı. PCR ürünleri %1.5'lik agaroz jelde koşturularak jel görüntüleme cihazında görüntüleri elde edildi.

Bulgular: Mikroskopik inceleme sonucunda 100 örneğin 4 (%4)'ünde *Cryptosporidium* spp. ookistlerine rastlanıldı. Nested PCR sonucunda ise 100 örneğin 6 (%6)'sında pozitiflik saptandı.

Sonuç

Bu sonuçlar, insanı enfekte eden *Cryptosporidium* spp. için rezervuar konakçı olarak kedilerin rolünü vurgulamaktadır. Sokak kedileriyle temasta olan insanların bu zoonoz parazit hakkında bilgilendirilmesinin, Cryptosporidiosis'in kontrol altına alınmasında olumlu katkı sağlayabileceği düşünülmektedir.

Anahtar Kelimeler: *Cryptosporidium* spp., Kedi, Kütahya, Moleküler

Transformation and Expression Analysis of CEMB VIP3A Gene in Local Maize Inbred Lines

Abdul Munim Farooq, Komal Shabir, Saman Riaz, Allah Bakhsh, Abdul Qayyum Rao

Abstract

Maize is a plant of worth importance owing to its nutritional quality, medical applications and the capability to be transformed especially by *Agrobacterium tumefaciens*. Maize, third most important cereal crop, serves its benefits in the production of food, fuel and fodder. Maize grown in spring is of prime significance to Pakistan. The annual yield of maize grain is 3.037 million tonnes. The production of maize plant has to be increased in order to meet the ever increasing demands of fast growing population. The transformation efficiency of maize has been best reported by the utilization of *Agrobacterium*-mediated plant transformation method. There is a need to develop transgenic maize plants, with altered genome. For this purpose, VIP3A gene was integrated into maize genome that is resistant to insect pest mainly *Lepidoptera*. The source of VIP3A gene was a bacterium i.e. *Bacillus thuringiensis*. This bacteria produces Vegetative Insecticidal Proteins during the vegetative growth phase. The cry and cyt toxins produced by bacteria, exhibit resistance to a variety of insects. Among these toxins, VIP3A has the most potential of insecticide resistance. The confirmed transformed *Agrobacteria* having the VIP3A gene were then transformed in CEMB maize inbred line. Optimization of the medium was also done for enhanced transformation efficiency by augmenting with silver nitrate, L-Cystein, Acetosyringone and Cefatoxine. After multiple transformations, only 15 plants were able to survive. They were then screened for molecular tests for instance PCR, Immunostrips detection and ELISA. Out of 15 transgenic maize plants, 7 gave positive result for PCR. These 7 plants: PCV 2, PCV 4, PCV 5, PCV 6, PCV 7, PCV 9 and PCV 10 showed test line on immunostrips rendering them positive. They also gave absorbance greater than 0.3 for ELISA which was the marking for good protein concentration. Among these plants, PCV 9 has the best protein concentration and is a potential candidate for insect bioassay.

Key Words: *Agrobacterium mediated transformation, Maize, VIP3A , Insecticidal , Cry toxins*
